much greater than thane between the nows of the n. . Harmer tural fale, as they take their ghaces, noe directly oppolite to the notes which thy are intended to heighten or deprefs, but in a denation betwest the hisheat and lowed, to flow, that in afending they are tharps to the one, and indefcending llts the other. This Hructure, however, is doubly inconvenient; for it not only incerates the labour and dificuly of the performer, but renders fome mofical operations i:mpacticable, which upou the Humonica, ascondtimet by Dr Franklin, may be execoned with eafe and pleafurc. In this fabric, if poperly formed an accurately tunen, the influment is equally adapted to harmony and melody. Dut as no material flucture could ever yet the brought to the perfection even of human ideas, this inftrument Itill in fome meafure retains the perverfe nature of its original ftamina. Hence it is no withous the nomor dififeulty that the ghffes can be tuned by grinding; and the lealt conceivable reduadancy or dete t renders the diferrd upon this initrument more contjicuous and intolerable than upon any other. Hence likewife that inespreffible delicacy to be obferved in the manner of the fritaion by which the fonnd is produced: for if the touch be too gentle, it canmot extort the tone; and if too ftrong, blides the mellow and delicate found which onght to be heard, we likewife perceive the funger jaring upon the glaf, which, mingled with thole fofter fomids by which the fenfes had beca foothed, gives a fecling limilar to iron grating upor iron, but more difagreeable. In wind-intrumens the operation of the tongue, in harplichords the itroke of the quill, and on the violin the motion of the bow, gives that flrong and fenible interruption of found wheh may be called articulation, and which renders the hiythemus or neafare of an airmore perceptible: but, upon the glafes, the touch of the finger is too foft to divide the ares with fo mach force; fo that, urdefs the mind be theadly attentive, they feem to melt one into another, by which means the idea of rhythmus is almot loft. There is no way of performing a flar but by forbearing to thop the firte found, when that which is immediately fubicquent commences. Thas, when the flur is of any length, and regularly defents or rifes by the interval of a fecond, all the notes in the flur mult be heard together, and produce no agreable diffonance; yet if it rifes or defeends by perfect chords, the effeet is pleating. The open thake, or trill, is annther unhappy operation upon mufical gluffes; which can orly be performed by the aliernate pulfations of two continued founds, differing from each other only by a note or femitone. But as thefe pultations thus managed cannot be dittinct, the refult is far fiom being pleafant; nor is there any fuccedansum for the clofe flake, which in the violin is performed by alternately depreffing the Atring to the finger-board, and fuffering it to rife without entirely removing the finger from it, and which, by giving the note that tremulous found produced by the human voice affected with grief, is a grace peculially adapted to pathetic and plaintiv: airs.

We proced, however, to a farther aceount of the fame intrument, extrafed from the Annual Regilter, vol. iv. p. 149.
"Belides thofe tones (fays the author of that account) which every claftic ttring produces by a vi-
,

## H A R

armeni- bration of all its parts, it is capable of arothec fet of tones, in which only a part of the atring is fuppiofed to vibrate. Thefe fomds are produced by the ligheet touches, either by air, as in Ofwald's lyre, or by rubbing the bow in the foftell manner on the fring of a fiddle.
"A Analogous to thefe founds are thofe produced by bells: in thofe laft, befides thofe tones produced by their elliptical vibrations, thare are a fet of tones which may be bruught by gently rabbing their tdges, and in which the whole inftument does not appear to vibrate in all its parts as before.
" Take, for inllance, a be!l finely polithed at the edges; or, what will perhaps be more convenient, a drinking. glafs: let the edges be as frec from any thing oily as poffible; then, by moiltening the linger in water (I have found alun-water to be beft), and rubbing it circulatly roums the edge of the glafs, you will at length bring out the tone referred to.
"This note is poffled of infuite fiveetuef; ; it has all the excellencies of the tone of a bell without its defects. It is loud, has a fuficient budy, is capable of being fwelled and continued at pleafure; and, befides, las maturally that vibrawory foftening which muficians eodeavoni to imitate by nixing with the nose to be played a querter tone from below.
"To vary theic towes, nothing more is required than to procurt feverai bells or giafics of different tones, tuned as nearly as pelible, which may be doue by thinning the edges of cither: or, for immodiate fatisfaction, the glafls inay be tuned by pouring in water; the more vater is poured in, the graver the tone will be.
"Let us fuppofe then a double octave of thofe glafles, thus tuned, to be procured. Any common tune may be execnted by the fingers rubbing upon each glafs fucetfively; and this I have frequently done without the leal d:ficulty, only cho ding thofe tunes which are flow and eafy. Herc then are numbers of delicate tones, with which mulicians have been till very lately unacquainted; and the whly defeci is, that they cannot le made to follow each other with that celerity and eafe which is requifite fur melody. In order to remedy this, I took a large drinking glafs, and by means of a wheel and gut, as in the electrical machine, made is to turn upon its axis with a modesately quick but equable motion; theo moitlening the finger as before, nothing more was required than merely to touch the glafs at the edge, without any other motion, in order to bring out the tone.
"Intlead of one glafs only turning in this manner, if the whole number of glaffes were fo fixed as to keep continually turning by means of a wheel, it follows, that upon every toneh of the finger a note would be expreffed; and thus, by touching feveral glaffes at once, an harmony of notes might be produced, as in an harpfichord.
"As I write rather to excite than fatisfy lise curious, I hall not pretend to direct the various ways this number of glaffes may be contrived to turn; it may be fufficient to fay, that if the glaffes are placed in the fegment of a circle, and then a lirap, as in a cutler's wheel, be fuppofed to go round them all, the whole number will by this neans be made to turn by means of a whecl.
" Inteand of the fumst, I have appried moilened Harnonileather whe the elfe of the glafs, in corder to bring out ca. the tone: but, for wan af a proper clallicity, this did not fueceed. I tried conk, and this anfivered every purpofe of the finger; but mate the tone much louder than the finger could do. Inteal, therefore, of the finger, if a number of corks were fo contrived as to fall with a proper degree of prefiure on the edge of the glafs, by means of keys like the jacks of an organ, it is evident, that in fuch a cafe a new and tolerably perfect inltrument would be produced; not fo loud indeed as lome, but infinitely more melodinus than any.
"The moutlis of the glafles or bells ufed in this experinent hoold not refemble the mouth of a trumpet, but thould rather come forward with a perpendicular edze. The corks ufed in this cafe fhould be fmooth, even free from thore blemithes which are ufually found in them, and at the fame time the more elaftic the better."

In the two acconnts here given feems to be comprehended every thing valuable which has been faid upon the fubject. It remains, however, our permanent opinios, that the form and Itructure deligned and conflituted by Dr lianklin is by much the mut eligible; nor can we admit, that a cork, however fuccefsfully applied, will produce the fame metlownefs and equality of tone in general with the finger. It appears to us, that, by this kind of voluntary attrition, a note may be funk or fwelled with much more art and propriety than by the fubititution of any thing elfe extrinti= to the hand; and when chards are lons protracted, that degree of trition, which renders every found in the chord fentible to the eat, without hathonef, mat be the molt agrecable. For this reafon, likewife, we thould recomneed alum-water in preference to chalk.

From what has already been fail, it will eafily be perceived, that this in'trumant requires to be tuned with the nicell degree of delicacy whici the laws of temperament will polibly acmit. For thefe laws the reader will naturally have recourfe to the article Music $t$, in + Chap. wiz. this Dictionary; where, from M D'Alembert, is gi-art. Gat. ven a plain and latisfactory account, both of the method propoved by Ramceu, and of that eflablimed in common practice, without antcipating the experience and tale of the reader, by dietating which of thefe plans is preferable. To thofe who bave occation to tune the inltrument, it may likewife be ufeful to perufe the detached article Temererament in this Work. Without recapitulating the different rules of alteration prefcribed in thefe accounts, we thall prefuppofe the reader aequainted with them ; and proceed to deferibe how, under their influence, the Harmonica may be tunod. But it is previoully expedient to obferve, that the fane rules which conduct the procefs of tuning a harplichord, will be tqually effictual in tuning the forrmishica ; with this only differcnce, that greater delicacy in adjulting the chords thould, if practicable, be attempted.

There are different notes from whence the procedure of tuning may commence. I.a or $A$, which is the ber that pretty nearly divides the harplichord, is chofen by fome; this $l a$ in common fpinets is 24 natural keys from the bottom, and is from the top: and the at above it, or fecond C apon the G eleff, by others. This lat: we thould fatlew advife, becaule we imatian thase

İarmoni- intervals which we havecalled ficonds major to be mose co. jull through tho whole octave, when the courfe of tubing is begun by a natural femitune. 'Ihe initiate, therefore, may legin by tuning the fecond ut of his /l.amonkit, on C above the treble cleff, in unifon with its correfpondent $C$ upon the harplichord or any other inflrument is concert-pitch; then, defecmeding to its octanc below, adjull it with the $u t$ above, till every pultation if pofible be loft, and the founds rendered fearedy difinguifhable when timultaneoufly heard. I'o the lowelt note of this odtave he mutt tune the fol or $C$ immediately ahove it by a fifth, fill obferving the laws of itmperanent: 'I'o this G , the re or D inmediately above it, by the fame chord: 'lo the re, or D above, its octave below: 'l'o this, by a fifth, the la or A immediately above it: To la, the mi or E afcending in the fanse propertion: 'lo mi, its octave below : To this, the for B inumediately abure it by a fifth: To the firl it, or C , which was tuned, the for or immedietuly below by the fame chord.

That the practitioner may be !lill more fecure in the juttice and propriety of his procedure, he may try the lhirds of the notes already adjutted, and alter, as much as is confifucut with the fifths and octaves, fuch among thefe thirds as may feemgrating and difagrecable to his car. 'Lhus far having accomplifhed his operation, he may tune all the other natural notes whether above or below by octares. His next concern is with the femitones. And here it will be fuggelted by common fenfe, that as in all influments with fixed fales the flarp of a lower mult likewife anfwer for the flat of a higher tone, the femitone ought as nearly as poffible to divide the interval. He may begin with la or A fhatp; which $/ a$ in its natural flate is a third minor beneath the at or C , from whence he began in the natnial feale. This femitone fhould correfpond with the $F$ ratural imnediately above by a fifth. To it may be tumed the re or D tharp immediately below by a fimilar chord: 'To D harp, its octave above: To $\sqrt{2}$ or B natural, immediately above the ha or A firl mentioned, may be adjulted the F or fa harp immediately above it: 'Io this its octave below: 'lo that oftave, the C or ut flarp above by a fifth: To the C tharp, its octave below: To this, by a lifth, the Gor fol tharp above. Between this $G$ flarp and the 10 harp immediately above it, the fift will probably be too flarp; but if the others are julty tuned, that difcord will not be extremely offenfive; and it is a neceflary confequence of temperament. The relt of the fharps and flats, like their naturals, whether afcending or defcending, may be tuned by their octaves.

The notes, with their chorls, may be expreffed by hl:ers and figures, thus; where, however, it mult be obierved, that the higher notes of any chord are marked with larger capitals. It fhondd likewife be remarked, that the figures are not expreflive of the different ratios which the notes bear one to another, confidered with wefpect to their vibrations; but only fignificant of their nominal dikances, according to the received denominations of the intervals. $\quad \mathrm{Cc}_{\mathrm{C}}^{8} \stackrel{5}{\mathrm{C}} \mathrm{G}_{5}^{5} \mathrm{CD}^{8}{ }_{\mathrm{D}} \mathrm{D}{ }^{5} \mathrm{DA}$

 © $\AA_{8}^{5} G *$. In running over the tharps and flats as the
naturals, it will likewife be neceffary to try the thirds, Ifarmont and to alter fuch as may uffend the ear; whith, if cau. tiouly done, will not fenfibly injure the other chords. -Though this aticle has been protracted to a length which we did not origitally intend, we have howtwer the fatisfaction to find, that it comprehends every thing effential; fo that any perfon who underthands the nature of chords, and the practical prine ciples of mulic as univerfally taught, may not only be ahle to tune his in!rument, but to acquire its whole manceure, without the leat affilance from a matter.

On l'ate CCXXVI. is reprefented an inftrument of this kind, made by Mr Dobb of St Paul's churchyard, London.

Though this topic appeared in itfelf comolete in the former edition of this extenfive work, yet having fince received from Dr Edmund Cullen of Dublin the fullowing oblervations, and reflecting that men of mufical talents have net only different taltes, but different powers of mechanical operation, we have thought it proper to fubmit to the choice of our readers, either Dr Franklin's form and arrangement of the glafes, or that which has been adopted by Dr Cullen; but in either cafe, we would recommend it to the initiate in this inflrument, to dillinguith by colours, according to 1)r Franklin, the notes and femitones.-We likewife cannot forbear to think, that the complete bafs practicable on the harmonica, is by many degrees preferable to the chords with which Dr Cullen propofes to grace every emphatic note, with which, fiom the thructure and arrangement of his inftrument, he is under a neceffity of deluding intleal of fatisfying the ear, with the full effect of the regular procedure of the treble and bafs upon the fame inllument.

This miltrument the Doctor deferibes as confling "of 35 glafles of difiturent fizes, anfwering to fo many dikinet founds, and ranged inthe manner hereaftertobe defcribed. They are exactly of the form of a cocoa nut when the $u$. Sual quantity of the top is cut off, or the fugar-bowls made of cocoa not fhells fo much in ufe will give a precife idea of their figure. They are blown with plain long ftalks, which are titted to wooden feet fcrewed on a buard at proper diftances, in fuch a manner that the cir: cular tops of all may be in the fame horizontal plane, at the diflance of about an inch afunder. Of thefe 35 , 10 only are allotted for loalf tones; there remain therefore 25 for the diatonic feale. The lowett note correfponds to $G$ in the bafs clef; lience it extends upward to the octave above C inalt. For uniformity, take the glaffes which are chofen gradually and regularly diminithing in fize as they afeend in tone. 'This, however, is not abfolutely necelfary, as the tone of the glafs does not entirely depend upon its dize, but in a great meafurc upon the proportion of its different parts to one another: hence the glafs consefponding to one note may be fmaller than a ghafs correfponding to a note three or four tones higlaer: however, where it is practicable, they thould always be chofen gradually diminifhing as they afeend, both on account of the elegance of appearance, and that an equality in point of loudnefs may be preferved: fur, as every body knows, an intrument may be liable to great inequality in point of frength, though perfectly in tune. This mufl lave a very bad effect; and therefore we lind performers on the violin and other inftruments of that kind wery folicitons about the propor-
amoni- tional thicknefs of their ftrings. The glaffes being chofen in the beft manner circumftances will permit, we proceed to arrange them. Here let me ohferve, that in general the diameter of the largeft giafs at its mouth is about feven inches, and its folid contents about five Englifi pints, while the higbelt is of about $\frac{1}{4}$ inch, and its contents abour $\frac{3}{3}$ of a gill : this, however, is arbitrary, and depends upon the pitch of the infrument. In arranging the glafes, we thall. to avoit confution, take the diatonic feale firlt, ant afterwards the half tones sill be eafity underituod. The wooden feet befure mentioned are to be ferewed on a tirong hoard of a proper fize, and they are difpofed at convenient irtervals in rows perpendicular to the bongelt fites of the rectan. gular board on which they tland. In thefe fett the glaftes are difpofe! in the following manner: Beginning with the lowelt nute $G$, we fix that on the foot which ftandsy in the neareft angle of the hoard on the teft hand, $A$ in the next buttom in the fame perpendicular line, $B$ in the third: when we come to C , however, we do not place it in the fame perpendicular line, but in the nearelt bottom of the fecond perpendicular row to the left hand, D in the fecond of the fame row, E in the third; Fagain in the rearell bottom of the third row, $G$ in the feennd of the fame row, $A$ in the third; $B$ again in the nearett bottom of the fourth row, C in the tecond of the fame, and fo on. By this cuntrivance, it is eafy to fee an immente compafs is obtained: fo great a one indeed, that if the glaffeo were difpofed according to the old method, regularly afeending in a line parallel to the front of the indrument, to take in the fame compafs, it muit Atretch to a conliderable length, no lefs than a length equal to the fum of all the perpendiculars we before fpoke of, which in ordinary fize of the glaffes would amount to upwares of 16 feet; the inconsenience of which it is minecellary to dwell upon. As to the half tones, perhaps a more judicious and convenient arrangenent may be thought of for them: but the prefent mode is far from inconvenient, except in fome keys; and it is fufficiently commodious for performing fuch airs as are belt fuited to the nature and delign of the inftrument. After explaining the arrangement, we thall fpeak fomewhat mote exactly of them. Eb on the firt line of the treble thave flands in the fourth hottom of the frett perpendicular row to the left hand; F"f on the firt fpace llands in the fourth place of the fecond row, Giy on the fe. cond line of the arcble flave ftands in the fourth of the third row, C h on the third fpace of the fame flave flands in the fame manner in the fourth row, and fo on, afcending $\mathrm{F} \%$ in the fifth row, $G ;$ in the fixth, At in the feventh, Ch in the cighth. In the ninth perpendicular row, that is, the lat to the right hand in the diatonic fale, flands C alone; but immediately behind is placed $\mathbf{B b}$ of the middle line of the treble Aave, and again behind it $D$ ) of the fourth line of the treble flave, which finithes the whole. There is fomething fingular, and perhaps uhimical, in the diftribution of the half tones: but it is found fufficiently convenient; and if a better is thought of, it may eafily be adnpted. In the mean time I mult obferve, that two of them, viz. Chand F h, Randing immediately behind the D and G refpectively above them, are fingulatly well fitted for performing running paffages either up or down in the key of G. Ex: gr. let us fuppofe that we
have that very common A, G, Fh, E, femiquavers. Harmonio Here the performer tunches $A$, which is in the firit place of the 6ith row, wath his left hand, $G$ with the fore-finger of his 1 ight, Fy with the midsle, and E agaia with the Ieft hand; in the fame manner may E, D, C $=$ and B , be played, or upwards by inverting the motion: Thus we can with the utmoll eafe run cither up or down two very frequent palfages in a key, which might naturally be fuppofed difficult upon this inftrument, and that with any given rapidity. I with as much could be faid of all the other half tones, of which, by the bye, fone are altogether wanting: it is obvious, however, that they may eafily be atded, if we can find convenient praces; and I apprehend even that very praticable. Be that as it may, notwithlanting the feemingly inconvenient lituation of lume halit tones, and the total want of others, pieces may be performed on this intitument of confiderable rapidity. 1 myfulf, though very far from being an accomplithed player, can with great eafe go through all the parts of Fither's cellbrated Ronceau; nay, I bave heard the fith concetto of Vivaldi played upon it with as much dillinetnefs as upon a viuhn. The glafles are not neceflarily chofen pertectly in tune, but are tuned by the help of a quantity of water. Here, however, two cautions are neeeflary: ift, By no means to take a glafs which is, when wishout water, flatter than the note you intend; as in tha: cale you cannot remedy it, the water making the tone llill llatter: rather let it be Comewhat flarper, and you may tune it to the utmolt nicuty by a litele water. The feeond caution is, nut to choofe a glafs which is very much fharper than the nute required; as in that cafe, fo large a quanaity of water will be required to tune it as will entirely fmother the tone.
"This inflrument is to be played fomewhat in the mannct of the harmonica, viz. the fingers are to be well wetted; and by the application of them io the fide, af. lifled by a proper motion, the found is produced. And here 1 would obferve, that the proper motion is, to make the fingers fultow the thumb, riot the thumb fuilow the fingers in going round the glafs: it is necelfary alfo to priferve the circular motion very exacily, as the leat deviation from it produces the molt horrible found that can be conecived. It i, Jike wife to be obferved, that you muat touch the fmaller glafles upon the very top of the brim ; and for that purpofe the palm of the band mula be nea:ly parallel to the top of the glafs: but in coming to the larger glafies, it is abfolutcly neceffary to make the lingers touch the fide, not the top of the glafs ; and the larger the glafs, the more dittant from the top mutt they be touched. Practice alone can determine this matter.
"From this difpufition of the glaffes, it is eafy to fee that the perfect chord of C is always mort conpletely in our power, namely, by uing different fingers to the different notes at the fame time : and althorgh a full bafs cannot be executed upon this influment, we have always a great number of accompaniments which can eafily be introduced; more pertaps than upon any int rument, the organ and ochers of that fpecies excepted. The thirds or fiftus occafionally can be introduced; and when cone with talte and judgment, will farcely yichl to a middling bafs. If to this is added the thrilling foftnefa of the tones, inimitable by any other fubftance, it will readily appear to be an inftrument more in che tras fyla
${ }_{\text {ca. }}$ $\xrightarrow{\sim}$

Harnoni- of mufic, of that nutic which the heat acknowledges, than any that cther chance or inesemity has bitherto protuced. It is indeed incapable of that whimfical fubdivifion to which the tatte of m dun compoters. that fiv in encmy to harmony and real mutic, lvads: which ferves no end but to exhitit the wonderful executions of a favourite perfomer, and to ovenwhem his hearess with fapid admiration. This is not mufic: and upon thate occalions, though I acknowiedge the difficulty of doing what I fee done, I lament that the hovet mas has taken fo much pains to to litule purpure. Our indrunent is not capable of this (at leath not in fo exquinte a degree as the harplechord, volin, and a few others) : wet if the true and origimalintent of mu. fic is not to allonith but to pleate. if that inftament which mot readily an: pleafingly teizes the heart thro' the ears is the belt, llave not a moment's hefitation in feating is d wn the trat of all matheal inftruments. There is but one which will in any degree bear the comparion, of rather they are the fame indtrurent, I mean hr Fraritin's lrarmonica: bu: I am inclined to think that the indrument we have been fpeaking of has fome faperiority over the harmenica The fort Atriking difference is in the inpracticability of executing quick palfages or the later: whereas it is in moll cafesex. tremely eafy on the other. Asain. the very long continued vibration of the glafs. inevitably mutt produce horrible dicurd, or at leat confution, except the piece played be fo dow that the vibration of one glats be nearly over before the other is heard. Now, in our infrument, this may be remedied by laying pieces of fpunge lightly between the glafes, fo as to allow them onle the proper content of vibration. This, however, is an excoptionabie methed: and it is much better done by the touch of the performer's finger. which intanty ftops the vibration; and the ufe of this may be leamed by a wery litide praciice, the aooion here being ent re15 voluntary: lint in the Eamonica, the mution being partly mechanical, a $a$. the rotatior of the glates, thi: cannot be cione; and for the fame reafon, in the execution of the crefeendo the harmonica is nut fo perfeet as this intrument. Delides, the inconvenience of tuning the half tones, as tharpe or fats feparately, is as great in the tarmonica as in the harpschord. This is a very great :mperiction; as half tones, being tuned at the medium. are falif bo:h as tharps and as flais. The learned Dr $\operatorname{Sin}$ ith (a)s, there is no leis than one Enth of the incicval drfierence between the tharp of one nure and the flat of the next -bove; and for this purpofe propofes to have an harplichord conitructed with a itop, io as to direct the jacks to the flarps or flats according to the prevalence of either in the piece to be playe $\dot{L}$ : but in our initrument from its vesy contrution, this in mbenience is avoided. As to maters of converience, the harmmica is exceedingly apt to be out of order: the glaties frequently breck, piainiy on account of the yo is lrain up n them where they join the fponule. a. are thus with much difficulty renewed; wherens whe us the 1 If of a glats is nothing. Add to a!l $\mathrm{t}^{1}$ :- , that the harmonica, in point of origmal expence, is abou: neetimes as high as the other: although I apprymen it perer mo une adranage, except that the perormer may fit at it, wheceas with our infleument it is convenierto if nof madifery, to fiand; but he mout be a laey muitian that gives himiflif much concern

abosi that: Ard if he will fit at our infrument, he may, though at the expence of much cafe in puint of exccution.
"Let us now confider fe me obections that have been made to this infrument. One is, that neceffity of Handing, in order to do any thing capiesi upouit. But is not that the cale in all intruments, except where the periormer fits of neceffity? Did aver :any one fee Giardini or fifier play a folo littin!? But for the fatiafaction of the ie torpid gentlemen, if can faith. fully afiare them, I knew a lady who performed on this inttrument perfectly well, though the had lat the ufe of both her legs. A more ferious and important objection lies bo:h to this and the harminica, viz. the want of a thake. How this is fupplied upon the harmonica, 1 cannot fay, as 1 never faw it even attempted: but on vur inflement, al:humgh a very perfect make can fearely be projuced, ionethag folike it may be done as will fairly excule the want; and that is, by whiling the two flates rond the note concerned with the fhake with the utmol relucity, beginning the lower note a litle fooner than the wher liy this means, except in very large glaties where the vibrations are too dittant in time, luch an intermisture of the two founds is produced, as extremely well initates a the thake, and the dexterons perfirmer will make the beat in a turned thate with a fpare tingtr. This operation requites fome dexterity; but this is a charge common to all mulical intruments; and I quetion not bat that the Highland bagpipe irfeif requires fome fort of $\mathbb{k}$ ill.
"Upon the whole, I am clearly of opinion, that the harmonica, and more efpecially this infrument which has as yet got no name, is the motl exquilite and noble prefent that the lovers of true harmony have ever yet received; and it is with nowh altunifment I find this invaluable thafure aimul entincly confaned to Irciand, a country not very remarkable for matical tatle or talents: But 1 hope foon to fet this elegant fpecies of munc very generally known and pracififed over all Europe."
HARMONY. The fenfe which the Greeks gave to this word in their mulic, is fo much lefs eafy to be determmed, becaufe, the word itelf being originally a fublantive proper, it bas no radical wards by which we might analyfe it, to dicover its etymology. In the ancient treatios which remain to us , harmony appears to be that department whofe obicct is the a reeable fuccefion of towads, mercly conidered as high or low; in uppolition th the two others called reythanica and mefrica, which have their principle in time and meafure. This leaves our ideas concerning that aptitude of found rafue and undetermined: nor can we fix them without itudying for that purpore all the rules of the art: and even after we have done fo, it will be very difficult to dittinguith harmony from melody, unlet's we add to the tal the ideas of hythmus and meafure ; without which, in reality, no melody can have a dillinguithing character: whereas harmony is characterifed by us own nature, independent of all other quantities except the chords or intervals which compofe it.

It appears by a paffage of Nicomachus, and biy others, that they likewife gave the same of barmong to the chord of an octare, and to coneerts of voices ind ialtruments, which performed in the ditance of an oc-
tave one from the other, and which is more commonly called antiphore.

Harmony, according to the moderns, is a fuccefloon of chords agreeable to the laws of modulation. For a long time this harmony had no other principle but fuch rules as were almoll arbitrary, or folely founded on the approbation of a practifed ear, which decided concerning the agreeable or difagrecable fuccetion of chords, and whofe determinations were at lat reduced to calculation. But father Merfenne and M. Saveur having found that every found, howerer limple in appearance, was always accompanied with other founds lefs fenfible, which conflitute with itfelf a perfect chord. major ; with this experiment M. Rameall fet out, and upon it formed the batis of his harmonic fyftem, which he bas extended to a great many volumes, and which at latt M. D'Alembert has taken the trouble of explaining to the public.

Signior Tartini, taking his route from an experiment which is newer and more delicate, yet not lefs certain, has reached conclufons fimilar enough to thote of Ramean, by purfuing a path whofe dircetion leems quite oppofite. According to M. Rameau, the treble is generated by the bals; Signior Tartini makes the bafs refult from the treble. One deduces harmony from melody, and the other fuppofes quite the contrary. To determine from which of the two fchools the bell performances are likely to proceed, no more is neceflary than to invelligate the end of the compofer, and difcover whether the air is made for the acconspaniments, or the accumpaniments for the air. At the word Syetem in Rouffeau's Mufical Dictionary, is given a delincation of that publifhed by Signior Tartini. Here he continues to fpeak of M. Rameau, whom he has followed through this whole work, as the artilt of greatelt authority in the country where he writes.

He thinks himfelf obliged, however, to declare, That this fyltem, however ingenious it may be, is far from being founded upon nature; an affirmation which he incettantly repeats: "That it is only eftablimed upon analogies and congruities, which a man of invention may overturn tomorsow, by fubilituting others more natural: that, in thoit, of the experiments from whence be desuces $i$, one is dstected fallacious, and the other will not yield him the confequences which he mould extort from it. In reality, when this author took it in his head to dignify with the title of demonfration the reafonings upon which he ellablikied his theory, every one sumed the arrogant preterce into ridicule. The Academy of Sciences loudly difapproved a title fo ill founded, and fogratuitoufly aftumed; and M. Eftive, of the Royal Society at Montpelier, has fown him, that even to begin with this yropolition, That according to the law of nature, founds are reprefeated by their octaves, and thas the oetaves may be fubitituted for them, there $n$ as not any one thing demonftrated. or eveo firmly eltablithed, in his pretended demontration." He returns to his fyRen.
"The mechanical principle of relonance prefents us with notbing but independent and folitary chords; it neither preferibes nor ellablifhes their lucceffion. Yet a regular fucceffion is neceflary; a dictionary of felected words is not an oraticr, nor a collection of Kgitimate chords a piec: of mufic: there mut be a

Vol. VIII. Part I.
meaning, there mult be connections in mulic as well Harnory. as in language: it is neceffary that what has preceded fhould tranfmit fomething of its nature to what is fubfequent, fo that all the parts conjuined may form a whole, and be Itamped with the gentine character of unity.
"Now, the complex fenfation which refults from a perfect chord mull be refolved into the fimple fenfa. tion of each particular found which compofes it, and into the fenfation of each particular interval which furms it, afcertained by comparifon one with another. Beyond this there is nothing fentible in any chord: from whence it follows, that it is only by the relason between founds, and by the analogy between intervals, that the connection now in yuclion can be efablifed; and this is the genaine, the unly fource, from whence fluw all the laws of hammony and modulation. If, then, the whole of harmony were only formed by a fucceffion of perfect chords-major, it would be fufficient to proceed by intervals finsilar to thofe which compofe fuch a chord: fur then fome one or more founds of the preceding chord being neceffarily protracted in that which is fublequent, all the chords would be found fulficiently connected, and the harmony wuuld, at leat in this fenfe, be one.
"But belides that thefe fuccefions mu!l exclude all melody by excluding the diatonic feries which forms its foundation, it would not arrive at the real end of the art; becaufe, as mulic is a fyttem of meanings like a difcourfe, it ousht, like a difcourfe, to have its periods, its phrafes, its fufpenfes, its cadences, its punctuation of every kind ; and becaufe the uniformity of a harmonical procedure impies nothing of all this, diatonic procedures require that majer and minor chords thould be intermixed; and the neceffity of difunances has been felt in order to diatinguinh the phrales. and render the cadences fenlible. Now, a coanected firics of perfect chords-major can neither be prolutive of perfect chords minur nor of diffonances, nor can fenlibly mark any mufical phrale, ard the punctuation mull there be found entireiy defuetive.
"M. Rameau being abolntely determined, in his fyitem, to deduce from nature all the harmony practifed amons us, had reconfe, for this effect, to another experiment of his own invention, of which I have formerly [poken, and which by a difierent arrangement is taken from the fint. He pretended, that any Gomple found whatever affurded in is rathipies a perfect sinor or dlat chord, of which it w'ts the dominant or lifth, as it furnithed a perfect chord major by the vibration of is alignot parts, uf which it is the tonic or fundamental fourd. Ile has atfirned as a certain fact, that a wocal lloing caufed two uthers luwer then itfeif to vibrate through their whole extent, ?et without makins them produce any found, one to i'stwelith major atid the other to its fowentecuth; and from this joined to the furmer fact, he has rery ingenioufly deciuced, not orly the application of the minor mode and of diftonances in tarmony, but the rules of harmonic phrafes and of all moctalation, fuch ss they are found at the wards Cloord, A'cconyominemb, Fu:udrmerosal Bujs, Cisdotie, Difinanase, Aloriuhation.
" But list (continuts Ronfeau). the experiment is fate. It is difcoverch, that she lhrines tuned teucatt the funcamenta! lound do not eative vibrate
whea

## $\mathrm{H} A \mathrm{R} \quad\left[\begin{array}{lll}322\end{array}\right] \quad \mathrm{H}$ A R

Hermony. when this fundamental found is given; but that they are divided in fuch a manner as to return its unifon : lone, which of confequence can lave no harmonics below. It is moreover difcowerd, that the property of Arines in divicime themelves, is not pecular to thofe whichare und by d welfth and feventeenth below the princighlound ; but that ofeilations are likewife proIf ced ia the lower itrings by all its multiples. Whence it follow: that, the intervals of the twelfth and fevenfern behw not being lin rular phenomena of their kind, nothing can be concluded in favour of the perfect minor chord which they reprefent.
" Though the trath of this experiment were granted, even this wond by no means remove the dificulty. If, as M. Kzmeau alleges, all harmony is derived from the refonance of fonorous bodies, it cannot then be derived only from the vibrations of fuch bodies as do not refound. In reality, it is an extraordinary theory, to deduce from bodics that do not refound the principlea of harmony; and it is a polition in natural philofoplay no lefs trange, that a fonorons body fhould vibrate without refounding, as if found itfelf were any thing elfe tut the air impelled by thefe vibrations. Moreover, fonorous bodies do not only produce, beflues the principal found, the other tones which with itfelf compofe a perfect chord; but an infinite number of other founds, furmed by all the aliquot parts of the bodies in vibration, which do not enter into that perfeet harmony. Why then thould the furmer founds produce confonances, and why hould the latter not produce them, lince all of them equally refult from nature?
"Every found exhibits a chord truly perfect, fince it is compoferl of all its harmonics, and fince it is by them that it becomes a found. Yet thefe harmonics are not heard, and nothing is diftinguthed but a fimple found, unlefs it be exceedingly trong: whence it folI wos, that the coly good harmony is an unifon; and that, as foon as the confonanees can be diftinguifhed, the natural proportion being altered, the harmony lias lolt its parity.
" "hat alteration is in this cafe produced two different wiys. Firt, by coufing certain harmonics to refound, and not the other, the proportion of force which ougle to preva!! in all of them is aleered, for producing the fenfation of a fingle found; whence the unity of nature is dethroged. Wy doubling thefe harmonics, an clicet is exhibited finilar to that which would be prodnced by fupprelfing all the others; for in that cafe we cannot doubt, but that, along with the generating found, the tones of the other harmonics which were permitted to found would be heard: whereas, in leaving all of them to their natural operations, they dettroy one another, and confpire together in furming and flengthening the fimple fenfation of the principal found. It is the fame effect which the full found of a tlop in the organ products, when, by fucretherly removing the Atopper or regitter, the thind and Whthare permitted to found with the principal; for then that tifth and third, which remained abforbed in the uther founds, are lequrately and difagreeably dittinguiged by the eer.
"Moreover, the hamonies which we caufe to found have other harnonics pertaning to themfeives, which cannot be fuch to the fundantetal fuud. It is by
thefe additional harmonies that the founds which pro. Harr duce them are diftinguithed with a more tendible degree of harfhnefs; and thele very harmonies which thus render the chord perceptitle, do not enter into its harmony. This is the rafun why the moll perfect chords are naturally dippeating to eirs whofe relifh for harmony is not futficiently formed; and I have no heftation in thinking, that even the netave itfeff might he difpleahng. if the mixture of mate and female voices did not inure us to that interpal from our infancy.
"With diffonance it is flll worfe; hecaufe, not only the harmonics of the found by which tise difcord is produced, but even the found itelf, is eacluced from the natural harmony of the fundamental: which is the caufe why difcord is always dillinguithed amongt all the other founds in a manner flocking to the fenfe.
". Every key of an organ, with the top fully opened, gives a perfect chord with its third major, which are not dittinguifhed from the fundamental found, if the hearer is not extremely attentive, and if he does not found the whole thop in fucceflion; but thefe harmonic founds are never abforbed in the fundamental, but on account of the prodigious noife, and by fuch a fituation of the regillers as may caule the pipes which produce the fundamental found to conceal by their force the other founds which produce thefe harmonics. Now, no perfon obferves, nor can oblerve, this continual proportion in a concert ; lince, by the manner of inverting the harmony, its greatelt force mult in every inflant be transferred from one part to another ; whielz is not practicable, and would detroy the wh le melody.
"When we play upon the organ, every key in the bafs caufes to refound the perfect chord major; but becaufe that bafs is not always fundamental, and becaufe the mufic is often modulated in a perfect minor chord, this perfect chord-major is rarely ftuck with the right hand; fo that we hear the third minor with the major, the fifth with the triton, the feventh redundant with the octave, and a thoufand other cacophonies, which, however, do not much difgult our ears, becaufe habit renders them tractable; but it is not to be imagined that an ear naturally juil would. prove fo patient of difcords, when tirit expoled to the teft of this harmony.
" M. Ramean pretends, that trebles compored with a certain. degree of limplicity naturally fugget their own balles; and that any man having a jutt, though unpractifed ear, would fontaneoully fing that bafs. This is the prejudice of a mulician, refuted by univerfal experience. Not only would he, who has never heard either bafs or harmony, be of himfelf incapable of finding either the bafs or the harmony of M . Rameau, but they would be difpleafing to him if he heard them, and he would greatly prefer the fimple unifon.
"When we confider, that, of all the people uponearth, who have all of them fome kind of mufie and melody, the Europeans are the only people who have a harmony confiting of chords, and who are pleafed with this mixture of founds; when we confider that the world has endured for fo many ages, whilit, of all the nations which cultivated the fine arts, not one has found out this harmony: that not one aumal, not onebird, not one being in nature, produces any other chord

## H A R

mony. but the anifon, nor any other mufic but melody : that the eaftern languages, fo fonorous, fo mufical; that the ears of the Greeks, fo delicate, fo fenfible, practifed and cultivated with fo much art, have never conducted this people, luxurious and enamoured of pleafure as they were, towards this harmony which we imagined fo natural : that without it their mufic produced fuch allonihing effects; that with it ours is fo impotent : that, in fhot, it was referved for the people of the north, whofe grofs and callous organs of ienfation are more affected with the noife and clamour of voices, than with the fweetnefs of accents and the melody of inflections, to make this grand difcovery. and to vend it as the effential principle upon which all the rules of the art were founded; when, in fhort, attention is paid to all thefe obfervations, it is very difficult not to fufpect that all our harmony is nothing but a Gothic and barbarous invention, which would never have eritered into our minds, had we been truly fenible to the genuine beauties of art, and of that mufic which is unquetlionably natural.
" M. Ramean afferts, however, that harmony is the fource of the moft powerful charms in mufic. But this notion is contradictory both to reafon and to matter of fact. To fact it is contradictury; becaufe, lince the invention of counter-point, all the wonderful effects of mulic have ceafed, and it has loft its whole force and energy. To which may be added, that fuch beauties as purely refult from harmony are ouly perceived by the learned; that they affect none with tranf. port but fuch as are deeply converfant in the art: whereas the real beauties of mulic, refulting from nature, ought to be, and certainly are, cqually obvious to the adept and the novice. To reafun it is contradictory; fince harmony affords us no principle of imitation by which mulic, in forming images and exprefling fentiments, can rife above its native excellence tillit becomes in fome meafure dramatic or imitative, which is the highell pitch of elevation and energy to which the art can afpire; fince all the pleafures which we can receive from the mere mechanical influence of founds are extremely limited, and have very little power over the human heart."

Thus far we have heard M. Rouffeau, in his obfervations on larmony, with patience; and we readily grant, that the fyftem of bormony by M. Rameau is neither demon: rated, nor capable of demonftration. But it will not fullow, that any man of invention can fo eafily and fo quickly fubvert thoie aptitudes and analogies on which the iftem is founded. Every hypothelis is adinited to ponfefs a degree of probability proportioned to the mumber of phenomena for wheh it ofiers a fatisfactory folution. The firft experiment of M. Rameau is, that every fonorous body, together with its principal found and its oftave, gives hikewife its twelfuand ferenteenth major above; which being approximated as much as polifle, even to the churds immediately reprefented by them, return to the third, fifth, and uctave, or, in other words, produce perfect harmony. This is what nature, when folicited, fpontaneoully gives; this is what the human ear, unprepared and uncultivated, imbibes with ineffable avidity and pleafure. Could any thing which claims a right to our attention, and acceptance from nature, be impreficd with mure genuinc or more legible fignatures of
her fanction than this? We do not contend for the Harmony. truth of M. Rameau's fecond experiment. Nor is it necellary we fhould. The firft, expanded and carricd into all its confequences, refolves the phenomena of harmony in a manner fufficient to eflablifh its authenticity and influence. 'The difficulties for which it affords no fulution are too few and too trivial either to merit the regard of an attift, or a plilofopler, as M. 1)'Alembert in his elements has clearly fhown. The facts with which M. Rouffeau confrontsthis principle, the armies of multiplied harmonics generated in infin: tum, which he draws up in formidable array againt it. only fhow the thin partitions which fometinics may divide philofophy from whim. For, as bodies are intinitcly divifible, according to the philofophy now efldblimed, or as, according to every phitofophy, they mult be indetinitely divifible, each infinitefinal of any given mafs, which are only harmonics to other principal founds, mull have fundamental tones and harmonics peculiar to themfelves; fo that, if the reafoning of Ruaffeau las any furce againit M. Ramean's expertment, the ear mult be continually diftracted with a claos of inappretiable harmonics, and melody itfelf mult be loft in the confution. But the truth of the matter is, that, by the wife inlitution of nature, there is fuel a conformity eftablithed between our fenfes and their proper objects, as mut prevent all thefe difagrceable efficis. Roulfeau and his upponent are agreed ia this, that the harmonics confpire to form ene predominant found ; and are not to be detected but by the nice:t organs, applied with the deepctt attention. It is equally obvious, that, in an artificial harmony, by a proper managenent of this wife precaution of nature, diflonances themfelves may be either entirely concealed or confiderably foftened. So that, fince by nature fonorous brdies in actual vibration are predifpofed to exhibit perfect harmony; and fince the human car is, by the fame wife regulation, fabricated in fuch a manner as to perceive it ; the harmonical chaos of M. Rouffean may be left to operate on his own brain, where it will probably meet with the warmunt reception it can expectuefind *. Nor does it awail him to pretend, that • M. Ro:r. before the harmonics can be dillinguihed, fonorous bo. feau was adies mult be impelled with a force which alters the live when chords, and deftroys the purity of the harmony; for was wrictethis pufition is equally falfe both in theory and prac- ten.
tice. In theory, becaufe an impulfe, however forcible, muil proportionally operate on all the parts of any fonorons body, fo far as it extends: in practice, be. caufe the human ear actually perceives the harmony to be pure. What effects his various manœuvres upon the organ may have, we leave to fuch as have keifure and curiofty cnough to try the experiments: but it is appretiended, that when tied, their refults will lcave the fylkm of Rameau, particularly as remodelled by D'Alembert, in its full force.

Of all the whims and paradoxes maintained by this philofupher, none is more extravagant than his affirtion, that every chord, except the fimple unifon, is difpleating to the human ear: nay, that we are only reconcilal to octaves themfelves by being inured to hear them from our infancy. Strange, that nature fhould have fixed this invariable proportion between male and female roiecs, whillt at the fane time the infpired the harers with fuch violent prepoffeffions a-
ifarnory. gaint it as were invincible but by long and confirmed habit! 'Plee tranfator of D'Alembert's Elements, as givenumer the article Music in this Dictionaly, has been ut peculiar pains to invelticate his carlictt recollections upon this fuhjeet; and has had fuch opportunities, both of attending to his original percestions, and of recongrifing the fidelity of his memory, as are not conanon. He call remomber, even from a period of ealy hathoud, tol ave been plafed with the fimphet sinds of arrificial harmeny ; to have dillinguined the harmonics of fonorons bodics with delight; and to have beeldreck with theriur at the found of fuch bodies as, by tha it meture, or by the cohtion of their patts, exhibited thete harmonics falfe. This is the thief, if ant the oly came, of the trmendous and ditagreable faration whech we ferl from the fomad of the Chanctephate. The fame horrible cacoptony is frequerly, it t me degree, produced by a drum unequally bat from this fimand the tranllator often remembers th tave tharted and fercamed, when carried through the 昭ct of the thwn in which the was born in the arne of tion nutiorymand and as he is confeious, that the aconitic organs of many are as exquifie as his own, he cannot doniot but they may have had the fame fenfations, thongh perlaps they do not recolleet the fact. So cally and fo niecty may the fenfations of hamony and difeord be dithaguihed. But after al, it feems that harmony is no more than a modera invention, and even at this late period only hnown to the lurepeans. We fhould, however, be flad to know, from what oracle our philofopher learnad that harnony was not known to anticuity. From what remains of their works, no proof of his polition enn be derived; and we hate at kat mentioned one pretadility againd it in our notes to the Preliminary, Difcourfe to the article Mesic, (fee Note b) But tho' Roulfou's mighty objections were granted, that harnamy can only be endared by fuch ears as are hatitually formed and cultivated; that the poriod of its prevalence las beea fhore, and the catent of its empere lanted to Europe; till his comlution, that it is a Ef the a:d burbraus inventiva, $i$, nut farly deducible : en is m the fe pamife. Rink we a firm, that epic petey has no fundation in mature, becaure, ining Whe in as inerva! whin happend from the beginuing of tie sumb to the detmiction of Troy, no epic puen foun whate appared? Or bectue a matural and meldian wituraton is leio rulited by an unpolithed tathe, han the uncouth dhates of a comaron ballad, hiall we infor, that the privel of numbers is merely fuppubitions and abitrary? On the contrary, we will venture to whirm, that thongh harmony canoot, as :aman fappofes, be mathmatically demonllated ficm the satuce and vileratio ns of fono ons bod.cs; zet the ibn of its comblament pais, and of their coralefcanc, is mo lefo eltabliflech, no lets procile and delifice da any mode or propety of face or quantity

 imiative fomer of matic chas ernitts in nelndy; but

lefs remotely conneeted with fome fentiment or paffion Harmone of the human heart. We know, that there are indinctive experfions of pain or pleafure in their vasious modes and degrees, which, when uttered by any fenfitive, and perceived by any confcious being, excite in the mind of the percipicat a fecting fynapathetic with that by which they are prompted. We likewife know from experience, that all artificial founds modulated in the fance nanner, have fimilar, though not equal, effects. We have feen, that, in order to render harmony compatitue with ificlf, the melody of each :rats mult be congenisl; and, for that reaton, one kindres meiody refut from the whole. So far, therefore, as any compuler has it in his power to render the general inelody homageneors; fo far the imitation may be pelefred, and even heighened: for fuch objects as are majeitic and augul, or the feelings which they excite, are more aptly expreffed by a compolition of kindred founds, than by anly fimple tone whatever. They who fuppofe the mimetic powers of numfic to be confummated in the innitation of mere unmeaning founds or degrees of motion, mult entertain limited and unworthy ideas of its province. It is naturally a reprefentative almolt of every fentiment or affection of the foul; and, when this end is gained, the att mut bave reached its highen perfection, and produced its nobleit effects. But thefe effects, hoatier fenfible among the ancients, may in us be fuperfeed by other caufes which remain yet unexplored. Theatical performances are likewile, by them, faid to have produced the molt wonderfal effects: yet thefe we do not recognife amongt ourfelves, though we have dramatic entertainments perhaps not infenor to theirs.

Ronflean proceeds to tell us, that among the ancients the collarmonic fpecies of molic was fometincs cull.d hamang.

Divit himanow, is that in which the hafs is fundamental. and in which the upper parts preferve among themblocs, mid with that fundameatal bafs, the natutal a:d uriginal owler which ought to fublitt in each of the ehond biat compufe this hamony.

Sinartod If iksont, is that in which the fundamental or gencrating found is phated in fome of the apper parts, and when fome oflar found of the chord is transeried to the bafe bencath the sthers.

Harnuan of the Soheres, or Cel, hial Harmony, a fort of in fie much taliced of by matiy of the ancient philofophers aad tathers, fufpofed to be produced by the fweetly zuned motions of the flars and planets. This harmony they attributed to the various proportionate imprefluns of the heavenly globes upon one another, acting at proper intervals. It is impofible, according to them, that fuch prodigious large bodies, moving with fo mach rapidity, fhowd be flent: on the contraty, the atmolphere, comtinually impelled by them, mut yiell] a fit of founds proportionate to the impreffon it receives; confequenty, as they do not all run the fram circuit, nor with one and the fame velocity, the different toms arifing from the diverfity of motions, directed by the hand of the Almighty, mult form an almarable fyenphony or concert.

They thereare fuppofed, that the moon, as being the loweft of the phants, correfponded to mi ; Merettiry, to fil; Vinus, to fol; the Sun, to la; Mars, to

harmostes, or Harmosta, in antiquity, a fort of magiftrate among thic Spartans, whereof there were feveral, whofe bulinels was to look to the building of citadels, and repairing the forts and fortifications of the cities. - "lhe word is ace25n", formed of opsew, open, concino, "I adaft, concert," \&s.

HAKMOSMNANS, a;apon, in antiquity, were magitrater among, the Spartans, whu, after the death of Lycurgus, were appuinted to enfure the obfervance of that law of the spartan leghlater which required married women to licar a will when they appeasedi in the Rerees, wherchy they were diftinguthed ísom tingle female", who were a!dured to apprar abroad with their faces uncovered.

HARNESS, a complete armour, or the whole equipage and accoutremerts of a cavalier heavily armed; as calque, cuirafs, \&c. The word is formed of the French hacnsis; which fome derive from the Greek "graxi, "a lamb's than," becaufe they anciently covered themfelves theremith. Du Cange obficers, that the word barn fium is ufed in the corrupt Latin in the fame fenfe, and that it conces from the High Dutch harnas or barnifich. Oibers derive it from the Italian arnefe; others frum the Celtic barnes, "a cuirafs."

Under king Richard 11. it was exprefsly forbidden all wen th ride in harm fo with launcegays. Wide flat. 7 Ric. II. cap. 13. In the flatutc 2 Hen. VI. cap. If. harnefs ferms to iaclude all kinds of furniture for of fence as wedl as defence, bo:h of men and horie; as fwords, buekles for belts, givdes, \&e.

Harness is alfo ufed for the furbiture put on a hurfe to draw in a coach or wagyon, or other carriage; fuch as coilars, leathers, traces, âe.
haro, Haroce, or Mard, in the Norman cufons. - Clamour dé Laro is a ery or formula of invuking the aflilance of juttice arainat the violence of fome offender, who $u_{i}$ n haring the word haro is obliged to defif, on pain of beng liverely punifled for his outage, and to go with the party belure the judge.

The word is commonly derived of boand romb, as bee ing fuppofed an invocation of the fovercipn power, to afint the weak againt the theong, on octation of Remol Grft duke of Nurmandy, bbout the gear 9:2, who iendered himfelf wemable to his fubjects by the feverity of his jullice; fo that they called on homeven after his death when they fuffered any opptefina. Some derive it from Harola king of Deumark, who in the year 826 was made grand confervator of juftice at Mentz. Others from the Daninh aa rau, q.d " help me;" a cry railed by the Nommans in flying from a king of Denma:k named Runx, who made himielf duke of Normandy. The letters of the French chancery have ufually this claufe, Non olyant clameur de baro, \&c.

The haro had anciently fuch vall power, that a poor man of the city of Caean named Afflin, in virtue hereof, arrelled the corgs of William the Conqueror, in the middle of the funeral proceflion, fill fued time as his fon Hersy had paid the value of the land in que. ftion, wheh was that wherenn the chapel was buik wheren he was interred.

HidROLD, the nainc of two Englifh kings. See Exgland, n ${ }^{2} 77,83$.

HARP, a mufical inftrument of the fringed kind, of a triangular iggure, and held upright between the lege of the performer.

Papiab, and Du Cangeafter him, will have the harp to have tahen its name from the Arpi, a people of Italy, who were fuppofed the firft that invented it; and from whom, they fay, it was borrowed by other natiuns. Mensere, Sce. derive the word from the Lation barev, and that from the (ierman berp or bayp. Others bring it from the Latin (a), becomice tmenche or thram,med with the fugers. Dir hickes decrives it frombarpa or harga, which lignify the fame thing; the tirtl in the language of the Cinibri, the fecond in that of the Auglu Saxons. 'The Enghn priet wha wate the life of Sit Duntan, and who lived with him in the wath century; fays, cap. ii. n. 12. Sunsfin fecunt ex nure cilharamn fiuam, quanm paticrna lingua hear pam vocamus; which intimates the word to be Anglo-Saxon.

The harp was the favourite malieal intirument of the Bitous and other northern nations in the middle ages; as is evident from their laws, and from every paflage in their hiflury, in which there is the leala alhution to mufic. By the laws of Wales, a harp was one of the three things that were neceffary to conflitute a gentleman, i.c. a freeman; and none could pretend to that character who had not one of thefe favomite indruments, or could aut play upon it. By the fame laws, to prevent laves from pretending to be gentlemen, it was expreffly forbidden to tcach, or to permit, them to play upuu the harp; and none but the king, the king's mufuans, and gentlemen, were allowed to have harps in their pufieftion. A genteman's harp was toct lable to be fereed for debt ; becaufe the want of it woukt have degraded him frum his rank, and redaced him to a flave. The harp was in no lef, ellimation and univerfal nfe among the Saxons and Danes. Thofe who played upan this indtument wore dechared geniemen by law ; their perfons were ellemed inviolable, and fecured from inguries by very fevere prewaltics; they were rearily adaritud into the highat compaly, and truted with dilinguilhed math.s of refpect wheienc they appensed.

Therese is tume divertity in the thecture of harps. That called the trigne harph lus of llings or chords in three rows, extending from C in wie terner diff to dumbie $G$ in ale, whin make five oclayes: the nidde row is for the kemitunes, and the two ontide rows are perfect unifons. On the bats lide, which is played with the right hand, thele are $3^{6}$ Alings; on the trebbe dide, 25; and in the middle row, 35 Arimes. There are worows of pins or forews on tha bight fide, ferving tu keep the efrings tight in their huics, which are fa. Honed at the other cond to three rows of pins on the upper fide. The harl?, within the talt qo jears, tats been in forme degree inproved by tha addition of eight Ifrings to the unifun, aiz. from E to double F in att. This interunent is ltruck with the figger aud thamb of both hatid. Its mulic is much like that of the fpinet, all its drings going from femitune to fennit me; whence fome call it an inacited fing. It is capable of a much greater degree at perfiction than the lute.
There are umong us two forts of this indrument.

## If A H

Harp. siz. the Welch harp, being that juf defcribed; and the Irifl burp. Plate LCXXVI, $\mathrm{n}^{2}$ I. teprefonts the hat of Brian Bosiromh, king of all I reland, dhain in battle with the l)anes $A .1)$. IO14, at Cloutarf. Ilis fon Donagh having murdered his brother 'Teige, A. D. 1023, and being depofed hy his nephew, retired to Rome, ant carried with him the crown, harp, and other regatia of his father, which he prefented to the Pope in order to obtain abfulution. Adrian IV. furnanied Ereak Cpear, alleged this circumflance as one of the principal titles he clamed to this kingdom in his bull tranferring it to Henyy IE. 'Thefe regalia were kept in the Vatican till the pope fent the hasp to Henry V'll. with the tithe of Defender of the Faith; but kept the crown, which was of maftive gold. Henry gave the harp to the firt earl of Clanricard; in whofe family it remained till the beginning of this century, when it came by a lady of the De Burgh family into that of Mac Nahon of Clenagh in the county of Clare, afier whofe death it paffed into the poffiffion of commiffioner Mac Namara of Limerick. In 1782 it was prefented to the right honourable William Conyngham, who depofited it in Trimity college library. It is $3^{2}$ inches high, and of extraordinary good workmanhip; the founding-board is of oak, the arms of red fally; the extremity of the uppermof arm in part is capt with filver, extremely well wrought and chiffeled. It contains a large cryftal fet in filver, and under it was another ftone now loft. 'The buttons or ormamental knobs at the fides of this arm are of filver. On the fiont arm are the arms chafed in filver of the OCBrien famaty, the bloody hand fupported by lions. On the fides of the front arm within two circles are two Irifh wolf dogs cut in the wood. The holes of the founding board where the ftrings entered are neatly ornamented with efeutcheons of brafs carved and gilt; the larger found-ing-holes have been ormamented, probably with filver, as they have been the object of theft. 'lhis harp has 28 keys, and as many fluing.holes, confequently there were as many ftrings. The foot-piece or relt is broken off, and the parts round which it was joined are very rotten. 'The whole bears evidence of an expert artift.

King David is ufually painted with a harp in his hands; but we have no teflimony in all antiguity that the Hebrew harp, which they call dimor, was any thing like ours. On a Hebrew medal of Simon Maccabxus we fee two forts of mufical inll ruments; but they are both of them very different from our harp, and only confill of three or four fleings. All authors agrec, that our harp is very different from the lyra, cithara, or barbiton, ufed anong the Romans. Furtunatus, lib. vii. carm. S. witnefles, that it was an inflrument of the barbarians:

> Romanujque 'yra, Mlavdit thbi Larharns !arpa,

Of ancient harps, $t$ wo are reprefented on the fame platc. $-\mathrm{N}^{\circ} 2$ is a trigomm or thingular harp. It is taken from an aucient painting in the mufeum of the king of Naples, in which it is placed on the fhoulder of a little dancing Cupid, who fupports the intrument with his left hand and plays upon it with his right. The trigonam is mentioned by Athenreus, lib. iv. and by Julius Pollux, lib. iv. cap. 9. According to Athencus, Sophocles cails it a Phryigion infrmm; and one of his
dipnofophifts tells us, that a certain mufician, named Alexander Alcatandrinus, was fuch an admirable performer upon it, and had given fuch proofs of his abilities at Rome, that he made the inhabitants seneoperier, "mulscally "nad." $N^{-} 3$ and 4 . are varieties of the fame inArmment. N 5 . is the 'l'heban harp, according to a drawing made from an ancient painting in one of the ftpulchral grottos of the lirt kings of Thebes, and communicated by Mr Bruce to Dr Burney*. The performer is clad in a habit made like a fhirt, fuch as *Vide $B_{x}$ the women ftill wear in Abyffinia, and the men in Nubia. ney's Hip. It reaches down to his ancles; his feet are without Ninfic, fandats, and bare; his neck and alms are alfo bare; his P. 224. loofe white lleeves are gathered above his elbows; and his head is elofc lhaved. His left hand feems employed in the upper part of the inftrumer among the notes in alto, as if in an arpeggio; while, fooping forwards, he feems with his right hand to be beginning with the loweft ftring, and promiling to afcend with the moft rapid execution : this action, fo ubvioufly rendered by an indifferent artilt, fhows that it was a common one in his time; or, in other words, that great hands were then frequent, and confequently that mufic was well undertlood and diligently followed.

On this inltrument Dr Burney makes the following obfervations: "'The number of flrings, the lize and form of this inltrument, and the elegance of its ornaments, awaken reftections, which to indulge would kead us too far from our purpofe, and indeed out of our depth. The mind is wholly loft in the immenfe antiquity of the painting in which it is reprefented. Indeed the time when it was executed is fo remote, as to encourage a belief, that arcs, after having been brought to great perfection, were again lofl and again invented long after this period. - With refpect to the number of flings upon this harp, if conjectures may be allowed concerning the method of tuning them, two might be offered to the reader's choice. The firlt idea that prefented itfelf at the fight of 13 frings was, that they would furnifh all the femitones to be found in modern inftruments within the compafs of an octave, as from C toc, D to $d$, or E to e. The fecond idea is mure Grecian, and conformable to antiquity ; which is, that if the longett flring reprefented freflambanomenos, or D , the remaining it ftringe would fupply all the tones, femitones, and quater-tones, of the diatonic, chromatic, and enharmonic genera of the ancients, within the compafs of an octave: but for my pat, I would rather inchine to the firtt arrangement, as it is more natural, and more confurmable to the flructure of our organs, than the fecond. For with refpect to the genera of the Greeks, though no hiftoric tettimony can be produced concerning the invention of the diatonic and chromatic, yet anciont writers ate unanimus in aforibing to Olympus the Phrygian the firt ufe of the charmonic: and though in the beginning the melody of this genus was fo fimple and natural as to refemble the wild notes and rude eflays of a people not quite emerged from barba. rifm; yet in after-times it became overeharged with finical foppenicz and fanciful beaties, ariling from fuch minute divifions of the ta ale as had no other morit than the great difliculty of forming them. It feems a mattur of great wonder, with fuch a model before their eycs as the 'fheban harp, that the form and manner of
ufing fuch an inllrument fhould not have been perpetuated by polterity; but that, many ages after, another of an inferiur kind, with fewer ilrings, fhould take place of it. Yot if we confider how little we are acquainted with the ufe and cven conflruction of the intruments which afforded the greatell delight to the Greeks and Romans, or even with others in common ufe in a neighbouring part of Europe only a few centuries ago, our wonder will ceafe; efpecially if we refect upon the ignorance and barbarifm into which it is punfible for 20 ingenions people $t$ be planged by the tymany and devaltation of a powerful and cracl invader."

BCll-HARP, a mufical influment of the ftring kind, thus called from the common players on it fwinging it about, as a bell on its hafis.

It is about threce feet long; its thrings, which are of no determinate number, are of brafs or fteel wire, fixed at one end, and Atetched acrofs the found-board by ferews fixed at the other. It takes in four octaves, according to the number of the flrings, which a"e ttruck only with the thumbs, the right hand playing the treble and the left hand the bafe: and in order to draw the found the clearer, the thumbs are armed with a little wire pin. This may perhaps be the lyra, or cythara of the ancionts; but we find no mention made of it under the name it now bears, which muft be allowed to be modern.

## Harp of Eolus. Sce Acoustics, 10 o.

HARIAGINES, in antiquity, were hooks of iron, hanging on the top of a pole, which, being fecured with chains to the malts of flips, and then let down with great velocity into the enemy's veffels, caught them up into the air. By way of defence againt thefe machines, they coveled their thips with hides, which broke and blunted the force of the iron. The harpagines, by the Greeks called Aprayes, owe their invention to Anacharfis the Scythian philofopleer.

HARPAGIUS. See Arpagius.
HARPALUS, a Greek aflronomer, who flourithed about 480 B . C. corrected the cycle of cight years inrented by Clenftratus; and propofed a new one of nine years, in which he imagined the fun and moon returned to the fame point. But Harpalus's cycle was afterwards altered by Micton, who added ten full $y$ zars to it. Sce Chronology, 1027.

HARPIES (arntrat, Harpyie), in antiquity, a rapacious impure fort of mon?ers of the bird kind, mentioned among the poits. They are reprefented * with wings, ears like bears, bodies like vulturs, faces like women, and feet and hands howked like the talons of birds of prey.

The ancients looked on the harpies as a fort of genii or demons. Some make thern the daughters of Tellus and Oceanus, the earth and ocean; whence, fays Servius, it is, that they iahabit an ifland, half on land and half in water. Valerius Flaceus makes them the daugliters of Typhon.

There were three hargies, Acllo, Ocypete, and Celono, which latt Homer cails lodarge. Hetiod, in his Theogon;, ver. 267 . only reckuns two, Aello and Ocypete, and makes them the daughters of Thammas and Elecera, affirming that they had wings, and went witl the rapidity of the wind. Lepligrus begat of them

Balius and Xanthus, Achilles's horfes. Pherecydes Harping relates, that the Boreades expelled them from the Eegean and Sicilian feas, and purfued them as Ear as the iflands which he calls Prote and Ilouater Caljne; and which have fince been called the Strophatis.

Voffus, De Idolol. lib. iii. cap. 29. 1.63. thinks, that what the ancients have related of the larpies, ageees to nu other birds fo well as the buts tound in the territories of Darien in South Arnerica. Thefe animals kill not only birds, but dogs and cats, and prove very troublefome to men by their peckings. But the ancients, as the fame Voflus obferies, knew nothing of thefe birds. by the harpies, therefore, he thinks, they cond mean nothing tife but the winds; and that it was on this account they were made daughtors of Electra, the daughter of Oceanus. Sush is the opinion of the fcholialts of Apultmines, Hefiod, and Eultathius. Their names, Achlo, Cospete, Celeno, are fuppofed to fugget a farther argunent of this.

Mr Bryant fuppofes that the harpies were a college of priefts in Bithynia, who on account of their repeated acts of violence and cruelty, were driven out of the conntry: their temple was called Arpi, and the invirons Arpiai, whence the Grecians formed Ap $=2 / a ;$ and he obferves farther, that Harpja, APTuoz, was ecrtainly of old the name of a place.

## Harplng iron. Ste Harpoon.

HARIPINGS, the fore-parts of the wales which encompafs the bow of a mip, and are faltened to the ftem, being thicko than the after part of the wales, in order to reinforce the thip in this place, where the fuftains the greatct thock of refitance in plunging into the fea, or dividing it, under a great preffore of fail.

HARPOCRATES, in mythology, the fon of Iis and Ofiris. This is an Egyptian deity, whofe dillinguifhing attribute is, that he is reprefented with his tingers applied to his mouth, denoting that he is the god of filunce. The farue of this idol was fixed in the entrance of moft of the Egyptian temples, and he was commonly exhibited under the figure of a youmg man naked, crowned with an Egyptian miere, holdins in one hand a cornucopia, and in the other the nower of Ictus, and fometimes bearing a quiver.

HARPOCRATION (Valerius), a cclehrated ancitnt rhetorician of Alexandria, who has left usan ex cellent Lexion upon the ten ormors of Greas. Aldes frot publifited this lexicon in the Greck at Venice in 1603. Many learned men have laboured upon it: but the bell edition was given by James Gronovius at L , y don in $10 g 6$.
harloon, or Harping-iron, a fpear or javelin ufed to trike the whales in the Creenland tiflery.

The harpoon, which is fomttimes called the harpe insoiron, is furnihed with a long thaff, having at one end a broad and flat triangular head, harpened at both edges, fo as to penctrate the whale with facility: to the head of this weapon is fattened a long cord, called the awhale line, which lies carefully coided in the boat, in fuch a manner as to run out without being inicrruptert or entangled. Sce Whale-Fishser.

Gun-H.akpoox, a kind of live-arm for difcharging harpoons at whales, and therehy killing them more eafily and expeditionfly than formerly when the ha:-
poons were thrown by the hand. Though this me thod was profected a good many years ago, $i$ has but bately come int ove; and premiums lave been annually offered ty the focety ior encouraging ats, \&c. to the perfons wh firflytuck a filh in this mamer. In the 'Iranfactions of that fociety for 1786 , we have an account of the lirff fifh ftruck in this manner in 1784. The gun was of the blunderbufs cunilruction, loaded witl four commom tobacco-pipes full of glared powder; the fith was fl:ot at the ditance of ten fatboms, the harpoon foing into her back up to the ring; and fire was killed in about an hour. In 1785 three whales were killed in this mamer: four in 1786 , and three in $1 \% 87$. Since that time the gun-harpoun has come more into we, and will probably foon fuperfede the other mextod enitiely. In the Tranfactions of the Sinciety $f+1=8 y$, We have accounts of a number of whates killed in this maner. 'The inltrument appears to tee exturmely uffal in calm thill weather, as the whale, thongh a timorous creature, will frecuently atlow a hoat to approach it to the diftance of 20,15 , or even rofahoms, all of which ditances are within ofach of the gum-harpoon, though not within the reach of that thrown by the hand. The greateft incenvenience was in cafe of rain or fuow, by which the lock was apt to get wet. To remedy this, a cafe of leather was made to tis round the run and over the lock, lined with tin, and big enough to fire the gun when it was on. The fith truck with an harpoon difcharged in this manner are fron killed by reafon of its penetrating thein hodics to a great depth, not lefs than tive or fix feet, which no man's lireugth would be able to accomplifh. In the volume jult quoted, we have an account of one which was fhot through the tail. The harpoon broke in the flit, luat five fathoms of line went throngh the tail. The finh was killed in cight hours, which is perthaps the only intance of a fith track in that part being canght. In another, the harpoon carried fix feet of lime into its body; the ercature dicd in ten minutes. Others were killed in 15 minutes or half an hour, and one had a ril, broken hy the violence of the ltoke. In the Pranfactions If Ite Society for 1700 , there are other accounts fimihar to the fortgoing, and all ageseing as to the grat uffolnts of the indtument both for triking the fifh at a conflubrable datance, and for killing them in a wey hont time.
ifilinslCTIORD, die mor hamonious of all the mulical inftrmmente of the tring-kind. It is played on after the mamer of the organ, and is fumitmed with afot, and fometime: with iwo fets of keja; the wachiner or thriking os thefe keys moves a kind of I the jaks, which alfo mose a double row of chonds on Armes, of brafs or iron, Athelied over four bridges on the table of the intament.

If-ARQUEBLSS, a piece of fre-arms, of the durth of a muthet, ufually cocked with a wheel. It carrica a batl that meighed one ontace feven-cighths.

There was alfo a bager fort, called the great haroncbuls, ufed for the defonee of frong phaces, wheich "anicd aloh of ahout three onnces and a haf: but they are now hat hitie ulid, cxapt in fome old cailles, and by the lionel in forme of their gatifons.

HAXRR[ER, a lind of homd. chdoned with an N゚11\%。
admirable gift of fmelling, and very bold in the pur. Harringto fuit of his yame See Canis.

HARRINGTON (Sir JMn), an ingenous Englim puet, was the don of Julin Larrington, ELq; who was committed to the "lower by queen Mary for holding a correfpordence with her titer Elizabetli; who, when the came to the crown, frod godmother to this fon. Before he was 30 , he publifhed a tranflation of Ariolto's Oilando Furiofo, a work by which he was principally known; for though he afterwards publifhed fome epigrams, his talent did not feem to have lain that way. He was created knight of the bath by James 1.; and prefented a NS. to prince Henry, levelled chiefly at the married bifhops. He is fuppofed to have died about the lattur end of James's relign.

Harrington (James), a mol eminent Englifh writer in the 1 -th century, bied at Oxford, travelled into Holland, France, Demmark, and Germany, and learned the lansuages of thufe countries. Upon his return to England, he was admitted one of the prisychamber extraordinary to king Chaties I. He ferved the king with great fidelity, and made ufe of his incereft with his friends in parliament to procure matters to be accommodated with all parties. The king loved his company except when the conserfation happened to turn upon commonwealths. He found means to fee the kingy at Si James's; and attended him on the faffold, where, or a litthe before, he received a token of his majelty's affection. After the death of king Chales, he wrote his Ocema: a kind of pulitical romance, in imitation of Plato's Commonwealth, which he dedicated 10 Oliver Cromweli. It is faid, that when Oliver perufed it, he declared, that "the gentleman had wote very well, but mut not think to cheat him ont of his power and authority; for that what he liad won by the fword, he would not fuifer himfelf to be feribuled ont of." This work was attacked by feveral writure, againt whom he defended it. Befide his witings to promote republican principles, he inflituted likewife a nithtly meeting of feveral ingenions men in the New Pulace-Yard, Weftmintter; which club was called the Rota, and continued till the fecluded menbers of parliament were rellored by genetal Munh. In 1661, he was committed to the Tower for treafonable deligns and practires; and chancellor Hyde, at a conference with the lords and commons, charged him with being concenned in a plot. But a committee of lords and commons could make nothing of that plot. He was conveyed in Si Nicolis's illand, and from thence to Plymonal, where be fell into an uncommon diforder of the imagimation. Having obtained his liberty by means of the eal of 13 ath, he was carried to London, and died in 1677. He publihed, befides the above norke, fevaral others, which were firt collected by 'I'olant, in one volume folio, in 1700 ; but a more complete edition was publifned, in 1737 , by the reverad Dr Dirch.

HARRTOT (Thomas), a celebrated algebrait, was born at Oxford in 1560 , where he was alfo cducated. In 1579, the empleted his bachelou's degrec ; and, being already dittinguihed for his mathematical Jearning, was foom after recommended to Sir Walter

Raleigh,

Raleigh, as a proper perfon to infruf lim in that fcience. He was accordingly received into the family of that gentleman; who, in 1585 , ferit him with the colony, under Sir Richard Grenville, to Virginia; of which country, having remained there about a year, he afterwards publifhed a topographical defcription. About the year 1588, Mr Harriot was introduced by his patron Sir Walter Raleigh, to Henry Percy earl of Northamberland, who allowed him a penfion of $120 \%$ fer annum. He fpent many years of his life in Sion college; where he died in July 1621, of a cancer in his lip, and was buried in the church of St Chriftopher, where a handlome monument was erteed to his memory. Anthuny Wood tells us, he was a deit, and that the eivines looked upon his death as a gudgment. Be his religious opinions what they night, he was doubtlefs one of the firlt mathematicians of the ege in which he lived, and will always be remembered as the inventor of the prefent improved method of algebraical calculation. His improvements in algebra were adopted by Des Cartes, and for a confilerable time impofed upon the Frencle nation as his own invention; but the theft was at laft detected, and expofed by Dr Wallis, in his Hillory of Alrebra, where the reader will find our author's invention aceurately specified. His works are, 1. A bricf and true report of the new-found land of Virginia; of the commodities there found, and to be raifed, \&c. 2. Arlis analytica praxis ad aquationes alyebraicas nova expedita, et generali methodo refolvendas, epofthunis Thome Harrioti, \&c. 3. Ephcm-ris chyromerrica. Manufcript, in the library of Sion college. He is faid to have left feveral other manufripts which are probably lot.

HARRIS (William), a proteftant difenting minifter of eminent abilities and character, refided at Honiton in Devonflire. Sept. 20. 1765, the degree of D. D. was conferred on him by the univerfity of Glafgow, by the unanimous confent of the members of that body. "He publillid an Hittorical and Critical Account of the Lives of James I. Charles I. and Oliver Cromwell, in five vols 8 vo. after the manner of Mr Bayle. He was preparing a like account of James II. He alfo wrote the life of Hugh Peters; befides many fugitive pieces occafionally, for the pub. lie prints, in Cupport of liberty and virtue. All his works have been well received; and thofe who differ from him in principle, thill value him in puint of in. duftry and fathfuhefs." We give this charaaer in the words of his inunificent patron Mr Holli,, who had prefented him with many valuable books relative to the fubjects of his hiflories; and was at the expence of procuring his degree. But the Ductur's works were differently thought of by the authors of the Critical Revie. (March ${ }^{7} 766$ ). "Indultry was their principal characteribic. They certainly have none of the vivacity which infpied Bayle; and in the judgrent of difpationate readers, impartiality is frequently violated." Dr Harris died at Heniton, Feb. 4. 2770.

HARR1S (Jamcs, Efq;), an Englith gentleman of very unconmon parts and learning, was the fon of James Harris, Efq; by a fifter of lurd Shaftelbury author of The Characterillice. He was born in the Clofe at Salißury 170n; and educated at the gram. mar-feliool there. In 1726, he was remuved to Wad. Vol. VIII. Part I.
ham-college in Oxford, but took no degree. He cultivated letters, however, moft attentively; and alfo mufic, in the theory and practice of which he is faid to lave had few equals. He was member for Chrittchurch Hants, which lee reprefented in Ceveral fuccefdive parliaments. In 1763 , he was appointed one of the lords commiflioners of the admiralty, and foon af. ter removed to the board of treafury. In $177+$ he was made fecretary and comptroller to the qucen, which poft he held untilhis death. He died Dic. 21. 1780, in his 72 d year, after a long illnefs, which he bore with calmanefs and refignation. - He is the author of fome valuable works. 1. Threc Treatifes: concerning Art; Mufic, Painting, and Poetry ; and Happinefs, 1745 , Svo. 2. Hermes; or, A Philofophical Enquiry concerning Univerfal Grammar. 3. Philofuphical Arrangements. 4. Plitulogical Inquiries, 1782,2 vols Svo. Trinifed jutt before his death, and pubiihed linee. Thefe Inquiries flow much ingenuity and learning; but being the amufement of his old age rather than an exertion of genius, they have not the philofophic tone of his former productions.

HARRIS, one of the Hebrides or Wetern Illands of Scotland. It is 20 miles in length, and 10 in breadth. Upou the eaft fide it is motly roex; bur on the weft there are fome tolcrable farms, and the number of prople amounts to 2000. It has Lewis on the north, and North, Uitt on the fouth, from which it is feparated by a channel of four miles in width, called the Sound of Harris This channel is navigable for veffels of burten, but it requires a deilful pilot. It is the only paffage between the Butt of the Leewis and Bara for veffels of burden paffing to and from the wett fide of the Long Illand. The found is greatly encumbered with rocks and inlands, fome of which are conifleiable, as Bernera, Pabay, Enfay, Killegray. Thefe, with Scalpay, Taranfay, and Scarp, compole the inhabited iflands on the coaft of Harris. Some of them produce good erops of grain, and all of them good pafturc. Harris and its iflan's fell from 400 to 500 ton of kelp annually; it abounds on the eadt fide in excellent lochs or bays, and its thores on both fides form one continued fifiery. The fifh on this coalt, and along the whole fhores of the Long Ifland, are more numerous, and of larger dimenfions, than thofe on the oppofite continent; on which account, two royal lithing flations were begun in the reign of Charles I. one in Lach Maddie, and the other in the Sound of Harris.

HARIRISON (William), a writer much efteemed and patronifed by the literati of his time, was fellow of New college, Oxford, and had no other income than 4ol. a year astutor to one of the duke of Queenbery's fons. In this employment he fortanately attracted the favour of Dr siwitit. whofe folicitations with Mr St John obtained for him the repuable employment of fecretary to lord Raby, ambaffador at the Hague, and afterwards carl of Siraford. Alstter of his whilt at Utreehr, dated Dec. 16.1712 , is printed in the Dean's worke. Mr Harrifon, wha did not lung enjoy his rifing fortunc, was difpatched to Londoa with the Barrier-treaty ; and dicd Feb. 14.1712-13. See the Journal to stella, of that and the following day ; where Dr Swift laments his lofs with the moll unaffecled fincerity. Mr Tickel has mentioned litu with

Harris,
Harrita.

Harrifen. refpeat in his Profpect of Pcace; in Englifh Pucte, Vol. XXVI. p. 113; and Dr Young in the beautiful clofe of an Epitle to Lord Landdowne, Vol. L.lf. p. 185, moft pathetically bewails his lofs. Dr Dirch, who has given a curious note on Mr Harrifon's Letter to Swift, has confounded him with Thomas Harrifon, M. A. of Queen's college. In Nichols's Sclect Collection are lome pleafing fpecimens of his pretry; which, with Wuoditock-Park in Dodney's Collection, and an Ode to the Duke of Marlborough, 1707, in Duncombe's Horace, are all the proetical writings that are known of this excelle nit young inan; who tigured both as an humousit and a politician in the fifth rolume of the Tatler, of which (under the patronage of Bolingbroke, Henley, and Swift) he was profefledly the editor. See the Supplement to Swift. - There was another Ivilliom Hiarifon, author of The Pilgrim, or the happy Convent, a Paftoral Tragedy, 1709.

Harrison (Iohn), a mof accurate mechanic, the celebrated inventor of the famons time-kepeer for afcertaining the longitude at fea, and alfo of the compound, or, as it is commonly called, the gridiron fendulum; was horn at Foulby, in the parifh of Wrasby, near Pontcfratt in Yorklhire, in 1693 . The vigour of his natural abilities, if not even tlrengthened by the want of cducation, which confined his attention to few objc as, at Iealt amply compenfated the deficiencies of it ; as fully appeared from the afonithing progrefs he made in that branch of mechanics to which he devoted bimfelf. His father was a earpenter, in which profeffion the fon affifted; occationally alfo, aecording to the mifeellaneous practice of country atifts, furveying land, and repairing clocks and watches. He was, from his early childhood, attached to any machinery moving hy wheels, as appeared white he lay fick of the fuall-pox about the fisth year of his age, when he had a watch placed open upon lis pillow to amufe himfelf by contemplating the movement. In 1,00 , he removed with his father to Barrow in Lincolnhire; where, thougla his opportunities of acquiring knowledge were very few, he eagerly improved every incident from which he might collect information; frequently employing all or great part of his nights in writing or drawing: and he always acknowlecged his obligations to a clergyman who came every Sunday to officiate in the neighbourhood, who lent him a MS. copy of profeffor Saunderfon's Lectures; which he carfully and neatly tranicribed, with all dhe diagrams. His native genius exerted itfulf fuperior to thefe folitary difadvantages; for in the year 1,26 , he had conftrusted two clocks, motily of wood, is which he applied the efcapement and compound pendulum of his own invention: thefe furpaifed every thing then made, fcarceiy erring a fecond in a month. In 1728, he came up to London with the drawings of a machine for determining the longitude at fea, in expecation of heing nabled to execure out by the board of longiture. Upon applicatwa to Mr Halley, he referred him to Mr George Graban; whe, diforerimg lie had uncommon merit, advifell him to make his machine before he applied to the hoard of longitude. He returned home to ferform this tafk: and in 1735 came to London again writh his forft machiae; with which be was fent to

Lifon the nest year for a trial of its properties. In Harri this fhore voyage, he corrected the dead reckoning about a degrec and a half; a fuceefs that proved the means of his receiving borh public and puivate encouragement. Aboat the year 1739 , he completed his fecond machine, of a conltruction much more fimple than the former, and which anfwered much better: this, though not fent to fea, recommended Mr Harrifion yet flonger to the patronage of his private friends and of the public. His third machine, which he produced in $\mathbf{1} 7 \cdot 9$ ), was thill lefs complicated than the fecend, and fuperior in accuracy, as erring only three or four feconds in a week. This he conceived to be the ur flus alevic of his attempts; but in an endeavour to improve pocket-watches, he fonnd the principles he applied to furpans his cxpectations fo much, as to encourage him to make his fourth time-kceper, which is in the form of a pocker watch, about fix inches ciameter. With this time-keeper his fon made two voyages, the one to Jamaica, and the other to Barbadoes: in both which experiments it corrected the longitude within the nearell limits required by the aft of the sath of queen Anne; and the insentor therefore, at different times, though not without ininite trouble, received the propofed reward of 20,0001 . Thefe four machines were given wp to the board of longitude. 'The three former were not of any ufe, as all the advantages gained by making them were comprehended in the hilt; they were worthy, however, of being carefully preferved as mechanical euriofities, in which might he traced the gradations of ingentity executed with the moft delicate workmanhhip; whereas they now lie totally neglected in the royal obfervatory at Greenwich. The fourth machine, emphatically diftinguifhed by the name of The time -kiceter, has been copied by the ingenious Mr Kevdal ; and that duplicate, during a three years circumnavigation of the globe in the fouthern hemifphere by captain Cook, anfwered as well as the original. The latter part of Mr Harrifen's life was cmployed in making a fifth improved time-keeper on the lame principles with the preceding one; which, at the end of a ten weeks trial, in 1772, at the king's private obfervatory at Richmond, erred only $+\frac{1}{2}$ feconds. Within a few ycars of his death, his conftitution vilibly declined; and he had frequent tits of the gout, a diforder that never attacked him before his 77 th year: he died at his houfe in Red-Lion Square, in 17776 , aged 83. The reclue manner of his life in the unremitted purfuit of his favourite object, was by no means caleulated to qualify him as a man of the world; and the many difcouragements he encountered in folicising the legal reward of his labours, ftill lefs difpofed him to accommodate himielf to the humours of mankind. In coavering on his profeffion, he was clear, dillinct, and modert; yet, like many other mere mechanics, found a difficuky in dslivering his meaning by writing; in which he alliered to a peculiar and uncouth phrafeology. 'This was but too cvident in his Dijcription concerning fuch machanijm as wuill afford' a nice or true menfura. tion of timn, \&e. Svo. 1775 ; which his well-known mechanical talents will induce the public to account for from his unacquaintance with letters, from his advanced age, and attendant mental infirnities; among

## $\mathbf{H} \mathbf{A} \boldsymbol{R} \quad\left[\begin{array}{lll} & 33\end{array}\right] \quad \mathrm{I}$ A $\boldsymbol{R}$

rrogate moag which may be reckoned his obfinate refulal to accept of any afillance whatever in this publication. This fmall work includes alfo an account of his new mufical fcale; or mechanical divifon of the oftave, according to the proportion which the radius and diameter of a circle have refpectively to the circumference. He had in his youth been the leader of a diftinguined band of church-fingers; had a very delicate ear for mufic ; and his experiments on fund, with a moft cusious monochord of his own improvement, are reported to have been not lefs accurate than thofe he was engaged in for the menfuration of time.

HARROGA'I'E, a village in the Wcft Riding of Youkthire, in the parith of Knareborough, remarkable for its medicinal fprings. Thele are three in number, all different in their qualities, notwithtanding their contiguity. 1. The Tewet water or Sweet Spa, a vitriolic fpring of a fort of milky tafte ufed in gravelly cafes, was difcovered by Mr Sling $\mathrm{By}_{5}{ }_{1638}$. 2. The finking or fulphur fpring, ufeful in droplical, fcorbu. tic, and gouty cafes, rifes in the town, and is received in four bafons under four different buildings; at one it is drunk, at the others ufed for hot or cold baths. It is perfectly clear; but the tate and finell a compofition of rotten egss, fea-water, and fulphur, and extromely falt. Bathing is the molt general mode of ufing it. It is the ftrongelt fulphur water in Great Britain; and from the fuperior ftrength of the impregnating fulphur, it does not lofe the fulphureous finell even when expofed to a fcalding and almolt boiling heat; and in diftilling it, when three pints had been taken off from a gallon of it, the latt was as Itrong as the firt, and lunk intolerably: It is difcutient and attenuating, and a warm bath of it is of great benefit in pains and aches, ttrains and lamenefs; difolving hard fwellings, curing old ulcers and fcrophulous complaints, and is a powerful cleanfer of the fomach and bowels. 3. St Mungo's well, is fo called from Kentigern a Scotch faint much honoured hereabouts, whom his tutor Serranus bifhop of Orkney, out of affection for him, called Miongal, which in the Norih or Norway language fignifies a dear friend.-The Harrogate feafon is from May to Michaelmas; and the company af. femble and lodge in five or fix large houles or inus on the heath, a mile from the village, each houfe having a loag room and an ordinary: the beft company ufed to lodge at Koareßorough, which is three imiles off.

HARROW-on-the.Hill, a towa of Middlefex, fo called from its fituation on the highelt hill in the county, is 10 miles north-weft of London. This parifls is noted for a free fchool, foundsd in the reign of queen Elizabeth. A filver arrow is fhot fur heic once a year, viz. Auguft 4. by a felect number of the fcholars, who are dreffed for the purpofe in the habit of archers.

Harrow, in agriculcure. See there, ${ }^{\circ} 98$.
HART, a ltag, or male deer, in the fixth year. See Cervus.

Hart-Befl, or Quanga. See Capra.
HART's. Horns, the horns of the common male deer. - The fcrapings or rafpings of the horn of this aniimal are medicinal, and ufed in decoctions, ptifans, \&e. Harthorn jelly is nutritive and Atrengthening, and is fometimes given in diarrhoas; but a decoction of
burnt harthorn in water is more frequently ufed for Hartford. this purpole, and is called hart/hor.a drink.

The coal of larthorn, by being calcined with a long continued and ftrong fire, is changed into a very white earth, cailed barthorn calcined to whitenefs. This carth is employed in medicine as an abforbent, and adnuiniftered in dyfenterics and labour-pains, which are fuppofed to be caufed by acrid and ill-digefted mat ters. 'This earth levigated is the bafis of Sydenham's white decoction, which is conmuonly preferibed in thefe difeates.

The falt of halthorn is a great fudorific, and fiven in fevers with fuccef; and harthorn ulfo yields, by didillation, a very penetrative volatile fpirit.

HARTFOR1), the capital of the ccunty of the fame name, fignifying, as is coamonly thought, the " ford of harts," fands on the river Lea, 21 miles from London; and is of couffderable anticuity. Here the Ealt-Saxon kings ofted kept their court; and here, in 673, was held a fynod. King Alfred built a caftle here, by which the Danilh vellels were dellroyed, that came up from the Thames by its river as far as Ware, where the Danes had ereeted a fort, from which they made frequent fallies to plunder and deltroy the country. The prefent catle conlitts of a gate-houfe, or lodge of brick, and a range of brick buildings, which feem of the time of James or Charlés I. and alfo of a very ancient wall of ruble tone, with angular towers, fuppofed to have been flanding ever fince its firif foundation. The manor of this town was all along the king's, of whom both the town and cafle were formenly held in capite. The harons took the latter from king John, but Henry III. recovered it. Edward III. gave the town a charter for markets on Thurfday and Saturday, and in his grant of it to John of Gaunt it is called The Honour of Hartford. It fent members to parliament in the reign of Edward I. but after the 7th of Henry V. on the petition of the bailiff and burgefles to be exempted by reafon of their poverty, that privilege was difiontinued till the 22 d of James I . Henry VI. who kept his Eatter here in 1429, ordained by his charter, contirming their market, that no other floull be kept on the fame days, within feven miles, on pain of having the goods feiced by the bailiffs of Hartford. This manor being then part of queen Margaret's jointure, the courts were held in her name, aad the appointed a horfe fair to be kept in what part of the town the bailiff and conftables thought fit. The ftandard of weights and meafures was fixed here in the reign of Henry VII.; and Mary I. made this a corporation by the name of bailiffs and burgeftes, of whom the latter were 16 by her charter. In the 25 th and 35th of Elizabeth, Michaelmas-term was kept liere, by reafon of the plague at both tintes in London; and that queen, who fometimes refided in its caflle, and declared the borough as parcel of her duchy of Lancalter, granted it a new charter, by the ftyle of a bailiff, it capital burgeffes, and 16 afifitants, with a market on Saturday. James I. granted it a new charter, with the ftyle of mayor, burgeffes, and commonalty, to have 10 capital burgeffes and 16 affitants, the mayor to be chofen out of the former by buth of them; and a fair was then appointed here on May 12. Here was once a monaftery, founded by a nephew of Wil. S f 2 liam

Horifrel liam the Conqueror; and here were formenly five fhire, Hartland churehes which are now reduced to two. In sit Andrew's there is a feat not only for the mayor and al-
dermen, but another for the governors of Chrilt-charch hofpital in London, who have erteted a houfe in this town on account of its healethy air and dry dituation, to reeeive fuch children as wanted either health or room in that holpital; and they have built a gallery in the church, wherein 200 of their chitdren may be accommodated. The town is now governed by a mayor, high-lleward, who is generally a nobleman, is recorder, 9 aldermen, a town-clerk, chamberlain, to capital bugeffes. and 16 affilants, and has 2 ferjeats at mace. Ihe chicf commodities of its market are wheat, malt, and wool: and it is faid to fend ;000 quarters of mak to London weekly by the river Lea. Befides the ahovementioned, here are two fairs on July 5 and November 8 , and two others for cattle, viz. the Saturday fortnight before Eater, and its Midlummer fair is chiefly for horfes. Here is a handfome free grammar-fchool, befides 3 charity-fchools; but the jplendor of the place is much diminilhed lince the north road from London was turned through Ware. 'Ilse county gaol, however, is kill kept in the town, and the gaol-delivery in the cafle. It gives the title of earl to the noble family of Seymour-Conway.

HARTFORDSHIRE, a county of England, deriving its name from Hartford the capital ; and that from che harts with which it anciently abounded, being then over-run with woods. It is bounded on the ealt by Effex, on the well by Dedfordhire and Buckinghamfhire, on the fouth by Middlefex, and on the north by Cambridgefhire. This county is much indented by thofe that furround it : the longelt part is about 35 miles, and the broadeft abont 27 ; and the circumference is 190 , containing about $+51,000$ acres. It is divided into eight hundreds, which contain to market towns, 54 vicarages, 120 parihhes, and near 950 villages, with about 16,500 houfes, and 90,000 inhabitants ; and fends fix members to parliament, two knights for the fhire, with two burgeffes for St Alban's, and as many for Hartford. Before the reign of queen Elizabeth, one fheriff ferved both for this fhire and Effex ; but in the ninth year of her reign, it had one aliotted for itfelf. With regard to eccletiattical jurifdiction, it belongs partly to the diocefe of Liucoln, and partly to that of London. Thougl the foil in general, efpecially in the Chittern and fouthern paris, is but very indifferent, and much inferior to that of the neighbouring counties; yet the air is fo much fuperior, that lands in this fhire generally fell at three or four years purchafe more than in many others on that account. But it mutt be owned, that the foil of Hartfordfhire has been much improved of late, by draining, fowing grafs feeds, and other methods. There are few or no manufactures in the county; but its markets are much frequented, in confequeace of its being near London, for malt and all forts of grain, which, with the many thoroughfares through it, make ample amends.

HARIL. iND, a town in. Devonhhire, near the Brillol chanuel, with a market on Saturdays, much frequented by the people of Cornwall, who come hither in boats. It gives its oame to a point, called

Hartand Poim', at the entrance of Brifol channel. Hartlepo W. Long. 4. 45. N. Lat. 51.9 .

HAR TLEPOOL, a teaport town in the county of Durhom. It is commodiouly leated on a promon. tory, and is almoll encompalted by the fea. It is an. ancient corporation, governed by a mayor and aldermen, with other fubordinate officers. It is at prefent a pretty large but poor place. It depends chiefly onthe fithing tade: and its harbour is much frequented by collers patling to and from Newcaltle. W. Long. 0. 55 . N. $5+4 \mathrm{C}$.

HARTLEY, a town of Northumberland, on the coath, fitaated northenet of Tyumouth, where Lord Delaval has contructed a pretty haven, whence coals are fhipped for London. Here are large falt works and copperas works, and likewife contiderable glafs works; and there is here a canal cut through a folid rock to the harbour, 52 feet deep, 30 broad, and 900 long. 'Thefe works are the fole property of Lord Delaval, and yield a revenue ef above 20.0001. per annum.

Hartiey (David), M. ̇̀. born at Ilingworth, where his father was curate, received his academ:cal education at Jefus collere, Cambridge, of which he was a fellow. He firt began to practife phyfie at Newark, in Nottinghamfhire; from whence he removed to St Edmund's Bury, in Suffolk. After this, he fettled for fome time in London; and laltly went to live at Bath, where he died in 1757, aged 53, leaving two fons and a daughter. He publthed "A view of the prefent evidence for and againit Mrs Stephens's * medicines as a folvent for the ftone, contain- - See St ing 155 cafes, with fome experiments and obferva-pbens's? tions;" London, 1739. He is faid to have alfo writ-dicines, ten againtt Dr Warren, of Si Edmund's Bury, in defence of inoculation; and fome letters of his are to be met with in the Philofophieal Trantactions. 'The doctor was certainly a man of learning, and reputed a grod phylician ; but too fond of roltrums. But his molt confderable literary production is a work intitled, "Obfervations on man, his frame, his duty, and his expectaitions, in tro parts;" London, 1749,2 vols. 8vo. The firl part contains obfervations on the frame of the human body and mind, and on their mutual connections and influences. The fecond part contains obfervations on the duty and expectations of mankind.

IIARTMAN (John Adolphus), a learned divine and hiftorian, was born at Muniter in 1680. After being a Jefuit for feveral years, he became a Calvinitt at Caffel, in 1715 ; and foon after was made profeffor of pbilofophy and poetry, and in 1722 profeffor of hiftory and eloquence, at Marpurg, where he died in 174. 'The mott efteemed of his works are, I. The fate of the fciences at Heffe, in German. 2. Hiforia.Ha/huca, 3 vols. 3. Pracepta cloquentic rationafis, ice.

He ought not to be con؟ourded with George Hartman, a German mathematician, who, in 1540 , wrove a book on perfpective; nor with Wolfgang Hartman, who, in 1596 , compoled the A nnals of A ugfourg.

HARTOGIA, in botany: A genus of the pentandra order, belonging to the moncecia clafs of plants; and in the natural method ranking under the 48 th order, Aggregate. The male calyx is pentaphyllous, the

## H A R

irices petas fiee the female callys triphylous, with five 333 , ]
II A $R$
room, a library, and a mufenm; and in 16,56 he Harves, brought the deels of his efla:e, and prefented them to Haw wath. the college. He was then preferat at the firet feall, inllituted by himfelf, to be continued anmually, to. gether with a commemoration fyreech in Latin, to be fpoken an the 18 ith of Octuber, in honour of the benefactors to the college; the having appointed a handfome ellipend for the ora:or, and allo for the keeper of the library and mureum, which are thill called by his name. He died in 1657.

This great phyfician had the happinefs, in his lifetime, to find the clamours of ignorance, envy, and projudice. againlt his doctrine, totally filenced, and to fee it univerlatly eltablified. It has, by length of time, been mure and more confirmed, and every man now fees and knows it from his own experionce. It appears to be of the utmolt importance in medicine; as it is perhaps impoffible to detine heath and ficknefs in fewer words, than that the one is a free, and the other an obllracted, circulation.-Dr Harvey was nor oaly an exceltent phyfician, but an excellent man; his madely, candour, and piety, were equa! to his knowledge; the farther lie penietrated into the wonders of nature, the noure he was inclined to venerate the Author of $i$.

HARTWICH, a tnwn of Effx, in England, 72 miles from Londun. It is not large; but is well built and populons, has a good maritime trale, is almoft encomp:ffed by the fea, and has frong works. It is walled in ; ard the frects are paved for the moff part with clay, which tumbling down from the clif, where is a peirefying water between the town and Beacon-Hill, foon grows as hard as fone; and the inhabitants boait the wall is as flrong and the treets are as clean as thoie that are of real dtone. The harbour or bay is very large, fafe, and deep; and is commanded by a frong fort on the Suffolk fide, though not in that county. Here is a dock belonging to the government, with ail conveniences for buiding, cleaning, and refitting mea of war. A little way from the town, on a high hill called Beacon bill, is a very fine light houfe, which is feen at a great difance, and is very wieful on this danyerous coalt. At this place :he packet boats which pafs between England ard Holland are llationed, and the town is much benelited by the paffengers. The bay is fo facious, by the infux of the Stoui from Maningtree, and the Orwell from 1 ffuich, and fueh ufe was made of it in the Dutch war, that 100 fail of men of war have been feen there at one time, with their tenders, belides 300 or 400 fail of colliers; for it is a periect harbour to within two miles of Iplwich, and ahle to receive mips of 100 guns all the way. The inns here are very good; but the accommodations dear, by reafon of the great concourfe of paffengers to and from Holland, which was the motive of fitting up noops to go thither dircetly from the Thames, when the ftage-coaches that ufed to ply two or three tinies a week between this place and London were laid down. This place was firlt made a free borough, and had a grant of its market on Thuefdays in the reign of Edward II. Its government was fettied by charter ofking James I. in a mayor, chofen yearly, Novenber 30 , out of eight aldermen, who with 24 eapital burgeffes, the electors, and the recorder, make flie corporation. By this charter it had alfo a power to eleat iwo bur- are each for three days. The town las alfo an ad-
viraly farifdiction within its liberties, and the return of all writs, fines, \&e. Though the entrance into the fathere is tetween two and three miles wide at high. water, ye: the channel where the hips mult keep to cone th the harbour, which is on the suffolk fide, is deep and narrow ; fo that all fhips that come in or go out are commanded by the guns of Landguard-Fort on that fide. This town was furtified heretofore on the land fice, but in the reign of king Charles I. the fortifeations were demulined. It has fince been ordered to be refortified.-The church here, ceer lince the eformation, has been a chapel to the mother-chureh at Dover-Court.

HARWOOD, a mall but pretty town in the north ridiag of Yorkithe, with a conty fone-bridge of in arches orer the Wherfe, which runs in a bed of fone, and is as clear as rock-water. Near it are the ruins of an ancient calle, built foon after the conquefl ; and which remained a neat Atrong building in Canbden's time. It had a variety of maflers; one of whom, in the reign of king John, obtained a grant for a market and fair here. In the reign of Edward III. it was valued at 400 marks a-jear. This catle was ruined in the civil wars. It has eight or nine depentent conflabularies, wherein are many antiquities. The remains of the cafte, which feens to have been the keep, is in a condition to exit long. The cafle iticlf covered near an acre of ground. Near it is now Harwood-Honle, one of the firt houles in the county for elegance and fuperior embellihments; built on part of the fite of Gaw-thorp-Hall, now no more. In the church are fome ancient monuments, particularly that of lord chief.juftice Gafcoigne, who committed the Prince of Wales to prifon for friking him on the bench.

HASLEMERE, a town of Surry, in England, feated on the edge of the county next Hamphire, 43 miles from London, is an ancient place, and was once deflroyed by the Danes. It is a borough by prefcrip. tion, and has fent members to parliament ever fince the reign of Edward IV. who are chofen by a bailiff and lurgage-teeners. It is faid to have hat feven parifhchurches formerly, though but one church now, which is a chapel of eafe to Chidingfold; and that it flood heretofore upon a hill more to the fouth than the preǐnt town.

HASSELQUISTA, in botany: A genus of the digynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the $4 ;$ ch order, Umbellate. The fruits are quite fmooth; the feeds of the radius oval, plane, marginated, and conrex in the middle; thofe in the difk hemifpherical and urceolated or bladder-flaped.

HASSELT, a handfome town of the United Provinces, in Overyffel, feated on the riven Wecht, in E. Long. 6. 5. N. Lat. 23.46.

Hasselt, a town of Germany, in the circle of Wellphalia, and in the territory of Liege, fituated on the river 1)emer, in E. Long. 4.49. N. Lat. 50.55 .

Hassideans, or Assideans. Sec Assidrans.

HASSOCK, a bafs made of rufhes, to kneel or reft the feet upon in ehurehes.

IIASP and Staple, in Scots law, the fymbol com-
monly ufed in burgags tencments for entering and infefting an heir, by delivering into his bands the hafp and itaple of the thoor.

HASTA, or Hasta Pura, among medalits, fignifics a kind of fpear or javelin, not thod or headed with iron; or rather an ancient fceptre, fornewhat louger than ordinary, oceafionally given to all the gods.

The balta is fuppoled a fymbol of the goodnels of the gods, and of the conduft of providence, which is equally mild and forcible.

Hast.a, in fome countrics, is a meafure or quantity of ground amounting to thirty paces: thus called, according to $\mathrm{M} . \mathrm{Du}$-Cauge, from the haita or rod wherewith it was meafured.

HASTATED Leaf. Sce Botany, p. 442.
HASTING-pEAR, a name given by the gardeaers to a fpecies of pear, called alfo by fome the grecen chilid par. This is a moderately large pear, and is longifh towards the pedicle; its fixn is thin, and of a whition green; the pulp is melting, and of a fugary flavour. It ripens in July.

HASCINGS, a town of Suffex in England, 6 miles from London. It is the chief of the cinqueports; and was formerly obliged to tind 21 hhips, within 40 day's after the king's fummons, well furnifhed and armed for fervice, and to maintain the crews a fortnight at its own charge. This town is fuppofed to have taken its name from Haftings, the fanous Danih pirate, who ufed to build fortrefles where he went afhore for his prey, to cover his men, and fecure his retreat. In King Athelitan's reign here was a mint. This town had charters from Idward the Confeffor, William I. and II. Henry II. Richard I. Heary III. Edward I. and Charles II. exempting it from toll, and impowering it to hold conits of judicature on life and death. It is incorporated by the ftyle of mayor, jurats, and commonalty. It has handome houles, and cuftomhoufe officers; but frequent floms bave rendered it an indifferent harbour, though a vaft fum of money has been laid out at times to make it a good one. It has fent members to parliament ever fince Edward III. London is fupplied from hence with abundance of fifh that are taken on the coalt. The town lies between two high cliffs towards the fea, and as high a hill on the land fide, having two freets, and in each a parifl. church, divided by a llream of frefh water called the Bourne. About the year 1377, this town was burnt by the French; and after it was rebuilt, it was divided into the two parifhes. Here are two charity fchools, erected for the teaching of 200 or 300 children. There was a cafte on the hill, which overlooked the town, but it is now in ruins. The markets here are on Wedne 1 days and Saturdays: the fairs are on Tuefday and Wednefday in Whitfun-week, and July 26, October 23, and 24. Here was formerly a priory. Hattings was a barony in the Huntington family, now in the Rawdon family.
This town is remarkanle for a battle fought in its neighbourhood, between Harold king of England and William duke of Normandy, on the 15 th of October r 66 , in which the former was defeated and killed; and by his death William, furnamed the Conqueror, became king of England: (See England, n` 86.) -The night before the battle, the afpect of things was very different in the two camps. The Engliih spent the time in riot, jollity, and diforder; the Normans in prayer

Hanings and other duties of religion. The next day both armies prepared for battle. The duke divided his aray into three lines: the firf, headed by Montgonery, confited of archers and light-armed infantiy: the lecond, commanded ty Martel, was compofed of his braveft battalions, heavy-armed, and ranged in dofe order: his cavalry, at whofe head he placed himfelf, formed the third line; and were fo difpoled, that they ftretched beyond the infantry, and hanked each wing of the army. He orderd the fignal of battle to fuynd; and the whole arny, moving at onee, and linging the hymu or fong of Roland the fanous peer of Charlemagne, advanced, in order and with atacrity, towards the enemy.

Harold had feized the advantage of a rifing ground, and having betides drawn fome trenehes to fecure his flaiks, he refolved to lland upon the defenfive, and to avoid all action with the cavalry, in which he was inferior. The Kentilh men were placed in the van, a poft which they had always chimed as their due; the Londuners guarded the flandard; and the king himfilf, accompanicd by his two a aliant brothers, Gurth and Leofwin, difmounting fion horfeback, placed himfelf at the head of his infantry, and exprefFed his refolution to conquer or to perifh in the ation. The firlt attack of the Normans was defperate, but was received with equal valour by the Englifh: and after a furious combat, which remained long undecided, the former, overeome by the difficulty of the ground, and hard prefled by the enemy, began firit to relas their vigour; then to give ground; and confufion was freading among the ranks, when William, who found himfelf on the brink of deltruction, haftencd, with a felect band, to the relief of his difmayed forces. His prefence reflored the action; the Englith were obliged to retreat with lofs; and the dake, ordering his fecond line to adrance, renewed the attack with frefh forces and with redonbled courage. Finding that the enemy, aided by the adrantage of ground, and animated by the example of their prince, flill made a vigorous refiftance, he tifed a flratagem, which was very delicate in its managemenr, bat which feemed advifable in his defperate fituation, when, if he gained not a decifive victory, he was totally undone: he commarded tis troops to make a hafty retreat, and to allure the enemy fiom their ground by the appearance of flight. Thic ariifice fucceeded again? thefe unexperienced troups; who, heated by the action, and fanguine in their hopes, precipitantly followed the Normans into the plain. William gave orders, that at once the infantry frould face about upon their purfuers, and the covalry make an affault upon their wings, and both of them pusfue the advantage which the furprize and terror of the enemy mult give them in that critical and decifive moment. The Englin were repulied with great naughter, and driven back to the hill; where being rallied again by the bravery of Harold, they wacre abli, notwithflanding their lofs, to maintain the $\mathrm{p}^{\text {te }}$ and continue the combat. The duke tried the fam firtagem a fecond time with the fame fuccefs; but even after this double advantage, he ftill found a great body of the Englifh, who, maintaining themfelves in firm array, feemed determined to difpute the vistory to the laf extremity. He ordered his heavy-armed infantsy to make the af-
fault upon them; while his arehers, placed bchind, hould gall the eremy, who were expoled by the fituation of the ground, and who were intent in defend. ing themfelves againtt the firords and fpears of the affailants. By this difpofition he at laft prevailed. Harold was flain by an a row, while he was comhating with great bravery at the head of his men. His txo brothers hared the fane fate; and the Englifh, difcomraged by the fall of thefc princes, gave ground on all fides, and were parfued with great naughter by the vict rious Normans. A few troops, however, of the vanyuithed dared ftill to tura upon their purfuers; and taking them in deep and miry ground, obtained fone revenge for the flanghter and difhonour of the day. lut the appeaance of the duke obliged them to feek their fafety by fight, and darknefs faved then from any farther purfuit by the enemy.

Thus was gaiaed by William duke of Normandy, the great and decifive victory of Haftings, after a battle which was fonght from moning till tunfet, and which feemed wouthy, by the heroic feats of valour difplayed by beth armies, and by both commander;, to decide the fate of a mighty kingdum. Willian had thee horfes kilide uncer him: and thete foll near fifteen thoufand men on the fide of the Normans. The lols was alill more contiderable on that of the vanquith. ed; befides the death of the king and his two brothers. The dead body of Harold was brouglit to William, who reftured it without ranforn to his mother.

HASTIVE, a French term, fome:imes ufed in Eneclifl fur early, forward, or fomething that comes before the ordinary time or feafon. The hallive fruits are thrawberries and cherties. We have hathive peas, re.

HAT, a covcring for the head, worn by the men throughout the weltern part of Europe. Hats are faid to have been firlt feen about the year $14=0$, at which time they became of ufe for county wear, riding, \&e. F. Daniel relates, that whe: Charles II. made his public eutry into Rouen, in 1449, he had on a hat linet] wieh red velvet, and furmounted with a plume or tuft of feathers: he adds, that it is from this entry, or at leaft under this reign, that the ufe of hats and caps is to be dated, which henceforward began to take place of the chaperoons and hoods that had been worn before. In the procefs of time, from the laity, the thergy alfo took this part of the hajit ; but it was looked on as a great abufe, and feseral regilations were puhlihed, forbideing any priett or religious perfon to appear abroad in a hat without coronets, and emoining them to keep to the ufe of chaperoons, made of black cloth, with decent coroncts; if they were poor, they were at leaft to have coronets fultened to their hats, and this upon penalty of fufpenfion and excommunication. Indeed the ufe of hats is faid to have been of a longer flanding among the ecclefiallics of Brittany, by two hundred years, and efpecially, among the canons; but thefe were no other than a kind of caps, and from hence arofe the fquare caps worn in collegce, \&c. Lobineau obferves, that a bithop of Dol, in the 12 th century, zealous for good order, allowed the canons alone to wear fuch hats; enjoining, that if any otber perfon come with them to church, divine fervice thould inmediately be fufpended.

## 4- $\mathrm{r}^{-\infty}$

Iftes make a very confiderabie articie in commerce: the finctl, and thefe moft valued, are made of pure hair of an amphibious animal, called the caltor or beaver, frequent in Canada and other prosinces of North America. See Bfayer.

Method of makieg H.its. Hats are made either of wool, or hair of diverfe animals, particularly of the caltor, hate, rabbet, camel, \&c. 'The procefs is much the fame in all ; for which reafon we thall content ourfelves to inflance in that of caftors.

The fin of this animal is covered with two kinds of hair ; the one long, thiff, gloffy, and pretty thin fet; this is what renders the flin or fur of fo much value: the other is thort, thick, and fofe, which alone is ufed in lats.

To tear off one of thefe kinds of hair, and cut the other, the hatters, or rather the women employed for that purpure, matse ufe of two knives, a large one like a thocmaker's knife for the long hair; and a fmaller, not unlike a vine knife, wherewith they flave or ferape off the ftoricr hair.

When the hair is off, they mix the fuff; to one third of dry calior putting two thirds of old coat, i. e. of hair which has been worn fome time by the favages, and card the whole with cards, like thofe ufed in the woollen manufactory, only finer; this done, they weigh it, and take more or lefs according to the lize or thicknefs of the lat intended. The fluff is now laid on the hurdle, which is a fquare table, parallel to the horizon, having longitudinal chinks cut through it; on this hurdk, with an inftrument called a low, much like that of a violin, but larger, whole flring is worked with a little bow flick, and thus made to play on the furs, they fly and mix sogether, the dult and filth at the fame time paffing through the chinks; this they reckon one of the moit difficult operations in the whole, on account of the juftuefs required in the hand to make the fluff fall precifely together, and that it may be every where of the fame thicknefs. In hieu of a bow, fome hatrers make ufe of a fieve or fearce of hair, through which they pafs the fuff.

After this manner they form gores, or two capades, of an oval form, enüng in an acute angle at top; and with what ituff remains, they fupply and Atrengthen them in places where they happen to be flenderer than ordinaty; though it is to be remembered, that they defignedy make them thicker in the brim, near the chown, than toward the circumfercnce, or in the crown itfelf.

The capades thus finifhed, they go on to harden them into clofer and more confitent flakes by preffing down a hardening Rin or leather thereon; this done, they are carried to the bafon, which is a fort of hench with an irun plate fitted therein, arda little fire underneath it; upon which laying one of the hardened ca. pades, Sprinkled over with water, and a fort of mould being applied theion, the lieat of the fire, with the water and prefling, imbody the mater into a night hairy fort of thut or felt; after which, turving up the edges all romid the mould, they lay it by, and thus proceed to the other: this finifhed, the two nest are joined together, fo as to mincet in an angle at the top, and only form oue conical cap, after the manner of a manica Hippociatis, or flaunel bag.

The hat hams bafoned, they remore it to a large kind of receiver or trough, refembling a mill-hopper, going floping or narrowing down from the edge or rim to the bottom, which is a copper kettle filled with water and grounds, kept hot for that purpofe. On the defeent or floping fide, called the phank. the bafoned lat. being firle dipped in the kette, is laid; and hete they procece to work it, by rolling and unrolling it again and again, one part after another, firft with the hand, and then with a little wooden roller, taking care to dip it from time to time, till at length by thus fulling and thickening it four or five hours, it is redaced to the extent or dimenfions of the hat intended. To fecure the hands from being injured by this frequent rolling, \&c. they ufually guard them with a fort of thick gloves.

The hat thus wrought, they proceed to give it the proper form, which is done by laying the conical eap on a wooden block, of the intended fize of the crown of the hat, and thus tying it round with a packthread, called a commander: after which, with a piece of iron, or copper bent for that purpofe, and called a faniper, they gradually beat or drive down the commander all round, till ic has reached the bottom of the block, and thus is the crown formed ; what remains at bottom below the Mring being the brim.

The hat being now fet to dry, they proceed to fiuge it, by holding it over a flarc of traw or the like; then it is pounced, or rubbed over with pumice, to take off the coarfer knap; then rubbed over afref with falfin to lay the knap a little finer; and lafty, carded with a fine card to raife the fine cotton, with which the hat is afterwards to appear.

Thines thus far advanced, the hat is thus fent, upon its block, and tied about with a packthread as before, to be dyed. The dye being completed, the hat is returned to the hatter, who proceeds to dry it, by langing it in the top or roof of a Itove or oven, at the bottom of which is a charcoal fire; when dry, it is to be ftiffened, which is done with melted glue or gum fenegal, applied thereon by firf fmearing it, and beating it over with a brufh, and theis rubbing it with the land. The next thing is to fleam it on the ftcaming bafon, which is a little hearth or fire place, raifed three fett high with an iron-plate laid over it, exactly covering the hearth; on this plate they firft Spread clochs, which being fprinkled over with water to fecure the hat from burning, the hat is placed brim downwards thereon; when moderately hot, the workman Arikes gently on the brim with the flat of his haud, to make the joinings ineorporate and bind fo as not to appear ; turning it from time to time, this way and that way, and at laft overturning and fetting it in the crown. When fleamed futucirutly, and dried, they put it again on the block, and bruth and iron it on a table or bench for the purpofe, called the fall-board; this they perform with a fort of irons like thofe commonly ufed in ironing linen, and heated like them; which being rubbed over and over cach part of the hat, with the affithance of the bruth, finouthes and gives it a glofs, which is the lalt operation; nothing now remaining but to clip the edges evcu with fcifiars, and few a lining to the crown.

Dyeing of Hats. The inftuctions of Mr Colbert direct hats to be firft frongly galled, by boiling them a long time in a decoction of galls with a little log. wood, that the dye nay penetrate the better into their fubitance; after which a proper quantity of vitriol. and decoction of logwood, with a little verdigris, are added, and the hats continued in this mixture alfo for a confiderable time. They are afterwards to be put into a frefh liquor of $\log w o o d$, galls, vitriol. and verdigris; and where the hats are of great price, or of a hair which difficulty takes the dye, the fame procefs is to be repeated a third time. For obtaining the mott perfect colour, the hair or wool is to be dyed blue previoufly to its being formed into hats. - "I'he prefent practice is more compendious, and affords, as we may daily fee, a very good black. According to Dr Lewis, it does not materially differ from that of the Encyclopidie, which is as follows.

An hundred pounds of logwood, 12 pounds of gum, and lix pounds of gralls, are boikd in a proper quav. tity of water for fome hours; after which, about fix pounds of verdigris and ten of green vitriol are added, and the liquor kept juft fimmering, or of a heat a little below boiling. Ten or twelve dozen of hats are immediately put in, each on its block, and kept down by crois bars for about an hour and an half: they are then taken out and aired, and the fame num. ber of others put in their room. The two fets of hats are thus dipped and aired alternately, eight times each; the liquor being refrefhed each time with more of the ingredients, but in lefs quantity than at firt.

This procefs (fays Dr Lewis) affords a very good black on woollen and lilk ftuffs as well as on hats, as we may fee in the fmall pieces of both kinds which are fometimes dyed by the hatters. The workmen lay great Atrefs upon the verdigris, and affirm that they cannot dye a black hat without it : it were to be wifhed that the ule of this ingredient were nore common in the other branches of the back dye ; for the hatters dye, both on filk and woollen, is reckoned a finer black than what is commonly produced by the woollen and tilk dyer.

Hats are allo made for womens wear, not only of the above fluffs, but of chips, Araw, or cauc, by plaiting, and fowing the plaits together; beginning with the centre of the crown, and working round till the whole is finifhed. Hats for the fame purpofe are alfo wove and made of horfe-har, filk, \&e.
$\mathrm{H}_{\mathrm{A}}$ is alfo figuratively ufed for the dignity of care dinal, or a promotion to that dignity. In this fenfthey fay, " to expect the hat; to claim, or have pretenfions to, the hat," \&c.

Pope Innocent IV. firt made the hat the fymbol ar cognizance of the cardinals, enjoining them to wear a red hat at the ceremonies and proceffions, in token of their being ready to fill their blood for Jefus Chrilt.

HATCH, or Hatchway, a fquare or oblong opening in the Deek of a thip, of which there are feveral, forming the paffages from one deck to another, and into the hold or lower apartments. See Plate CLVI. where A reprefents the main-hatchway of the lower deck; NN the forelatchway; and OO the after-hatchuay.-There are likewife hatches of a finaller kind, called fouthes. See UU in the fame tigure; as alfo the article Scutrle.- Hatches is alfo, though

Vol. VIII. Part I.
improperly, a name applied by failors to the covers or lids of the hatchway.

HATCHEL, or Hitchel, in the manufactory of flax, hemp, \&c. a tool, not unlike a card, for drefing and combing them into fine hairs.

They confilt of tharp-pointed iron pins, or teeth, fet orderly in a board.

Of thefe there are feveral forts, fome with finer and thorter tecth, others with thern coarfer and longer.

HATCHES, in mimng, a term ufed in Cornwal, to exprefs any of the openings of the earth either into mines or in fearch of them. The fruithefs openings are cal'ed eflay buthes; the real mouths of the veino, tin harches; and the places where they wind up the buckets of ore, wind basches.

Hatches allo denote fleod-gates fet in a river, Sc. to flop the current of the water, particularly certain dams or mounds made of rubbifh, clay, or earth, to prevent the water that iffues from the itream-works and tin-wafhes in Comwal from ranning into the freth rivers.

HATCHET, a fmall light fort of an axe, with a baliledre on its left fide, and a thert handle, as being to be ufed with one hand. - Hatchets are ufed by various artificers, and more particularly in hewing of wood.

HATCIIING, the maturating fecundated eggs, whether by the incubation and warmeh of the parent bird, or by artificial heat, fo as to produce jomms chickens alive.

The art of hatching chickens by means of ovens has long been practifed in Egypt ; but it is there only known to the inhabitants of a tingle village named Berme, and to thofe that live at a fmatl dittance from it. Towards the beginning of autumn they fatter themfelves all over the country; where cach perfon among them is ready to undertake the managereent of an oven, each of which is of a different fize; hut, in general, they are capable of containing from forty to fourficore thouland egers. The number of thefe ovens placed up and down the country is about $3 S G$, and they ufualty keep them working for about fix months: as, therefore, each brood takes up, in an oven, as under a hen, onty 21 days, it is eafy in every one of them to hatch eight different broods of chickens. Every Bermean is under the obligation of delivering to the perfon who intrults him with an oven, only two-thirds of as many chickens as there have been eges put urder his care; and he is a gainer by this burgain, as more than two-thirds of the esges ufually produce chickens. In order to make a calculation of the number of chickens yearly fo hatched in Egypt, it has been fuppofed that only two-thirds of the eges are latched, and that each brood confifts of at leait 30.000 chickens; and thus it would appear, that the ovens of Egrpt give life yearly to at leafl $22,6,0,000$ of thefe anmals.
'lhis ufeful and adrantageous nethod of hatching eggs has been lately difcovered in lrance by the ingenious Mr Reaumur; who, by a number of experiments, has reduced the art to certain principles. He found by experience, that the heat neceffary for this purpofe is nearly the fame with that marked 32 on his thermometer, or that marked 96 on Fahrenheit's. This degree of heat is uearly that of the tkin of the hen, and, what is'remarkable, of the nkin of all other domedic
' 1
fowls,

Hatche: II $\underbrace{\text { Ha:ching. }}$

Heicutag. fowls, and probably of all other kinds of hirds. The degree of heat which brings about the developement of the cygnet, the gonling, and the tukey-pout, is the fane as that which fits for hatching the canary fongfier, and, in all probability, the fmalle hummingbird: the diference is only in the time during which this leat ought to be communicated to the eggs of different birds; it will bring the canary bird to perfection in 11 or 12 days, while the turkey pont will require 27 or 28.

After many experiments, Mr Reamur found, that floves heated by means of a baker's oven, facceeded better than thofe made hot by ldyers of dung: and the furnaces of glafs-houles and thofe of the melters of metals, by means of pipes to convey heat into a room, might, no doubt, be made to anfwer the fame purpofe. As to the form of thefloves, no great nicety is required. A chamber over an oven will do very well. Nothing more will be necellary but to afeertain the degree of heat; which may be done by melting a lump of butter of the fize of a walnut, with half as much tallow, and putting it into a phial. This will ferve to indicate the heat with fufficient exactnefs: for when it is too great, this mixture will become as liquid as oil ; and when the heat is too fmall, it will remain fixed in a lump: but it will How like a thick fyrup, upon inclining the bottle, if the dove be of a right temper. Great attention lherefore mould be given to keep the heat always at this degree, by letting in fref air if it be too great, or fhutting the gove more clofe if it be too fmall: and that all the egrs in the ftove may equally fhare the irregularities of the heat, it will be neceffary to fhift them from the fides to the centre; and thus to imitate the hens, who are frequently feen to make ufe of their bills, to puh to the outer parts thofe eggs that were nearell to the middle of their nefts, and to bring into the middle fuch as lay neareft the fides.

Mr Reamur has invented a fort of low boxes, without bottoms, and lined with furs. Thefe, which he calls artificial parents, not only melter the chickens from the injuries of the air, but afford a kindly warmth, fo that they prefently take the benefit of their fhelter as readily as they would have done under the wings of a hen. After hatching, it will be neceffary to keep the chickens, for fome time, in a room artfully heatfd and furnifhed with thefe boxes; but afterwards they may be fafely expofed to the air in the court-yard, in which it may not be amifs to place one of thefe artif. cial parents to fhelter them if there fhould be occafion for it.

As to the manner of feeding the young brood, they are generally a whole day after being hatched, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, after which they will begin to pick up infects and grafs for themfelves.

But to fave the trouble of attending them, capons may be taught to watcl them in the fame manner as hens do. Mr Reaumur affures, that lee has feen above 200 chickens at once, all led about and defended on. ly by three or four fuch capons. Nay, cocks may be taught to perform the fame office; which they, as well as the capons, will continue to do all their lives afier.

Hatchinc, or Hachinc, in defigning, Eec. the
making of lines with a pen, pencil, graver, or the like; : Aathm and the interfecting or going acrofs thofe lines with othets drawn a contrary way, is called counter batching. The depths and thadows of draughts are ufually formed by hatching.

Hatching is of fingular ufe in heraldry, to ditinguifh the feveral colonrs of a fhield. without being illomined: thus, gules or red is hatched by lines drawn from the top to the bottom; azure, by lines drawn acrols the thield ; and fo of other colours.

Hit TCHMENT, in heraldry, the coat-of-arms of a perfon dead, uftrally placed on the front of a houfe, whereby may be known what rank the deceafed perfon was of when living : the whole dittinguifhed in fucla a manner as to enable the beholder to know whether he was a bachelor, married man, or widower; with the like diftinctions for women.

Bifloop's Hattifen, a town of Hartfordhire in the great coach-roal to the north, 19 miles from London. It was called Bifhops. Hatfield, becaufe it did be. long to the BiMops of Ely. Theodore archbithop of Canterbory held a fynod here, anno 681, againtt the Entychean herefy. Here was once a royal palace, from whence both Edward VI. and Queen Elizabeth were conducted to the throne. King James I. exchanged the manor with Sir Robere Cecil, after,sards earl of Sa. litbury, for Theobald's, in the parith of Chemunt in this connty; and the lordmip fill remains in that noble family, who have a very tine feat here. The rectory, which is in that earl's gift, is reckoned worth 802 pounds a-jear. Here are two charity fchools; and there is a market on Thurfdays, with two fairs in A pril and October.

HATFIELD and Chace, a town in the welt riding of Yorkfhire, four miles from Doncafter. The chace is famous for deer-hunting. There are many intrenchments near the town, as if it had been the camp of fome great army. It is faid that no rats were ever feen in this town.

Hateleld-broad-oak, or King's Hufful, a town of Eflex in England, feated on a branch of the river Lea, 30 miles from London, is fo called from the nature of the foil, from its tenure by king William the Conqueror and his fucceffors, and from a broad oak growing in the town. It has a market on Saturdays, and a fair in Augult.

H:iTTEM, a town of the United Provinces, in the duchy of Gueldetiand, feated on the river Uffol, in $\mathbf{E}$. Long. 6. o. N. Lat. 53. 30.

HA I TEMISTS, in ecelefaltical hitory, the name of a modern Dutch fect, fo called from Pontian Van Hattem, a miniller in the province of Zealand, towards the clofe of the latt century, who being addicted to the ientiments of Spinoza, was on that account degraded from his paltoral office. The Verfehorifts and Hattemilts refemble each other in their religious 1 y ftems, though they never fo entirely agreed as to form one communion. The founders of thefe fects deduced from the doctrine of abfolute decrees a fyftem of fatal and uncontrollable neceffity; they denied the difference between moral good and evil, and the corruption of human nature: from hence they farthor concluded, that mankind wero under no fort of obligation to correct their manners, to improve their minds, or to obey the divine laws; that the whole of religion confifted
not in aeting, but in fuffering; and that all the precepts of Jefus Chrilt are reducible to this one, that we bear with cheerfulnefs and patience the events that happen to us through the divine will, and make it our conflant and only flucy to maintain a permanent tran. quillity of mind. Thus far they agreed; but the Hattemills farther affirmed, that Clurit made no expiation for the fins of men by his death, but had only fuggened to us by his mediation, that there was nothing in us that could offend'the Deity ; this, they fay, was Chritt's manmer of jullifying his fervants, and prefenting thens blamelefs before the tritunal of God. It was one of their diftinguifhed tenets, that God does not punifh men for their lins, but by their fins. Thefe two feets, fays Molheim, itill fubfilt, though they no longer bear the names of their founders.

HATTOCK, a hock of corn containing twelve Sheaves; others make it only three fheaves laid together.

HATUAN, a town and fort of Upper Hungary, in the county of Novigrod. It was taken by the Imperialifts in 1685 . It is feated on a mountain, in E. Long. 19. 48. N. Lat. 47. 52.

HAVANNA, a fea-port town of America, in the ifland of Cuba, and on the north-weft part of it, oppofite to Flurida. It is famous fur its harbour, which is in every refpect one of the beft in the Weft Indies, and perhaps in the world. It is entered by a narrow palfage, upwards of balf a mile in length, which afterwards expands into a large bafon, forming three Cul de Sacs, and is fufficient, in extent and depth, to contain 1000 fill of the largelt hips, having almont throughout fix fathom water, and being perfetty covered from every wind. The town was built by Diego de Velafqucz, who conquered the ifland of Cuba. It was but a fuall place, and named originally the port of Carenas; but afterwards, when the city by its increafe of wealth grew confiderable, it was called St Chrifo. pher of the Havenna. In 1536, it was of fo inconfiderable a value, that being taken by a French pirate, he ranform the place for the paltry fum of 700 pieces of eight. Some time after it was taken by the Englift, and a fecond time by the Frencb: nor was its value underitood, or any care taken to put it in a pofture of defence, till the reign of Philip If.; though what was then done proved infufficient. But fince the acceffion of a branch of the Houfe of Bourbon to the Spanifh crown, nore pains have been taken to render it a place of f rength.

The Havanna flands on the weff fide of the harbour, in a pleafant plain; and is the refidence of the governor and captain general of Cuba, and of the royal off. cers, as well as of an affeffor for the aflitance of the governor and captain-general of the Weft Indies. The biflop of St Jago de Cuba likewife choofes to fix his refidence here. The buildings are elegant, built of flone, and fome of them moft fuperbly furnifhed. Here are eleven churches and monafteries, and two handfome hofpitals. Near the middle of the town is a fpacious fquare, furrounded with uniform buildings. The churches are rich and magnificent; the lamps, candlellicks, and ornaments for the altars being of gold and filver; fome of the lamps are of the moft curious workmanfhip, and weigh near 100 weight. The Recollects church, which ftands on the beft ground in
the city, has 12 beautioul chapels in it, and in the mo. naftery are cells for 50 fathers. The church of St Clara lias feven altars adorned with plate, and the nunnery contains 100 women and fervants, all clothed in blue. 'The elurch belonging to the Augultines has 13 altars; that of St Juan de Dios 9, with an hofpital for fuldiers of $12,0 c 0$ pieces of eight revenue. It is not a bilhop' fee, though the bifhop of St Jago refides here, the revenue of whleh prelate is not lefs than 50,000 pieces of cight a-year. In 1700 the inhabitants were computed at 26,000 , and we may very well imagine them to be increafed fince. They are a more polite and focial people than the inhabitants of any of the Spanith ports on the continent ; and of late imitate the French both in theit drefs and manners. The city is fupplied with water by a fmall river called Lagida, which rifes fiom the hills on the fouth-welt fide of the town, and divides itfelf into three ftieams, one of which falls into the fea on the eaft fide of the town, but the other two flow through the place, entering the walls near the middle of the city.

As to the fortificaiions, it was already remarked, that the entrance to the harbuur is by a nartow gut near half a mile in length: this paffage is defended on the eall fide by a flrong caltle called EI Mforo, fituated on a ligh rock; and on the walls and battions are mounted 40 pieces of cannon. Under the faces of the fouth-welt baltion of the Moro, and morc within the entrance of the harbour, is a battery of ftone called the Truelve fipofles, almolt level with the water, and the guns of which carry each a ball of 36 pounds. A little higher, and oppofite to the Point gate, is the La Divina Pallura, or the Shepherd's Battery, of 14 guns, level with the water. On the weit fide of the entrance, at the point, is a fquare fort called the Pianta, with four baltions well monnted with cannon, about 200 yards diftant from the Punta gate of the town. On the battions of the town, next the harboar, are a number of cannon; and about the middle of the coty is another fort, called El Fucrte, a fquare furt with four baltions, mounted with 22 picces of cannon, of no great trength; but in this laft the governor retides, and in the king of Spain's treafures are depofited till the arrival of the galleuns. On the land- $\sqrt{3}$ de, from the Punta gate to the duck.yard, there is a rampart with baltions, faced with tone, and carthen parapets with a ditch, which in feveral places has fallen in, and is almort filled up, particularly behind the Punta and land gates, near the ftone quarries, which, if joined to one another, might be of great detriment to the place in cafe of a fiege, as a lodjement might be made in them. The ground here rifes with an eafy afcent to the land-gate; and is either open pafture or garden ground, well fored with the cabbage-tree. Before the land-zate is a ravelin. 'The hillon a rifing ground from this gate (which is the highett part of the town) to the dockyard, is ftecper than on the other fide.

Such are the fortifications of the Haranma, which are the bell the Spaniards have in the Welt Indies, as indeed the place is of the greatef importance. Bet though Arong, they have many defects, and from the fituation of the town and forts, are commanded by many eminences, of which an enemy could not fail to take advantage. On the eaft fide of the harbour, the Cavanuas, on a part of which the Moro is built,

Hevanta. commands in a creat mealure that fort, but abfolutely commands the Punta. El Fuerte, and whole north eat part of the city, which is the bett fortified. On the whel fide of the city runs a fabub, called Giambaiouf, whufe church is fituated on an emimence about halt a srite from the hand-gate, which it is on a level with, and higher than any other pat of the fortiliations. I'rom the north fide of this rifine ground, the Panta gate may be Hanked; and from the loutherall li.le the dock-yard is commanded. Along the nonth tide runs an aqueduct, which falliag into the ditch at the land. gate, runs down to the dock-yard, both for watering the hips and urning a faw-mill. About half a mile from the charch, is a bridge made oxer a moukt that runs into the bay about 100 yards. That road leads to the centre of the illand, and extends to Baracoa, above Goo miles ditant. From this bridge to the Lazaretto, is about two miles, with a rifing ground betwixt them. A trench thrown up between thefe two places would cut off the communication with the town by land. From thefe oberrvations it will plainly appear, that the Havanna, though well fortified, is not impregnable.

The Havanna has greatly contributed to the maritime ftrength of the crown of Spain, many thips having been buil here within thefe few years, from 60 1080 guns, the inand furnithing the finet materials, fuch as oak, pine, codar, and naloogany. 'The only defect of the harbutr is the narmownefs of its entry: jor though free from bars and thoals, yet only one mip at a time can enter it ; from which circumbance the galleons have more than once been infulted, and fome of then taken, at the month of the harbour, the forts there not being able to afford them any affillance.

Upon the rupture with Spain in 1762 , the Britim minitery feat a fquadron and army ardint this place under the command of admiral Pucock and lord Albemarle. The Spaniards hat in the harhour at the time a flect of twelve fail of the line, two of them but jutt launched, two more on the llocks nearly finibed, and feveral merchant hips. 'The men of war were almott ready for fea; bust no account had reached the governor of the intemded attack. The place, however, was gallantly defeuded, and futtanced a liege of two months and eight davs before it could be reduced; when a capitulation was figned, and alongtt with the city was gielded a dikrict of 180 miles to the weftward. 'This conquelt was without doubt in itfelf the moll comberable, and in its confequences the moft decilise, of any we had made fince the beginning of the war; and in no operation were the courage, feadinefs, and perfeyerance of the Britifh troops, and the conduct of their leaders, more confpicuous. The acquifition of this place united in itfelf all the advantages which can be acquired in war. It was a military atchievement of the higheit chafs. By its effect on the enemy's marine it was equal to the greateft naval victory, and in the plunder it equalled the produce of a national fublidy. Nine fail of the enemy's line-ol-battle hips were taken; three of their capital hips had been funk loy themfllves at the begimning of the flege; two more were in furwardnefs upon the llocks, and ware afterwards deftroyed by the captors. 'Ilie enemy on this occafion luft a whole fteet of hips of war, betides a number of confiderable merchant thips; and in ready
money, in tobacco colleeted at the Havanman account of the king of Spain, and in other vabubie mechandizes, the fum lut by the enemy perhaps did not fall thort of three milhions ferting.

The city of Havana was retored by the peace of $1-63$; and is of the greatat importance to Spain, being the remacovous for all then hects to retarn from America to Ewope, lying at the mouth of the gulph of Flurida, through which they are all obliged to pals. Here the navy of Spais hationed in the Weat Iudies ride; and here the galleons, the fota, and other merchant thips from otlier ports both of the eontinent and iflands, meet in Septenber, to take in provifions and water, with gleat part of their lading, and for the convenience of ecturning iospain in a bajy. A continual fair is hede till their departure, which generally happens before the end of the month, when proclama-
tion is made, forbidding any perfon betonging to the happens before the end of the month, when proclama-
tion is made, forbidding any perfon belonging to the fleet to Atay in town on pain of death; and accordingly, on firing the warning gun, they all retire on board.on firing the warning gun, they all retire on board.-
The commerce carried on in this port, which is very confiderable, may be ditinguithed into the particular commerce of the inand of Cubs, and that more general by the galloons and flota. The former contitts in hides, ufually thyled of the Havana, which are excellent, and of great value ; jugar, tubseco, admirable in its kind, \&x. Though frangers are prohibited to trade, yet a contraband commerce is carried un brikker trade, yet a contraband commerce is carried un briker
here than at La Vua Cruz. Some litte trade is carried on by other ports of Cuba, but it is very inconfiderable. As to the general commerce, this port is the place of rendezrons (as already mentioned) for all flips, particularly from Carthagena, Pueroo Valo, and La Vera Cruz, which return to Spain from the Indies. The Havanna is regularly fupplied with European goods only by the regite flaips fron Cadiz and the Canaries. The flota and gatleons brigg there no more
than the refufe of their cargoes, which they had not Canartes. The flota and galleons bring there no more
than the refufe of their cargoes, which they had not been able to difnofe of at Carthagena, Puerto Velo, or La Vera Cruz. When the fleet is in the harbour, provifions are exceffively dear on thore, and money fo plenty, that a Spaniard expects half a piece of eight aday from a male flave, and a quarter from a female, out of what they carn for their labour. The fleet geout of what they carn for their labour. The fleet ge-
nerally fails from thence, through the channel of Bahama, in the month of September; and is the sichelt in the world: fince, in fiter and merchandife, there
is fetdom lefs than thirty millions of pieces of eight on in the world; fince, in fibver and merchandife, there
is feddom lefs than thirty millions of pieces of eight on board, or fix millions feven humered and fifty thoufand pounds of our money. - It is naturd to imagine, that a port of in much confequence as the Havana ought to be well fortitied. Since it has been reltored to Spain, many new works lave been added, to preventif pofible a fimilar difater befalling it. W. Long. 82. 13. N. Lat. 23.12.

HAVEL, a river of Erandenburg, which proceeds from a lake in the duchy of Mecklenburg, and running
thro' the middle Marche, and thro' Brandenburg and from a lake in the duchy of Mecklenburg, and running
thro' the middle Marche, and thro' Brandenburg and other towns, runs north, and "alls into the Elbe.

HAVELBERG, a town of Germany, in the circle of Lower Saxony, and in the electorate of Brandenburg, with a bilhop's fee, fecularized in favour of the houle of Brandenburg. It isfeated on the river Havel, in E. Lone. 12. 43 . N. Lat. $53 \cdot 4$.

HAVEN, a fea-pst or harbour for fips. See

$\qquad$
$\qquad$

Port and Harbour. - The word is derived frem the Saxon havene, or the Gurman bufcn, or the Freneh baver; which all fignify the fame thing.

HAVERCAMP (Siribat), a celebrated Dutch fcholas and critic, profeflor of history, cloquence, and the Greek tongue, at Leyden. He was particularly fikilled in medals; and was the anthor of fonme ctecemed works in that way, befide giving good and clegant critions of feveral Greek and Latin authors. He died at Leyden in 1742, aged 58 .

HAVERFORD-west, a town of Penbrokeflire in South Wakes, feated in W. Long. 5. N Lat. 51.50. It is a neat, well built, popubus place, on the lide of a hill, which forms a part of the weit bank of the river Dongledye, 256 miles from London. It is an incorperated town and county of itflf, governed by a mayor, fheriff, town-clerk, two bailiffs, ferjeants at mace, and other officers. The mayor of the town is admiral, coroner, efcleater, and clerk of the markets, within its precincts. The houfes are well built and well inhabited, and the people enjoy a grood trade. Here the affizes are held and the county jail kept. The town enjoys feveral privileges, and has its own courts. There are three parih-churches within the town, and one in the fuburbs. Here is alfo a commodious quay for hips of burden, a cuttomhoufe, and a fine ftone bridge over the Dongledye, with a good free-fchool, a charity-fchool for boys and girls, and an alouhoufe. It was formerly fortified with a tampart and cafte, now denoliflud.

HAVERILL, a town if England, in the county of Suffolk, where there is a conliderable manufactury of checks, cottons, and fultains. By the ruins of a church and cafte ftill to be feen, it appears to have been formerly a place of mush greater confequence than at prefent. It has now only about 300 poor clayhoufes, and one wide itreet not paved.

HAUL, an expreftion peculiar to feamen, implying to pull a fingle rope, without the affitance of blocks or other fuch mechanical powers. When a rope is otherwife pulled, as by the application of tackles, or the connedion with blocks, \&c. the tern is changed into borvfing.

To Have the Wind, is to direct the fhip's courfe nearer to that point of the compafs foom which the wind arifes. 'I'hus, fuppofing a hip to fail fouthweft, with the wind nortierly, and fome particular occafion requires to haul the wind more wellward; to perform this operation, it is neceflary to arrange the fails more obliquely with her keel; to brace the jards more forward, by fackening the Itar'ooard and pulling in the larboard braces, and to haul the lower fheets further aft; and, finally, to put the helm a.port, i.e. over to the larboard fide of the veffel. As foon as her head is turned directly to the wellward, and her fails are trimmed accordingly, the is faid to have hauled the wind four points; that is to fay, from fouth-wet to welt. She may fill go two points nearer to the direction of the wind, by difpofing her fails according to their greatell obliquity, or, in the fea phrafe, by trinming all flazep; and in this fituation fhe is faid to be clofe hauled, as failing welt-north-wett.
HAUM, Halm, or Hozum, among farmers, denotes the Atcm or Italk of corn, peafe, beaus, そic. from the poot to the ear.

- HAUNCH, or Hasch, the His, or that part of Hzunet the bolly between tlic lat tibs and the thigh.

The haunches of a larfe are too long, if when fanding in the thable he limps, with his hind fegs farther back than be olight; and when the top or onfet of his tall is not in a perpendicular line to the tip of his hocks, as it always does in horfes whof haunches are of a junt leugth. 'Illoure atre fome hoifes which though they have too lone lanm:thes, yet commonly walk well: fuch are goon to climb hinks, bat are not at all fure upon a defeent; for they canoot ply their hams, and nower gallop fowly, but tways nealy upon a full fiped. The and of riding the great horie has not a more neceflary hfon then that of puting a hinife upon bis haunches; which, in other woids, is called. couthing him auedl. or putting him wall togetner, of compack. A borfe that cannot bend or lower his haunches, throws himfelf too much upon his thouter, and lies heavy upon the bridle:。

HAVRE, in gengraphy, \&c. a French term fignifying the fame with haven or harbur.

Havere de Grace, a fea port town of France, and capital of a ditrick of the fune name, is feated in the province of Normanty, on the Eurlith Chamel, in a large plain at the mouth of the river 'sine. It is a fmall fortified town, neally of a fquare figure, divided into two parts by the harbour, furrounded with a wall and other works, and defended by a very ftrong citadel. It is one of the mofl important places in France, on account of its foreign trade and convenient harbour ; for which reafon it was made a dittinet government from the rell of Normandy. It was furprifed in 1562 by the Protellants, who deliucred it to queen Elizabeth; but it was lott next year. In 169+ it was bumbarded by the Englith, and alio in the year 1758. E. Long. O. 11. N. Lat. 49. 29.

HAURLANT, in heraldy, a term peculiar to finhes; and hignifies their thanding upright, as if they were refrefling themfelves by fueking in the air.
HAUTE FEUILLE (John), an ingenious mechanic, burn at Orleans in 1647 . Thungh he embracedthe ftate of aneceldialic, and eajuyed feveral benetices, he applied almof his whole life to mechanies, in which he made a grat progrefs. He had a particular talle for elock work, and made feveral difeoveries in it that were of fingular ufe. It was he who found out the fecret of moderating the vibration of the balance by means of a fmall Atcl foring, which has lince been made ufe of. This difcovery he laid before the mem. bers of the Academy of Sciences in 1674 ; and thefe watches are, by way of eminence, called pendulumweatches; not that they have real pendulums, but becaule they nearly approach to the jullucts of pendulums. Ni. Huygens perfected this happy invention; but having declared himfelf the inventor, and obtained from Louis XIV. a patent for making watches with foiral fprings, the abbe Fcuille oppofed the regitering of this privilege, and publuthed a piece on the fubject againt M. Huygens. He wrote a great number of other pieces, moll of which are fmall pamphlets confifting of a few pages, but very curious; as, 1. His perpetual pendulum, quarto. 2. New inventions, quarto. 3. The art of breathing under water, and the means of proferving a flame thut up in a fmall place. 4. Retlections on machines for raling water..

1:sution 5. His opidien on the different fentiments of Mallemoon when feen in the horizon. 6. 'The magnetic
belance. 7 . A places to the king on the longitude. 8. Letter on the fecret of the longitude. 9. A new fyllom on the flux and reflux of the fea. ro. The means of araking lenfible exporiments that prove the rotion of the earth ; and many other picces. He disd in 172.

HAUTBOY, a mufa al inftrment of the wind kind, flapted mach lohe the lute ; only that it fpreads and widens rowards the hotom, and is funsded alarongh a reed. 'Ilee treble is two feet long; the tenor goes a fifth ICwer when blown open: it has only cight looles; but the bafs, which so five feet long, has cleven.
"Ille wond is French, bath his, 4. d. " ligh wood:" and is given to this inftrument becaufe the tone of it is higher than that of the riolin.

HAW a for: of berry, the fruit of feveral fpecies of mespilus, thence denominated lavothorns. Ste Meispleve.

Han, among farriers, an excrefence tefembling a grille, growing under the nether tye-lid and eye of a lorfe, which, if not simely renoved, will put it quite cut. Sce larraery, Sect xr. 4.

Hav, a fmall parcel of land to called in Kent, as a Mompluw, or Beconbazu, lying near the houfe, and incluitd for thefe ufes. But Sir Edward Coke, in an ancielst plea concerning Fevertham in Kent, fays bawis are houfes.

Musr Jïnh. See Loxia.
HAWGH, or Howgh, fignifies a green plot in a walley as they ufe it in the north of England.

HAWK, in ornithology. See Faico.
IfAWKERS, anciently wre fraudulent perfons, nlw went from place to place buying and felling brafs, fenter, and other merchandize, which ought to be uticred in open market. In this fenfe the word is mentioned amo 25 Hen. VllI. cap. 6. and 33 ejujdem, cap. \&. The appellation bawkers feems to have arifen from their uncertain wandering, like thofe who, with hawks, leek their game where they can find it.
'lhe term is now ufed as fynonymous with pedlar ; a perfon who travels about the cowntry felling wares. IVyry lawker muit take out an annual licence, for which he muft pay 4 l. and if he thavels with a horfe, afs, or mule, for every one of them 8 l . If he travels without a licence, or contrary to it, he forfeits for every affence to the informer, and the poor of the fanim who difcovered, idl. The acts relating to baxkers do not extend to makers of goods or their agents; or to thofe who fell gonds in fairs or markets; to the fellers of fin, fruit, or other victuals; nor to the venders of books and newfpapers, 9 and 10 W . cap. 27. 3 and 4 Anne, cap. 4. But hawkers hall not, by vitue of fuch licence, fell or offer to fale any tea or fibituons liysors, though with a permit, under the penalty of having the fame feized, and imprifonment and profecution of the offender. 9 Geo. II.cap. 35 . Hankers who were licenfed on June 23.1785 may fet up any bufinefs in the place where they are refident inhabitants, thongh not brought up thereto, and may employ thesein perfons who have not been apprentices.

Hawsers is a term alfo applied to thofe who go up Hawkes and down London frects aad country towns, felling newipapers pamplatets, Sic.

HAWKESWORTH (John), a celebrated Faglimuriter, was horn about the sear 1719: though his epitaph, as we find it in the Gentleman's Magazine for Aug. 1785, makes him to have been born in 1715. He was brought up to a mechanical profffion, that of a watchmaker as is fuppoied. He was of the Prefbyterian perfuation, and a member of the celehrated 'rom Bradbury's meeting, from which he was expelled for fome irregularities. He afterwards devoted himfelf to literature, and became an author of confiderable eminence. In the cally part of life his circumftances were rathen contined. He relided feme time at Bromley in Kent, where his wife kept a buarding fehool. He alterwards becane known to a lady who had great property and intereft in the Eaft India company, and thwugh her means was chelen a dircetor of that body. As an anthor, his Adventurer is his capital work; the nuctits of which, if we millake not, procured him the degree ui LL.D. from Herring archbifhop of Canterbury. When the delign of compiling a narrative of the difcoveries in the South Seas was on foot, he was recommended as a pruper perfoe to be employed on the occalion: but in truth he was not a proper petfon, nor did the performance anfwer expectation. Works of tatte and chgance, where imagination and the pafhons were to be affected, were his provinee; not woiks of dry, cold, accurate narrative. However, he executed his tatk, and is faid to have received for it the enormous fum of 6000 . He died in 7773 ; fome lay of high living ; others, of chagrin from the ill reception of his Narrative: for he was a man of the keenet fenfibility, and obnoxious to all the evils of fuch irritable natures. On a handfome marble monument at Bromley in Kent is the following infeription, the latter patt of which is taken from the laft number of The Adventurer:

## To the memory of

JOHN HAWKESWORTH, LL.D.
Who died the 16 h of November mocelxxar, aged 58 years.
That he lived ornamental and uleful
To fociety in an eminent degree Was among the boalted felicities Of the prefent age;
That he laboured for the benefit of fociety, Let his own pathetic admonitions

Record and realize.
"The hour is hatting, in which whatever praife " or cenfure I have acquired will be remembered
"s with equal indifference. Time, who is impatient
" to date my laf paper, will fhortly moulder the
" hand which is now writing it in the duft, and ftill
"6 the breaft that now throhs at the reflection. But
" let not this be read as fomething that relates
" only to another; for a few years only can divide
"the eye that is now reajing from the hand that
"has written."
HAWKING, the exercife of taking wild-fowl by means of hawks. The method of reclaiming, man. ning, and bringing up a hawk to this exercife, is called falconry. Sec Fazcons\%.

## H A W

king. There are only two countries in the wolld where we have any evidence that the exercife of hawhing was very anciently in vogue. Thefe are, Thrace and Britain. In the former, it was purfued mercly as the diverfion of a patticular diftriet, if we may believe
:8. Pliny*, whofe account is rendered obfcure by the darknefs of his own ideas of the matter. The primaval Brituns, with a fondnefs for the exercife of hunting, had alfo a tafte for that of hawking; and every chief among them maintained a confiderable umaber of birds for that fport. It appears alfo from a

1. I. p curious paflage in the poems of Offant, that the fame diverfion was fohionabte at a very eanly period in Scotand. The poet tells us, that a peace was endeavoured to be gained by the proffer of 100 managed fleedz, roo foreign captives, and " 100 hawks with fluttering wings, that fly acrofs the fly." To the Romana this diverfion was fearce known in the days of Vefpafian; yet it was introduced immediately afterwards. Mot probally they adopted it from the Britons; but we certainly know that they greatly improved it by the introduction of fpanicls into the ifland. In this ftate it appears among the Roman Britons in the fisth century. Gildas, in a remarkable paffage in his firf epille, fpeaks of Maglocunus, on his relinquifhing the fiphere of ambition, and taking refuge in a monattery ; and provertially compares hin to a dove, that haftens away at the noify approach of the dogs, and with varions tu:ns and windings takes her flight fiom the talons of the hawk.

In after times, haw king was the principal amufement of the Euglifh: a perfon of rank fearce firred out without his hawk on his hand; which, in old paint-

- Brit. ings, is the criterion of nobility. Harcld, afterwards
:axion. king of England, when be went on a molt ingrortant embaffy into Normandy, is painted en.barking with a bird on his fift, and a dog under his arm: and in an ancient picture of the nuptials of Heary VI. a nobleman is reprefented in much the fame manner; for in thofe days, it suas thousht fufficient for noblimun to winde their born, and to carry their bawd fuir, and leave fuly and learning to the children of mean people. The furmer were the accomplifhents of the times; Spenfer makes his gallant Sir Triftram boat,
Ne i- there hawk which mantech her on pearch, Whether high tow rint, or accoanning low,
But the neature of her flishe de fearch, And all her pres, and ald her diet know. B. vi. Canto 2.
In fhort, this diverfion was, among the old Englifh, the pride of the rich, and the privilege of the poor; no rank of men feems to have been excluded the amufement : we learn from rle book of St Alban's, that every degree had its peculiar hawk, from the emperor down to the boly-watir cherk. Vall was the expence that fometimes attended this fport. In the reign of James 1. Sir Thomas Monfon is faid to have given 1000 . for a caft of hawks: we are not then to wonder at the rigour of the laws that tended to preferve a pleafure that was earried to fuch an exiravagant pitch. In the $34^{\text {ch }}$ of Edward III. it was made felony to fleal a hawk; to take its eggs, even in a perfon's own ground, was punifhable with imprifonment for a year and a day, befides a fine at the king's pleafure: in queen Elizabeth's reign, the imprifonment was reduced to three months; but the offender was to
find fecurity for his good behaviour for fiven years, os lie in prifon till he did. Such was the enviable itate of the times of o.ld England; during the whole day, the gentry were given to the fowls of the air and the bealts of the field; in the evening, they eclebrated their exploits with the moft abandoned and brmin futionnefs; at the fame tome, the inferior rank of poople, by the moil unjutt and arbitrary laws, were liable to capital punifhments, to fines, and lof of liberty, for deftroying the moft noxious of the fathered tribe.

According to Olearius, the diverfion of hawking is more followed by the 'lattars and Perfians than ever it was in any part of Europe. Il n'y avoit puint do butle (fays he) qui n'cuifl fon aigle ou fon faucon.

The falcons or lawks that were in ufe in thefe kingdoms, are now found to breed in Wales, and in North Britain and its ifles. The peregrine falcon inhabits the rocks of Caemarvonhthire. The fame (pecien, with the gy rfalcon, the gerith, and the gofhawk, are found in Scotland, and the lanner in Irctand.

We may here take notice, that the Norwegian breed was, in old times, in high efteem in Eugland: the were thought bribes worthy a king. Jcolfrey Ficz Mr-hdxaco pierre gave two good Norway hawks to king J.hn, to uquif. Exobtain for his friend the liberty of exporting 100 wt . chequer, !. of cheefe; and Nicholas the Dane was to give the +69. king a hawk every time he came into England, that he might have free liberty to traffic throughout the king's dominions.

They were alfo made the tenures that fome of the $B^{\prime}$ unt's $A n$ ce nobilty held their eftates by, from the crown. Thus Tenures, って. Sir Jolun Stanley had a grant of the Ille of Man from Henry IV. to be held of the king, his heirs, and fucceflors, by homage and the fervice of two falcons, payable on the day of his or thenr coronation. And Plitip de Haftang lield his manor of Combertoun in Cambridgethire, by the fervice of keeping the king's falcons.

Hewking, though an exercife now muc! difufed among us, in comparifon of what it anciently was, does yet furnifh a great varicty of lignificant terms, which fill obtain in our language. Thus, the parts of a hawk have their proper names. - The legs, from the thigh to the foot, are called armas; the tors, the perty) fingles; the claws, the founces. - The wings ate called the foils; the long teathers the reof, the leems; the two longett, the principal forthers; thofe next thercto, the flags. - The tail is called the truin; the breaf-feathers, the mails; thofe bethind the thigh, the pendant foublers. - When the feathers are not yet foll grown, the is faid to be unfimmed; when they are complte, the is fummed:-The craw; or crop, is called the gorge:- The prpe next the fundanent, where tha freces are drawn down, is called the fomach: - The nimy fubflance lying in the pannel, is called the ghut:- The upper and crooked part of the hill is called the leak; the nether-part, the clap; the yellow part between the beak and the eyes, the jarr or fere; the two fimall boles therein, the narci.

As to her furniture:- The Jeathers, with bells buttoned on her legs, are called lewits. - The leathern thong, whereby the falioner holds the hawk, is called the liafe or lea/b; the little ftraps, by which the leale is fattened to the lege, jeffs; and a line or pack-thread fattened to the leafe, io difcipliniay har, as anse.

1haning. A cover for her head, to keep her in the cak is called a lood; a large wide hood, open belhind, to be wore at firt, is called a rufier lood: So draw the atrings, that the bood may be in readinefs to be pulted off, is called rempriking the bast. - 'l'he blinding a hawk juft taken, herunning a thread through her eye lids, and thus drawing them over the cyes, to prepare her for being looded, is called feeling. - it tigure or refemblance of a fowl, made of leather atad fathers, is called a luv.- Hes relling-place, when off the falcones's fith, is called the foobs-- The place where her meat is laid, is called the bait; and that wherein the is fet, while her feathers fall and cume again, the now.

Something given a lawk, to cleanfe and purge her gorge, is catled cafting.- Small feathers given her to make her calt, are called fimase:-Gravel given her to help to bring down her thomach, is called ranele: Her throwing up till from the goige after calling, is calted ghaming. - The purging of her greafe, \&e. cifaming. -A being fuffed is called gurgiting.-The inferting a feather in her wing, in licu of a hroken one, is called impirg. - The giving lier a leg, wing, or pision of a fowl to pull at, is ealled tiring: - The neck of a bird the hawk preys on, is callid the ghe: _ What the hawk laves of her prey, is called the pill or pif.
'There are alfo proper terms for her feveral actions. -When the flutiers with her wings, as if diving to get away, either from perch or fift, the is faid to bate. -When landing too near they fight with each other, it is called crabfing :- When the young ones quiver, and thake their wings in obedience to the elder, it is called cowring: - When the wipes her heak after feeding, the is fad to foak: - When the hleeps, the is faid to jouk:- From the time of exchanging her coat, till the turn white again, is called her intermetwing:Treading is calted caruking: When the tretches one of her wings after her legs, and then the other, it is called mantitys:- Her rlung is called muings; when The mutes a grood way from her, bhe is faid to fire; when the does it directly down, inttead of yerking backwarls, the is fad to fime; and if it be in drops, it is calld dropsing. . When the as it were freezes, it is called firins.-When the raifes and frabs herfelf, the is faid to roses:-When, after mantling, the croffes her wings together over her baek, fhe is faid to wnite.

Wher a haw foizes, fie is faid to lind: - When, siter leiking, the pullo of the feathers, the is Caid to flume. When the railes a fowl alolt, and at longth defeencis with it to the gromad, it is called truffas.When, being alot, the dufends to ftrike her prey, it is called forfing. -When the 1lics out too far from the game, the in faid to thate - When. forlaking her proper fame, the fies at pyes, crows, \&e. that chance to crofs laer, it is ealled check. - When, niting the fowl, the betakes herfelf to the next check, fhe is faid to fly on bect.-The fowl or game the fles at is called the guary. - lhe dead body of a fowl hilled by the hawk, is callcd a frit. - Whan the fles aray with the quany: fhe is Gid eo corry. - When in flooping the turns two or thee tirees on the wing, to recover herfelf ere the fisk, it in colicd catioterige. - When the lits the prey, fet doess at mufs it, it is called ruff-The maxing e hask tome and genti, is called ratming. - The bringug her to endure company, waming her. $\mathrm{N}^{2} 140$.
-An old fanncin hawk, ufed to fly a
The reclaiming, manning, and bringing up a hawk to the fport, is not eafy to be brought to any precife fet of mules.- It conflls in a number of little practices and obfervances, calculated to familiarize the falconer to his bird, to procurc the love thereof, de. See the article lialconri.

When your hawk comes readily to the lure, a large pair of luring-bells are to be put upon her; and the nore giddy-leaded and apt to rake out your hawk is, the larger mult the bells be. Having dune this, and the being fharp-fet, ride out in a fair morning, into fome large ficld unencumbered with trees or wood, with your hatw on your filt ; then having loofened her hood, whiltle foftly, to provoke her to fly; unhood her, and let her dy with her head into the wind ; for by that means the will be the better able to get upon the wing, and will naturally clinb upwards, flying a circle. After the las flown three or four turns, then lure her with your voice, cafting the lure about your head, having firlt tied a pullet to it; and if your falcon come in and approach near you, calt out the lure into the wind, and if the floop to it reward her.

You will often find, that when the flies from the fitt, he will take ftand on the ground : this is a fault which is very common with foar-falcons. To remedy this, fiight her up with your wand; and when you have forced her to take a turn or two, take her down to the lure, and feed her. But if this dues not do, then you mut have in readinefs a duck fealed, fo that the may fee no way but backwards, and that will make her mount the higher. Hold this duck in your hand, by one of the wings near the budy; then lure with the enice, to make the falcon turn her head; and "hen the is at a reafonable piteh, calt your duck up jut under her; when, if the thike, thoop, or trufs the duck, permit her to kill it, and reward her by giving her a reafonable gorge. After you have practifed this two or three times, your hawk will leave the ftand, and, delighted to be on the wing, will be very obedient.

It is not convenient, for the firf or fecond time, to foow your hawk alarge fow'; for it frequently happens, What they efape from the hawk, and the, not recovering them, takes after them: this gives the falconer trouble, and frequently uecanons the lofs of the hawk. But if the happons to purfue a fowl, and being unable to re. cover it, gives it over, and comes in arain directly, then catt out a fealed duck; and if the ftoop and trufs it acrofs the wings, permit her to take her pleafure, rewarding her alfo with the heart, brains, tongue, and liver. But if you have not a quick duek, take her down with a dry lure, and let her plume a pullet and feed opon it. Dy this means a hatw witl learn to give over a fowl that rakes our, and on hearing the falconer's lure, will make back again, and know the better how to hold in the heas.

Some hawks have a didainful coynefs, proceeding from their being high fed : fuch a hawk mult not be rewarded thoush the thould kill: but you may give hor l ave to plume a little; and then taking a fhetp's heat cold, or the leg of a pallet, when the hawk is bufy in pluming let eitinci of them be conveged into the budy of the fowl, that it may favour of it; and
wood when the hawk has eaten the heart, brain's, and tongue of the fowl, take out what is inclofed, call her to your fift, and feed her with it: afterwards give her fome of the feathers of the fowl's neck, to fcower her, and make her caft.

If your hawk be a ftately high-flying one, the ought not to take more than one aight in a morning; and if the be made for the river, let her not fly more than twice: when the is at the highof, take her down with your lure; and when the has plumed and broken the fowl a little, feed her, by which means you will keep her a high-flyer, and fond of the lure.

HAWKWOOD (Sir John), a famous Engling general, was the fon of a tanner at Heddinghan-Sihil in Eflex, where he was born in the reign of Edward III. He was bound apprentice to a taylor in London; but being fortunately preffed into the ammy, was fent abroad, where bis genius foon expanded itfelf, and furmounted the narrow prejudices which adhered to his birth and occupation. He lignalized himfelf as a foldier in France and Italy, and particularly at Pifa and Florence. He commanded with great ability and fuccefs in the army of Galeacia duke of Milan; and was in fuch high efteem with Barnabas his brother, that he gave him Domitia his natural daugliter in marriage, with an ample fortune. He died at Florence, full of years and military fame, in 1394 .

HAWSE, or HAUSE, is generally underftood to imply the fituation of the cables before the fhip's ftem, when the is moored with two anchors out from forward, viz. one on the flarboard, and the other on the larboard bow. Hence it is ufual to fay, fle has a clear bawfe, or a foul bowefe. It alfo denotes any Anall diftance a bead of a hhip, or between her head and the anchors employed to ride her, as, "He has anchored in our hawfe, The brig fell athwart our hawfe," Eic.

A thip is faid to ride with a clear hawfe, when the cables are directed to their anchors, without b-ing athwart the ftem; or crofling, or being twitted round cach other by the fhip's winding about, according to the change of the wind, tide, or current.

A foul hawfe, on the contrary, implies that the cables lie acrofs the Itcm, or bear upon each other, fo as to be rubbed and chafed by the motion of the veffel. The hawfe accordingly is foul, by having either a crofs, an elbow, or a round turn. If the larboard cahle, lying acrofs the flem, points out on the flarboard fide, while the ftarboard cable at the fame time grows ont on the larboard fide, there is a crofs in the hawfe. If, after this, the lhip, without returning to her former pofition, continues to wind about the fame way, fo as to perform an entire revolution, each of the cables will be twifted round the other, and then dircted out from the oppofite bow, forming what is called a round turn. An elbow is produced when the fhip flops in the middle of that revolution, after having had a crofs: or, in other words, if the rides with her head northward with a clear hawfe, and afterwards turns quite round fo as to direct her head northward again, the will have an clbow.

Harse-Holes, certain cylindrical holes cut through the bows of a hip on each fide of the flem, through which the cables pafs in order to be drawn into or let

Vol. VIII. Part I.

345 ] H A Y
out of the veflel as occafion requires. They are fortified on eath dide by the

Harse. Pieces, a name given to the foremoll timbers of a thip, whofe lower ends reft on the knuckle-timber, or the formoft of the cant-timbers. They are generally parallel to the Atem, having their upper ends fometimes terminated by the lower part of the beakhead ; and otherwife, by the top of the bow, particularly in fmall hips and merchantmen.

HAWSER, a large rope which holds the middle degree bctween the calle and 1ow line, in any fhip whereto it belongs, being a fize fmaller than the former, and as much larger than the latter.

HAI, any kind of grafs cut and dried for the food of cattle.

The time of mowing grafs for bay mult be regulated according to its growth and ripenefs; nothing bcing more prejudicial to the crop than mowing it too foon; becaule the fap is not then fully come ont of the root, and when made into hay, the grafs fhrinks away to nothing. It muft not, however, be let fland too long till it have thed its feeds. When the tops of the grafs look brown, and hegin to bend down, and the rcd honeyfuckle flowers begin to wither, you may conclude it ripe for mowing.

Sain-Foin H.ir, is of feveral forts, which may be diAtinguifhed by the following terms, viz. 1. The virgin. 2. The bloffomed. 3. The fuil-grown. And, 4. The threfthed hay. The firt of thefe is beyond comparifon the beft. It mutt be cut before the bloffoms generally appear ; for when it ftands till it is full blown, the mot fpirituous and nourifhing parts of its juice are fpent, the fap is much impoverifhed, and the fain foin can never recover that richnefs it had in its virgin tlate. Lut this fine hay cannot well be had of uncultivated fain-foin, becaule that may not be much above an handful high when it is in a condition to be cut; it would then make a very light crop, and would be a grear while before it fprang up agrain: hut the rich will have two or threc tuns to an acre, and fring again
immediately for a Cecond crop; fo that little or none immediately for a Cecond crop; fo that little or none in quantity would be loll by fo great an improvement of its quality.

The fecond fort is that cut in the fower, which, though much inferior to the virgin-hay, far exceeds any other kind as yet commonly propagated in Britain ; and if it be a full crop, it may amuunt to three tuns an acre. This is that fair foin which is commonly made; and the larger it is, the more nourihing it is for horfes.

Tlae next fort of Cain-foin is the full grown, cut when the bloffoms are gine or going off: this alfo is good hay, though it falls thort by many degrees of the goodnefs of the other two forts: Uut it makes a greater crop than either of them, bucanfe it grows to its full bulk, and florinks little in drying.

The laft fort is the threthed hay; which, when not damaged by wet weather, has been found more nourithing to horfes than coarfe water-meadow hay: and, when it is cut fmall by an engine, is goud fur cattle, and much better than the chaff of conn. The bett time to cut it, is when the greatell part of the reed is well filled; the fint-blown ripe, and the lalt-blowa beginning to be full.

The goodncis of the bay depends greaty pron the
Uu
manner

## H A Y

Hay. manner of ordering it. The belt hay in all England is made of fain-foin, without ever foreading it. This method, though it be longer before it be thinihed, calts Iefs labour than the other. If lain-foin be laid up pretty green, it will take no damage, provided it be let i:a linatl round ricks, with a large biket drawn up in the middle of each, to have a vent-hole, through which the fup rfluous moiture of the hay may trinfpire. As foon as its heating is over, thef ricks oneght to be thatched; and all fain-foin ricks, that are made when the hay is full dried in the cocks, ought to be thatehed immediately after the making them. That which is laid up moll dried, will come out of the rick of a green colour ; but that which has been much heated in the rick, will be brown.
'The feed affords the owner another opportmity of making a proft of his fain-foin: but this, if the hoeing hufbandry were general, would not be vendible in great quantities for planting; becaufe the ordinary crop of an acre will produce feed enough to drill an hundred acres, which would nut want planting for a long time. The wher ufe then of this feed is for provender; and it has been affirmed by fome who have made trials of it, that three buthels of good fain-foin feed given to horfes, will nourih them as much as four bufhels of oats; and when well ordered, it is lo fweet, that moll forts of cattle are greedy of it.

Haw- Alaking. See Agriculture, $n^{\circ}$ 199, at feq.
Hay, a town of BrecknockMire, in Wales, feated near the confuence of the rivers Wye and Dulas. It was a town of good note in the time of the Romans; it being then fortified with a cafle and a wall, which were ruined in the rebellion of Owen Glendower. It is at prefent a pretty good town; and the market is large for corn, catte, and provitions. W. Long. o. 56. N. Lat. 52. 10.

Hay (William, Efq;), an agreeable Englifa writer, was born at Glenburae in Suffex, about 1700 , as is conjetured; and educated at Headley.fchoch. In 1730, he publihned a poem, ealled Mount Caburn, dedicated to the duchers of Newcalle; in which he deferibes the beauties of his native country, and celebrates the virtues of his friends. When lord Hardwicke was salled up to the troufe of lords in :734, he was chofen to fucceed him in reprefenting the borough of Seaford among the commons: and he reprefented this borough fur the remainder of his life. He defended the meafures of Sir Robert Walpole, and was the fuppofed author of a minikerial pamphiet, intituled, A Letter to a Frecholder on the late Reduction of the Land-tas to one Shilling in the Pound; which had been printed in 1732. In 1735, he publifhed Remarks on the Laws relative to the Poor, with Propofals for their better Relief and Employment ; and at the fane time brought in a bill for the purpule. He made another attempt of this kind, but without effect. May 1739 , he was ap. pointed a commiflioner of the Victualiing.office. In 1-53, appeared Rellysio Philofophi; or, the Principles of Morality and Chriftianity, illuftrated from a View of the Univerfe, and of Man's Situation in it. This was fullowed, in 1754, by his Eflay on Deformity; in which he rallies his own imperfection in this refpect with much livelinefs and good humour. "Bodily deformity (fays he), is very rare. Amung 558 gentle-
men in the Forare of Commons, I anm the onlyone that is fo. l'hasks to my worthy condtituents, who never objected to mr perfo.. and l hopenever to give them caufe to objoct to my behaviour." The fame year, he tranthued Inwkina Browne D: Imnortaliate Animi. In 1755, he tranlated and modernized fone Epigrams of Martial; but furvived this publication o:lly a fhort time, dying June 19. the fame year. A little time before, he had beea appointed keeper of the Records in the lower: and it is faid that his attention and afil luity during the few months he held that offiee were eminently ferviceable to his luceeffors.- He left a fon, who intherited the imperfeec form of his father. This geneleman went into the fervice of the Eatlladia company, where he sequired rank, fortune, and reputation; but being one of thofe who oppofed Coffim Ally K:wn, and unfortunate'y falling into his hands, was, with other gentlemen, ordered to be put to death at Patia, Oct. 5. 1763.

HAYES (Charles, Efq;), a very fingular perfon, whofe great erudition was fo concealed by his modelly, that his name is known to very few, though his publications are many. He was born in 1678 , and becane diftinguifhed in $170+$ by A Treatife of Fluxions, folio: the only work to which he ever fet his name. In 1710 , came out a fanall + to pamphlet of 19 pages, intituled, A new and eafy Method to find out the Longitude, from obferving the Altitudes of the Celeltial Bodies: and, in 1723, The Moon, a Philofophical Dialogue; tending to fhow, that the moon is not an opaque body, but has original light of her own. During a long courfe of years, the management of the late Royal African company lay in a manner wholly upon Mr Hayes, he being annually either fub-governor or deputy-governor; notwithltanding which, he continued his purfuit after general knowledge. To a ikill in the Greek and Latin as well as modern languages, he added the knowledge of the Hebrew: and publifhed feveral pieces, relating to the tranflation and chronology of the fcriptures. The African company being diffolved in 1752, he retired to Down in Kent, where he gave himfelf up to ttudy. May 1753, he began to compile in Latin his Chronographia Afatica \& IEgyptiaca, which he lived to finifh, but not to publith; which, however, was publifhed afterwards. Auguft 1758, he left his houle in Kent, and took chambers in Gray-Inn, where he died, December 18. 1700, in his 82d year. The title of his pothumsous works runs thus: Cbronographic Affaticie EF Egyptiacu Sperimen; is quo, 1. Origo Chronologie $L x x$ Intorpram inatfigatyr. 2 Conjpelus totias operis exbibetur, Svo.
haynault. See Hainault.
HAYS, particular nets for taking rabbits, hares, \&e. common to be bought in thops that fell nets, and they may be lad larger or fhorter as you think fit; from 15 to 20 fathoms is a good length, and for depth a fathom.

As rabbits often Atraggle abroad about midday for fref grafs, where you perceive a number gone forth to any remote brakes or thickets, pitch two or three of thefe hays about their burrows; lie clofe there: but in cafe you have not nets enougb to inclofe all their burrows, fome nay be flopped up with Itones, \&c. Then fet out with the coney-dog to hunt up and down at 2
good
good diftance, and draw on by degrees to the man who is with you, and lies clofe by the hay, who may take them as they bolt into it.

HAYWARD, the perfon who keeps the common herd or cattle of a town. He is appointed by the lord's court; and his office is to fee that the cattle neither break nor crop the hedges of inelofed grounds.

Hayward (Sir John), an eminent Englifh hiforian and biographer in the beginaing of the $1-$ th century, was educated in the univerfity of Cambridge, where he took the degree of doctor of laws. In 1610, he was appointed one of the hiltoriographers of a college then at Chelfea; and, in 1619 , received the honour of knighthood. He wrote, 1. The lives of the three Norman kings of England, William I. and II. and Henry I. 2. The firlt part of the life and reign of king Henry IV. 3. The life and reign of king Ed. ward VI.; and feveral theological works. Hie died in 1627.
H.AZAEL, an officer belonging to Benhadad king of Syria, caufed that prince to be put to death, and reigned in his ftead. He defeated Joram, Jehu, and Jehoahaz, kings of Ifrael; and, after his death, was fucceeded by licnhadad his fon, 852 B . C.

HAZARD, or Chance, in gaming. See Ga. ming.

Hazard, a game on dice, withont tables, is very properly fo called; fince it fpeedily makes a man, or undoes him.

It is played with only two dice; and as many may play at it as can ftand round the largeft round table.
$\therefore$ Two things are chiefly to be obferved, viz. main and chance; the latter belonging to the caltor, and the former, or main, to the oiber gameflers. There can be no main thrown above nine, nor under five; fo that five, fix, feven, eight, and nine, are the only mains flung at hazard. Chances and nicks are from four to ten: thus four is a chance to nine, five to eight, fix to teven, feven to fix, eight to five: and nine and ten a chance to five, fix, feven, ard eight: in fhort, four, five, fix, feven, eight, nine, and ten, are chances to any main, if any of thefe nick it not. Now nicks are either when the chance is the fame with the main, as five and five, or the like; or fix and twelve, feven and eleven, eight and twalve. Here oblerve, that twelve is out to nine, feven, and five; eleven is out to nine, cight, fix, and five: and anses-ace and duce-ace, are out to all mains whatever.

Hazle, or Hazel, in botany. See Coryzus.
The kernels of the fruit have a mild, farinaceous, oily tatte, agreeable to molt palates. Squirrels and mice are fond of them, as well as fome birds, fuch as jays, nuterackers, \&c. A kind of chocolate has been prepard from them, and there are intances of their having been formed into bread. The oil expreffed from them is little inferior to the oil of almonds; and is ufed by painters and by chemifts for receiving and retaining odours. The charcoal made of the wood is ufed hy painters in drawing.-Sume of the Highlanders, where fupertition is not totally fublided, look upon the tree itfelf as unlucky; but are glad to get two of the nuts naturally conjoined, which is a good onen. Thefe they call ctro-chomblaich, and carry them as an efficacious charm againt witcheraft.

Evelyn :ells us, that no plant is more proper for
thickening of copfes than the hazle, for which he directs the following expeditious method. Take a pole of hazle (ath or poplar may alfo be ufed) of 20 or 30 feet in length, the head a little lopped into the ground, giving it a chop ncar the ground to make it fuccumb; this faftened to the earth with a hook or two, and covered with fome frefh mould at a competent depth (as gardcners lay tleir earnations), will produce a great number of fuckers, and thicken and furnifh a copfe ipeedily.

Haszes.Earth, or Hazley-Earth, a kind of red loam, which is faid to be an excellent mixture with other forts of earth; uniting what is too loofe, cooling what is too hot, and gently retaining the moilture.

Writch-Hazel. See Hamamalis.
HEA1), the uppermolt or foremoft part of the body of an animal. See Anatomy, Part I. fect. ii.

MEAD-Ach, a moft troublefome fenfation in the head. produced by various caufes, and attended with different fymptoms, according to its different degrees and the place where it is feated. See (the Index fubjoined to) Medicine.

Dragon's Hfan, in altronomy, is the afecnding node of the moon or other planet.

Hkan of a Ship, an ornamental figure ereted on the continuation of a fhip's ftem, as being exprefive of her name, and emblamatical of war, navigation, commerce, \&c.

Head, is alfo ufed in a more enlarged fenfe to fignify the whole front or forcpart of the thip, including the bows on each tide: the head therefore opens the column of water through which the flip palfes when advancing. Hence we fay, head-fails, head-fea, headway, \&c.
'Ilmus, fig. i. Plate CCXXVI. reprefents one fide of the fore part or head of a 74 gumbip, torether with part of the bow, kcel, and gunnel. The names of the feveral pieces, exhibited therein, are as follow:

AA Fore-part of the keel, with $a$ a the two falie keels beneath it.
$A C$ the ftem.
a a The cat-head.
66 The fupporter of the cat-head.
cc The kaight-head, or bollard-timber, of which there is one on cach lide, to fecure the inner end of the bowiprit.
dd the haufe-holes.
ic The naval-hoods, i. e. thick pieces of plark laid upon the bow to ftrengthen the edges of the haufe holes.
$f$ The davit-chock, by which the davit is firmly wadged while employed to fith the anchor.
$g$ The bulk-head, which terminates the forecaftle on the fore fide, being called the beak-bead bulk-bead by flipwrights,

H The gun-ports of the lower deck.
$b$ The gun-ports of the upper deck and forecaftle.
I, I, The channels, with their dead eyes and chainplates.
$i$ The gripe, or forefoot, which unites the keel with the llem , forming a part of either.
ld Thefe dotted lines reprefent the thicknefs and defcent of the diffcrent deeks from the fore-part of the thip towards the midde. The lowell of the three dot-

It is cudent that the fore-part of a flip is called its hand, from the aftinity of motion and pofition it bears to a bith, and in general to the horizonal fituation of all animals whith fiwimming.

By the Hesid ; the Itate of a Mip, which is laden deeper at the fore-end than the after-end.

Heils Borow, or Hend-Boroush, lignifies the perfon who is the chief of the frank pledge, and had ancient. ly the principal direction of thofe within his own pledge. He was alio called burrowe-kat, burflouldar,
 Borose dider, according to the divertity of fpeech in different places. This offee is now ufually called a bighcong.able. The bead-borow was the chief of ten pledges: the other nine were called bathd-borows, or flegii malmazles, ixe.
Fitado-Monht, pot, a difeafe in children, wherein the Futures of the fkull, generally the coronal, ride; that is, have their edges thot over one another; and are fo clufe lucked together, as to comprefs the internal parts, the meninges, or even the brain itfelf. The difeale ufually occafions convulions, and is fuppofed to admic of no curc from medicine, unlefs roum could be given by manual operation or a divnlimn of the futures
The bead-moull hoot is the diforder oppolite to the horfe-hoe head.
firad. Pence, an exaction of a certain fum formerly colle Eted by the fherifi of Northumberland from the inhabitants of that county, without any account to be mace to the king. This was abolithed by the itatute 23 Hen. VI. cap. 7.

Herd-Tin, in metallurgr, is a preparation of tinore toward the fitting it for working into metal. When the ore bas been pounded and twice wafhed, that part of it which lies uppermolt, or makes the furface of the mafs in the tub, is called the head tin ; this is feparated from the reft, and after a little more wafhing beeomes fit for the blowing houfe.

HEAB Fufl. a rope employed to faften a fhip to a wharf, chain, or bney, or to fome other veffel alonghde.

Hfrio- Iond, a name frequently given to a cape or pron mory.

Ho :Href, anongit the I=wif, Greeian, and Rom. brice, as am p gouftion, was varions, according to the dificant priods of time, and the fluctuation of falture tore wish, prinepally confitted of their

before, with a bodkin, into two equal parts; fonietimes it was covered with a net, or put into a kind of purfe, or tiod behind in the furm of a knot, or bound back and phited with ribbands. It was wathed with great care; effence and perfumes were applied to it, and gold dult fometimes made ufe of as powder. P'arls and jewels made a part of their ornaments; and pendancs were won in the ear. To cover the defect of hair, perukes were made ufe of by the gentemen of Rome. And we read that Otho had a covering of falfe hair, becaufe he had not much of his own. See Hair, Juwels.

Boch Grecian and Roman ladies wore tettes. But whether they ever built up their heads fo high as the Englih, or our continemtal neighbours, will admit of a difputc.

Headmost, the fituation of any thip or fhips which are the moll advanced in a flect, or line of battle.

Hasid-Rope, that part of the bolt-rope which terminates any of the principal lails on the npper edge, which is accordingly fewed thereto. Sce the article Bult-rope.

He.ti) Sails, a general name for all thofe fails which are"extonded on the fore-mall and bowfrit, and employed to command the fore-pant of the thip: fuch are the fore-fail, lore-top fail, fore-top gallant fail, jib, fore-Itay-fail, and the fprit-fail with its top-fail. This term is ufed in oppofition to after:fails, viz. all thoic which are cxitended on the mizen-malt, and on the ftays between the mizen and main matts.

HE.id.torvinh; ; the fituation of a hhip or boat, when her head is turned to windward.
He.id-IVay, the motion of adrancing at fea. It is generaliy ufed when a hip firtl begins to advance; or when it is dunbtful whether fhe is in a flate of relt or motion. It is in both fenies oppofed to retreating, or moxing with the thern foremolt. See the article Sternway.
healfang, Healstang, or Halsfang, in our ancicht cuftoms, lignities collifrigium, or the punifhment of the pillory. The word is compousded of two Saxon words; hal?, neck, and pangen " to contain:" Pana filicet qua alicui collum frivg atur. The healfang, how ver, cannot fignify a pillory in the charter of Canutus, De l'oreftis, cap. xiv. Et pro culpa folvat regi duos foltus, quos Dani vocant halfehang.

Healfang is alfo taken for a pecuniary punilhment or mulci, to conmute for ftanding in the pillory; and is to be paid either to the king er the chief lord. © $\boldsymbol{Q}_{u i}$ falfum teflinoniam dedit, reddat regi vel terre donino healfang.

HEALING, in its general fenfe, ineludes the whole procefs of curing or removing a diforder, and recovering health. In this fenfe medicine is defined the art of healing. In its more reftrained fenfe, as ufed in furgery, \&c. luealing denotes the uniting or confolidating the lips of a wound or ulecr. The medreines proper for this intention are called incarnatives, ags luatinatives, vulnerartes, \&c.
healing, in arel tecture, denotes the coverng the roof of a haisug. The healing is varions; at of lead, tiks, flate, Horflaminme, fhingles, or reed and flraw.

HEAL!'H, is a right difputition of the body, and

## H E A

of all its parte; confiting in a due temperature, a right conturmatiun, ju't conneation, and ready and irce ex ercife of the feveral wital functions.

Healrh adinits of latitude, as not being the farse in all fuhjects, who may yet be fail to enjuy weath.

That part of medicine which thows the means of preferving lacaleh, is termed bigitine. Sice Mentenes.

The Grecks and Rumans deitied Healdh, repreienting it under the figure of a woman, whom they furpo. fed to be the danghter of Afchlapius. We find the name of the godedefs Sibis, or Health, on many incdals of the Roman emperors, with d.fferent infoip. tions; as, sates peblica, salecsreipublicea, sales AUGisti, \& C .

Midhods of priferving the Health of Mariows. See Mapiner.

LiE. 1 M , in bealts, denotes the fance with aficr birth in women. Thyme, penny-royal, winter-favory, and common hore tound, boiled in white-wine, and given to a mare, are elleened good to expel the heam. Dittany, applied in a pellary, expels the heam, as well as the dead fual; to alio do fennel, hops, favin, angelica, \&e.

HEARING, the act or faculty of perceiving founds. Hraring is reckoned anong our external fenfes. Its organ is the ear, and particulally the anditory nerve diffufed rharough the fame; and its objcet, certain notions or vibrations of the air. Hence hearing may be more fecentitically defined, a fenfation, wherely, from a due motion impreffed on the tibrillie of the audtory nerve, and eommunicated thence to the fenfory, the mind perceives and gets the idea of founds. Sec Anatomy, ñifl.

Hearing in different animals. See Compir, thef Ahafomy, Entomology, and Ichthyology.

HEARNE (Thomas), a celebrated antiquarian, eminent for lhis writings and editions of MSS. His father was parifh-clerk of Little Waltham in Berkhire, -where he was burn in 1680. He had a liberal education by the patrunage of a neighbouring genticman; and even from a boy difcovered a llrong propentity to the lludy of antiquities. He did great iervices to the Bodleian library, and died in 1735.

HE $\rightarrow \mathrm{RSE}$, among hunters, a hind in the fecond year of ler age. Ste Huntise.

Hearse is the name of a weil known carriage, ufed for conveying the dead to the grave. The word is alfo ufed by Shakefpeare in his Henry VI. for a monument ereged ourr a grave.

HEART, in anatony, a mufculous part of the ani. mal body, fituated in the thorax, on the anterior part of the diaphragm, between the two laminx of the mediaftinum, wherein the veins all terminate, and from which all the arteries arife; and which, by its alternate contraction and dilatation, is the chief intrument of the
circulation of the blood, and the principle of life. See
Hear:. Anstony, $n^{\circ}$ 121, 122 .

S'seral ingenious pertons have from time to time a:tempeed to make ellimates of the force of the blood in the neart andarceries; wish hase ai widely difered fren cach other, as they have from the truth, for want of a fuffieient uumber of data io argue upon. 'This fet the truly ingenious 1)r Hades upon making praper experiments, in order to afecrtain the forece of the bloud in the veinsand arterics of feveral animals.

If, accurding to Dr ifcil's thimate, the left ventricle us a man's heart throwsout in cauh fyble an chnee or 1.63 eubic inclues of bloud, and the arca of the crisce of the aurta be $=0.4187$, then cividing the fornter by this, the quotient 3.9 is the length of the cylinder of blood which is formed in pafing thro' the acrea in each fyltole of the vemericle; and in the 75 puifes of a minuse, a cyliader of 292.5 incles in length will pafs: this is at the rate of $1+62$ feet in an hour. But the fyttole of the heart being perfurmed in one third of this sime, the velucity of the blood in that intant will be thrice as much, viz. at the raie of 4386 feet in an hour, or 73 feet in a minute. And if the ventricle throws ont one ounce in a pulte, then in the 75 pulfes of a minute, the quantity of blood will be equal to +4 lb . 11 oz . and, in $3+$ minutes, a quantity equal to a middle-frzed man, viz. 158 lb . will pafs through the heart. But if, with Dr Harvey and Dr Lower, we fuppofe two ounces of blood, that is, 3.275 cubic inclies, to be thrown out at each fyftole of the ventricle, then the velocity of the blood in entering the orifice of the aorta will be double the former, viz. at the rate of 146 feet in a minute, and a quantity of blood equal to the weight of a man's body will puis in half the time, viz. 17 mi nutes.
If we fuppofe, what is probable, that the blood will rife $7+\frac{1}{2}$ feet high in a tube fixed to the carotide artery of a man, and that the inward area of the left ventricle of his heart is equal to 15 fquare inches, thefe multiplied into it: fect, give 1350 cubic inches of blood, which preffes on that ventricle, when it firtt begins to contract, a weight equal to 15.5 pounds.

What the doctor thus calculates, from fuppofition, with regard to mankind, he actually experimented upon horfes, dogs, fallow-does, \&.c. by fixing tubes in orifices opened in their seins and artenies; by obferving the feveral heights to which the blood rofe in the le tubes, as they lay on the ground; and by meafuring the capacities of the ventricles of the heart and orifices of the arteries. And, that the reader may the more readily compare the faid eftimates together, he has given a table of them, ranged in the following order.

Heart-burn, a difeafe ufually called cardialgia by phyficians. In furfeits, or upon fwallowing without due maltication ; when meats are eat tough and fat, or with farinaceous fubflances unfermented; or when by any accident the faliva is vitiated, too fcanty, or not intimately mixed with the food, the fermentation becomes tumultuous, the flomach fwells with air, and this extraordinary commotion being attended with an unufual heat, brings on the uneafinefs called the bart-burn; which is remedied by whatever promotes a greater fecretion of faliva, or helps to mis it with our aliment. The teflaceous powders, as oyfter-hhells, crabs eyes, chalk, \&c. are the ufual remedies for the heart-burn.

HEARTH, that part of the pavement of a room on which the fire is inmediately placed.

Heafth-Money. See Chimner- Money.
HEAT, in phyfology, has a double meaning; being put either for that peculiar fenfation which is felt on the approach of burning bodies, or for the caufe of that ferfation : in which lafl fenfe it is fynonymous with Fire. This mode of fpeaking, however, is inaccurate, and, by confounding the effect with the caufe, fometimes produces obfeurity: it were to be wihhed therefore that the word beat was ufed only to denote the effect; and fire, or fome other term, to denote the caufe of that effect.

The difputes which formerly were fo mach agitated in the learned world concerning the nature of heat, viz. whether it confilled merely in the mution of the terreftrial particles of bodies, or in that of a fubtile fluid, are now mofly ceafed, and it is atnolt univer.
fally believed to be the effect of a fluid. Unluckily, however, from the promifcuous ufe of the words fire and beat, an opinion feems to have gained ground, that there is in nature a fluid effentially bot; and that wherever the oppofite fenfation prevails, the former Guid is in part abfent. Hence have alifen numberlefs fpeculations concerning the attration, abforption, and capacities of bodies for heat; all of which being built on a talfe principle, have ferved no other purpofe but to involve this part of natural philufophy in obfcurity and confulion. Under the articles Chemistry, Combustion, Electricity, \&c. it is fo fully flown that beat properly fo called is not a fluid, but the modififation of a fluid, that it is fuperthaous to fay any more on the fubjêt-at prefent. This being admitted, it will evidently follow, that leat can neither be abforbed nor attracted; neither can any body have a greater capracity for it than another, except is proportion to its bulk, which athows a larger quantity of the fluid to enter and to aflume the particular motion which conAltutes heat. From fume of Dr Black's experiments indeed it would appear at firtl view, that heat was abforbed, or attraged in the frictelt fenfe of the word: but this muit be attributed merely to the transferring of the modification of the fluid from one fubtance to another, withont eggarding whether it is the identical quantity of fluid which acts as heat in one fublance that is transferred to the other, or whether only by fome unknown means a fimilar motion is produced in another portion of the fame. At any rate, however, fone word mull be made ufe of to exprefs this operation; aud abfortion or attraation will anfwer the
purpole as well as any others: but nin we ought to remember. that thele are inaccurate; and when we begin to argue from them as if they fully and exactly determined the mode in which the fuid acts, or rather is aeted upon (for both thefe words fuppole heat to be palfive, and not active), we mutl certainly crr. As to the plurafes capacity for containing heat, abfolute beat, \&c. they are fill more inaccurate than the norts abforption and ateracion, and cannot convey any dithinct icea; whence the fyftems founded upon the explanations of thefe terms, aflumed gratis ditum without the lealt proof, have never been able to fapport themfelves, but are liable to endlefs and infuperable objections.

It is by no means indeed caly, nay we may boldly. fay that it is abfolutely impolfible, for human genius to invofligate all the phenomena of this fubtile and invifible element. All that can be done is, to difcover a few general rules according to which the fluid acts in certain cafes. From thefe we can only reafon analogically to cales where its action is lefs obvious. Lut we are not to expeet that by reafoning in this manner we can folve every phonomenon : nor can it be any recommendation to an hypothefis, merely that it fulves fome phenomena, unlefs we were able by its means to folve them all ; but this no wife man will pretend to do, nay, not even to know them all. It appears exceedingly erroneous therefore to invent folutions of certain phenomena, and then to argne for the truth of the hypothelis from the facility with which the phenomena are explained by it. The true and proper method of proceeding in this cale is to lay down certain principles eftablifhed from the obvious phenomena of mature, and to reafon from them fairly as far as we can; but where this ends, our sinowledge mufl top, and we cannot by any means proceed farther upon a fure foundation.

The only general principles as yet certainly eftablifhed from obvious phenomena upon this fubject are the following: 1. Heat and cold are found to expel one another Hence we ought to conclude, that heat and cold are both pofirives; for a megative can neither be expelled nor accumulated. 2. Heat is aiffly occalioned by the rays of the fun concentrated, and likewife by the fuid of electricity concentrated. If free, therefore, properly fo called, be the caufe of heat, than which nothing can be mure evident to our fenfes, we are certainly intitled to conclude, that both the light of the fin and the clectric Quid are dementary fire. Hence allo we conclude their identity; for two different fubttances camot by any means produce conflantly the fame effect when put in the fame circumfances, which both hight and electricity do in this cafe, merely by comentration, or difcharging a great quantity of the fluid upon a fmall portion of any terreflrial body. 3. Heat expands bodies in every dircetion: whence we conclude, that the fluid, when producing heat, ass from a centre towards a circumference; and by analogy, that when it produces cold it acts from a circomference towards a eentre. 4. It appears from undeniable experiments, that heat, fomehow or other, is the caufe of fuidity. As the action of the fluid bas already been fhown, when it produces heat, to be from a centre to a circumference, it follows, that when the expantive action of the fluid is confined within the furface of any body,
this may be called its laten: heat; hecanfe it extends not beyond the furface, and thereforc cannot affect the thermoncter, or be known to us as heat by tine fenfe of reeling. But when this expantive action in trassferred from the internal parts of the fubitance to the Surface, it then affects the thermoneter, and the boty is faid to become botere at the fame time that it congeals or is faid to be frozen. "Ihis is what fonme philofophers call the convertion of the la: an into fonfluie heat; others, the alteration of the capacity: but whatever term we give to the effit, the caufe mult remain the fame, viz. the oppofite actions of the fame fluid; the cxpanlive power in foone cales connteractiang or overcoming the condenfing one, and wiee verfa. 5 . Thougb fometimes the expanfive action is fuffieiently freng to produce fluidity naturali', and in mofl cafes may be made fo Rrong arificially as to make bodies flaid, yet in all cales it is not fio. A certain degree of cxpantise power exits in all bodies whatever, and this by philofophers is called the jpoigic beat of the body. 6. Whatever is called the cooliner of any body is oniy the diminution of the expanfive action upon its furface, or, if we may ufe the exprefion, on the furface of its particles. This is accomplimed by an oppotite power or modification of the tluid taking place on the outfide; but when this becomes fufficiently ftrong to penetrate the whole fubltance, it then expels part of the fluid acting in the oppofite direction, and then fome change takes place in the texture of the body. It is, however, impoffible to fpeak very perfpicuoully upon this fubject, as the fubtility and indivilbility of the fluid render all reafonings upon it very precarious. 7. It is altogether impolible to calculate the quantity of abfolute heat contained in any fubftance, becaufe this depends on the proportion betwixt the quantity of fluid aeting expanfively and that acting in the oppofite direction in the fame. Thefe two mult fome way or other counterbalance each other throughout the whole fyltem of nature; and we may fay with certainty, that any fubtance in which the one exilts without the other, is none of thofe fubject to the invelligation of our lentes, and all fpeculaions concerning it mult be vain. 8. When the fluid contained in any lobftance is vehemently agitated, this natura!ly produces an expandion in it ; and therefore bodies become bot by violent friction, percuffion, \&c. In thefe cafes, however, we have no right to fay that the lluid is capellad, but only that its mode of action is alecred; for this is conflantly fufficient to produce heat, and in this indeed the very elfence of heat conlits. 9. When the expanfive action of clementary fire within any lubfance becomes greater than is confillent with the cohefion of that fublance, it is difipated or refolved into vapour. This, however, may be done in fuch a manner that the heat ftill acts upon the Reparated parts of the body without Spending any of its force upon external fubfances. Hence vapour continues to exitt in a tomperature much below that in which it was originally produced; nay, will fometimes be exceffively cold to the touch, when it really contains as much heat, though in a letent ltate, as before. 10 . When this latent heat is transferred to external bodies, the vapour then ceafes to be vapoir, or is condenfed, and infome cafes retarns to its original Aate; in others, it is productive of light and vehoment fenfible heat:

Heal. whence all the phemomena of Distillation, Eqaporation, Flame, Ignition, Combustion, \&c.

Thefe are the principal facts which can be looked upon as efablifored with reyard to beat condidered in a plilofophical vicw. In common difcourfe it is always ipoken of as a certain fubilance dittinct from all others, and may properly enough be reckoned fo with regard to all the purpoles of tite In this fenfe, heat is accumulated by certain bodies 14 a much greater proportion than otleers. Dr Franklin made the experiment with pieces of cloth of various colours land upon fuow and expofud to the funhine, and in all cafes found that the pieces dyed with the darkeft colours funk decpett in the fnow. Mr Cawallo cxamined the matter more accuratcly; filll by wbierving the height to which a thermometer with a blackened bulb rofe in comparifon with one of clear glafs, and then by comparing the heights of differcm thernometers whofe buibs were painted of varions colours. Having therefore conItructed two thermometers whofe frales exactly correfponded with each other, he lixed them both upon the fame frame, abour an inch afunder, having the balls (quite detached from the frame; and in this manner expofers them to the light of the fun or of a lamp. When thefe were expofed to the fun or kept in the thade, with the glafs of both bulbs clear, they thowed precifely the fame degree; and the difference between the degree hown by the themometers when expofed to the fun and when kept in the fhade, at about the fame time of the day, was very triffing.

The ball of one of the thermoneters being painted black, and that of the other left clean, they thowed different degrees of temperature on being expofed to the fun; the difference fometimes amounting to $10^{\circ}$ : but was never conttant; varying according to the clearnet's of the fin's light as well as of the air, and likewife according to the different degrees of temperature in the atmofplace.

On keeping the thermometer with the painted ball on the inflide of a window, Mr Cavallo oblerved that ftrong day-light had an effect in raifug the mereury as well as the fun's light. To afcentain this, he cleaned the bulb of the painted thermometer, and blackened that of the other; but the effeci was conltant, via. the quicklilyer in the tube of the thermometer, whofe ball w7s painted black, was conilantly higher than the other whenever they wers expofed to the itrong daylight. The differelice was commonly about one-third of a degree, but fomet imes it amonnted to three-fout ths, or even to a whole degree; and the experiment anfwerat even when the fun was hid by clouds, which feems windicate that every degree of light is accompanied "th a corsefponding one of heat.

By this confideration Mr Cavallo was induced to try whither, by dirceting the concentrated light of the :noren upon the blackened bulb of a therrometer, it would be rafed higher than a clean one ftanding in the frome. The experiment was fectral tines tried with a large lens, and afterwards with a burning mirwir of 18 inches diancter; yet foretimes for want of poper mans of cbferving the height of ehe mercury in the tubes of the thermometers, fometinzes for want of acontinued chat light of the noon, or in thort from fome unfavourable circumbance or ohlcr, he was never able to make a fair and decilive trial of this experiurent.
$\therefore 4$.

Making trial of the heat of a lamp, he found that it alfu had a confiderable effee. The ball of one being blackuned, and buth fet at two inches ditance from the flame of a lamp, they both rofe from 58 to $65 \frac{1}{2}$ deg. and the thernometer which wes blackened to $67 \frac{1}{2}$. Another time the uncoloured thermometer rofe to $67 \frac{3}{3}$, and the coloured onc to 683 ${ }^{3}$. From a number of trials it at lant appeared, that the difference at this diflance from the lamp amounted generally to about a degree. When the thermometers were removed farther than two inches from the lamp, the difference decreafed; and at the dillance of about $1+$ or 15 inches it vanifhed entirely.

On this occation Mr Cavallo had an opportunity of making a curious obfervation concerning the decreafe of heat at different difances from the centre. "It is mathematically true, that emanations which proceed from a centre, and expand in a fphere, mait become more and more rare in proportion to the fquares of the diftances from the centre. Thus it is faid, that the intenlity of light procceding from a luminous body, at the donble, treble, quadruple, \&e. diftance from that body, mut be refpritively four, nine, listeen, times, \&c. lefs derife. The fame thing may be faid of heat; but with refpect to the latter, it appeared, that its intenfity did rot decreafe exactly in the duplicate proportion of the ditances from the flame of the lamp, but fhowed a very odd irregularity. It feemed to decreafe fafter than the duplicate proportion of the diflances for the fpace of two inches and a half or three inches, after which it decreafed much flower; but whether this proceeded from fome different tlate of the air's purity at different dillances from the flame of the lamp, or flom the vapours coming from the flame, I cannot take upon me to determine."

Mr Cavallo next made fome experiments upon thermometers, the balls of which were painted of various colours. His view was to exanine with precifion the degrees of heat imbibed by differently coloured fubfances, in orke to determine whether they kept any proportion to the faces occupied by the prifmatic colvars in the prifmatic fpectrum, or if they followed any other law. In thefe experiments he met with confderable difficulties, chiefly ariling from the different nature of the colours with which the bulbs were painted. By reafon of this diverfity the bulbs could not be made equally fmooth, which occainoned a confiderable difference in the effea; as he found by paintiny tho bulbs of thermometers with the fame colour, only making the one fmooth and the other rough.

To aroid this inconvenience, he attempted to make thermancters with tubes of diferently coloured glafs; but whena ball was formed with any of thefe, the glafs of the ball was fo thim, that it differed very little from that which was cntirely colourlefs. He thea included the thermometers in boxes, where the rays entered throngh coloured glaffes; but here the rays were not only far from being homegeneous, but there was fuch a difference in the tranfparency of fome of the coloured glaffes, that this methorl proved alfo ineffectual. The leaft ambiguous metirod, thereforc, was that of painting the balls of the thermometers with water-coloure, taking care to lay them on as equally and fmouth as poffible. In this manner the experimeats were repeated, uling fometimes a dozen of thermometers
mometers at once, whore balls were painted with various colours, and were expofed to the fun : but from a valt number of experiments, and forme weeks olfervasion, it could only he deduced, that if the colours with which the balls of the thernometers were painted had any confiderable refemblance to thofe of the prifm, thofe which were nearelt to the violet fhowed a greater degree of heat than the others; bat they were all, even that painted with white lead, in fome intermediate degree between the blackened thermometer and that which was left quice clear. If the colours had not the proper denfity, the effects were dilferent: thus, a thermometer painted with a light blue food Jower than another painted with good carmine.

In the courfe of his thermonetrical experiments, Mr Cavallo likewife difenvered a new method of determining the expanfion of mercury by weight, which feemed capable of being carried to a greater degree of exactnefs than any other hitherto propoled. Having firt blown a ball to a capillary tube, fuch as are commonly ufed for thermometers, he weighed it, and fourd the weight when empty to be 79.25 grains; and he obferves, that in this experiment it is a precaution abfolutely neceffary to have the glafs as accurately cleaned as pofible. Some mercury was then introduced into the ftem of the thermometer, taking care that none of it entered the ball; and by adapting a fcale of inches to the tube, obferved iliat 4.3 inches of it were filled with the mercury. The thernometer was now weighed again; and from this the wight of the glafs being fubtracted, the remainder, aiz. $0.2+\mathrm{gr}$. fhowed the weight of that quantity of quicktilver which filled the +3 inches of the tube. Now the ball of the thermometer, and alfo part of the tube, vicre entirely filled with quickfilver; and in order to find -out the weight of the mercury contaised in it, the thermometer was weighed for the laft time; and the weight of the glafs being fubtracted from this, the remainder, viz. 3205 grains, thowed the wcight of the whode quantity of quicklilver contained in the thermometer.

By comparing this infrument with a graduated thermometer of Fahrenheit, ant by applying a feale of inches, he found, that $20^{\circ}$ on the new thermometer was equal to 1.37 inches. But $0.2+$ grains was the weight of as much mercury as filled $4 \cdot 3$ inches of the tube. Therefore, by the rule of proportion, it will be found, that the weight of as much quickfilver as fills 1.33 inches of the tube, viz. the length of $20^{\circ}$, is equal to $0.074^{2}$ of a grain nearly; and that the weight of as much quickfilucr as fills a length of the tube equivalent to one degree, is equal to 0.00371 grains. Now it is clear, that the weight of the whole quantity of quickfilver contained in the thermometer is to the weight of as much as fills the length of onc degree of the tube, as the bulk of the whole quantity of quickfilver in a given degree of heat to the increafe of bulk that the fame whole quantity of quickfilver acquircs when heated but one degree ; viz. 32.05 grains is to 0.00371 grains as 1 to 0.0011 t. By which experiment it appears, that one degree of Fahrenheit's thermometer increafes the bulk of mercury not above eleven .hundredth thoufandth parts. A fmall deviation from mathematical exactnefs is indeed produced by the difference of weight between the quickfilver of the tube Vol. VIII. Part I.
when tirt weighed and when it is afterwards heated to one degree; but by an cafy calculation it will be found, that this difference is fo excecdingly fmall that it cannot be perctived with our mott exadt inllruments either of weight or mcafure.

On repeating this cxperiment with other thermometers, each procefs varied a littic from the other; which irrcgularity, Mr Cavallo thinks, was certaindy owing to the inperfecion of Lis fealcs: but by taking a mican of various esperiments, it appears, that one degrce of heat, according to Fahrenheit's thermoneter, increafes the bulk of a quantity of quickfilver in the tenperature of $50^{\circ}$ by about nine pans in 100,000 : that is, if the bulk of any quartity of quickflece in the termperature of $50^{\circ}$ be 100,000 , it wiil be 100,009 in the tempcrature of $5^{\circ}$.

In making experiments of this kind. it is necefary to have the bores of the tubes abfolutely cylindrical; and the feales fhould be fo exact as to tun with the hundredth part of a grain when clarged with half an ounce weight.

Fitat of Barning Bodis. See Coneustion.
HEAT of Clicmical Miatares. This is a phenomenon ncceflarily refulting from the change of form produced in the different fubllances which are mixed together; and the manner in which it happens may be eafly underfond from the examp le of oil of vitriol and water. If equal quantities of concentrated vitriolic acid and water are mixed together, a very great degree of heat inmediatcly takes place; infomuch, that if the veffel which consains the mixture is made of glafs it will probably lreak; and after it is cold, the mixture will be found to have mank in its dimenfions, or will occupy lefs fpace than the bulk of the water and acid taken feparattly. In this cafe we know that the water, while in its fluid flate, hath as much latent heat as it can contain; i.e. the clementary fre within it expands or feparates its parts from each other, as much as is confiftent with the contlitution of the body. If any more is added, it cannot be abforbed, or direct its force upon the particles of the water without raifing them in vapour: of confequence, part of this additional expanfive power will be employed in the formation of vapour, and the reft will be difcharged upon the neighbouring bodies, i.e. will be converted into femfibit heat. The vitriolic acid, in its concentrated Atte, contains a grcat quantity of latent heat, which is neceflary to preferve its fluidity. But when it is mixed widh the fluid water, the latent heat contained in the latter is abundantly fuficient for both: of confequence, the great expanfive power in the oil of vitriol itfelf becomes now totally ufelefs, and therefore exerts its force upon the ncighbouring bodies; and when the mixture returns to the original temperature of the oil of vitriol and water, it hows a lofs of fuhftance by its dinimution in bulk. This may ferve to explain all cafes in cheming where heat or cold is produced: ard it will generally be fousd, that where bodies, by being mixed together, produce heat, they flaink in their dimeritions; but when they produce cold, they ase cnlarged.

Heat. lying within the tropics were uninhabitable by reafon of their heat: but time has difcovered their millake; and it is now found, that no part of the world is too hot for mankind to live in. The learned profefor Boerhaave, in his chemiltry, relates certain experiments made with great accuracy by the celebrated Fahrenheit, and others, at his delire, on this fubject, in a fugar-baker's office; where the heat, at the time of making the experiments, was up to 146 . degrees of Fahrenheit's thermometer. A fparrow, fubjected to air thus heated, died, after breathing very laborioufly, in lefs than feven minutes. A cat refilted this great heat fome what above a quarter of an hour ; and a dog about 28 minutes, difcharging before his death a confiderable quantity of a ruddy coloured foam, and exhaled a ftench fo peculiarly offulive, as to throw one of the affitants into a fainting fit. This diffulution of the humours, or great change from a netural ftate, the profeffor atributes not to the heat of the ttove alone, which would not have produced any fuch effect on the flefh of a dead animal ; but likewife to the vital motion, by which a till greater degree of heat, he fuppofes, was produced in the fuids circulating through the luags, in confequence of which the oils, falts, and fpirits of the animal became fo highly exalted.

Meffieurs Du-Hamel and Tillet having been fent into the province of Augomois, in the years 1760 and 1761 , with a view of endeavouring to deftroy an infect which confumed the grain of that province, effected the fame in the manner related in the Memoirs for 1761, by expofing the affected corn, with the infects included in it, in an oven, where the heat was fuflicient to kill them without injuring the grain. This operation was performed at Rochefoucault, in a large public oven, where, for economical views, their firlt ftep was to affure themfelves of the heat remaining in it on the day after bread had been baked in it. This they did, by conveying in a thermometer on the end of a fhovel, which, on its being withdrawn, indicated a degree of heat confiderably above that of boiling water: but M. Tillet, convinced that the theumometer had fallon feveral degrees in drawing to the mouth of the oven, and appearing under fume embarrafinent on that head, a ginl, one of the attendants on the oven, offered to enter, and mark with a pencil the height at which the thermometer flood within the oven. The girl finiled on M. Tillet's appearing to heflitate at this llrange propofition; and entering the oven, with a pencil given her for that purpofe, marked the thermometer, after flaying two or three misutes, fanding at 100 degrees of Reaumur's fale, or, to make ule of a fcale better known in this country, at near 260 degrees of Fahrenheit's. M. Tillet began to exprefs an anxiety for the welfare of his female affilant, and to prefs her return. This female falamander, however, affuring hin that the fete no inconvenience from her fismation, remained there 10 minutes longer ; that is, near the time when Bocrhaave's cat parted with her nine lives under a much lefs degree of heat; when the thermometer ftanding at 288 degrees, or 76 degrees above that of boiling water, the came out. of the oven, her complexion indeed confiderably heightened, but her refpiration by no means quick or laborious, After M. Tillet's retury to Paris, thefe
experiments were repeated by Monf. Marantin, commifaire de guerre, at Rochefoucault, an intelligent and accurate obferver, on a fecond girl belonging to the oven, who remained in it, without much inconvenience under the fane degree of heat, as long as her predeceffor; and even breathed in air heated to abuut 325 degrees for the fpace of live minutes.
M. Tillet endeavoured to clear up the very apparent. contrariety between thele experiments and thole made under the direction of Boerhaave, by fubjecting various animals, under different circumitanees, to great degrees of heat. From his experimems, in fome of which the animals were fwaddled with clothes, and were thereby enabled to relitt for a much longer time the effects of the extraordinary heat, he infeis, that the heat of the air received into the lungs was not, as was fuppofed by Boerhaave, the only or principal caufe of the anxicty, laborious breathing, and death . of the aninals on whom his experimenta were made : but that the hot air, which had free and immediate accefs to every part of the furface of their bodies, penetrated the fublance on all lides, and brought on $a_{2}$ fever, from whence proceeded all the fymptoms: on the contrary, the girls at Rochefoncault, having their, budies in great meafure protected from this action by their clothes, were enabled to breathe the air, thue. violently heated, for a long time without great inconvenience. In faet, we thould think two, that the bulk of their bodies, though not thought of mucb confequence by M. Tillet, appears to have contributed not a little to their fecurity. In common refpitation, the. blood, in its paffage through the lungs, is cooled by being brouglit into contact with the external infpired air: In the prefent experiments, on the contrary, the velicles and veffels of the lungs receiving at each infiration an air heated to 300 degrees, mult have been. continually cooled and refrefhed, as well as the fubcutancous veffels, by the fucceflive arrival of the whole mafs of blood contained in the interior parts of the body, whofe heat might be fuppoied at the beginning of the experiment not to exceed 100 degrees. Nok to mention, that M. Tillet's two gir's may not poffibly. have been fubje\&ted to fo great a degree of heat as that indicated by the thermoncter; which appears to us to have always remained on the fhovel, in contact with the earth.

Thefe experiments foon excited otber philofophers to make fimilar ones, of which fome very renarkable ones are thofe of Dr Dubfon at Liverpool, who gives the following account of them in the Philofophical Tranfactions, vol. lxv.
"I. The fwcating-room of our public hofpital at L ;verpool, which is nearly*a cube of nine feet, lighted from the top, was heated till the quicklilver ftood at $224^{\circ}$ on Falirenheit's fcale, nor would the tube of the thermometer indeed admit the heat to be raifed highcr. The thernometer was fufpended by a ftring tixed to the wooden frame of the lky -light, and hung down about the centre of the room. Myfelf and fareral others were at this time inclofed in the ilove, withous experiencing any oppreflive or painful fenfation of heat proportioned to the degree pointed out by the thermometer. Every metallic about us foon became very hot.
"II. My friend Mr Park, an ingenious furgeon of this place, went into the flove heated to $202^{\circ}$. Af-
ter ten minutes, I found the pulfe quickened to 120. And to dctermine the increafe of the animal heat, another thermometer was handed to him, in which the quickfilver already ftood at $98^{\circ}$; but it rofe only to $99 \frac{1}{2}$, whether the bulb of the thermometer was inclofed in the palms of the hands or received in the mouth (A). The natural thate of this gentleman's pulfe is about 65 .
" III. Another gentleman went through the fame experiment in the fame circumblances, and with the fame effects.
"IV. One of the porters to the hofpital, a healthy young man, and the pulfe 75 , was inclofed in the fove when the quickfilver food at $210^{\circ}$; and he remained there, with little inconvenience, for 20 minutes. The pulfe, now 164 , and the animal-heat, determi ned by another thermometer as in the former experiments, was $101 \frac{6}{2}$.
"V. A young gentleman of a delicate and irritable labit, whofe natural pulfe is about 80 , remained in the ftove ten minutes when heated to $224^{\circ}$. The pulfe rofe to 145 , and the animal heat to $102^{\circ}$. This gentleman, who had been frequently in the flove during the courfe of the day, found himfelf feeble, and difpofed to break out into fweats for $2 \neq$ hours after the experiment.
"VI. Two finall tin veffels, containing each the white of an egg, were put into the flove heated to $224^{\circ}$. One of them was placed on a wooden feat near the wall, and the other fufpended by a ftring about the middle of the fove. After ten minutes, they began to coagulate; but the coagulation was fenfibly quicker and firmer in that which was fufpended, than in that which was placed on the wooden feat. The progrefs of the coagulation was as follows: it was firlt formed on the fides, and gradually extended itfelf; the whole of the bottom was next coagulated; and lalt of all, the middle part of the top.
"VII. Part of the fhell of an egg was peeled away, leaving only the film which furrounds the white; and part of the white being drawn out, the film funk fo as to form a little cup. This cup was filled with fome of the albumen ovi, which was confequently detached as much as poffinle from every thing but the contald of the air and of the film which formed the cup. The lower part of the egge ftood upon fome fight tow in a common gallipot, and was placed on . The wooden feat in the fove. The quickfilver in the thermometer ftill continued at $2: 4^{\circ}$. After remaining in the fove for an hour, the lower part of the egg. which was covered with the fuell was firmly coagulated, but that which was in the little cup was fluid and tranfparent. At the end of another hour it was fill fluid, except on the edges where it was thinnet; and liere it was ftill tranfparent ; a Tufficient pronf that it ras dried, not coagulated.
"VIII. A picee of bees-wax, placed in the fame fituation with the allumen ovi of the preceding expesiment, and expofed to the fame degree of heat in
the llove, began to melt in five minutes: another piecc fufpended by a fring, and a third piece put into the tin veffel and fufpended, began likewife to liquefy in five minutes."

Iiven thefe experiments, though more accurate than the former, do not fhow the utmolt degrees of heat yhich the human body is capable of enduring. Some others, ftill more remarkable (as in them the body was expofed to the heat without clothes), by Drs Fordyce and Blagden, are alfo recorded in the Philofophieal Tranfactions. They were made in rooms heated by fues in the floor, and by pouring upon it boiling water. There was no chimney in them, nor any went for the air, excepting through crevices at the door. In the firt room were placed three thermometers, one in the hottelt part of it, another in the cooleft part, and a third on the table, to be ufed occationally in the courfe of the experiment. Of the le experiments, the two following may be taken as a fpecimen.
"About three hours after breakfaft, Dr Fordyce having taken off all his clothes, except his thirt, and being furnithed with wooden fhoes titd on with lift, went into one of the rooms, where he ftaid five minutes in a heat of $90^{\circ}$, and begun to fweat gently. He then entered another room, and ftood in a part of it heated to $110^{\circ}$. In about half a minute his fhirt became fo wet that he was obliged to throw it afide, and then the water poured down in ftreams over his whole body. Having remained in this heat for ten minutes, he removed to a part of the room heated $120^{\circ}$; and after ftaying there 20 minutes, found that the thermometer placed under his tongue, and held in his hand, ftood jult at $100^{\circ}$, and that his urine was of the fame temperature. His pulfe had gradually rifen to 145 pulfations in a minute. The external circulation was greatly increafed, the veins had become very large, and an univerfal rednefs had diffuled itfelf all over the body, attended with a ftrong feching of heat ; his refpiration, however. was: little affected. He concluded this experiment by planging in water heated to $100^{\circ}$; and after being wiped dry, was carried home in a chair ; but the circulation did not fubfide for two hours.
" Dr Blagden took off his coat, wailtcoat, and fhirt, and went into one of the rooms, as foon as the thermometer had indicated a degrec of heat above that of boiling water. The firft impreftion of this hot air upon his body was exceedingly difagreeable, but in'a few minutes all his uneafinefs was removed by the breaking out of a fweat. At the end of 12 minutes he left the room vety much fatigued, but no otherwife difordered. His pulfe beat 136 in a minute, and the thermometer had rifen to 220 degrees.

In others of thefe experiments it was found, that a heat even of $260^{\circ}$ of Fahrenheit's thermometer could be fubmitted to with tolerable eafe. But it mult be oblerved, that in thefe great heats every piece of metal they carried about with them became intolerably X $\times 2$
hot.
(A) The fcale of the thermometer, which was fufpended by the ftring about the middle of the room, was of metal; this was the only one I could then procure on which the degrees ran fo high as to give any feope to the experiment. The fcale of the other thermometer, which wasemployed for afcertaining the variatious in the ani-mal-heat, was of ivory.
hot. S nall quantitics of water placed in metalline *elels quickly boiled; but in a common earthen vef. fel it required an hour and an half to arrive at a tem. perature of $1+0$, nor conld it eser be brought near the builing point. Neither durft the people, who with impunity breathert the air of this very hot room at $26+$ degrees, bear to put their fingers into the bolling water, which indicated only a lieat of $212^{2}$. So far from this, they could not bear the touch of quickillver heated only to $120^{\circ}$, and conld but jult Dear flpirit of wine at $130^{\circ}$.

Animal HEAT. Of this there are varioue degrecs; fome animals preforving a heat of $100^{\circ}$ or more in all the diferent temperaturs of the atmofphere; others keep only a few degrees warmer than the medium which furrounds them; and in fome of the more imperfect anmals, the heat is fearcely one degree above the air or water in which they live.

The phenomenon of animal-heat hath, from the earlieft ares, been the fubject of philofophical difenffion; and, like molt other fubjects of this nature, its caufe is not yet afcertained. The beft treatifes that have appeared on the fuhject are thofe of Dr Dugud Leflie, publithed in 1778 ; and Mr Adair Crawfore, in 1.79 . From the tirl of there performances, the following accuant of the different opinions on this I rabject is cxtracted.
Opinines of "The ancients peffeffed not the requifites for mithe ancerte nutely inveltigating the feience of nature; and, prone concert. aniandben:。 to fupertition, atributed every phenomenon which eluded their invetigation, to the influence of a fuper- natural power. Hipnoctates, the fatler and founder ofmedicine, accounted animal heat a myftery, and bethowed on it many atributes of the Deity. In treat ing of that fu-ject, he fays in exprefs terms, "what we call keat, orpears to me to be fomething immortal, which undertands, fees, hears, and knows every hing prefent aad io cone."-Aritotle fiems to have confhcered the fubject particularly, but nothing is to be net with in his works that can be faid to throw lignt upon it.-Galen tells us that the difpute between the philofophers and phyticians of his time was, "whedher animal heat depurded on the motion of the heart and arterits: or whether, as the motion of the heart and arterics was innate, the hetat was not alfo innate." Both thele opiniore, hoverer, he rejeets; and attempts a folution of the qutetion on his favourite fytem, namtly, the feripatetic philolophy: but his leading principles being erronsons, his dedintions are of cumfe inscmiable.
" "1\% enter into a minute detail of all the opinions offered by the moderns on the caufe of animat-teat, nuuld fat exceed our limits. Mofl of them, howeven, may be refersed to one or wher of the three general caties of heat, viz. misture, fermentation, and mechanical taians, each of which we thall partieular b) cunfider.
" t. Chamicel miatwe. When chemical philofoply firf came into rogue, and prevaited in the theory as well as prućtice of medicine, almofterey operation in the animat machine was fuid to be the effect of formath or mixture. Fiom ubferving, that on the mixing of certain bodies far below the temperatare of the human body, a degre of heat fometimen rifing to aduad iddammation nas produced; they, without fur-
ther invefigation, pronounced misture the fole caufe of animal heat. Vanious, however, were the opinions, not only refpeeting the place where the mixture lappenct, but alfoconcerning the nature of the Aluids of which it contrted. Van Holunont, Sylvius, and feveral others, fuppord that the mixture took place in the inteftimal tube ; and aferibed it to an efervefeence between the pancreatic juice and the bile. Others difcovered acids in one place, and alkalies in another; but the general opinion for near two centurics was, That acefeent fluids taken in, mecting with others of an alkaline nature already prepared in the body, gave rife to the degree of heat peculiar to animals. But thofe who are in the lealt acquainted with the laws of the animal economy, need not be toll that thefe opinious are mere conjectures, founded on facts gratuitoufly affumed. No experiments have fown cither an acefeency or alkalefeney in the bile that is fufficient to mite with the other animal juices, and generate the hat of animals. But though we thould admit the fuppofition in its full extert, ftill it would by no means he fulfeient to account for the dlability of animal heat in different climates and fealums; its equasility all over the body when in health; its partial increnfe in topical inflammations; or hardly indeed for any one phenomenon attending its production.
"Since, then, it appears that the fllids fuppofed to be mised, the place in which the misiture is made, and every other circumfance relating to it, are neither afcertained nor ficonded by analogy, none will, we profume, helitate to reject every hypothelis of the caute of animal heat founded on the effects of mixture.
"2. Fermentotion. When a more accurate and extenfive knowledge of the various operations of nature had convinced phyfiologits of the abfurdity of explaining the vital functions of animals, and the feveral changes which take place in the living body by the effects of chemical mixture, fermentation was fubtituted in its Alead. All had oblerved, that fermentation was renerally accompanied by heat; and for were ignorant, that that identical procefs, or one ext:emely fimilar to it, was conltantly going forward in living animals; and it was not without fome appearance of irath, that phyfologits attributed animal heat. to that caufe.
"Formesly there were various modibeations of this opinion ; but of hate it has been chiefly confined to one faccies of fermentation, viz. the putrefactive, which indecd is more confentaneous to experience and fou:rd philufoply. For althotagh animal fubllances are either direcily or indircilly produced from vegetables, as all animals live on regctables, or on animals that have lived on them; and though they may be ultimataly refolved into the finme principles; yet they are certainly combined in a diferent manner : for they conflutute empound:, tiee natures of which are effentially different ; and of the three Itages of fermentation, the vinous, actous, wud purid, the lalt is the only one towhich they how a tolency. Mik indeed tend to the accous, and even to the vinous fermentation; but as it can hardly be confidered as perfeetly animalized, it ought not to be cunfuered as an exception to the general pofition. And though it be readily admitted, that animal matter is extremely apt to putrefy, and that even

Heat. in the living body there is a tendency to that procefs; yct it may be hown, that the degree to which it takes place can have little or no hare in generating the heat of animals. In the lirit place, the effet of any degrec of putrefaction in producing heat, is to this day fo ill afectaincd, that, with many ingenious philofophers, it is altogether problematical, whether or not animal fubftances, duriug the putrefactive procefs, do ever generate heat. Neither M. Beaume nor Dr Pearfon, who made feveral accurate experiments with a view to afcertain this point, could, by the affitance of the molt fenfible thermoncters, difoover the leat difference betwixt the temperature of the patefying mixtures and the furrounding medium; and were the putrefaction of animal fubtances readdy attended with the gencration of heat, we might expect to find it greater in proportion to the bulk of the phtrefying mafs. This, however, is not the eafe; for it has often been found, that the larget maffes of aninal matter, fuech as the carcale of a large whale, haid out and expoled to the air in fuch a purid condition as to affit all the neighbourhood with an intolerable ftench, did not to the perfons handling it fecl fenfibly hotter than the circumambient nir. But what at once overturnsevery thing that can be advanced in favour of the generation of animal heat on the principles of putrefacition is, that heat is far more confiderable in a living than in a dead body; and no rational phyliologit will deny, that the putrid fermentation is going forward raore rapidly in the hater than in the former.
" 3. The mechanical sencration of heat. This opinion fift took its rife from an obfervation, that animal heat generally keeps pace with the tate of the circhlation : while the action of the heart and arteries continues unimpaired, a high degree of animal heat is produced; but when that aftion lecomes more lainguid, the leat of the animal is diminihed alfo. This, till very lately, was the favourite opinion of phyicians, and was introduced immediately after Harvey liad difcovered the circulation of the blood, and indeed feems to be fupported by many firiking fatts. Phyfiologits looked upon it as a matter ahnolt capable of mathematical demonftration ; yet they could not agree whether the heat of animals is occalioned by the friction of the blond againg the veffels which contain it, or by the interral friction and agitation of the parsicles among one another. Yarious hypothefes accordingly were framed, and many ingenious argunents brou the in fupport of thein : but all hiepoftions of the nechanical kind are overthrown by fome thermometrical obfervitions of De Haen and othere, from which it appeared, that the heat of the body was fometimea greater than is ulual with healthy people, at the tine the perfon was jult expiring, when the aetion of the xeffls was very weak; nay, even after be was dead, when it had entirely ceafed. The abovementioned phyfician relates two very remarkable cafes of this kind. In the one, he found that the temperature of his patient, which during the courfe of an iaflammatory fever had never exceeded 103 degrecs, at the time he expired, and for two minutes after, ftood at 105 . From the other it appeared, that the heat of a perfon who was dying of a lingering diftemper, rofe in the lalt agony from 100 to 105, and continued there Ilationary for two
hours; and, even at the expiration of 1 ; houre, hat Hose. only fallen to $85^{-3}$, though the fursounding mediun did not exceed 60\%. The cramples alio of thofe who are faffocated by fixed air, entirely oveturn not only the mechanical fytter, but almolt every cher whicha hath yet appeared on the fubject. [See the article Llood, n' 31.$]$
"One or enter of the abovementioner haypottefis Dr Cultes's continued to be alopesd by phyficiars, tilf Dr Cullencernion, atempted a folution on a new fet of principles; but, with cb. attentive to the dilisence with which norel opinions ${ }^{\text {scthour. }}$ oughe to be broached, he delivered his as litthe more than a mere eonjecture. 'May it not (foys he) be Irfit of finpenfed, wat there is fome circumstance in the vital itatione, piluciple of aminald, which is in common to thofe of p.224. the fane ofs, and of lite economy; and which of tomines the cffect of motion upon the vial princigle to be the fanc, though, the mution acting upon it may be in differme circumtances?"-The doetor weas driven to this fuppofition frum the difficaliy he found in opphining how fo many animals of a diferent age, fizc, and temperament, thould pofefs very nearly the fanc degree of locat; and in which it is imponible to flow, that the motion of the biood in all its circurnAnaces is exactly the fame; or that in the diferent arimils in which the degree of heat is confiderabiy different, the motion of the circulating mafs is in each correfponcent to the difference of temperazure. But, granting that the degree of heat does not always ohtain in an cxast ratio with the motion of the bood, and that this is an infuperable objection to its mechanical generation; yet hicte appear no plaufible growads for fuppofing that the effect of motion may be the fame, while the motion atting upon it is in different circumitances. Byr this Dr Culten mean3, that the differeut temperature of diferent animals is owing to a diference of the vital primsiple, infomuth that the velocity of the blood may be the fame in a frog as in a man; and yet, in confequence of the diferent vital principle, the heat produced may be diferent. The facts upon which he feems to lay the greatelt it cis are, That neither where the furrounding medium confiderably furpafies the temperature of the living body, nor whene it is far below it, is there any fenible change in the hat of animals. Thefe, and forme fimat facts, in appearance countenance his hypothefis; yet we have no folid reafon for imagining the prirciple of life to be diferent in different animals. And how are we to concive, that the fame dagree of motion fiotid in one clife of antunals always produce a centain degrec of heai, and in another clafs as regularly a different oac? A propofition of fuch a mature thould, no doubt, require the mot cbvious facts and conclulive arguments to ellablith it ; but, in the prefent inflance, we do not perceive any probable reafor, even from analogy. Belides, to fay that the principle of life can generate heat or cold, indeperdent of chemical or mellanical means, is contrary to experictice, and feems in itfelf abfurd.
" In the C6th volume of the Philofop:" cal Tranfac. tions, Dr Hunter, after reciting fome experiments concerning animal heat, aftuts, that cortain animals entirely deflitute of nerves, are endowed with a power of generating their own heat; and this be brings as

Hos?. an argumentum crucis againtt thofe who account the nervous fyttem the feat of animal-heat. If this is really a fact, it muft, no doubt, have all the weight he afcribes to it ; but it is plain that no ltrefs can be laid upon it, unlefs it was better efcertained, which it is evident it never can be. For though we can poli:tively affert that nerves exit where we fee thern, yet we cannot affirm with equal certainty that they do not alfo exitt where we are not able to difcover them. For all anatomilts allow, that there are thoufands of nervous filaments fo finely interwoven into the compofition of the more perfect animals of every fize, that they elude not only the knife and naked eye, but even the bett optical inllruments hitherto invented. Since then we adinit the prefence of nerves in ore tribe of animals, though we can only perceive them in their effects; what folid reafon have we to deny them in another, i) which we have the very fame evidence, viz. certain indication, of fenfe and motion?
"Awother theory, and perhaps the belt fupported which hath yet appeared on the fubject, is that of Dr Black. That excellent chemift having obferved, that not only breathing animals are of all others the warm-
the doctrine they are meant to eftablifh: and the fub. fequent animadverfions on Dr Black's theory at large, will, it is hoped, fuffice to how, that it is not only founded on dubious and controvertible principles, but that it is, in every point of light, clogged with unfurmountable difficulties.
"I. Many and various are the proofs which evince the improbability of the luags being the fource or elaboratory of animal beat: for, though it be granted, that there fubfills a very ftriking connection between the flate of refpiration and the degree of heat in animels, and that they are even in proportion to one another; yet it by no means enfues, that the former is pofitively the caufe of the latter. For, were that really the cafe, it is obvious, that thofe animals which are deftitute of the organs of refpiration would generate no heat. That, however, is not true in fact: for thofe fifhes which are even dettitute of gills, appear from various experiments to be warmer than the ordinary temperature of the element in which they live; an irrefragable proof that the function of refpiration is not abfolutely neceflary to the production of heat in animals.
"II. If the heat of living animals be generated folely in the lungs, two things neceflarily follow: the firit, That it can only he communicated to the other parts of the body through the channel of the artcrial fyltem; the fecond, That the heat mult decreare as it recedes from its fuppofed centre. And a clear and fatisfactory evidence of both thefe points will, no doubt, be deemed requifite to render Dr Black's opinion in any degree probable. So far, however, are we from meeting with thofe pofitive and convincing proofs which we had reafon to expect, that we are not prefented with a fingle plautible argument in favour of either of the points. On the contrary, it is more conformable to facts, that the venal blood is, if not warmer. at lealt as warm as the arterial. Dr Stevenfon, an ingenious and accurate phyfologitt, with a view to afcertain this matter, laid bare the jugular vein and carotid artery of a calf, and then tied and cut them of at once, in order to let equal quantities of blood flow, in a given time, into veffels of an equal capacity, in each of which be had placed a well-adjufted thermometer; the refult of the experiment was, that the thermoneter immerled in the venous blood rofe feveral degrees above that placed in the arterial. But though it is probable that there is not fuch a difference as that experiment feems to make, yet feveral reafons incline me to think, that the venous blood, inllead of being colder, as Dr Black maintains, is in fact fumewhat wamer, than the arterial; aod what entirely overturus his opinion is, that no experinemt, though many have been made, has ever hhown that the temperature of the blood is higher in the left venticle of the heart than in the right, which inult neceflarily be the cafe, were all the heat of the auimal body generated in the longs.
© III. Having thus rendered it improbable that the generation of animal-heat fhould be entirely confined to the lungs, we thall venture a thep farther, and endeavour to how, that the vital fluid, fo far from acquiring all its heat in the pulmonary fyitem, communicates no inconfiderable portion of what it had received in the courfe of the circulation to the air al-
ternately
ell, but alfo that there fublifts fuch a clofe and Atriking connection between the flate of refpiration and the degree of heat in animals, that they appear to be in an exact proportion to one another, was led to believe, that animal heat depends on the flate of refpiration; that it is all generated in the lungs by the action of the air upon the principle of inflammability, in a manner little diffimilar to what he luppofed to occur in actual inflammation; and that it is thence diffufed by means of the circulation over the relt of the vital fyftem.
"This opinion is fupported by many forcible arguments. I. It is pretty generally known to naturalits, that a quantity of mephitic phlogitticated air is conitantly exhaling from the lungs of living animals.Since, therefore, atmofpherical air, by paffing through the lungs, acquires the very fame properties as by pafling through burning fuel, or by being expofed to any other procefs of phlogitication, it is obvious, that the change which the common air undergoes in both cafes mutt be attributed to one and the fane caufe, viz. its combination with phlugitton. 2. It has likewife been urged in favour of the dame hyputhefis, that the celerity with which the principle of inflammability is feparated in refpiration, is very clofely connected with the degree of heat peculiar to each animal. Thus, man, birds, and quadrupeds, vitiate air very falt ; ferpents, and all the amphibious kind, very flowly; and the latter are of a temperature inferior to the former, and breathe lefs frequently. 3. The moft cogent argaments that have been brought in fupport of this opinion are, that no heat is generated till the function of refuiration is ellablifhed; and that the foctus in utero derives all its heat from the mother."

Upon this theory our author makes the following obfervations, which we thall give in his own words.
"Thefe arguments may, perhaps, on a fuperficial view of the quettion, appear conlufive; but a found reafoncr, who thall coolly and impartially weigh every circumbltace, will, I am confident, allow that they coly afford a yery ambignous and imperfect evidence of

## H E A

ternately entering into that organ and iffuing from it Various are the arguments which tend to evince this opinion. Were the blood heated in the lungs, we flould centainly need lefs of their function in a warm than in a cold atmofphere: but we are taught by experience, that wheu the air is extremely hot, and we wifh to be cosoled, we breathe full and quick; and that when it is intenfel- cold, our refpiation is how and languid; which, were the blood heated in the lungs by the action of the air upon it, furcly fuould not be the cale. It is therefore more confonant with reafon and experience, that the air which we infpire, by carrying oll a quantity of evolved phlogillon from the lungs rather contributes to diminith thin increafe the heat of beathing animats. Refpiration, for this realon, has been very properly compared, by an ingenious phyfologill, Dr Duncan of Edinburgh, to the blowing of bellows on a hot body. In both cafes a confiderable degree of heat is cominunicated to the air: but in meiher can the air be faid to generate any heat; for if it did, the heat of breathing animals fhould isereale in proportion to the quantity of air inhaled, and a piece of inert matter heated to a certain degree flould become hotter by ventilation.
"IV. The fuetus in wero, according to Dr Black's hypothefis, generates no heat. 'The arguments by which he fupports that pofition, how ingenious foever they may be, feem not fufficiently cogent to produce conviction; and as the quellion from its nature hardly admits of any direćt experiment, our realoning upon it muft necefrarily be analogical. Hence arifes our embarraffment; for, as the difcovering of atalogies depends on the quicknefs and fertiiity of fancy, and the tuth of all analogical ratiocination on the acutenefs and nicety of judgment, two powers of the foul feldom united in an eminent degree, we cannot wonder that arguments of this kind, which to one man feem unanfwerable, fhould to anotber appear futile.
"The only plaufible objection to the generation of heat in the foctus. is, the fuppofition that it would in a fhort time accumuiate in fuch a manner as to be. come incompatible with life.
"This argument, however, is more fpecicus than .olid; for, granting that the circulation which is carfied on between the foetus and the muther, tranfmits very nearly the temperature of her blood, that by no means entirely fuperfedes the neceflity of heat being generated in it. Various reafons lead to this opi-nion.- lt is an axiom, that heat decreafes as it recedes from the fource from which it fprang. Now, if we admit fur a moment Dr Black's opinion, and believe the heat of animals to be generated folely in the lungs, is it not obvious, that before it reaches the uterus, paffes through the very ninute tubes by which that organ is connected to the placenta, circulates through the umbilical veffels, and pervades the extreme $p^{\text {arts }}$ of the foctus, it mult be too much diminified to fuppurt that equilibrium which obtains in every part of the living fyllem. Defides, as the fatus in utero may properly enough be accounted a part of the mother,
the fame objections that are brought againt the generation of heat in ic would hold equadly good againlt the production of heat in any part or organ of her body, exeept the lungs. But fuch a multitude of accurate thermometrical obfervations have evinced the purtial increafe of heat in lueal inflammations, that ros room is left to doubt, that in cvery individual part of the vital frame heat is generated; and if the fuetus be, from any caufe whatever, liable to topical inlammation, a thing which no phyhologit has ever pretended to deny, what hadow of reafon is there for doubting that fuch aflecions are accompanied with the fame effects before as after birth, and confequently with a partial increale of heat !"

Our author having now, as he fuppofes, refuted the Dr buopinions of others, after fhowing that lecat, though gud's che: generated, cannot accumulate in the fuetus, proceeds to ory. lay dowo his own theory, which depends on the following principles.

1. That the blood does contain phlugifton.
2. 'That this phlogition is evolved, extricated, or brought into a llate of activity and morion by the action of the blood-veffels to which it is fubjected in the courfe of circulation
3. That the evolution of phlogifton is a caufe which throughout nature prodices heat, wlsther that heat be apparently excitcd by mixture, fermentation, percuffion, friction, iuflammation, ignition, or any fimilar caufe.
4. That this heat, which mult be produced in confequence of the evolution of the phlogitlon from the blood of different animals, is in all probability equal to the highelt degree of heat which tiede animals in any cale poflefs ( B ).

The firf and fecond of thefe propofitions will rea. obje ${ }^{7}$ eion dily be granted: but the third is liable to a very great to is.
objection, namely, that from putrefying bodics, phlo. gifton is evolved in quantity futficient to reduce to their metallic form the calces of fome metals expofed to the vapour, as Dr Dugud hath acknowledged; yet he himfelf affirms, that no fenfible heat is produced by putrefying animal lubflances. To this he is obliged to reply, that phlogitun is extricated more flowly from mixtures undergoing the puirid fermentation, than from fuch as are undergoing the vinous and acetous ones; and that the volatile alkali produced from putrefying fubftances likewife hinders the action of the phiogilton. But the finf part of this anliver is not proved, and is what he himfeli calis only a proballe conjicture. Neither doth the fecond appear to be well founded: for putrefying fubfancs, urine excepted, afford but little volatile alkali; and even putrid urine itfelt, which affords fueh a large portion, is not colder than other putrid matters.

It is however needlefo to infit farther on this theory, fince his fundamental principle, namsly, That the venous blood is warmer than the arterial, hath been Rown to be falle by Mir Adair Crawford, of whofe hypothefis we mull now give an accomnt.

This gentleman, who, in his gencral doctrine of heat, Mr Crave feems to agree with Dr Livin of Glafgow, begins with ford', the
$\qquad$
$\underbrace{\text { Heat. }}$ fire, he tells us, are ambiguous. Heat in common crimiuately to exprefo a fenfation of the mind, and an nuknown principle, whether we call it a qualify or a fublane, which is the exciting cause of that fellation. The latter, he, with Dr Levin, calls abfolute beat; the former, ferfoble beat. The following are the gearal faces upon which his experiments are founded.
i. Heat is contained in great quantities in all bodies when at the common sernperature of the atmofyhere.
2. Heat has a conllant tendency to diffufe itself over all bodies, till they are brought to the fame de. gree of fencible heat.
3. If the parts of the fame homogeneous body have the fame degree of fenfible heat, the quantities ot $a b$. folute heat "ill be proportionable to the bulk or quan. tidy of matter. Thus the quantity of absolute heat contained in two pounds of water, mull be conceived to be double of that which is contained in one pound, when at the fame temperature.
4. The mercurial thermometer is an accurate maSure of the comparative quantities of abfolute heat which are communicated to the fame homogeneous bodies or Separated from them, as long as fuck bodies continue in the fame form. If therefore the fenfiole heat of a body, as meafured by the mercurial thermometer, were to be diminifhed the one half, or the one third, or in any given proportion, the ableluce heat would be diminified in the fame proportion.
5. The comparative quantities of abfutute heat which are communicated to different bodies, or feparated from them, cannot be determined in a direct manvier by the thermometer. Thus, if the temperature of a pound of mercury be railed one degree, and that of a pound of water one degree, as indicated by the thermometer, it does not by any means follow, that equal quantities of absolute heat have been communigated to the water and the mercury. [See Heat and Thermometer.]-If a pint of mercury at $100^{\circ}$ be mixed with an equal bulk of water at $50^{\circ}$, the change produced in the heat of the mercury will be to that produced in the water as three to two: from which it may be inferred, that the abfolute heat of a pint of mercury is to that of an equal bulk of water as two to three; or, in other words, that the comparative quantities of their absolute heats are reciprocally proportionable to the changes which are produced in their fencible heats, when they are mixed together at different temperatures. This rule, however, does no i apply to thole mixtures which generate fencible heat or cold by chemical action.

From the above pofition, fays Mir Crawford, it follows, that equal weights of heterogeneous fubflances, as air and water, having the fame temperature, may contain unequal quantities of absolute heat. There mut, therefore, be certain effertial differences in the nature of bodies. in consequence of which fume have the poser of collecting and retaining the element of fire in greater quantities than others, and the fe differrenes be calls throughout his treatife the capacities of bodies for containing heat.

Having premifed thefe general facts, our author gives an account of a number of experiments made, No 149.
in order to afcertain the quantity of absolute heart contained in different bodies. There experiments were made by mixing the bodies to be examined with water, heated to different degrees; and by the emperature of the mixture, he found the proportion of the capacity of the bodies for containing heat, to water, and, of confequence, to one another. Thus he found the capacity of wheat: for containing heat to be to that of water as 1 to 2.9 ; and, of confequence, the abfolute heats of the two fubltanees to be in the fame proportion. The absolute heat of oats to that of water he found as I to $2 \frac{1}{5}$; of barley, as I to 2.4 ; of beans, ar 1 to 1.6 ; of flem, as ito 1.3 ; of milk, as 1 to 1.1 ; and of a mixture of venous and arterial blood from a hep, as 25.4 to 24.4 . Dy other experimenes he determined, that the absolute heat of venous blood was to that of water only as 100 to 112, whereas the abfolute heat of arterial blood was to that of water as 100 to 97.08 .

By experiments made with air of different kinds contained in bladders, and inmerfed in water, he found that the absolute heat of atmofpherical air was exceedingly great, being to that of water as 18.6 to 1 ; that of dephlogilticated air was fill greater, being to the heat of common atmofpherical air as 4.6 to i. The heat of phlogillicated and fixed air was much lefs; that of the latter, particularly, being to the heat of atmoSpherical air only as 1 to 67 .

From other experiments made on metals, $\mathrm{MrCrav-}$ ford concludes, that the abfolute heat of tin, in its metallic tate, is to that of water as 1 to 14.7 ; but the heat of calcined tin is to that of water as to toot. In like manner, the heat of iron was to that of water onlye as : to 8 ; but that of the calx of iron was to the heat of water as 1 to $3.1, \$ \mathrm{c}$. And from the fe experiments he is of opinion, that the more phlogitton that is added to any body, the left is its capacity for contailing heat.

From the fe experiments our author deduces the furl. lowing theory of animal heat.-"It has been proved, that the air, which is expired from the lungs of animals, contains lefs absolute heat than that which is inhaled in infpiration. It has been flown, particalarry, that in the procefs of refpiration, atmofpherical air is converted into fixed air ; and that the absolute heat of the former is to that of the latter as 67 to t .
"Since therefore the fixed air which is exhaled by expiration is found to contain only the one fixtyfeventh part of the heat which was contained in the atmofpherical air previous to infpiration, it follows, that the latter mut neceffarily depolit a very great proportion of its absolute heat in the lungs. It has moreover been flows, that the absolute heat of florid arterial blood is to that of venous as $11_{2}^{\frac{1}{2}}$ to 10 . And hence, as the blood, which is returned by the pulmonary vein to the heart, has the quantity of its ablolute heat increafed, it is evident that it mut have acquired this heat in its paflage through the lungs. We may conclude, therefore, that in the procefs of respiration, a quality of abfulute heat is feparated from the air and abforbed by the blood.
". That heat is feparated from the air in refpization, is farther confined by the experiment with pllagiticatted air ; from which, compared with Dr Prielley's dir-
difcoveries, it is manifer, that the power of any feecies of air in fupporting auinal life, is nearly in propoution to the quantity of abfolute heat which it contains, and is conicquently proportionable to the quantity which it is capable of dep liting in the lungs.
"The truth of this conclufion will pcrhaps appear in a clearer light from the following calculation, by which we may form fore idea of the quantity of heat yielded by atmofpherical air when it is conscted into fixed air, and alfo of that which is abforbed during the converfion of venous into arterial blood.
"We have feen, that the fame heat which raifes atmofpherical air one degree, will raife fixed air nearly 67 degrees; and confequently that the fame heat which raifes atmofpherical air any given number of degrees, will raife fixed air the fame number of degrecs multiplied by 67 . In the Peterfurgh experiment of freezing quick filver, the heat was diminifhed 200 degrees below the common temperature of the atmofphere. We are therefore certain, that atmofpherical air, when at the common temptratutc of the atmoSphere, contains at leaft 200 degrees of hicat. Hence, if a certain quanticy of atmofpherical air, not in contact with any body that would inmediately carry off the heat, thould fuddenly be converted into fixed air, the heat which was contained in the former would raife the latter 200 degrees multiplied by 67 , or 13400 degrees. And the heat of red-hot iron being 1050, it follows shat the quantity of heat, whith is yielded by atmofpherical air when it is converted into fixed air, is fuch (if it were not diffipated) as would raife the air fo changed to more than 12 times the heat of yed hot iron.
"If therefore the abfolutc heat which is difengaged from the air in refpiration, were nct abforbed by the blood, a very great degree of fenfible licat would be produced in the lungs.
"Again, it has been proved, that the fame heat which raifes venous blood 115 degrees, will raife arterial only 100 degrees; and contequently, that the fame heat which raifes venous hlood any given number of degiece, will taife arterial a lefs number, in the propertion of roo to 115 , or 2 C to 23 . But we know that venous blood contains at leaft 230 degrees of heat. Hence, if a certain quantity of venous hlood, not in contact with any bedy that would immediately fupply it with heat, fhould fuedenly be converted into arterial, the beat which was contained in the former would raife the latter only $\frac{20}{2}$ or 230 degrees, or 200 de grees; and confequently the fentible heat would fuffer a diminution equal to the difference between 230 and 200 , or 30 degrees. But the common temperature of blood is 96 : when, therefore, venous blood is converted into arterial in the lungs, if it were not fupplied by the air with a quantity of heat proportionable to the chance which it undergocs, its fenfitle heat would be diminithed 30 degreas, or it would fall from 96 to 66 .
"That a quantity of heat is detached from the air, and commanicated to the blood, in refpiration, is moreover fupperted by the experiments with metals and their calces: from which it appears, that when bodies are joined to pllogithon, they lofe a portion of their abfolute heat; and that, when the phlogitton is agam

Vot. Vill. Pate I.
difengazed, they reabiorb an equal portion of heat from
Ifer the furrounding bodies.
"Now it has been demontrated by Dr Prictley, that in refpiration, plafogifon is feparated fro:n the blood, and combined with the air. During this procefs, therefore, a quantity of abfolute heat muft necef farily be difengaged from the air by the action of the phlogiton; the blood, at the fame moment, being left at liberty to unite with that partion of heat which the air had depofited.
"And hence animal heat feems to depend upon a procefs limilar to a chemical elective attraction. The air is received into the lungs, containing a great quantity of abfolute heat. 'The blood is returned from the extremities, highly impregnated with phlogiton. The attraction of the air to the phlogiton is erreater than that of the blood. 'This principle will, therefore, leave the blood to combine with the air. By the addition of the phlogillon, the air is obliged to depofit a part of its ablolute luat; and as the capacity of the blood is at the fame moment increafed by the feparation of the phlogiton, it will inlantly unite with that portion of heat which had been detached from the air.
"We learn from Dr Priefley's experiments with refpect to refpiration, that aterial blood has a ftrong attraction to phlogilton: it will confequenty, during the circulation, imbibe this prisciple from thofe parts which retain it with leall force, or from the putefecent parts of the fytem: and hence the venous blood, when it returns to the lungs, is found to be highly impregnated with phlogiton. By this impregnation, its capacity for containing heat is diminifhed. In proportion, therefore, as the blood, which had been dephlogifticated by the procefs of refpiration, becomes again combined with phlogiton in the courfe of the circulation, it will gradually give out that heat which it had received in the lungs, and difinfe it over the whole fyttem.
" Thus it appears, that, in refuiration, the blood is continually difcharging phlogiton and abforbing heat: and that, in the courfe of carculation, it is continually imbibing phlogiton and emirting tieat.
"It may be proper to add, that as the blond, by its impregnation with phlogiton, has its capacity for containing heat diminifthed: fo, on the contrary, thofe parts of the fyftem from which it receives this principle, will have their capacity for containing heat increafed, and will confequenily abforls heat.
"Now if the changes in the capacitics, and the quantities of matter changed in a given time, ware fuch, that the whole of the abfolute heat feparated from the blood were abforbed, it is manifett that no part of the heat which is received in the lungs would become fenfible in the courfe of the circulation.
"That this, however, is not the care, will, 1 think, be evident from the following contiderations:
"Wicknow that fenfible heat is produced by the circulation of the blood; and we have proved by experiment, that a quantity of abfolute heat is commu. nicated to that Auid in the lungs, and is again difengaged from it in its progrefs through the fyttem. If, therefore, the whole of the abfolute heat, which is feparated from the blood, were abforbed by thofe parts

Heat. of the fytem from which it receives the phlogiton, it would be neceflary to have recourfe to fone other caufe, to account for the fenfible heat which is proonced in the circulation. But. by the rules of philofophifing, we are to admit no more caufes of natural things than fuch as are both true and fulficient to ex. plain the appearances; for nature delights in fimplicity, and affects not the pomp of fuperflious caufes.
"We may, thcrefore, fafely conclude, tha: the abfolute hcat which is feparated from the air in refpirasion, and abforbed bs the blood, is the true caufe of animal heat.
" It mult neverthelefs be granted, that thofe parts of the fyltem which commanicate phlogiton to the blood, will have their capacity for containing heat increafed; and therefore, that a part of the abfolute heat which is feparated from the blood will be abforbed.
" But from the quantity of heat, which becomes fenfible in the courfe of the circulation, it is manifert that the fortion of heat which is thus abforbed is very incorifiterable.
"It appears, therefore, that the blood, in its progreis throigh the fyftem, gives out the heat which it had received from the air in the lungs: a fmall portion of this heat is abforbed by thofe particles which innpatt the phlogiton to the hlond; the reft becomes redundant, ot is converted into moving and fentible heat."
The fuljeet Mrat. Crawford's theory, which doth not effentially ftill uncer- differ from Dr Black's, feems to be the bef that hath rain.
confiderable degrec of heat always felt in digging to great depths in the earth, is agreed upon by all naturalits: but the quantity of this heat hath feldom been neafured in any part; much lefs is it known, whether in digging to an cqual depth in different parts of the earli, the heat is found always the fame. In digging mines, wells, \&ec. they find that at a litele depth below the furface it feels cold. A little lower it is colder ftill, as being beyond any immediate infuence of the fun's rays; infomuch that water will ferezs alnoft at any feafon of the ycar: but when we go to the depth of 40 or 50 feet, it begins to grow warn, fo that no ice can bear it; and then the deeper we go, ftill the greater the heat, until at lat refpiration grows diffo cult, and the caudles go out.

This heat of the earth hath been varioully explained Some have had recourfe to an immenfe body of fire lodged in the centre of the carth, which they confider as a central fun, and the great principle of the generation, vegtation, nutsition, sec. of foltil and vegetable bodies. But Mr Beyle, who had been at the bottom of fome mines himfelf, fufpects that this degree of heas, at leat in fume of them, may arife from the peculiar nature of the minerals generated therein. Tis coufirm this, he inflances a mincral of a vitriolic kind, dug up in large quantitics in many pars of Eingland, which by the bare aftution of common water will grow fo hot, that it will almolt take tive. - Thete hyputhefes are liable to the following objections. 1. If there is within the earth a body of actual tre, it feems difficult to fhow why that fire fould not confume and motider away tle outer thell of earth, till either the earth was totally deltroyed, or the fire cxtinguifted. 2. If the internal heat of the earth is owing to the action of water upon mineral fubltances, that action through time mult have ceafed, and the heat have totally vanifled; but we have no reaf n to think that the heat of the earth is any thing lefs juit now than it was a thoufand years ago. The phenomenon is ealily explained by the propolitions laid down under the article Heat. If heat is nothing elfe than a certain mode of action in the exhereal fluid, or the matter of light, by which it flows out from a body in all discetions as radii drawn from the centre to the circumference of a circle; it will then follow, that if an opaque body abforbs any confiderable quantity of light, it mut ne. ceffarily grow hot. The teafon of this is plain. The body can hold no more than a certain quansty of thereal matter; if more is continually forcing itfelf in, that which has already entered muft go out. But it cannot eafily get out, becaufe it is hindered by the particles of the body among which it is detained. It makes an effort theretore in all directions to feparate thefe partictes from each oher; and hence the body expands, and the effort of the fluid to efcape is felt when we put our hands on the bady, which we then fay is bot. Now, as the earth is perpetually abforbing the ethereal matter, which comes from the fun in an immenfe liteam, and which we call his hight, it is plain, that every pore of it mult have been filled with this matter long ago. The quantity that is lodged in the earth, therefore, mutt be comirnally endeavouring to fuparate itz particles from each other, and confequent. ly mut make it hot. The atmofplere, which is perpetually receiving that portion of the ethereal matier

## H E A

which ifues from the carth, counteratts the force of the internal hicat, and cools the external furface of the earth, and for a confiderable way down; and hence the earth for 20 or 30 feet down, hhows none of that heat which is felt at greater dephls. See Heat.
Heat, in medicine. Great hicats are not fo much the inmediate, as the remote, caufe of a general ficknefs, by relaxing the fibres, and difpofing the'juices to putrefaction ; cipccially among fodiers and perfuns expured the whole day to the fun: for the greateft heats are fellom found to produce epidemic difeafes, till the perifiriation is flopped by wet clothes, fogs, dews, damps, \&c. and then fome bilious or putrid diftemper is the certain confequence, as fluxes and ardent intermitting fevers. Neverthelefs, it mutt be allowed, that heats have fometines been fo great as to prove the more imnnediate caufe of particular diforders; as when centinels have been placed without cover or frequent reliefs in feorching heats; or when troops march or are extrifed in the hat of the day; or when people imprudently lie down and lleep in the fun. All thefe circumftances are apt to bring on ditempers, varying accurding to the feafon of the year. In the beginning of fummer, thefe errors produce inflammatory fevers; and in autumns a remiting fever or dyfentery. To prevent, therefore, the efficts of immoderate heats, connmanders have found it expedient fo to order the marches, that the men come to their ground before the luat of the day ; and to give frict orders, that none of them flecp cut of their tents, which, in fixed encanpments, may be covered with bough, to fhade them from the fun. 1t is likewife a rule of great impurtance to have the foldiers exercifed before the cool of the morning is over; for by that means not ouly the fultry heats are avgided, but the blood being cooled, and the fibres braced, the body will be better prepared to bear the heat of the day. Laflly, in very hot weather, it has ofien been found proper to therten the centincls duy, when obliged to fland in the fun.
Heath, in botany. Sec Erica.
Bery-bearing He,qu. Sce Empetrum.
HEATH (James), an Englifin liitlorian, was born 1629 at London; where his father, who "as the king's cutler, lived. He was educated at Weflminfter fchool, and beeane a fludent of Clurill-church, Oxford, in 1646. In 1648 , he was cjected from thence by the palliament vifitors for liis adliernce to the royal caufe ; lived upon his patrimony till it was almolt fpent; and thien marrying, was obliged to write buoks and correet the prefs in order to maintain his family. He died of a confumption and droply at London in Augulf 1664, and left feveral children to the parifh. His principal publicationf were, 1, A brief Chronicle of the late Intentine War in the Three Kingtoms of England, Scothand, and Ireland, \&e. 1661, 8vo; afterwards enlanged by the author, and completed from 1637 to 1663 , in Lour parts, 1663 , in a thick 8 vo . To this was again added a continuation from 1663 to 1675 by John Plilips, nephew by the mother to Mill. ton, 1676 , folio. 2. Flagellum: or, The Life and Death, Birth and Burisl, of Oliver Crommell, the late Uferper, 1613 . The third edition came out with ad. ditions in $1665,8 v 0$. 3. A New Book of Loyal Englifh Marty's and Confelfors, who have endured
the Pains and Terrors of Death, Arraignment, \&c. for the Maintenance of the juil and legal Government of thefe Kingtoms both in Church and State, 1663 , 12 mo . The reafon why fuch writers as our author continue to be read, and will probably always be read, is not ouly becaufe Hifloria quogua modo fripsta dile eiat; but alfo becaufe in the meaneft hiftorian there will al. ways be found fome faets, of which there will be ne eaufe to doult the truth, and which yet will not b: found in the beft. Thus Heath, who perhaps hat nothing but pampllets and newfpapers to compile from, frequently relates facts that throw light upon the hiftory of thofe times, which Clarendon, though he drew every thing from the moft authentic records, has onitted.

Heath (Thomas), an aldermen of Exeter, and father of John Heath, Efq; one of the judges of the Common pleas, was author of $A_{n}$ Effay towards a new Englith Verfiun of the Book of Job from the original Hebrew, with fome account of his Life, 7755 8 vo . - His hrother Bonjamin, a lawyer of eminence, and town clerk of Excier, was likewife an author; and wrote, 1. An Effay towards a demonltrative Proot of the Divine Exiftence, Unity, and Attributes; to which is premifed, A hort Defence of the Aıgument commonly called á riori, 1740. 2. The Cafe of the County of Devon with refpec: to the Confequences of the New Excife Duty on Cyder and Perry. Publifhed by the direction of the Cominittee appointed at a General Meeting of tha: County to fupetintend the Application for the Repeal of that Duty, $1,63,4$ to. 3. Nota five Leciiones ad Tragicorum Grecornm veitrum,侑/Clyli, \&c. 1752, 4to ; a work which places the author's learning and critical filll in a very conficuous light. The fame folidity of judgment apparent in the preceding, diftinguithed the author's lail production. 4. A Kevifal of Shakefpeare's 'Text, whercin the alterations introduced into it by the more modern editors and critics are paticularly confidered, 1765, 8 ro.

HEATHENS, in matters of religion. See Pagas.
HEAVEN, litcrally fignifies the expanfe of the firmament, furrounding our earth, and cxtended every way to an imenenfe diftance.

Heaven, among Chriftian divines and philofophers, is coulidered ab a place in fome remote part of infinite fpact, in which the omniprefent Deity is faid to afford a nearer and more immediate view of himfelf, and a more fenfible manifeltation of his glory, than in the other parts of the univerfe. This is often called the empyrean, from that fplendor with palich it is fuppofed to be invefted; and of this place the infpired writers give us the noft noble and magnificent deferiptions.

The Pagans confidered heaven as the refidence only of the celcitial gods, intu which no mortals were admitted after death, unlefs they were deificd. As for the fouls of good men, they were configned to the elyfian felds. Sec ELrstav-Fields.

Heaves, among aftronomers, called alfo the zethereal and Ilary heaven, is that inmenfe region wherein the flars, planets, and comets, are difpofed. See Assrovoar, padin.

Heaven.

EMeaver, H.hion a,

This is what Mofes calls the fromant, feaking of it as the work of the fecond day's creation; at leatt it is thu: the word bpe is ufally rendered by his interpecters ; though tomewhat abusels, to conateanace their own botion of the heasens being firm or folid. 'Jhe worl, it is ectuin, peroperly lignaitits no more tian expank or extobtion; a tem very weld alapted by the prophet in the imprefion whech the heavens make on our fenfes; wisence, in other pats of foripture, the leavers is compared to a curtais, or a cent atretched ont to dwell in. The LXX firit added to this ides of expantion that of firm or folid ; render. iaf it by coremex, accomdiag to the philofoplay of thofe times; in which thes have becn followsed by the mo. dern trandators.

The hater philofoghers, as Des Cartes, Kireher, Sce. hare eatily temontrated this heaven not to be folid, toue Guid; but they ulill fuppufe it full, or perfectly deufe, without any vachity, and cantoned out into many vor-tiees.-- Bat others have overturned not only the folidity, but the fuppufed plenitude, of the heavens. Sir Ifac Newton has abundantly hown the heavens void of almott all reliltance, and, confequently, of almoft all maiter : this lie proves from the phenomena of the eclental bodies; from the planets pertatiog in their motions without any Senfible diminution of their velucity; and the comets frecly pafing in all directions towards all parts of the heavens.

Heaven, tahea in a general fenfe, for the whole expanfe betucen cur earth and the remotett regions of the fixed ilars, may be divided into two very unçual parts, according to the maters found therein; viz. the cumofphere, or aerial heaven, pofflled by air: and the sthered heaven, pullefed by a thin, matifing meGum, called ather.

Heayen is more farticularly ufed, in aftronomy, for an obb, or circular iegon, of the rehereal beaven.

The ancient aftronomers affumed as maty dillerent heavens as they obferved different mutions thation. Thefe they fuppofed all to be folid, as thinking they could not otherwife fultain the bodies fixed in them; and forerical, that being the moil proper form for motion. Thus we had feven heavens for the foven planets; viz. the heavens of the Moon, Mircury, Venus, the Sun, Mars, Jupiter, and Saturn. The eighth was for the fixed llars, which they panticularly called the formament. Ptulemy adds a ninth heaven, which le called the priinum mobile. After hin two cryflalline heavens were added by king Alphonfus, \&c. to account for fome irregularities in the motions of the other heavens: and latily, an empyrean heaven was drawn over the whole, for the refidence of the Deity; which made the number twelve. But others admitted many more heavens, according as their different views and hypothefes required. Luduxus fuppoled 23, Calippus 30 , Regiomon. tanus 33, Ariflotle 47 , and Fracathor no lefs than 70. It muil be added, however, that the aftronomers did not mueh concern themfelves whetleer the heavens they thus alluw of were real or not ; provided they ferved a purpofe in aceounting for any of the celeflial motions, and agreed with the phenomena.

HEbDOM:ADARY, Hebdomadarius, or Hebnomadis, a neerber of a chapter or convent, whofe week it is to officiate in the choir, to rehearfe the anthems and prayers, and to paform the whal
functions which the fuperiors perform at fotmen feafes,
and other extraudinary oceafons. 'Thi word is formed of the Greck Siopesi which ligntics the number foín ; of irta, fiocit.
'The lebdo matary menerally collates to the hencfices which become vacant during his weck; thongh it is ufually looked upon as an abufe.

In cathedrals, the hebdomadary was a canon or presend:ry, who had thre peentiar care of the choir, and the infpettion of the offiects for his week.

In monateries, the hebd madary is he who waits at t.able for a weti, or uther Itated periud; directs and allits the cook, \&se.

HEBDONE, a folemnity of the aucient Creeks, in honour of Apollo, in which the Athenians fung liyms to his praif, and carried in their handstranches of laurel. The word lignities the forento dhy, this folematy being ubierved oa the feventh day of every lunar month.

HEBE, in ancient mytholowy, a goddefs, the idea of whom, among the Romaus, feems to have been much the fane with that of eccmal youth, or an immortality of blifs; agreeably to which, the is reprefented on agem, in the great dake's collection at Florence, with a young airy look, and dinking out of a litale boal; or, acronding to Miton's exprofisa, " ()natfing immortatity aral juy." She is fabled to have been a daughter of Jupiter and Juno. Aceording to fome the was the daughter of Ju:so only, who conceived her after eating lettrees. As the was fair and always in the bloom of you:h, the was called the groddefs of youth, and irade by her mother cup-hearer to all the gode. She was dilmilled from hea whiee by Jupiter, becaufe the fell down in an indeent pofture as the was pourinir nectar to the gods at a grand feltival; and Gaymocles, the favourite of Japiter, fucceeded her as cup-bearer. She was employed $t$ y her mother to prepare her chariot, and to harnafo her peacocks whenever requifite. When Hercules was raifed to the rank of a god, te was reconciled to Juno by marring her daughter Habe, by whom he had two funs, Alexiares and Anicetus. As Hebe had the power of reAloring gods and inen to the vigour of youth, the, at the inftance of her hufband, performed that kind office to lolaus his friend. Hebe was wormipped at Sicyon, under the name of Din, and at Rome under that of Juventas.

HELINNSTRETIA, in botany : A genns of the angiofpermia order, belonging to the didynamia elafs of plants; and in the natural method ranking under the $f$ sth order, ascregedic. The caly $x$ is emarginated, and divided beluw ; the corolla unilabiate; the lip rifing upwards, and quadrifid; the capfule difpermous; the flamina inferted into the margin of the limb of the corolla.

HEBER, the fon of Salah, and father of Peleg, from whom the Hebrews derived their name, accord. ing to Jofephus, Eulebius, Jerome, Dede, and molt of the interpreters of the facred writins; but Huet bithop of Ayranches, in his Evangelical Demonitration, has attompted to prove, that the Jucburs took their mame from the word biber, which lignitics beynd, becaule they came from beyond the Euphrates. Heber is luppoled to have been born 22SI years B. C. and to have lived $f^{6}+$ ycars.

peculiar to the Hebrow language．See the next ar－ telle．

HEBREW，fomething relating to the Hebrew． Sec Hebrew．Thus we fay，hedre：Biblc．Sic libur．

Hebrig Charazer．＇There are two kinds of He－ brew charakeers：the ancient．called allo the facers； and the moderu，or rabbinical characters．

1．The fquare Hebrew takes its densmination from the figure of ats characters，which thand more iquare，and have their antes more exact and precife than the other．This character is ufed in the sext of holy feripture，and their other principal and molt imputant writings．When both this and the rabhinical charac－ ter are ufed in the fame work，the former is for the text，or the fundamental part；and the latter for the acceflory pari，as the glofe，notes，commentaries，\＆ic．

The bat and mull beautiful characters of this kind， are thofe copied from the characters in the Spanih manucripto；next，thofe from the lalan manuferipts； then thate from the French；and latly，thofe of the Germans，whole characters are much the fame，with refpect to the other genume £quare Hiebres charac－ ters，that the Gothic or Dutch characters are with telpect to the Roman．

Several authors contend，that the fquare character is not the real ancient Hebrew character，writen from the beginning of the language to the time of the $\mathrm{Ba}-$ bylonith captivicy；but that it is the Aflyrian，or Chaldec character，which the Jews aflumed，and ac－ cultemed themtelyss to，during the captivicy，and retained afterwarls．They lay，that the Jews，during thair captivity，lad quite difufed their ancient charac－ ter ；fo that Izza fornd it neceflary th have the facred beoks tranferibed into the Chaldean fquare character． Thefe authors add，that what we call the Samaritan cbaracter，is the genuine ancient Hebrew．Of this opinion are Scaliger，Buchart，Cafauton，Vi：fiens，Gro－ tius，Walton．Capellus，\＆c．and anoong the ancients Jerome and Eufebius．On this fide it is urged，that the prefent characters are called Allyrian by the an－ cient Jewinh writers of the Taimud，and therefore mult have been brought from Affria；but to this argunent it is replied，that there were two forts of chatacters anciently in ufe，viz．the facred or picfent Square character，and the profane or cisil，which we call Samaritan；and that the facted is called Afyrian， becaufe it firt began in Afyria to come into conmon ufe．It is farther alleged，that the Chaldee letters， which the Jews now ufe，were unknown to the ancient Jews before the captivity，from Dan．i．4．More－ over，it is inferred from 2 Kings ，xuii．28．Whence we learn that a Jewifh priett was fent to teach the Sama－ ritans the worthip of Jehovah；on which occafion the mult bave taughe them the law；and ye：no mention occurs of his teaching them the language or character that the law was then written in，the character which the Samaritans uied．But the chief argumeat is taken from fome ancient Jewifh fhekels，with a legend on one fide＂The thekel of lfrael，＂and on the other ＂Jerslalem the holy，＂both in Samaritan characters． Thefe thekels，it is faid，mult have been coined before the divition of the two kingdoms of Judah and Ifratl， or at lealt before the Affyrian captivity，becaufe the Samaritans never afterwards reckoned Jeruflem huly．

## H E B

On the other fice，of for the yimitive antiquity of Ifrores． the fquare charater，are the two Buxcurfs，leoufden，
 urge，from Whtinesp o．is．that jet！in raally the lealt of the cuatuanit．ia the preirit H：brew，whereas it is one of the larget characters in the Sumaritan al－ phabet：bu：Wi．．itea replies．that it reur Suviver here Tpeaks of the ladt htit of the aiphabet，we can only infer，that the Chidec charactur was ufed in our Savi－ ou：＇s sime，which is mitdenicd by thone who main－ tain the Sumarita to be the origat．fres aloo al－ lege，that the Jews were too ubti nate and fipertitious to allow their lacred charatier to be atorid：but if this＂as done under the dircetion and anthority of Lera，the argument whil be much invaldated．Far－ ther，they fay that Lexa cond fot atocr the ancient character，becanie it was itmp whte to make the alte－ rations in all thear ctupes．Ths argument，liowever， is contraditted by fact；fince the old Englith black letter is actua！！y charged for the Ronan．＇They fay， likevife，that Lezra was not difpoled to profane the facred writugs with a bodthen character：but this flippoles that Eara was furapertizin＇s as to in igine， that there was fome fecthar fanctity the the fope of the letters．Moreover．the adrocates for thit opinion appeal to ancient coins foumt in Judea，with al legsted in the Chaldee or Affyrian charam．But the ge－ nuinenefo of thefe coins is muct．fuipected．
＇The learned Jefuit Souciet maintains，with great addrefs，that the ancient liebrew character is that found on the modals of Simon，and othere，commonly called Somurion medals；but weith，he alleres，were－ really Hebrew medais，truck by the J．ws，and not the Sanlarizanô．

Buxtort chdeavours to reconcile thefe two opinions， by producinf a varicty of patage from the rabbies to prove，that both thete charaziors were anciently ufed； the prefut fy：are character bemy that in which the tabics of the law，and the copy depotitad in the ark， were witten；and the other character leing ufd in the copies of the law whath were writeon for pitivate and common uf，and in cisil affars in ；eneral；and that atter the captivity，Eara enjoned the former to be uked by the Jews on all occafions，laving the latter to the Samatitans and apotlaics．But it can hardly be allowed by any who confider the difference between the Chaltee and siamaritan charafters，with refpect to convenience and beauty，that they were ever afod at the fame time．After all，it is of no great moment which of thele，or whether either of thim，were the origiual characters；lince it appears，that no change of the words has arifen from the manncr of uriting them，becaule the Samaritan and Jewinh l＇entateuch almolt always agree after to many ages．It is molt probable that the form of thefe characters has varied itr different periods；this appears from the tellimony of Montfaucon，in his Hexaph Otigenis，vol．i．p． 22. \＆c．and is implied in Dr Kennicut＇s making the cha－ racters in which manuferipts are writata one teat of their age．
2．＇the modern，or rabbirical，is a gond neat cha－ racer，formed of the fquare Hebrew，by rounding it． aud attrenching moth of the angks or corners of the letters，to make it the more eafy and fluwing．Ti：e letters wided by the Cemana are very dfacme from the
mbliaical daracter ufed cvery whete cife, though all formedatike from the fquare chatacter, but the German in a more Novenly mamer than the reft. - The rablins frequenty make ufecilher of their own, or the dytac IWibew haracter, to write the modern han-
 pinned in llebrew characters; indances whercof are teen in the t'rerela king's libray.

Histeve Lenguage, that fpoken by the Detrews, and wherein the Ohd 'leftament 8 witten.

This appears to be the molt ancient of all the langruages in the world, at leath we know of none older; and fome learned men are of opinion, that this is the Jangatage in which Cod fooke to Adam in Paredife. Dr Sharpe adopts the upinion that the Hebrew wats the original language; not indeed that the Hebrew is the unsaried language of our hert parents, but that it was the general language of men at the difpertion ; and however it might have been improved and altered from the firlt fpeech of our linft parents, it was the oriminal of all the languages, or almont all the languages, or rather dialects, that have dimee arifen in the would.

The books of the Old Teflament are the only pieces to be found, in all antiquity, written in pure Hebrew; and the language of many of the ie is extremely fublime: it arjears penfectly regular, and particularly fo in its comugations. ludeed, properly fpeak. jug, it has but one conjugation ; but this is varied in each fewen or cight different ways, which has the effeck of fo many differnt conjugations, and affords a great variety of cxprefions to reprefent by a dingle word the different modilications of a verb, and many ideas which in the modern and in many of the ancient and learned languages cannot be exprefed withour a periperatis.

The prinitive worde, which are called rosis, have teldom mure than thre letters or two fyldables.

In this language there are 22 letters, only five of which are ufually reckoned vowels, which are the fame with ours, viz. $a, e, i, o, u$; but then each rowel is divided into swo, a long and a hort, the found of the fumer being tomewhat grave and long, and that of the later hiort and acute: it muft however be remark. cd, that the two latt rowels have Sounds that differ in vther jefpeeses belides quantity and a greater or lefs elevation. To thefe 10 or 12 vowels may be added whers, called lemi-soruls, which ferve to connect the confonanto, and to make the ealier tranlitions from one to another. The mumber of accents in this language whe indeed prodigions: of thele there are near 40, the ufe of fome of which, notwithttanding all the inpurries of the learned, are not yet perfectly known. The know, in general, that they ferve to difinguifa the fentence; dife the points called comimas, foricolors, ace. in our language; to determine the quantity of the fyllebles; and to mark the tone with which they are so be fooken or lung. It is so wonder, then, that there are more accento in the Hebrew than in other lan. guages, lince they pertorm the office of thace different rhings, which in other languages are called by different nares.

Is we lave no Hebrew but what is contained in she Scripture, that language to us wants a great many
words; not only becaufe in thofe primitive times the languages wore not fo copious as a: prefent ; but alfo on this account, that the infpired writers had no oc. cafton to mention many of the terms that might be in the language.

Phe Chaldee, Syriac, Ethiopic, \&c. languages, are by fome held to he only dialects of the Hebrew ; as the Frencl, Italian, Spanih, Sic. are dialects of the Latin. It has been linppofed by inany very learned 1.ten, that the Helarew characters or leters wete often ufed hieroglyphicatly, and that each had its feveral dithinct fenfe underfood as a bieroglyphic. Neuman, who feems to have taken imbinte parns to find out this fecret meaning of thefe letters, gives the following explication: $k$ aleph, he fays, is a charakter denoting mo. tion, readinefs, and activity; = beth, fignities, 1. Matter, body, fubllance, thing; 2. Place, fpace, or capacity; and, 3. In, within, or contaned: 2 gime!, llands for flexion, bending, or oblicuity of any kind: 7 duleth, fignifies any protrulion made from without; or any promution of any kind: i be, flands for pre. fence, or demonitrative effence of any thing: ' inas, ftands for copulation or growing eogether of things: 1 dfain, expreffes vehement protrution and violent compreffion, fuch as is occafioned by at once violently dilcharging and contringing a thing together; it alfo fignifies fometimes the fraitening of any figure into a narrow point at the end: $n$ cheth, expreffes affociation, fociety, or any kind of compolition or combination of things torether: 0 tith, Itands for the with. drawiug, drawing back, or recefs of any thing: - jot, lignifies extenfion and length, whether in matter or in time: J capb, exprefles a turning, curvednefs, or concavity: ל lamech, flands for an addition, accefs, impulfe, or adverfation, and fometimes for preffure: n mem, expreffes amplitude, or the amplifying any thing in whatever fente; in regat to continuons qualities, it fignities the adding kngth, breadth, and circumference ; and in disjunct qualities it fignifies multitude: a nim, lignifies the propagation of one thing from another, or of the fame thing from one perfon to another: D famed, expreffes cinclure and coarctation: y ain, ttands for oblervation, objection, or obviation: s pe, ftands for a crookednefs or an angle of any figure: : 8 dade, expreffes contiguty and clute fucceffion: i loph, exprelfes a circuit or ambit: " ro/b, expreffes the egrefs of any thing, as alfo the exterior part of a thing, and the extremity or end of any thing: $w$ jbin, fignifics the number tbree, or the thitd degree, or the utmolt perfection of any thing: A tats, expreffes a fequel, contiutiation, or fucceffion of any thing.

According to this explication, as the feveral particular letters of the Hebrew alphabet leparately fignify the ideas of motion, matter, fpace, and feveral modifications of matter, fpace, and motion, it follows, that a language, the words of which are compofed of fuets exprefive characters, muft neceffarily be of all languages the moll perfect and exprotive, as the words formed of fuch letters, according to their determinate feparate hignifications, mult convey the idea of all the matters contained in the fenfe of the feveral charac. ters, and be at once a name and a definition, or fuccinet defeription of the fubject, and all things mate

## H E B

rial as well as \{piritual, all objects in the natural and moral world, mult be known as foon as their names are known, and their feparate letters cunfidered.

The words urim and thunmin are thus eafily explained arol found, perlaps the moll appofite and expreffive words that were ever formed.
Rabbinical, or modern HERREV, is the language ufed by the rabbins in the writings thcy have compofed. The bafis or body hereof is the Hebrew and Chaldee, with divers alterations in the words of thefe two languages, the meanings whereof they have confiderably enlarged and extended. Abundance of things they have borrowed from the Arabic: the rell is chieny co.pofed of words and exprefions, chicily from the Greek; fome from the Latin; and others from the other modern tongues; particularly that fpoken in the place where cach rabbin lived or wrote.

The rabbinical Hebrew mut be allowed to be a very copious language. M. Simon, in his Hitt. Crit. du Vieux Tellam. liv. iii. chap. 27 obferves, that there is farce any art or fcience but the rabbins have :reated there. of in it. They have tranflated molt of the ancicnt philofophers, mathematicians, altronomers, and phylicians; and have written themfelves on mult fubjects: they do not want even orators and poets. Add. that this language, notwithlanding it is fo crowded with foreign words, has its beautics vifible enough in the works of thofe who have uriten well in it.

HEBREWS, the defeendarits of Hober, common. ly called Yews. See Heura and jew i.

Hebrews, or lipifle to the Mebrezes, a canonical book of the New 'lelkament.

Though St Paul did not prefix his name to this epifte, the concurent teftimony of the bed authors ancient and modern afford fuch evidence of his being the author of it, that the ubjections to the contrary are of litte or no weight.

The Hebrews, to whom this cpitte was wrote, were the believins Jews of Paletire; and its defign was to convince them, and by their means all the Jewih convcrts wherefoever difperfed, of the infufficiency and abolinment of the ceremonisl and ritual law.

HEBRIDES, the gencral name of fone inands lying to the north well of scotland, of which kingdom they conflitute a part. They are fituated between the $55^{\text {th }}$ and $59^{\text {th }}$ degrees of latitude, are fuppofed to be abuut 300 in number, and to contain 48,00 inhabitants. The names of the largeft are Skie, Mulul, Ilay, and Arran. Of thefe iflands Mi Permant hath given the following liftory.
"All the accounts left us by the Greek and Roman writers are inseloped with obfcurity: at all times brief even in their defcriptions of places they had eafiet accefs to, and might have defcribed with the mott fatisfactory precifion; but in remote places, their relations furnifh little more than hints, the food for conjecture to the vifionary antiquary.
"That Pytheas, a travellcr mentioned by Strabo, had vifited Great Britain, I would wint to make only apocryphal. He afierts that he vifited the remoter parts; and that he had alfo feen Thule, the land of rumance amongt the ancients: which all might pretend to have feen; but every voyager, to fwell his fame, madc the iffand he faw laft the Ultima "bule of his travels. If Pytheas bad reached thefe parts, he might have ob-
ferved, foating in the feas, multitudes of gelatinous Hebriden animals, the modufe of Linnxins, and out of thefe have formed his fable. He made his Turle a compfrien of neiblor earth, for, nor air; lut like a cominfluion of thon all: then, catching his fimile from what flonted betore him, compares it to the lungs of the fea, the Arituelian idea of thele bodies; and from lim alloped by naturalifts, fucceffors to that great philofophes. Straho very juitly explodes thefe ahfurd tales; yet allows hin merit in defcribing the climate of the places he hal feen. Is a farther proof of his having vifited the II brides, he mentions their unfriendly fiy, that prohibiss the growth of the finer fruits; and that the natives ale obliged to carry their corn under melter, to best the grain out, lef it hould be fpoiled by the defeet of fun and violence of the rains. "This is the probable part of his narrative; hut when the time that the great gengrapher wrote is confidered, at a period that thefe illands had been noglecked for a very long face by the Romans, and when the difficulties of getting among a Fierce and unfriendly nation inult be almot intuperable, doubts inammerable refpecting the veracity of this relater mult arie. All that can be adonitted in favour of him is, that he was a great traveller: and that he might have either vifited Britain from fome of the nations commercing wi:h our ille: or received from then acconats, which he afterwards dreffed out, mixed with the ornaments of fable. A traffic mut have been carried on with the vary northern inhabitants of our iflands in the sime of I'ytheas; for one of the articles of comnurce mentioned by Strabo, the ivory bits, were made either of the eceth of the walrus, or of a feecies of whale native of the northern feas.
"The grosrapher Mila, who nourifled in the reign of Claudius, is the next who takes noice of our leff: inands. He mentions the Orcades as confiting of 30 ; the Renode of feven. The Romans had then maje a conquet of the former, and might have feen the latter: but, from the words of the hiltorian, it is probable that the Shetland iflands were thofe intended; for he informs us, that the "S nodse were carricd ont ove: againf Germany:" the fite of the Hebrides will no: admit this defcription, which agrees very well with the others; for the ancients extende. 3 their Germany, and its imagimary illands, to the extreme north.
"Pliny the elder is the next that mentions thefe remote places. He lived later than the preceding writers, and of courfe his information is fuller; by mean: of intervering difcoveries, he has added ten more in the number of the Orcades; is the full writer that mentions the Hatudes, the intands in puention: and joins in the fame line the Senodr, or, as it $i_{s}$ in the: beft editions more properly written, the Aenods, or cxtreme point of the Roman expeditions to the no:th, as the Shetland ines in the highert probability were. Pliny and Mela agree in the nuaber of the Fimode, or Acmode: the former makes that of $t: 2$ Hobade: 30; an account extremely near thz truth, deducting the litule illes, or rather rocks, that furround molt of the greater, and many of them fo indilince as fearcel: to be remarked, except on an armal furvey.
"Solinus fucceen's Pliny. If he, as is fuppofed, wa: cotcmporary with Azricola, he has made sory ill ufe of the light de might have received from the expedi.

 *- he bas commaniated. The has rebued the number of the Habudes to fres. Ife tells us, that " the intabiinnts were unaeguabted with enon: that they lieed cold on lith and raik: that tho hod one king, as the hatads were only feporated from each other by :arrow traits: that their prince was boud be certain rukes of governmett, to do puliee ; and was prevented hy posenty from deviating from the troe courle, being fupported by the public, and allowed nothing that lue could eall his own, not even a wife; but then he was allowed free choice, by rurns one out of every dillict, of any female that casght his affection; which deprived him of all ambition about a fucceflor.
"By the number of thefe illands, and by the minute attention viven by the hithorian the circumfance of their being feparated from each other by sety sarrow haits, I thould imagime, that which is now cathed the Long Ifthat, and inchodes Lewis, North Uit, Benhecula, Senth Lith, and Barra, to have been the five Habude of Shoms ; for the other great inands, fuch as Skie, En. ste too remote from each other to form the preceding very characteritio defription of that chain of illands. Thefe might naturally fall :mder the rule of one peety prinee; almolt the only pro. bable part of Solimes's narrative.
"After a long interval appears Poleny, the Egyptian geographer. He alfo enumerates tive Ebudx; and has given each a name: the Wettern Elusha, the Eattern, R:ima, Maleas, Epidium. Cambden ennjectures them to be the modern Skie, Lewis, Rathry or Racline, Mull, and Ilay: and I will not controvert his opinion.
" The Roman hilorians give very little light into :he geography of thefe parts. Tacitu, from whom moth might have been expeeted, is quite tilent about the names of places; notwithlanding he informs us, that a fest by the command of Agricola performes the circummatication of Bitain. All that he takes notice of is the difeovery and the enoquet of the Orkneys: it thould feen, that with the biographers of an ambitions nation, nothing femed worthy of notiee but what they could dignif; with the grory of victory.
" $1 t$ is very diffent to afign a reafon for the change of nume from Eldade to Ifelvides: the lat is modern ; and deems, as the mnotator on Dr Macpherfon fuppofes, to have arifen from the error of a tranferiber, who chareed the $"$ into 1 .
"From all that has been collected from the aneients, it appears, that they were acquainted with little :nore of the Hebridestlan the bare names: it is probable, that the Romans, either from contempt of fuels barren poss, fom the dangers of the feas, the violence of the tides, and horrors of the narrow founds, in the in. experienced ages of navigation, never attempted their conqueld, or faw more of them than what thes had in fight during the few circumnavigations of Creat Dritain, which were expeditions more of ottentation than of utility.
" 'lhe inlohitants had probably for fome ages their own gowanors; one little kine to cach ilatad, or to each gronpr, as merelity repuited. It is reafon--able to fuppote, that their gowemenent was as much divided as that of Great brituh, which, it is whll
$N=1,50$.
known, was under the direction of numbers of petty prinees before it was reduced under the power of the Romans.
"No accont is given in hiftory of the time then iflands were annexed to the government of seo:Emd. If we may eredit our Saxon hilloriane, they appear t, have heen early uncer the dominion of the Picts; for IVde and Adamumes inform us, that foron after the arnival of St Cohmba in their country, Brude, a Pretirn monarch, made the faint a prefent of the eelebrated ifland of lona. Fut neither the holy men of this inand, nor the natives of the rell of the Flebrides, enjored a permanent icpofe after this event. The Gra intalion of the 1)anes does not feem to be eafily afeer. tained. It appears that they ravaged Ireland, and the ille of Rathry, as eally as the year 735 . In the followiny century, their expeditions became more fre. quent: Harold I Iarfager, or the hoho-baired, purfued, in 8.5 , feseral petty rincea, whom he had expelled out of Norway ; who hod taken refuge in the Flebridec, and moletted his dominions by perpetual defeents from thofe ifands. Ile feens to have mate a rapid conquet: he gained as many victories as he fought battles; he put to dea h the chief of the pirates, and made an indiferiminate flanghter of theirfollowers. Som after his return, the iffanders repoffeffed their ancient frats: and, in orcler to reprefs their infolts, he fent Ketil the fhat mofal with a fleet and fome forces for that purpofe. He foon reduced them to terms, but made his victories fubfervient to his own ambition: he made alliances with the reguli he had fubdued ; he formed intermarriages, and confrmed to them their old dominions. This effected, he fent baek the feet to Harold; openly declaved himfelf independent; made limflf prinse of the Hebrides; and caufed them to acknowledge him as fach, by the payment of tribute and the badges of valfalage. Ketil re mained, during life, mafter of the iflands; and his fubjects appear t! have been a wallike fet of freebooters, ready to join with any advonturers. Thus when Erie, ion of Harold Harfager, after being driven out of his own country, made an invanon of England, he put with his tleet into the Hebrides, received a large reinforement of people fired with the hopes of pecy, and then praceeded on his plan of rapine. After the death of Ketil, a kingelom was in aftertimes compofed ont of them, whith, from the redidence of the litne monarch in the ille of Man, was dyled that of Mase The inand: hecan? tributary to that of Norway for a contiderable time, and princes were fent from thence to govern; !et at length they again thook off the roke. Whether the litte petentates ruled independent, or whether they put themflus under the protection of the Scottifl monarehe, dnes not elearly appear; hut it is reatimable to lupnofe the laft, as 1 O-nald-bane is accufed of making the Hebrites the priee of the afii ${ }^{\text {b }}$ nee given him by the Aurscians againt his aven fa'jects. Netwithtandins they might oceafonally fee the protection of Scot!ad, yet they never were without princes of their awn: proticy alone dicested them to the former. Fron the ehronicies of the kings of Man we leam, that they had a fuecefion of princes.
" In 1089 is an evident pronf of the independency of the iflaumers on Norway; fo:, on the death of Lag-
man,

des. nan, one of their monarchs, they fent a deputation to O'Brian king of Ireland, to requelt a regent of royal blood to govern them during the minosity of their young prince. They probably might is turn compliment in fome other refpects their Scottith neighbours: the iflanders muft have given them fome pretence to fovercignty ; for,
"In 1093 , Donald-bane, king of Scotland, calls in the affiftance of Magnus the Barefooted, king of Norway, and bribes him with the promife of all the iflands. Magnus accept 3 the ternis; but at the fame time boalfs, that he does not come to invade the territories of others, but only to refume the ancient rights of Norway. His conquetts are rapid and complete; for, befides the illands, by an ingenious fraud he adds Cantyre to his dominions.
"The Hebrides continued governed by a prince dependent on Norway, a fpecies of viceroy appointed by that court; and who paid, on affuming the dignity, ten marks of gold, and never made any other pecuniaiy acknowledgment during life: but if another viceroy was appointed, the fame fum was exacted from him. 'Thefe viceroys were fometimes Norwegians, fometimes natires of the illes. In 1097 we find, that Magnus deputes a nobleman of the name of Ingemund: in after times we learn, that natives were appointed to that high office. Thus were the Hebrides governed, from the conquelt by Magnus, till the year 1263 , when Acbo, or Haquin, king of Norway, by an unfortunate invalion of Scotland, terminating in his defeat at Largs, fo weakened the powers of his kingdom, that his fucceffor Magnus IV. was conterit to make a ceffion of the iflands to Alexander III.; but not without flipulating for the payment of a large fum, and of a tribute of 100 merks for ever, which bore the name of the annual of Norway. Anuple provifion was alfo made by Magnus in the fame trea$t y$, for the fecurity of the rigits and properties of his Norwegian fubjects, who chofe to continue in the illes; where many of their polterity remain to this day.
"Notwithetanding this revolution, Scotland feems to have received no real acquifition of ftrength. The iflands ftill remained governed by powerful chieftains, the defcendants of Somerled, thane of Heregaidel, or Argyle, who, marrying the daughter of Olave, king of Man, left a divided dominion to lis fons Dugal and Reginald: from the firit were defcended the Macdougals of Lorn; from the laf, the powerful clan of the Macdonalds. The lordhip of Argyle, with Mull, and the illands north of it, fell to the mare of the firf; Ilay, Cantyre, and the fouthern ifles, were the portion of the lalt : a divition that formed the diAtinction of the Sudereys and Nordereys, (as farther noticed in the article Insa).
"Thefe chieftains were the foourges of the kingdom: they are known in hiftory but as the devalla. tions of a tempeft; for their paths were marked with the moft barbarous defolation. Encouraged by their diftance from the feat of royalty, and the turbulence of the times, which gave their munarehs full employ, they exercifed a regal power, and often afiumed the title; but are more generally known in hifory by the Ayle of the lords of the iles, or the earls of Rofs; and Sumetimes by that of the Great Maidonald.
*Hiftorians are filent about their procecdings, Voz. VIII. Pat I.
from the retreat of the Danes, in 126 , till that of Hebrides. 1335, when John, lord of the illes, withdrew his allegiance. In the beginning of the next century his fucceffors were fo independent, that Henry IV. entered into a formal alliance with the brothers Denald and John. This encouraged then to commit frem hoftilities againt their natural prince. Donald, under pretence of a claim to the earldom of Rofs, invaded and made a conquet of that county; but penetrating as far as the fire of Aberdeen, after a fierce but undecifive battle with the royal party, thought proper to retire, and in a little time to fwear allegiance to his monarch James I. But be was permitted to retain the county of Rofs, and affume the title of earl. His fucceffor, Alexander, at the head of $10,000 \mathrm{men}$, attacked and burnt Invernefs; at length, terrifed with the preparations made againlt him, be fell at the royal feet, and obtained pardon as to life, but was committed to Arict confinement.
" His kinfman and deputy, Donald Balloch, refenting the imprifonment of his chieftain, excited another rebellion, and dellroyed the country with fire and fword: but on his flight was taken and put to death by an Irith chieftain, with whom he fought protection.
" Thefe barbarous inroads were very frequent with a fet of banditti, who had no other motive in war but the infamous inducement of plunder.
"In the reign of James II. in the year i.f6i, Donald, another petty tyrant, an earl of Rors, and lord of the ines, renewed the pretence of independency; furprifed the caltle of Invernefs; forced his way as far as Athol ; and obliged the earl and countefs, with the principal inhabitants, to leek refuge in the elarch of St Bridget, in hopes of finding fecurity from his cruelty by the fanctity of the place: hut the barbarian and his fullowers fot fire to the church, put the ecclefialtics to the fword, and, with a great booty, carried the earl and countefs prifouers to his calle of Claig, in the ifland of llay. In a ficond expedition, inmediately fullowing the firf, he futered the penalty of bis impiety : a tempel overtook him, and overwhelmed moft of his affociates; and he, efcaping to Invernefs, perihed by the lands of an lrim harper: his furviving followers returned to llay, conveyed the earl and countefs of Athoi to the fanctuary they liad violated, and expiated their crime by rettoring the plunder, and making large dunations to the thrine of the offended faint.
" Juhn, fucceffor to the laft earl of Roes, entered into alliance with Edward IV. and fent ambafadors to the court of England, where Edward enpowered the bithop of Durham and earl of Wincheller to conelude a treaty with him, another Dunald Balloch, and his fon and heir John. They agreed to ferse the king with all their power, and to become his fubjects: the earl was to have 100 marks ftelling for life in time of peace, and 2001. in time of war; and thefe inland allies, in cafe of the conquef of Scotland, were to have confirmed to them all the pulfifiuns benorth of the Scottifl fea; and in cafe of a truce with the Scot. tifh monarch, they were to be incfuded in it. But about the year 1476 . Edward, from a chasige of politics, cousted the alliarce of Jemes IIl and dropi his new edllies. James, dicermired in fubduc this reber7

'l'lus the great moner (f he ifles was broke: get for a co:a 'aceable time after, the petty chaftion were contanally brakias out into dand rebeflionc, or hatatd acty other in private wars: and itranty feuma bat to hace been malaphicd. Jumes V. fumad it atecting t, make the royage of the ifcs in perfon in 1536, dized and brought arvay whin him evorat of the mot condilerable leaders, and wblited thom io fial fecmity fur their own good behaviour and that of their vaffals. The names of thefe chieftains were

 B at by the manea of fone of the above, there feem to lase been ometinental as well as itfular malecontents. Hacearined the tites of their holdines : and finding foveral to have been ufurped, remitud their lands to the crosn. la the fanc royare lie had the glory of "aunus a mivey to be taken of the coalts of Scotland, and of the illands, by lis pilut Alexander Limeday; which were pubhmed in $15 \%$, at Paris, by Nicholas de $\because$ Chond grographer to the Fiench monarch.
": 'lhe roculiks that fucceeded the death of James sicalomed a neglect of thefe infulated parts of the Scotifo dominions, and left them in a flate of anarchy. II 1 int, the XIec conalds made a formidable infur-以己̈̆n, oppurning the royal grant of Cantyre to the - ut of Argyleand his relations. The petty chirftains continuct in a fort of rebellion; and the fword of the sreater, as ufual in weak governments, was employed daind them : the encouragement and protection given ty them to pirates, employed the power of the Camp. I alis during the reign of James VI. and the begriming - Shat of Challes I. (A)
"But the turbulent $\int_{\text {r }}$ irit of the ald times contiFued even to the prefent age. The heads of clans were by the divitions, and a falle policy that podomimated in Scotland durimg the reign of William 111. flattered with an unreal importance: inftead of being treated as bad fubjects, they were courted as detirable allies: inflead of feeling the land of power, money was allowed to bribe the in into the loyalty of the times. They would have accepted the fublidies, notwith landing thoy detcitad the pince that offered then. They were tanght to believe themfelves of fuch confoquenee, that in the le days turned to their deltuetion. 'Wo recent
rebellions fave legillature a late experience of the folly of permisting the fendal fyltem to exit 10 any part of its dommions. The act of $174^{8}$, for abolthing heritahle jurifdetions, at once deproved the chicftains of all power of injuring the public by their commotions. Many of thefe Resuli fecond this efort of legitlature, and neglect no opporinnty of renderim: themfelves hateful t., incir unhappy valfals, the former intrmaents of their ambition."
"The fituation of the fe iflants in the ereat Atlantic Smolle O san ronders the air coll ard moit in the greater Mos? pate of them. In the moth wothegly ines the fun, at i. 430 , the fummer fillien, is not abrove an hour ander the las :rom at mixhiglat, and not longer above it at mid day in the depth of wanter. 'Thef flof ita Heburides varies
 ifond: fonce are motmainons and bares, producing little eife than heath, will mythe, fern, and a litte grals; whe others, beiny cultivated and manured with da-werd, yich phetiful creps of oars and barley.

- I.ead mines have been difoovered in fome of thefe illands, but not worked to much advantage; others fave been fond to contain quarrice of mirble, limeflone, and fice flone; nor are they defitute of iron. tale, eryltalc, and many curious pebbles, fome of which emulate the Braflian topray.
"With refpect to vugetables, over and above the plentiful harvells of com that the natios earm from agiculture, and the pot henls and roots that are planted in gardens for the futkenance of the people, thefe illands picduce fpontaneutdy a variety of plants and Emples, ufed ty the inaderers in the core of their dit. eafes; but these is hardly a fhrub or teee to be teen, except in a very few foot, where fome genatiomen have endeavoned to rear them with much more trouble than fuccels.
"The animals, both of the land and fea, domellic and wild, quadrupeds, fowls, and fithes, found in and about thefe illands, are of the fame fpecies, fize, and configuration, with thofe of the Oreneys.
"The ponple intabiting thefe ionads are of the fame race with thofe who live in the Highlands of Scotland; fpeak the fame larguage, wear the fane habic, and obferve the fame cuttoms. [See the article Highlands.]
"The commodities which may be deemed the flaples of this country are black cattle, fheep, and fifh, which they fell to their follow-fabjects of Scesiand. lart of the wool they work us into knit-tockings, coarfe cloth. and that vatiggated fluff called tamin. They likewife fatt mutton in the hide, and export it in toats or barklings to differeat farts of the nain-land. Cod, ling, mackarel, whiting, hacduck, and fole, are bere caught in abundance, logether with a finall red cod, remarkably voracious, of a voly delicate Havour: there are likewite two kinds of white filh, which feem to be peculiar to this coalt, known by the names of itho and cel, ellomed good cating. But the grentef treafure the ocean pours forth is the procigions quantity of herrings,
(A) In the beginning of the laft eentury the illanders were continually harafing Indard with their plurdering invafions, or landing there to fupport rebellions: at length it was made trafon to reecive thefe Hebridian kedhanks as they were hyled.

## H E B

cbrides. rings, which, at one featon of the year, fwarm in all the crecks and bays along the weltern floore of Seotland. Thefe are counted the largell, fatefl, and finell herrings caught in any part of the northern feas. Thiis fifhery employs a great number of hands, and britgs a comiteratle advanage to the kingtom. The lifh are canght, cured, barrelled up, and exported : but whether from want of thill, ot a proper falt for pickling, the Scotch cured herrings of this coatt, though fuperior to all others in their natural flate, are counted in. ferior to thofe which are drefled and pickled by the Dutch lifhermen.
"How muan and contracted foevor the commerce and produce of thefe illands may be at prefent, they are perhaps more capable of improvement in both articles than any part of the Britifo dominions in Eusope. The inhabtants are fo little filled in hufbandry, that the foil, though generally good in the low grounde, zields nothing but fanty crops of wats and barley; and great tacts of land lie altogether uncuhivated. If a icry frall mamber of jucicious farmers would fette in lorre of the rrott conliderable inands, they would from baife fuch harvefs as wold emich themflecs; employ and maintain all the idie people, a gieat nutaber of whom are obliged to repair to foreign countrics for Abliftence; aliord fufficient bread for the inhabitants, and even fupply the barren parts of the oppolitecemtinent. The foil in many places would prodace what, and almoft cwery where would give good pafturage, infomuch that, with proper culture, the people might provide hay and federe for their cattle, which during the feverity of the winter die ina great nambers for want of provifion. Improvements of this kided wonhe be the more caily made, as the feathore abounds with thells for lime and fea-meeds for manare ; and the labourers would be ealily fublited by the fith that fwarm not only in the ocean which furrounds thefe inands, bat likevife in the numetous lakes and rivers of feth water. Martin delares, that he knew 100 familics in this conntry mantaincd by as many lithe farms, the rent of each not exceeding 5 s. one theep, and a few pecks of oats.
"The commerce of thefe inands might be extenjod ia fuch a mamer as to reader them a faple of tradie, and an excellent muriery for feaica. 'ithy are furnimed wiel an intinite number of bays, crectio, and ha:bours, for the convenience of mavigation: the mabio tants are numerous, frong, actue, and every way qualitiod for the lise of a mariuer. The fea affords my:iás of finh for exportation : the lands mightationd pleney of pathage tor black catte, horfes, and theep, as well a plentecous barvelts of corn and veher grain: wowlen and limen manufuctures taight be profecuted wgisat advantage, where labour is chcap and provitions are reafonabie. Tice inlanels afford genel itone and liene; and fome parts of the oppulite main litul, timber for building. 'They have plenty of fuel, not only for the ondina'y purpofes of life, but alto for fato-pans, which might be ericted un difierent parts of the coatit; and for burning lea-ware for the ufe of a glafs or foap manticture. Finally, the lituation of thefe illands is fo commolions for trade, that the navigator is im. mectiately in the open fea, and alnof in the neighbourhood of Deamark, Sveden, Hamburgh, Hot. land; nay, with a favouratle wind, hee can reach the
coafts of France and Spain in a weele's failing; if the Hetridee, is bound for the Britih plantations, or indeed for any part of the known globe, he is at once difencumbered of the land, and profecutes his voyde through the openfea withon obitruction or dificuly."

To the neglected late of mefe illands, and th their great importance in various mat ural refpeets, the attention of government has been called within thefe few years by the reprefemtation and eflotes of dififerent patriotic noblemen and gentemen, and a regular ellablifment las been formed under the name of the britih Socicty for extending the Fifheries and in proving the Sea-coalts of the Kingthon; in confequence of which many ufeful plans for the improvement of thole iflands have been adopted, and are gradually carrying into exccution.

New Hebrides, a cluffer of inlands lying in the Great South Sea, ir l'acitic Octan. 'the worthera iflands of this archipelago were firll difeovered by thit Great navigator Quros in 1606, and not withont cadon conlidered as a pant of the fonthem contincia, which at that time, and till very lately, was fuppofed to exith. They were ucxt vilited by M. de Bougainvilie in $1-65$, who, Lefides landing on the inan! of Lepers, did no mure than difoner tha: the land was not conncted, but compofed of inants, which he cal:dd the Great Cycladis. Capain Conk, befides afeertaining the extent and ituation of thefe inams, added the knowledge of fercal in this group which were before unknown. He explured the whole cluller ; and thinkiug himelf the reloy iminted to affix to thom a generai appellation, lie namet them the Neew Hobrides. They are lituated betweendenitudes of $2+d .5 .25 \cdot \mathrm{~min}$. and 20 deg .4 min . South; and between 106 deg . 41 min. and 170 deg 21 min. ealt longitule; and extend 125 leagues in the direction of north-north.wed and fouth-fouth-cal?. The moll nomethern part of this awthipolaro was cailed by M. de Bongainville t ie P'ak of the Baik. The whole clutler contitis of the follo. sins ithas ; fone of which have rechiod narnes from the difficent European navigusts; ozhersceatin the nenaes which they bear among the arives, siz. 'l"ieria del Eiferitu Savio, Mallicollo, S: Bathulomew, Ife of Leuers, Aurua, Whisiontice, Ambrym, Inmer, Apte, Thret Hult, Sandwich, frontagu, Hinchanbrook, Shopherd, Eorramanga, I Ironan, Annatom, and Tama.

HEBRON (anc. geog.), a very ancient city fitua. ted in the lially county of we tribe of Judath to the fouih. Its wore ancime name was Airiatl, Airli, or Comath Arbu. In antiquiy this city vied with the now ancicut cities of kyyt, beifeteren yeas prior to Lua, trandated Tanis loy the seventy. Jofeptins makes it not only older than 'lanis, but even dian Nemphis It Itood to the will of ihe hake Aphalties, and was for fome time the royal relidence of Wavid. Atecrethe captivity it Eell into the hands of the Euxnites, as did all the fouth country of Juda. It is now called $/$ / 6 Irgur, fituated icuen leagues to the fouth of Bethlehem. The Arabs call it El-kalil, " the well belored;" which is the epither they ufualiy apply to Abraham, whofe fepulchral grote they lill finow: Habroun is feated at the fuot of an eminstice, on which arc fome wretched ruins, the mihapen reanins of an ancient cafle. The adjacuat country is a fort of oblong hollow, five or fix

Hebica logues in length, and not difagreeably varied by rocky hillock:, groves of fir trecs, llunted oaks, and a few Ilantations of vires and olive trees. Thefe vineyards are wot cuitivatod with a vicw to make wine, the in. \}akitan!s Ueine fuch zealous Mahometans as not to jernat: Enc Elattians to live anowg them: they are on? of whe to procnce dried sailins, which are badly prencel, though the grapes are of an excellent kind. The praiant-culavate cotton likewife, which is fpun by thetr wives, and fohl at Irufalem ans Gaa. "hey have a'ro fome bop mandactoris, whe kali for which is fodd them by the Bedonins; and a rery ancient glafs. houle, the wily one in suid. They make there a great quantity of conourel rings, bractets for the wrilts and lofs, and for the arms above the elbows, beliden a valiety of wher binkets, which are fent even to Confantimople. In confequence of thefe manafactures, Dir halic) informs us, Habroun is the moft pows ful silage in all the quater ; and is able to arm Sco or sec men, who adhere to the faction Kaifi, and are the purpetual cnemies of the people of Bethlehem. This difcord, which has prevailed throughout the country from the ealietl tines of the Arabe, caules a perpetual civil war. The peafants are incellantly maLing inroads on each orher's lands, deftroying their corn, dourra, fefamum, and olive trees, and carrying off their theep, guats, and cancls. The Turks, who are evers where negligent in reptefing fimitar diforders, ate the lefs attentive to them late, fince their authosity is very precalious. The Bersuins, whole cansps aecupy the lewl country, are continually at open hostalites with them; of which the peafants avail themtelves to refill their authority, or do michief to each other, according to the bind caprice of their ignorance or the intereft of the moment. Hence arifes an anarchy which is Atill more dreadful than the defpotifm which prevals elfewhere, whele the mutual devaltations of the contending parties reuder the appearance of this part of Syria more wretched than that of any other.

HEBKUS (anc. geog.), the largett river of 'Chace, rifugg from mount scombrus; running in two channels tili it comes in Philippopolis, where they unite. It emptics itfelf at two mouills into the Egean Sea, to the north of Samothrace. It was huppofed to roll its "aters upongolien fands. The head of Orpheus nas thrown moto it after it lad been cut off by the Cicohian women.

HECATEE (fab. hilt.), a dlanghter of Perfes and Atleria, the fame as Pioferpine or Diana. She was called Luna in heaven, Diana on earth, and Hecate or Proferpine in hell; whence her name of Divatriformis, reromina, trichs. She was fuppofed to pretide over magic and enehamments. She was generelly is preferted like a woman, with the head of a loorfe, a dog, or a boar; and fometimes the appeared whib three differcut bodies, and thee defernt faces, with one neck. 1)oge, latibs, and honey, were generally offered to her, efpectally un waysand coofs oads; whence the obtained the name of Trivia. Her power was catended over luaven, the carth, lea, and helt; and to hor kings and wations fuppeded themitves mdebted for their pro. ${ }^{4}$ perity.

HECATESIA, a yeally feltival ulferved by the St atonich lians m horen of Dreate. 'I'he Athenians x id allo particular worthip to thio godects, who wes
deemed the patronefs of families and of children. From this circumflance the flatues of the goddefs were erected before the doors of the houfes; and upon every new moon a public fupper was always provided at the expence of the richet perple, and fet in the Atreets, where the poorett of the citizens were permitted to retire and feat upon it, while they reported that Hecace had devoured it. "There were alfo expiatory offerings, to fupplicate the goddefs to remove whatever evils might inipend on the head of the public, \&c.

HLEATOMB, in antiquity, a factifice of an hmondred beafts of the fame kind, at an hundred altars, and by an hundted priells or facrificers.. The word is formed of the Greck "\%zious, which properly lignities a fumpthous or magnificent facrifice. - Others derive it from the Greck sx:troy centum, "a liundred," and ews bos, "bullock," Sic.; on which footing the hecatomb fould be a facrifice of 100 bullocks.-Others derive the word from sxxtor and axs pes, "foot;" and on that principle huld, that the hecatomh might confift of, only 25 four footed bealts. They add, that it did not matter what kind of bealts were chofe for victims, provided the quota of feet were but had.

Pythagoras is faid to have facriticed a hecatomb to the mules of 100 oxen. in joy and gratitude for his difcovering the demonttration of the 47 th propofition of the firlt book of Euclid, viz. that in a rectangled triangle the fquare of the liypothenufe is equal to the fquares of the two other fides.

For the origin of hecatombs: Strabo relates, that there were 100 cities in Laconia, and that each city uled to facritice a bullock every year for the common fafety of the country; whence the inflitution of the celebrated facrifice of ،oo victims, called becatombs. Others reler the origin of hecatombs to a plague, wherewith the 100 cities of Peloponnefus were afficked; for the renoval whereof, thes jointly contributed to fo Splendid a facritice.

Julius Capitolinus relates, that for a hecatomb they erected 100 ahtars of turf, and on thefe facrificed 100 theep and 100 hogs. He adds, that when the emperurs offured facrituces of this kind, they facrificed 100 lians, 100 earrles, and 100 other beatts of the like kind.

Hi:CATOMBMNON was the firt month of the $A$. themian year, confilting of 30 days; begianing on the firtt new moon atier the lummer foltice, and contequently anfwering to the later part of our June and the beginning of July. It had its name from the great number of hecatombs facrificed in it. See Hecatomb.

HECATOMPOLIS (anc. geog.), a furname of the illand of Cretr, from its 100 cities. The territory of Laconia alfo had anciently this name for the fame reafon; and the cuttom of thefe 100 cities was to Vacrifice a hecatumb antaally.

HECATOMPYLOS (ane. geng.), the metropolis of Parthia, and royal refideace of Arfaces, fituated at the fprings of the Araxes. Thehes in Egypt had alfo the fame name from its 100 gates.

HECK, an engine to ahe fifh. A falmon heck is a grate tur catchang that fort of Gifh.

HECKl.E, among hemp-drefirs. See Hatcuel.
HECL.A, a vole mof Iccland, and one of the auft fmous in the word, fituated on the Couthern part of illind. Seceluelann。

It was vifited an the year 1772 by Dr Van Trail, 3 Sserccify

On their firf landing they found a tract of land 60 or 70 mileg in extent entirdy ruired by lava, which appeared to havabere in the highelt Alate of tiquefaction. Hasing undertaken a journey to the top of the mountain, they travilled 300 or 310 Enghim miles over an uninterropted tract of hava; and had at hogth the pleafure of being the firf who hat arrived at the fummit of the monmain.

Hecla, according to the accounts of thefe eentic. men, is lituted in the fouthern part of the illand, a. bout four miles from the feacontt, and is divi ed into three parts at the top, the midalle point being the hiphell: and, acooding to an cract ubiervation with Ramelen's baromster, is 500 保et above the level of the fea 'lhey were obli; ed to quit their horfes as the firt opening from which the fae had burt. They deferibe this as a place wi h lufty glazed wails and high glazed cliff, unlike an $y$ thing which they had ewer feen betore.

A titele higher up thew found a large quantity of grit and Aones; and still father on arother opening, which, though not deep, decoended lower than that of the higlae! pornt. Here they imagined they plainly difcerned the effects of boiliaz water; and hot far from thence the mountais began to be covered with frow, excepting fonce spots whith were bare. The reafon of this dillerence they iom perceived to be the hot vapour alcending from the moutain. As they aliended high. er they found these fones hecome langer ; and about 200 yards below the summit, a hole about a yard and an half in diameus wos obferved, from whence iflaed fo hot a theam, that they could not mieafure the degree of heat with the themoncser. The cold now began to be very intente; Fabrenlecit's thermometer, vibich, at the foot of the mountain was at 54 , now fell to 24 ; the wind alto became fo viokent, that they were fometimes obliged to lie down for fear of being blown down the muil dreadful precipices. On the very fummit they experienced at the bame time a high degree of heat and colds; for, in the air, Fahenheit's tha mometer lowd conflantly at 24 , but when fet untte ground, rofe to 153; the barometer thood at 22:247. Though they were very much inclined tor remain here for tome time, it comld by no means be done with dafety; fir which reafon they were obliged to defind very guickly.

The mountain feems to be mate up, not oflava, but of fand, grit, and anhes; which are thruwa up with the ftones partly difcoloured, and partly meleced by the fire. Several forts of pumice llones were found on it, among which was one with fume fulphur. Sometimes the pumice was fo much burnt, that it was as light as two. Its furm and colour was fometimes sery fine, but at the fame time fo foft, that it was dificult to temove it fiom one place to another. The common hava was found both in large pieces and fmall bits; as likewife a quantity of black jafper burned at the extremities, and refembling trees and branches. Some llate of a Arong red colour was ohferved among the Aumes thrown out by the voleano In one place the lava had taken the form of chimery flacks half braken down- $\lambda$ s they defcended the mountain they obferved three openings. In one, every thing lonked as red as brick; from another, the lava had Howed in altream abont 50 yands
broad, and after proceeding for fome way, had divided into three large branches Further on they perccived an op=ning, at the bottom of which was a mouns, in in form of a furar. loaf, in throwing up of which the fire appeard t.) have exhated itielf.

We have already obfersed, that our travelles were the firt who alconded to the top of this mountata. 'The reafon that no one before them had ever done fo, was partly fommed in fuperitition, and partly the diepo nefs and diffinuly of the afcent, which ws sreatly focilited by an eruption in $1-66$. Moyt kinds of lave found an ontur voluanic countries ate to be mut with about Hecia, or other leeland voleanoes; as the ftey, dark perforated kind, fimilar to the Derby thine loa! Itone : the Ieclan I asate, pumex vitreu; boht the nits. and rinilis. Soine hiee conjectured this to be the hap obfidanus of the ancicmes, which they formed inta Haturs.

The lava is feldom found near the openings whence the cruptions procced, but rather lonfe grit and afhes; and inked the greater part of the Ictlandic mountaing confit of this matter ; which, when it is grown cold, generally tukes an archad form. The upper cruti frequently grows hard and fulid, whith the insled matter benea:h it continues liquid. This forms great cavities, whofe watis, bed, and roof, are of lava, and where great quantities of italactite lava are foul c . There are a valt number of thefe caves in the indond, fome of which are very large, and are made ufe of by the inhabitants for fhelteriug their cattc. The larget in the ifland is $503+$ feet long. and from 50 to $5+$ in brealh, and between 34 and $3^{6}$ in height.- There are tome prodigious cletis left by the cruptions, the largeth of which is called Almeneggat, near the water of Tingalla, in the fouthweltern part of the ifland. It is 105 feet broad and very long. The direstion of the chalm iffelf is from noith to fouth. Its wetlen wall, from which the other has been perpendiculanly divided, is 107 feet fix inclues in height, and contitts of many iltrata, of about 10 inches each in height, of lava grown cold at different times The eaRern wall is only +5 feet four inches in height, and that part of it whie is direttly opposite to the higheel part of the other fide is no mure than 36 Feet 5 inches high.
HLCDIC Fevtr. Sue (the Inlex fubj nired to) Memonf.

HECTOR, the fon of Priam and Hecula, and the father of Alyanax, is celsbated for the valour with which be detended the city of Troy againt the Creceks. He was killed by Achilles, who diragged his body, faAtend to his chariot, thrice rouad the walls of Troy, and afterwards retored it to I'riam for a large ranfom. Se Trpor.

HRDERA, Jys, in botany: A genus of the m"nogy:iala onder, belonging to the pentandria clafs of plants; and in the natual method gying name to the 46 h orser, Haleraces. There are five of 1 ing perals; the berry is pentalpermons, girt by the calys.
species. 1. The helix. or cummon iry, grows na. turally in many parts of Britain; and, where it mets with any happost, will rife to a great heighe. foncing ont roos on every lide. which thike into the jnints of wails or the batk if ticcs. If there is no fupp.rt, this $y$ trail on the ground, and take roos all their tength, fo that they clutely cover the furfase, and are 'i. Ficmet to.

1t ages. ciadicate. Vilite thefe llatks are fixed to any fippme
 but when they laversadmed the tog of their fup-
 fores iutu lage buthy !ese, and their kenves are larE.Or, mome of an owal thpe, and not divided intol joes line the lower leares, io has it hath a quite diferent apmarames. There are two varieties of this focies, wete with filise ilriped leaves, the other with yellowih leaves on the tabs of $h_{1}=$ branches: and thete are fomefimes adnited into gardens. 2. The quinguefolia, or Vireinea cereper, is a matici of all the nombern parto of Amatica. It was firtt brourht to Europe from Caonda; and has been !on $y$ cohivated tu the Eritith gardens, chis! !y to phat a anat wands or builling to cover then: which thele plats wili do in a Ruort time ; fir ther will thoot alnont 20 fees in one year, and will moant up to the top of the highed buids. ing: bat as the leaves fall off in antumn, the plants make hast as indiffereas appearnce in wimer, and thercfore are froper only for fuch ditution as will not edmit of hetter piants; for this with threve in the nudit of citis, and is not injused by finote or the eluenels of the air.

Cilltare. The furl fpecies is eaftly proparated by its trailing branches, and will thrive in ahnoth any forl or fituation. The fecond may be propagated by cuttioss; which if planicd in autumn in a thady border will take root, and by the follosing autum will be fit to plant in thoie places where they are detigned to remain.

Ujis. The roots of the ivy are ufed by ieather-cutters to whet their knires upon. Aprients and peaches covered with ity during the month of Febracrs, have been obferved to bear fruit plentifuliy. The leaves have a nanfous tate; Haller fays, they are given to caildren in Germany as a fpecite for the atroplly. The common people of England apply them to i. Fiss ; and an ciatmeat made from them is ing great efleem among the Highla ale:s of Scos!an! as a realy care for bums. The berries have a litile acdity. When fulty ripe, a dofe of thean has been reommended in the plague. In warm chmates, a rutinous juice extudes from the taiks, which is tais to be a powetill refolvent and difoutient, aml an excellert ingredient in platers and oionments edop:al for thule purpoles. Horfes and theep eat the plaat; goats and cows refufe it - Cafpar Buthine and Pournctort mention a fore of ivy that grows in many of the :hands of lle Archiplaga, to whica they have given the name of the poots ioy, becaufe the ancienssare faid to have made cromis of this plant for at ming the brows of their pocts. By cthers it is called hatera dionyfus, becaule they made nte of the fane hat of iny in their public rioiongs and fallo in bonom of libechas. The berries are of a tine gold čour, whence this fipecies has been teroned by others chowoarpes.

H1:DERACEA, (frombeder "ive") The name of tie foth order in Linnews's frapment of a natural neethod, contiting of ivy, and a few other senera, which from their fencral habit and appearance feen ncary alled io it. See Botasy, p. \&o゙.

IHEDClis, ia annculure, are chther planied to make ferces round inclofures, or to divide the feveral parts of a gardin. When they are deligned as out.
ward fences, they are planed either with hawthorn, crabs, or blackethorm: but thofe liedges weth are planted in andens, cither to furround whderats quarters, or to foren the other patis of a garden trom light, are phated accordmg to the fancy of the exiner ; lime preforring ever-gresta, in which cale the hotly is belt; next the yew, then the lamel, lamatimus, phyllyw, cec. Others pucfer the beech, the hombeam, and the elm.

Before planting, it is proper to confiter the nature general of the land, and what fort of plans will thise bett rections in it; and alf, what is the foil truan whence the plants hanting are t, be taken. As for the li\%, tice fets ongthe to be about the chacknefs of one's lictle lituer, and cut within about four or five inches of the gromd ; they ought to be freth taken up, fraight, finooth, and well-routed. Thuie flants that are ranied in the nuricry are to be preforred.

In piartiog outlide hedges, the turf is to be laid, with the grais-lide lownwards, on that fide of the ditch the bank is deligued to be made; and fome of the belt moud thould be laid upun it to bed the guick, which is to befet upon it a foo: afunder. When the firlt row of quic's is tet, it mult be covered with mould; and when the batiz is a foo: high, yon may lay another wow of fets againlt the $f_{\mathrm{p}}$ oces of the former, and cser them as you did the others: the bank is then tu be topped with the butom of the ditch, and a dry or deat-liedge lad, to made and defend the under. platation. stakes mould then be driven into the loofe carth, fo low as to reach the finn ground: thefe are to be placed at about two feet and a half ditance: and in order to render the herge yet ilronger, you may edder it, that is, bind the top of the Atakes sith finall long poles, and when the eddering is buined, drive the takes anew.

The guick mult be kept contantly weeded, and fe- of mana cured from being cropped by catie; and in Fobruary wne che it will be proper to cut it within an inch of the gromd, Hawthor which will caufe it frike root afieh, and he!p it much in the growth.

The crab is frequently planted for hedees; and if orthear the plants are rafed from the $k$ : ruels of the finall wild crabs, they are much to be preferred to thole taifed fron the kirnels of all furts of apples without ditinc. tion ; becanfe the plants of the true fmall crab never fhout fo ftrong as there of the sples, and may therefore be better kept whthin the proper compats of an heder.

The blackathorn. or floe, ia frequently planted for Blact ${ }^{4}$ bedges: and the bett me:hot of doung $i$, is to raite thon, the planes from the fones of the fruit, which hould be foun about the midule of Janary, if the weather will permit, in the place where the hedige is intended; but when lley are leept longer out of the ground, it will be proper to mix them with hand, and heop then in a cool place. 'The fance fonce will do fur it when fown, as when it is phated.

The holy is fometimes planted for herges ; but Holly. where it is expuled, there will be great ciffenley in preventing its being deltroyed : otherwile, it is by far the moll beantifnt plant ; and, baty an exererren, will alford much better thelier sur cotele in wister than any other fort of hedge. Tine bell matiod of raifing thefe bedges, is to fow the dlones in the place where the
hedge is intended; and, where this can be conveniently done, the plants will make a much better progrefs than thofe that are tranflanted: but thete berries fhould be buried in the ground feveral months befure they are fown. The way to do this, is to gather the berries about Chiflmas, when they are matlly riper, and put them into large tower pots, mixing tome fand with them; then dis holes in the ground, into which the pots muft be funk, covering them over with eateth, abote ten inches thick. In this place t!!ty mult resain till the fullowing Oetuber, when they fheak be taken up, and fosn in the place wlare the hed oe is intendal to be male. The grownd thonde be well irenclued, and clearsil foom the roots of all time wocis, lonltea, trees, Exe 'l'lan two drills flomll be mace, at shout a fout dithatce from cach ether, and about two inalies deep, into whath the fecds hould he feattored pretty clofe, leat forse thould fail. When the plaris grow up, they rand be carefolly weeded : and if they are defigned to be kept very neat, they thoult be cut twice a your, that is in May and in Ausurt; but if they are only cefigner! pur fences, they need only be mecred in July. The fences sor thele hediges, winle young, frould admit as mas' free air as foffitle: the beat fort are thofe made with pots and rails, or with ropes drawn through holes made in the pouls; and if the rupes are painted over whth a compotition of incled pitch, brown Spanifh colum and oil, well aixed, they nitl laft feveral jear:

Ifedges for ornament in gardens are fometimes planted with everegreens, in which cate the lowly is preterabie to any cither: next to this, moll people prefer the yesw but the dead colour of its leaves remders thofe hedges lefs agreable. The laurel is one of the mot beatiful ever-greens ; but the hono: are fis luxuriant that it is diffent to keep it in any tulerable fhape; and as the leaves are large, to prevent the difagreeable appearance given them by their being cut through with the theers, it will he the het way to prune them with a knife, cuting the thouts fuit down to a leaf. 'I'lue laurn.linus is a very hine fiant ior this parpofe; but the fame objection may te muter- tu this as to the laurel: :his, theiefure, ousht coily to be pruncel with a knate in Apul, when the thowero are gaing off; but the new thuots of the fame foring man by momeans be thortened. The finall-leaved and rough-leared lanruitinus are the belt plants for this pumpos. The true po ligeea is the next beth plant fur wedates, which mey be led up to the height of 10 or 2 icet; and if they are kept normow at the :up, that thene may be not too much wilth for the fnow tologe apon :ticm, they will be clofe and ilick, and make a none aptearance. The ilex, or ever-green oak, is alio planted for hedges, and is a. fit plans for thoie denerned to Erow very tall.-The decidnous plants ulisally phatited to form hedpes in gardens are, ' The bornbean, which nay be kept neat with ieis crouble thon ront oiller plants. The becelh, which ins the fame zoond qualities as the hormbeam; but the gradeal thling of its leaves in winter cautes a continual litter. The finallleaved Englith cim is a foper trec for tall herlges, but the ef thould ro: be plozed clofer than eight or ten fect. The limetree has aifo beea recommended for the fame plopade; but after they have dond fone years, they grou vorj thin at buttum, and
their learis frequently turis of a blach cifagresable Hes.ges. culour.

Naby of the fowering farubs have alfo been planed in hedges, tueh as rofes, honeyfuetter, fowet briar, Acc. but thete are diffecult to train; and if they are eat to brigg them within compurs, their flowers, which are their greatelt beanty, wh be catirdy. fletroyed. A correfpandent of the fucicty for improving dericulture in Scolland, howcrer, infurers us, that he the! with focels the eglartine, fwectoridr, or dog rofe, wheat
 and llamp! hire hed been tried! in vain I!io motho! Wis to gather the hipe of this plant, and (1) lis thona
 011: after which tiry wate fowed in a price of spullat preper I for gartsu peas. Next gent they cause n!'; an I the year after they were phaticu in the foilowin: insenner. Ateer inarkws out the ditch, the flatatswer: laitaout 18 inches afunder upon the fide grats, ant the ir roots covered whe the fart infothat were take" off from the farface of the intended dirch. The earela dide of thefe turfs was placed nest to the roots, and otiser eard laid upes the earfs which had been taken out of the ditc!. In four or tive years theie plants made a fence which neiher horfes nur catele of ang kind couid pors. Feven ia two or three years none of the larger catite will atempt a fence of this $k$ ind. Sheep indeed will fonctim:s do io, but they are always catangled to fuch a degree, that they orobld remai:a there tid they died unlefs relieved. Old briars dus u", and planted foon make an excellent fence; and, where thin, it may be eafiny thekened by laying down hranches, whali in one cear will make thoots of fix or ic vert feet. 'They bear clizping very well.
 ing vory particularly, is of opinion, that fome uthin fans diculiants befles thote abwementioned might be whefuliy cirployed in the conitruction of heceges. Among the he reckuns the common willuw. This, he fass, ty I: 3 means requires the wetncto of foil which in common- $F$.

 is wet or bougy ground! but this is whe of thote vilgar etrurs, fuaded up on inaceurate bobervation, s.a? olten to be met with in fubjects relating io roral at. faire; for experience has falliciently convinced nic, that this pl ut will not only gow, bit theive, in aty rich well cultivated foil (balels in particular ciron:-
 it be of a sery dry mature. It could $11 \therefore$. howeror, i, general be made to thrive, if planted in the fones reatinot as llwrus; nor would it, in any refoct, De proper to train it up for a fence in the fame wav as shat plant. The willow, as a fence, could feldm be fisecafulby of ter wa. employed, but for dividing into feparate incloiures any extenfice tield of rich groind : and, as it is aluays tes. cellay to put the fuil inten as good order as porible bo. fore a hodge of this kind is phaned in it, the ester? methed of putting it into the neceffary high tilth, wi!! be to mark off the boundaries of your feveral tields in the wintur, or early in the Spring, with a delign to give a complete fallow to a narrow ridge, dix or eight fect broad, in the midule of which, the hedge is intencul to be plansed the enfuing winter. This riage oaglat tu be fiepuenty ploughed during the fumatr-icafon,

Hedec. and in autum to be well manured with dung or lime, or both (for it cannos lie made too rich), and be neatly formal intes a riske before winter.
" llawne prepared elace ground in this manner, it will be an teadincos to receise the loedge, which ought (1) he plased at carty in winter as can be got convemicotly donc; as the willow is much hurt by being planted late in the fprivig. But before you begin to make a fence of this kind, it will be neceffary to proville a fullicient number of plants: which will be beft done by previoufly rearing them in a nurfery of your wsin, as acor the ficld to be inclofed as you can conveniembly have it; for as they are very bulky, the carrixge of them would be troublefome if they were bonght from any condiderable dittance. The belt kinds of willow for this ufe, are fuch as make the longet and itrongelt floots, and are not of a brittle nature. Sll the large kinds of hoop willows may be "mphoed for this ufe ; but there is another kind with Houngo and more taper thoots, covered with a dark green hatk when young, which, nom the older thoots, becomes of atl allogray, of a birm testure, and a little tomghto the touch. 'The leaves are not folong, and a great deal hoad or than thote of the common hoop"illow, pretty thick, and of a dark green colour. What mane this liecies is uftully known by, I canot tcil; but as it hecomes very quickly of a large dize at the root, and is floug and tim, it ought to be made choice of for this purpote in preference to all other kindi that I have fecn. 'The floots ought to be of swo or theec yeras srowth before they cain be properly uded, and thoudd nower be leds than eight or mine feet in length. 'Ihofe ought to be cut over clofe by the ground immeliately before planting, and carried to the beld at their whole length. "ile planter having thereind a line atong the middle of the ridge which was pepared for their reception, begins at one end thercof, thetling a row of thele plants timbly into the erwond, clofe by the lise of the line, at the ditance of is or so indes from one another; making them all Ant a litue to one dise in a direction paralld to the hise. This heing finilhed, let him begin at the oppo:actud of the line, and plant another row in the interbut between the phats of the former ros: making
 warity contaly: and then, phation the be baketways, wob thom into bexures like a net, fathening the top; Lu phating the lmall twiss with one another, which whan ror lizte trunte onty he made to lind together Bo inmly 'lhe whole, wen finifod, athomes a (w) beantul net-ike appeatance, and is even at fort
 moliandy take root and quakly iacrale in hare, it Hovenci dfur a kex years, a very thong fence "'uh modias an penctrate. This kind of hedge 1 nabis hinc emplosed: and hod that a man may

ally preferve the defencele $\int_{s}$ willow from being browfed upon by cattle.
" As it will be neceflary to keep the narrow ridge, upon which the hedge is planted, in culture for one year at leaft, that the plants of eglantine may not be choked by weeds, and that the roots of the willow may be allowed to fpread with the greater eale in the tender mold produced by this means, it will be proper to ttir the earth once or twice by a gentle horfe-hoe in the beginning of fummer ; and, in the month of June, it may be fowed with turnips, or planted with coleworts, which will abundantly repay the expence of the fallow."
'The fame anthor alfo gives the following ufeful di. of plant rections for planting hedges in fituations very much hedges in expofed to the weather, and recovering them when on the point of decaying. "Thole who live in an open ter, which others who inhabit more warm and fhelter- them wt ed regions never experience; and, aniong thefe dilli- $\frac{\text { decayci }}{F o l . M I}$. cultics, may be reckoned that of hardly getting hedges p. 16, \& to grow with faclity. For, where a young hedge is much expofed to violent and continued guits of wind, no art will ever make it rife with fo much freedom, or grow with fuch luxuriance, as it would do in a more theitered hituation and favourable expofure.
"But although it is impolfible to rear hedges in this fituation to fo much perfection as in the others, yet they may be reared even there, with a little atten. tion and pains, fo as to become very fine fences.
" It is advifable in all cafes, to plant the hedges upon the face of a bank ; but it becomes abfolutely neceffary in fuch an expofed fituation as that I have now defcribed: for the bank, by breaking the force of the wind, fereens the young hedge from the violence of the blath, and allows it to advance, for fome time at brd, with much greater luxuriance than it otherwife could have done.
"But as it may be expected foon to grow as high as the bank, it behores the provident hulbandman to prepare for that event, and guard, with a wile forecalt, againit the inconvenience that may be expected to arife from that circumbance.
"With this view, it will be proper for him, iuftead of making a lingle dith, and planting one hedge, to raiie a pretty high ban's, with a ditch on each lide of it, and a hedge va each face of the bank ; in which lisuatio:, the bank will equally thelter each of the two hedges whle they are lower than it; and, when they at leagth becume as high as the bank, the one hedge will in a manotr aford thelter to the other, fo as to enabie them to asance with much greater luxuriance than either of them would have done fingly.
". To effetaate this telll more oerfectiy, let a row of iervici-irces be planted along the top of the bank, at the didance of is inches from each other, with a plant of eglamene beiwten each two furwices. This plant il advance, ia fome degree, even in this expoled fituation: and by its numerous thoots, covered wish large leaves, will efiectuaiy feren the bedge on cach fide of it, which, in io zurn, will rective fome fuppur: and theiter from then; fo that they will be cmabisd to adracce all togtiher: and form, in time, a dok, itrong, ard beausiful fence.

- The jirate is a irse but Dule innuta in Scotland; although

Elthough it is one of thofe that oughe pellupe to he often culdivated there in preferenee to any wher we whatever, as it is mote hamy, and in an copoled then. ntion, affords more theleer to other phomis than atmont any cther tree 1 know: for it fenta ont a perte many troug brames for: the under pat of ble dem, vhich, in times, athane an upright decetion, ant sontinue to adsance with sigoner, and any wank leases to the very bosem, almoull sis long as the tere wills: ho that if it is not pruned, it rifes a large chole lomb, wht it ateains the height of a finest come.

hedges

Hetige, hedzet, the profit arifing from them onlp would abwitdantly repay the colt of the whole without any lofs of ground. It may poffibly be objected by fome, that the hedges would cften be hurt by the boys climbing up to get the fruit : but thofe who malse it fhould remember, or be tuld, that the beft kinds of cider-fruit are fo hard and auttere at the time of their being gathered, that nobody can eat them, and even hogs will hardly touch them. But the grateft bencfit, where no frut: trees are planted, arifes from the thorns and wood which quick hedges yield for the fire and other purpofes."

The author of the Effays on Hufbandry recommends the hornbeam plant as one of the beft yet known for making fences, according to the method practifed in Germany, where fuch fences are common. "When the German hufbandman (fays he) erects a fence of this nature, he throws up a parapet of carth, with a ditets on each fide, and plants his hornbcam fets in fuch a manner, that every two plants may be brought to interfect each other in the form of St Andrew's crofs. In that part where the two plants crufs each other, he gently ferapes off the bark, and binds them with ftraw thwart-wife. Here the two planes confolidate in a kind of indifoluble knot, and puht from thence horizontal flanting fhouss, which form a fort of lising palifado or Cheratu: de frife; fo that fuch a protection may be called a rural fortification. The ledges being prunce amually, and with diferetion, will in a few jears render the fence impenetrable in every part.
"It fumetimes lappens (fays $\operatorname{Dr}$ Andef fon) that a hedge may have boen long neglected, and be in gencral in a healthy fate, but full of gaps and openinge, or io thin and Atraggling, as to form but a vory imperfect furt of fence. On thefe occafions, it is in vain to hope to fill up the gaps by planting young quicks; for thefe would always be outgrown, choaked, and Iarved, hy the old plants: nor could it be recorcred by cutting clear over by the roots, as the gaps would fill continue where they formerly were. The only methods that I know of rendering this a fence are, either to mend up the gaps with dead wood, or to flafb the hedge; which latt operation is always the mott eligible where the gaps are not too large to admit of being cured by this means.
"The operation I here call plafing, may be defined, 'a wattling made of living wood." To form this, fome ftems are firft felceted, to be left as thakes at proper diftances, the tops of which are all cut over at the beight of four feet from the root. The Aragyling fide-branches of the other part of the hedge are alfo lopped away. Sevcral of the remaining plants are then cut over, clofe by the ground, at consenient dillances; and the remaining plants are cut perhaps half through, fo as to permit them to be bent to one fide. They are then bent down almoft to a horizontal pofition, and interwoven with the upright ftakes, fo as to retain them in that pofition. Care ought to be taken, that thefe be laid very low at thofe places where there were formerly gaps; which ourght to be farther Etrengthened by fome dead flakes or trunchions of willows, which will frequently take root in this cafe, and continue to live. And fometimes a plant of eglantine will be able to overcome the difficultics it there meets with, Atrike
root, and grow up fo as to Arengtion the hedge in a Hedges. molt effectual manner.
"The operator begins at one end of the field, and procects regularly forward, bending all the thens in one dirction, fo that the peints rite above the roots of the others, till the whole watting is completed to the fanne height as the uprights.
"An expert operator will perforn this work with mish greater expedition than one who has not feen it done could cafily imagiae. And as all the diagonal wattlings continue to lue and fend out thoots from many parta of their ftems, and as the upright thoots that rife from the thumps of thofe plants that have beea cut over quickly ruh up though the whoke hedge, thefe ferve to minte the whole into one entire mafs, that forins a flrong, durable, and beatiful fence.
"'This is the bett method of recovering an old negleeted hedge that hath as yet come to my knowledgre.
"In fome cales it happens that the young froots of a hedge are killed every winter; in which cafe it foon beconves dead and unfighly, and can never rife to any confiderable height. A remedy for this difeafe may therefore be wifhed for.
"Young hedges are olferred to be chiclly affeeted with this diforder ; and it is almot always oecafioned by an injudicious management of the hedge, by means of which it has been forced to fend out too great a number of floots in funmer, that are thus rendered fo finall and weakly as to be unable to retift the fevere weather in winter.
"It often happens that the owner of a young hedge, with a view io render it wery thick and clofe, cuts it over with the thears a few inches above the ground the firt winter after planting; in confequence of which, many fmall thoots fpring out from each of the Atems that has been cut over:- Each of which, being afterwards cut over in the fame manner, fends forth a ftill greater number of hoots, which are fnaller and finaller in proportion to the ir number.
"If the foil in which the hedge has been planted is poor, in confequence of this nanagement, the branches, after a few years, become fo numerous, that the hedge is unable to fend out any floots at all, and the utinot exertion of the vegetative puwers enables it only to put forth leaves. Thefe leaves are rencwed in a fickly ilate for fome years, and at laft ceafe to grow at allthe branches become covered with fog, and the hedge parifles entirely.
"But if the foil be very rich, notwithftanding this great multiplication of the ftems, the roots will ftill have fufficient vigour to force out a gieat many fmall fhoots, which advance to a great length, but never attain a proportional thicknefs. And as the vigour of the hedge makes them continue to vegetate very late in autumn, the frots come on before the tops of thefe dangling fhoots have attained any degree of woody firmuefs, fo that they are killed almolt entirely by it the whole hedge becomes covered with thele long dad Goots, which are always difugrecable to look at, and wfually indicate tie approaching end of the hedge.
"The caufes of the diforder being thus explained. it will readily occur, that the only radical cure is am• putation; which, by giving an opportunity to begin $3 \mathrm{~A}_{2}$
with

## H E D

Hedec. with training the hedge anew, gives alfo an opportunity of avoiding the crrors that occafoned it. In this calk, care ought to bo taken to clat the planta as clofe to the ground as polmble, as there the tems will be lefs numerons than at any greater hoight. And paricular attention ouzht to be had to allow very fow thoots to arife from the ttems that hase been cut over, and to guard carefully againt thotening them.
" But as the roots, in the cafe hote fufpoled, witl he wery ftrong, the fhoots that are allowed to furing from the fems will be very vigurous, and there will be fone danger of their continuigg to grow later in the feafon than they oughe in fation todo; in which cale, fome part of the top of the flout may perhaps be kill. ed the firlt winter, which onylit if pollible to be prevented. 'Ihisean only he eflectallly dont by giving a check to the vegctation in autum, fo as to allow the young thoots to harten in the points before the winter approaches. If any of the leaves or branches of a tree are cut away while it is in the thate of vegetation, the whole plant feels the lofs, and it fuffers a temporary check in its growth in proportion to the lof that it thus fuftains. To check, therefore, the vigorous vegetation at the end of autumn, it will be prudent to chnofe the beginning of September for the time of lopping off all the fupernumerary branches from theyoung hedge, and for clipping off the fide branches that have frung out from it; which will, in general, be fufficient to give it fuch a check in its growth at that feafon, as will prevent any of the fhoots from advancing afterwards. If the hedge is extremely vigorous, a fuw buds may be allowed to grow upon the large numps in the fpring, with a view to be cut of at this feafon, which will tend to Atop the vegetation of the hedge fill more effectually.
"By this mode of management, the hedge may be preferved enti:e through the fint winter. And as the fhoots become lefs vigorots every fucceffive feafon, there will be lefs difficulty in preferving them at any funtre period. It will always be proper, however, to trim the indes of a very vigorous hedge for fume years while it is young, about the fame feafon of the year, which will tond powerfully to prevent this malady. But when the hedge has advanced to any confiterable height, it will be tqually proper to clip it during any of the winter-months, before Candlemas."

Lord Kames, in his work intitled the Gentleman Farmer, gives feveral directions for the raifing and mending of hedges confidetably different from thofe above telated. For a deer-park he recommends a wall of thne coped with turf, having laburnums planted clufe to it. The heads of the plants are to be lopped off, in order to make the branches extend laterally, and interwtave in the form of a hedge. The wall will prevent the Leen from breaking through : and if the hedge be trained eight feet high, they will not attempt to leap orer. He prefers the laburuum plant, becaufe no beatt will feed upon it except a hare, and that only when young and the buhtender. Therefore, no extraondinary case is neceflary eacept to prefore them from the hare lor for or five years. A 10 of of alders may be planted in biont of the laburoums, which no bare nor any other beat will touch. The wall he recommends to be built in the following mannel, as being both cheaper and more durable than one contruc.

## HED

redges. barren trees! The plants thruft out long hoots, but
feeble and tender: when expofed in a cold fituation, they decay, and fometimes die. But there is a reafon for every thing: the nurferyman's view is to make profit by faving ground, and by inp. fing on the purchafer tall piduts, for which he pretends to demand double price. It is fo difficule to purchafe wholefom: and well natifed plants, that every gentlemas farmer ought to raife plants for himfelf.
"As thorns will grow pleafantly from roots, I have long practifed a fiugal andexpeditious method of raifing them from the wounded roots that mult be cut off when thems are to be fet in a bedge. Thefe roots, cut into froall parts, and put in a bed of frefh earth, will produce plants the next fpring no lefs vigorous than what are produced from feed; and thus a perpetual fucceffion of plants nay be obtai ed without any more feed. It ought to be a rule, never to admit into a hedge plants ender five years old: they deferve all the additional fum that can be demanded for them. Young and fecble plants in a hedge are of flow growth; and, betides the lufs of time, the paling neeeffary to fecure them from eattle mull be rencoved more than once before they become a fence. A thorn hedge may be planted in every month of winter and rpring unlefs it be frolt. But I have always oblerved, that thons planted in Octuber are more healthy, puth more vigoroufly, and fewer decay, than at any other time. In preparing the thorns for planting, the roots ought to be left as entire as poffible, and nothing cut away but the ragiged parts.
"As a thern hedge fuffers greatly by weeds, the ground where they are planted ought to be made perfetly clean. The common method of planting, is to lave eight or nine inches along a fice of the intended ditch, termed a farfement; and behind the fearfement to lay the furface foil of the intended ditch, cut into fquare fods two or three inches deep, its grafy furface under. Upon that fod, whether elean or dirty, the thorns are laid, and the earth of the ditch above them. The grafs in the fearferment, with what weeds are in the moved earth, foon grow up, and require double diligence to prevent the young thorss from being cho. kid. The fullowing method deferses all the additional trouble it requires. Leaving a fcarfement as above of 10 incles, and allo a border for the thorns, broad or narrow aeconding to their fize; lay betind the border all the fuface of the intended ditch, champed fmall with the frede, and upon it lay the mouldery earth that fell from the fpacte in cutting the faid fur. face. Cover the fcarfement and border with the mader earth, three inehes thick at leal; laying a little more on the border to raife it higher than the fearement, in order to give room for weeding. After the thorns are prepared by fmoothing their ragged roots with a knife, and lopping of their heads to make them grow bufhy, they are laid fronting the ditch, with their routs on the border, the head a little ligher than the root. Care muft be taken to fpecad the roots among the fur-face-earth taken out of the ditch, and so cover them with the mouldery earth that lay inmodiaely below. This article is of importance, becaufe the mouldery tarth is the fmefl of all. Cover the flems of the tharns with the next ftratum of the dich, leaving always an inch at the top frec. It is no matter how goor this
flratum be, as the plants draw no nourifnment from it. Go on to finith the ditch, prefling down care-
itedis. fully every ruw of earth thrown up betind the hedge, whach makes a goou folid monnd impervious to rain. It is a fafeguard to the yourg hedge to raife this mound as perpendicular as puftite; and for that reafon, it may be proper, in loofo fon, when the mound is raifed a foot or fo, to bind it with a row of the tough fod, which will fupport the ear:h above till it beeome folid by lying. In poor fuil more cate is neceflary. Behind the line of the ditch thes gromend intenaed for the fearfement and border thould be fummer fallored, manured, and cleared of all grafs roots; and this culture will make up for the inferiority of the foil. In very peor foil, it is vaiu to think of planting a thorn hedge. In fuch ground there is a noceftity fur a fone fence.
"The only reafon that can be given for laying thorns as above defribed, is to give the roots face to pulh in all dircetions; cren upward into the mound of earth. There may be fome advantages in this; but, in my apprchenfion, the difadvantage is much greater of leaping fo much earih upon the roots as to excluce not only the fun, but the rain which runs down the Aluping bauk, and has no accefs to the roots. Inftead of laying the thorns fronting the ditch, would it not do better to lay them parallil to it; covering the roots with three or four incluss of the bell earth, which would make a hollow botween the plants and the foping bank? This holluw would intercept every diop of rain that falls on the bank, to fink gradually among the routs. Why at any rate houkl a thorn be put in. 10 the grond sloping? This is not the practice wih regard to any other tree; and I have licardif no exponiment to perfuade me that a thorn thrives beter tloping than erect. There occurs, indeed, one dhjection againt planting thorus crect, that the roots haie no room to extend ilumfares on that lide where the ditch is. But does it not hold, that when, in their progrefs, roots meet with a ditch, they du not purh onward; bar, changing their dirséion, puh don award at the fide of the ditch? If fo, thefe downward rozis will fupport the ditch, and prevent it from being mouldered down by frull One thing is cident withumexperiment, that thorns planted erset may foener be made a compleiedence than when laid dopiog as ufual. In the latter cale, the operator is ecntined to thorns that $\delta_{0}$ riot exceel a fout or 15 inebes; bat shorns tive or fix feet high may be planued crect; and a hedge of fuch thorns, well culticated in the nutfery, will in three yeazs carive to greater perfsetion than a hedge managed in the urdinary way will do in tuice that time."
After the liedge is faithed. it is abfolutely neceflary of ${ }^{27}$ so fecure it for fome time from the deprodations of anf lecirese catte; and this is by me means an eaty mater. "Theafter i: is ordinary mestod of a parimg (Gays his brdhip) is nop'arect. fuffeient difence againtt catte: the molt gente make it a rubbing poll, and the vicion wantooly break it down with thecis hurns. 'The orly eftectnal iemedy is expenfive; riz. two ditches and two hederes, with a mound of carth fectween them. "ick es

From dight to thelve iblles, acconding to the fize of where phaing las been long practifed. A thorn is a Hedge the cattle that are to be inclofed ; and atl precifely of the fame hight. Prepare plates of wood fawed out of loze, evay plate thrce inches broad and half an inch thack. Fix them on the head of the lakes with a nail driven down into each. The llakes will be united fo fumby, that one eannot be moved without the whole: and will be proof accordingly againlt the rubbing of cattic. But, after all, it is no Sence againit vicions eattle. The only proper place for it is the dide of a high road, or to fence a plantation of trees. It will indued be a fufficient fence againt theep, and endure tid the hedge itfelf becomes a fence. A fence thus ennpleted, ineluding thorns, ditehing, wood, nails, see will not much exceed two fhillings ebery fis. yarch."
His lordhip difcommends the ordinary mathod of raining hedges by cutting of the top and thortening the latral branches in order to make it thiek and bufly. This, as well as the method of cutting off the fiens two or three inches above the ground, indeed produces a great number of thonts, and makes a very thick fence, but which becomes fo wak when bare of leaves, that cattle break through it in every part. To derermine the beft method of proceeding in this cafe, his lordmip made an experimont on three hedges, which were twelve years old at the time he wrote. The firt was annually pruned at the top and fides; the fides of the fecond were proncd, but not the top; and the third was allowed to grow withont any proning. lhe lint, at the time of writing, was about four feet broad, and thick from top to battom ; but weak in the fems, and unable to relift any horned beaft: the feeond was frong in its fems, and clofe from top to bottom: the third was allo ftrong in its ftems, but bate of branclues for two feet from the ground; the lower ones having been deprived of air and rain by the thick thade of thofe above them. Hence he directs that hedges fhould be allowed to grow till the ftems bs Five or fix inches in cireumference, which will be in ten or twelve years; at which time the hedge will beffeen feet or more in height. The lateral branehes next the ground mutt be pruned within two leet of the ftem; thofe above muft be made fhoter and fhorter in proportion to their diftanee from the ground; and at five feet high they mult be ent chore to the them, leaving all above full freetom of grosth. By this drefling the hedge takes on the appearanee of a very ftecp roof; and it ought to be kept in that form by pruning. This form gives free aceefs to rain, fun, and air: every twig has its fhare, and the whole is prelerved in viroun. When the ttems have arrived at their proper bulk, eut them over at five feet from the ground, where the lateral branches end. This anfwers iwo cacellent purpofes: the firit is to ftrengthen the hedge, ule fap that formerly afeended to the top being now dillibuted to the branches; the next is, that a tall lockge thagates the air, and poifons both eorn and gratis near it. A hedge traned in this manner is im-
lenetiable even by a bull.
With regrand to the practiee of pla/hing an old hedge recommended by I i Anderfon, his Wrdmip obferves that "it makes agood interim fence, but at the longrun is defluctive to the plants; and aecordingly there is farcely to be mot with a complete good hedge
tree of long life. If, inltead of being maffacred by plafhing, it were raifed and dreffed in the way here deferibed, it would continue a firm hedge perhaps 500 years.
"A hedge ought never to be planted on the top of Hetges the monnd of earth thrown up from the diteh. It oughe to has indeed the advantage of an awful fituation ; but panted being planted in bad foil, and dellitute of moifure, it the fide canot thrive: it is at beft dwarfifh, and frequently ard no decays and dies. Fo plant crees in the line of the treesalt hedge, or within a few fect of it, ought to be abfo.ed in the lutcly prohibited as a pernicious practice. It is amazing that prople chould fall into this error, when they oubht to know that chere never was a good thornhedge with trees in it. And how flould it be otherwife? An oak, a beech, an clm, grows fafter than a thom. When fuftered to grow in the midat of a thornhedge, it fureads its roots every where, and robs the thorns of their nouridment. Nor is this all : the tree, overfhadowing the thoms, keeps the fun and air from them. At the fame cime, no tree takes worle with being overthadowed than a thorn.
"It is fearce neceflary to mention gaps in a hedge, beeaule they will feldom happen where a hedre is up gaps trained as above reeommended. But in the ordinary method of training, gaps are frequent, partly by the failure of plants, and partly by the trefpafing of cattle. 'The ordinary method of filling up gaps is to plant fweet briar where the gap is fmall, and a crab where it is large. This method 1 cannot approve for an obvious reafon: a hedge ought never in be compoled of plants which grow unequally. Thofe that grow falt, overtop and hurt the flow growers; and with refpect, in particular, ta a crab and fweet biar, neither of them thrive under the fhade. It is a better method to remove all the withesed earth in the gap, and to fublitute frefl fapp: mould mixed with fome lime or dung. Plant upan it a vigorous thorn of equal height with the hedge, which in its growth will equal the thorns it is mixed with. In that view there thould be a nurfery of thorns of all lizes, even to five feet high, ready to fill up gaps. The beft feafon for this operation is the month of October. A gap filled with fweet briar, or a crab lower than the hedge, invites the cattle to break through and trample the young plants under foot; to prevent which, a paling raifed on both fides is not fufficient, unlefs it be raifed as high as the heoge.
"Where a field is too poor to admit of a thorn-In wha hedge, if there be no quantity of Atones eatily procu-cafes rable, whins are the only refource. Thefe are com-are net monly placed on the top of a dry eath-dyke, in which fary. fituation they feldom thrive well. The following feems preferable. Two parallel ditches three feet wide and two deep, border a fpace of twelve feet. Within this fpaee raife a bank at the frde of cach diteh with the earth that comes out of it, leaving an interval between the two banks. Sow the banks with whin Feed, and plant a row of trees in the interval. When the whins are pretty well grown, the hedge on one of the banks may be ent down, then the other as foon as it becomes a fence, and fo on alternately. While the whins are young, they will not be diturbed by cattle, if paffages be kft to go out and in. Thefe paffages

birch, however, he particularly recommends, as gros. He!ges ing equally on the drietl and on tlee wettelt foils, propargating itfelf in fuch numbers, that were they not deflroyed, all the fandy walles of this king. dom would be quickly covered with them. Ite re commends partionlanly the keeping of a mufery for 35 fuch plants as are commonly ufod for hedges. "I gene. Of a proper rally (fays he) piek out a bit of barren land, and if. rarferyo ter ploughing it three or four thans to buy and defroy the heath, I find it anfwer cxeremely well for a aurfery. Into this fpot I tranfplant quick, hollies, and every tree which I ufed for fences or plantations. Dy eftablifhing fuch a nurfery, a gentlenan will alvay. be able to command a fuffisency of lrong and I ardy plants which will not deceive his expectations. I look upon thorns of five or lix years oll, which have been twice tranflanted from the feed-bed, to be the be:t of all; but as it may be neeeftary to fill up cafual gaps in liedges that have been planted feveral ycars, a provifion thould be made of plants of every ange, to 12 or if years old. All plarts which are iniended to he moved, fhould be tranfolated every two or at moit three years; without this attention, they atmoh thenfelses fo lirmly to the foil as renders a lublequent aperation dargerous. All who tranfolant quicks or hollies onght to begin their labours as carly as convenient in the autumn; for I have found by repeated expe. rience that neither of thele plants fucceed fo well in the fpring."
Whire the fences of a track of ground are in a very of repairruinnus condition, it ie ablolutely neceftary to foower ing runous the ditehes, throw up the banks, and fecure the whole bedges. immediately by the firmelt dead fences we can procure. If there is a total want of living plants, the cultivator can do nothing but plant new hedges; but if, as is generally the cafe, the banks are furnithed with a multitude of old flems, though totally unconnected as a fence, the time and labour requitite for the inteaded improvement will be conficerably abridged. All the Atraggling branches which add no folidity to the fence are to be cut off; after which the rett of the flems muf be fhorenced to the height of three or four feet. The method of cutting down every thing to the ground, which is now to general, our author higthly conderns. "Such a fence (fayshc) has within it no principle of Atength and conaeftion; it is manlly expoided in every part to deprecations of cattie anil fpasfingen; and even hould it efoape thefe, the firit fall of fnow will nearly demoina it. On the constary, wherever thele vegetable palifides can be left, they are impentirable either for man or horfe, and form fo nany points of innion which fupport the rell."

Another method of Arengthening defucive fences, is to bend down fome of the lateral liocts in a hurizontal direction, and to fread them along the line of the farm like efpalier trecs in a garden. A fingle ftem, when it rifes perpendicularly, will not fecure a fpace of more than two or three feet, but whon bent longiundinally, they will form a barrier a: leatl fufficient to repal ail cattle but hogs for 12 or 14 feet on each fide. By bending down, our author does not mean pla his.go? the common plafhing method, which is very injurioushedves difto the plants; but the fpreading two or three of the c nume: molt convenient branches along the hedge, and fatening them down either by pegs or tying, without in-

33
firry to the ftem, until they habitually take the pro pofed direction. Thafe who make the experinment it the firl time will he aloninhed how fmall a num Eer of piants may he made to lill a bank, with only tifling inservals. The bich is particulaly ufetul for this purpofe; licing of fo Alexible a nature, that thoots of 10 or $1=$ leet in length may be eatily forced into a. horizobital dirction; and if the other thoots arc promet away, all the juices of the plant will be ap. Flied to nourint the felected few: by which means they will in a fow years acquire all the adrantages of folls and rails, with this material difierence. that in. heal of decaying, they becoms annatly better. It is belides the property of all inclined branches to fend up a miltitude of perpendicular thoots; fo that by this horizonta! inclination, if juticioully made, you may acquire almot all the advantages of the thicketh fenee: but when the thems are too old and brittle to bear this cperation, it will be advifable to cut off all the urclefs oncs elofe to the ground, and aext frring they will te fucceeded by a number of young and vigorousones. Solect the bell of thefe to be trained in the manner altendy directed, and ewirpate all the reft, to increale their vigour. The thoots of feet old items as have been jul now defribed will attain a greater tize in three or four years than any yourg ones that can be planted will do in twetw.
Another mecthod which our author has practifed with the greatell fuccefs is the following. The tender foots of moit trees, if bended downwards and covered with earth, will pat forth roots, and being divided from the parent 1 tem at a proper time become frefh plants; an operation well known to gardeners, under the name of loying. This may be as advantageous to the farmer, if he will take the very moderate trouble of laying down the young and flexible branclies in his fenees. Moft fpecies of trees, probably all, will be propagated by this method; but par ticulally the withy, the birch, the holly, the white thorn, and the erab, will allo take root in this method, though mose flowly; the batter being an excellent plant for fences, and nut at all mice in the foil on which it grows. The advantage of laying down brabches in this manner over the planting of young ones is, that when you endeavour to till up a gap by the latter method, they advance very lowly, and are in danger of being llified by the fhade of the large trees; whereas, if you furtify a gap by foteading the branches along it in the manner jut mentioned, and at the fame time infert fome of the mol thriving thouts in the gromed, they will advance with all the vigrour of the parent plant, and you may allow them to grow untit thiy ane fo fully rooted as to be fiee from danger of fiftucation.

It frequetitly happens, that the fences of an eltate have been neplefted for many years, and exhibit nothing but rayged and deformed thems at great intervals. In iliis cafe it will be proper to cut them all off level with the ground: the conferfuence of this is, that next yrar they will put forth a great number of nioots, which may be laid down in every directiom, and trained for the improvement of the fence. When this operation is pefformed, however, it ought always to be done with an ax, and not with a faw; it being found that the later intrument generally pievents the vegeN 150.
tation of the plant. All the thoots laid down in this manner fhould be allowed to semain for feveral years, that they may be lirmly rooted. Thus they will make prodigious advances; and it is to be oblerved, that the more the pavent plant is divelled of all fuperdwous branches, the greater will be the nouruhnent tranfmit. $t=d$ to the fcions.

Our zuthor, however, is inclined to fufpect that the molt perfect form of an hedge, at lealt in all but thofe compofed of thorns and prickly plants, is to train up as many thems as will nearly tonch each other. The furce of every fence contifis chiefly in the upright thems: where thefe are fullicienlly near and litong, the hedge reliths all oppolition, and will equally repel the violence of the bull, and the inlidious attacks of the loogs. It is abfolutely proper that all hedges thould be infpected once a-year; when not only the diteh ought to be thrown out, and the bank fupported, but the Itrargling moots of all the live plants ought to be prumed By thefe are meant all fuek as project over the ditch beyond the line of the hedge, and which add nothing to its Arength, though they deptive the wfefut Aems of pait of their nomilh. ment. Where an hedge is compofed of plants of inferior value, it will be proper to train thofe in the maner jut now secommended, and to plant the bank with quick or loully. When thete lat lave attained a fufficient lize, the others may be extirpated; which is bett done by cutting down all the thoots repeatedly in the fummer, and leaving the roots to rot in the hedge.

In the 13 th volume of the Annals, W. Erkine, Efq; gives an account of a method of fencing very much refembling that recommended by Lord Kames, and which has been already defcribed. That gentleman is of contruc opinion, that in tome cafes dal /ane zualls, as they are called, are mote advantageous than hedges. "That hedges (fays lie) are more ormamental, cannot be denied; and they are generally allowed to afford more fhelter: but the lengti of time, the conftant attention, and continual expence of defording them until they bear even the refemblance of a fence, induces many people in thole places where the materials are eatily procured, to prefer the dry thone walls; for though the tirit coll is conliderable, yet as the farmer reaps the immediate lenefit of the fence (which is undoubtedly the molt fecure one), they are thought on the whole to be the leall expentive : befides, the cattle in expoled lituations, and efpectally in the fe nothera parts, are fo impatient of confinement at the commeneement of the long, cold, wet nights, that no hedues I have ever yet fen, in any part of this ifland, are fulficient to keep them in."

From conitiderations of this kind, the late Sir George Sumic of Eatl Lochian was induced to think of a fence which might join the ferength of the wall to the ormanient of the hedge. His therris were planted in the ufual manner on the fide of the diteh : but inthead of putting behind them a poft and rail or paling on the top of the bark, he ereded a wall two feet and a half high; and being well fituated for procuring lime, he ufed it in the conltruction of thefe walls which Mr Eftkine greatly recommends;" as the fatisfaction they afford, by requiring no repairs, and the duration of then, nove than repay the expence: but where the price
liges price of lime is high they may be built without any cement, and anfwer the purpofe very well if the work is properly executed."

In making a new fence of this kind, the furface of the ground fhould be pared nff the brealth of the ditch, and likewife for two fect more, in order to prevent as much as poffible the thorns from being injured by the growth of grafs and weeds. The dicch mould he five feet broad, two and an half in depth, and one foot broad at the bottom. Leave one foot for an edging or fearcement, then dig the earth me fpit of a fpade for about one foot, and put about three inclics of good earth below the thorn, which fould be kid neatly horizontal, but the point rather inclining up. swards, in order to let the rain drip, to the ronts: then add a foot of good earth above it: leave threc or four inches of a fearcement before another thorn is planted; it mult not be diredly over the lower one, but about nine inches or a foct to one fide of it : then throw a foot of good earth on the thorn, and trangle it well -down, and level the top of the bank for about thre feet and an hall for the bafe of the wall to rett on. 'This wafe foould be about nive or ten inches, but mut mot exceed one foot from the thorn. The wall ourht to be about two fet thick at the bottom and one foot at the top; the cope to be a fingle fone laid flat; then covered with two fods of turf, the grafs of the undermoft to be next the wath, and the cther fot mult have the grafs fide uppemait: the fods inould be of fome thickne:s, in order to retain meiture; fo that they may axhere together, and not be catily difplaced by the wind: the height of the wall to lie two feet and an half, exclafive of the fods: which together fhould be from four to fix inches, by which means the wall would be wear to three feet alenguther. The expence of the fences cannot fo eafly be counted, on account of the difference of the prices of labour in different parts. Mr Iofkine had them done with lime, every thing inclutud, from ic id. to 13d. per ell (which is equal to 37 inches 2 parts), according to the cafe or difficulty of working the quarry, and the difance of it from the place where the fence is crected. The lime colls about Od. per boll of about 40872600 bufleets: and from 15 to 16 lolls of lime are ured to the rood of $3^{5}$ fquare elis Scots meafure; and there are upwards of 43 Scotch clte, or +4 Eaglifingards. When the common round or flint thones are made ufe of, as they require more lime, it is neceffasy to ute 30 or 35 bolis of lime to the rood. The thorns are fold from tive to ten millinge per thoufind, arcording to their age, reckoning fix fore to the hundred. Making the ditch, laying the thorns, and preparing the top of the wall, generally colt from 7 d . to 8 d . ivery fix clls. About 50 carts of Rones, each cart carrsing ferm 7 to 9 cwe. will build a rood; the carriage at 2 d . per cart for half a mile's dimance.

Warnth is undoubredly as bencficial to hedges as trees; and the walls give an uffecual metter, which in expofed fituations is ablolutely neceflary for rearing young leetges; :and the; likewife preferve a proper degree of moillure about the roots. If the hedges bave leen planted for fix or feven years before the wall is built, cut them oves to two or threc inches above the ground with a marp tool, cither in Ostober or Novenber, or early in the fpring; and erect the Vol. VIMI, Part I.
wall as quickly in that feafon as poffible (the fpring in this country can fearcely be faid to begin till the end of March). It is alnoit impofable to imagine the rapidity wit which bedges grow in favourable ficuations. Mr Ertkine had one cut over in the fpring, and by the end of the year it was alinofl as laigh an the wall. In three ycars he fuppofed, that not even the Highand theep, when calily overleap a wall of four feet and an half in heiglt, would have been able to break through it.

Notwithlandiag the reafons that have been given Resfons for already againt the planting of timber trecs in hedges, whing are find the practice recommended be fome authors as hats rees. one of the befl futuations for railing thip-tim', er. The reafons are, that the roots have free range in the adjoining inclufures, and the top is expoled to the cxercite of the winds; by which means the trees are at once cnabled to throw out Arong arms, and have a large fpreading luead at the fame time; fo that we thas at once obtain quicknefs of cowth, with ftrength and crookednefs of timber. Well trained timber trees it is alliged are not prejulicial to hedgee, though pollards and low fypeading trees are detituctive to the hedge-wood which grows under them; neither are ligh erees prejudicial to corn-fieks like hish hedges and pullards, which prevent a proper ciculation of air ; and in Norfolk, where the cultivation of grain is carried on in great perfection, fuch land are faid io be suogt-bound. But when an hedge is erimened down io four or live feet high, with oaks interfperfed, a circulation of air is rather promoted than re:arded by it; and a trimmed hedge will thrive quite well undcr tall ftemmed trecs, particularly oaks. For arable inclofures, therefore, lied ges are recommended of four on: five feet high, with oak-timbers from 15 to 25 fect Alem. Figher hedges are more eligible fors rafs lands: the grafes affect warmith, by which their g"outh is promoted, and confequenty their quantity is inercufed, though perlaps their quality may fuffer fone injury: A tall fence likewife affords thelter to catte, provided it be thick and clofe at the bettom; but otherwife, by admitting the air in currents, it does rather harm than good. The thade of trees is equally friendly to catte in fummer; for which reafon it is recommended in grats inclofures to allow the hedge to make its natural thoots, and at the fame time to have oak-trees planted in it at proper intervals. Upon bicak hillh, and in ex. pofed fitations, it will be proper to have two or even three rows of hedsew od, about four feet dillant from cach other; the middle row leing permitted to reach, and always to remain at, i:s natural height: whilt the Tide rows are cut down alternately to give perpetual fecurity to the bottom. and aford a contant fupply of materials for dead hedges ani other purpores of underwond.

Much has been faid of the excellency of the holly Be $\mathrm{R}_{\mathrm{ma}} \mathrm{m}^{3}$. as a maturial for hedges; and indeed the beanty of thon of the plant, with its extreme clofenefs, and continuing panengin tain green throughout the winter, evidently give it the pre- budy for fencece to ail others; and could it be raifed with equal hedyces. eafe, there is no doubt that it would come into univerfal practice. Beludes the above properties, the holly will thrive ahmolt upon any foil ; but thin-foiled Aony lwights feem to be its natural fituation; and it may properly crough be faid, that holly will grow 3 B where-

## H E D

wherever corn will. Its longevity is likewife exceffive; and teing of flow growth, it does not fuck the land, as the farmers exprefs it, or deprive the crop of its nourifhment, as other hedeges do. The difficulty of railing holly may be obviated by planting it under crabs, which have a tendency to grow more upright than hawthorns, and confequently affording morc air, will not impede its progrefs though they afford thelter. It may even be raifed alone nithout any great diniaculty; only in this cafe the dead fence, to focure it, mult be kept up at leat ten or twclye years, inlead of lix or feven, as in the other cafe; and indeed, comfidering the advantages to be derived from fences of this kind, they feem to merit all the additional trouble requift.
The holly may be raifed either under the crab or hawthurn in two ways, viz. by fowing the berries when the quick is planted. or by inferting the plants themflves the elfuing inidfummer. The turmer is by nowh the more fimple, and perhaps upon the whole the better method. The feeds may cither be fcattered among the roots of the deciduous plants, or be fown in a drill in front: and if plants of holly be put in, they may either be planted between thofe of the crab, or otherwife in frunt in the quincunx manner.
Where furze or whins are to be ufed either as a fence by themfelves or an affiftant to another, it is better to ufe the French feed than that profuced in this country, as the former feldom ripens in this country, and confequently cannot like the latter over run the adjacent inclofure. It may be had at the feedGops in London for about 15 d. per pound, and one pound will fow to flatute rods. When ufed as an difitant to an hedge, it is more proper to fow it on the back of the bank than on the top of it; as in this cafe it is more apt to overhang the young plants in the face of the bank; whilf in the other it is better fituated for guarding the bank, and preventing it from being torn down by cattle. The method of fowing is as follows: Chop a dill with a fharp fpade about twothirds of the way up the back of the bank, making the cleft gape as wide as may be without breaking of the lip; and having the feed in a quart butte, thopt with a cork and goofe quill, or with a perforated wooden flopper, tilckle it alung the drill, coverime it by means of a broom drawn gently aljove and uere the mouth of the drill. Clofing the dill with the back of the fparde, fhuts up the feeds too much from the air, and thus kecps them tool long froms riting.
hedge Mog. See Erinaceus.
Hedife Sparroze. Sce Motacilla.
HEDYCARYA, in botary: A genus of the po. lyandria order, belonging to the dice ia difs of plants. The caly $x$ of the male is eleft in ci, he or ten parts; there is no corolla, nor are there any filaments; the antherex are in the bottom of the caly $x$, four furrowed, and bearded at top. The caly $x$ and corolia of the female are as in the male ; the exernas pedrellated; the nuts pedicellated and in nofpermous.

HEDYOTlS in botany: A genus of the monogynia order, belonging to the tetrandia clafs of plants; and in the natual mathod ranking under the 47 th order, Stillutx. The curolla is monopetalous and fun-
nel-fhaped ; the capfule is bilocular, poly fpernous, in. Hedyl ferior.

HEDYSARUM, in botany: A genus of the decandria order, belonging to the diadelphia clafs of plants; and in the natural method ranking under the $32 d$ order, Papilionacex. The carina of the corolla is tranfverfely obtufe; the feed-veffel a legumen with monofpermous joints. These are 59 \{pecies of this plant, of which the molt remarkable dre, 1. The gyrans, or fenfitive hedyfarum, a native of the Ealt Indies, where it is called lurrum chundalli. It arrives at the height of four feet, and in autumn produces bunches of y yllow fluwers. The root is annual or biennial. It is a trif. lious plant, and the lateral leaves are fmaller than thode at the end, and all day long they are in confant motion without any external impulfe. They move up and down and circulaty. This lat motion is performed by the twilting of the foottalks; and while the one leaf is rating, its affociate is generally defending. The mution downwards is quiker and more irregular than the motion upwards, which is fteady and uniforma Thefe motions are oblictadile for the foace of 24 humers in the leaves of a branch whith is loppent off from the thrub if it is kept in water. If from any obttacle the motion is retarded, upon the removal of that ohtacle it is refumed with a greater degree of velocity. 2. The coronarium, or conmon bienmial French honcyfuckle, hath large deeply-ftiking biennial roots; upright, hollow, fanoth, very branchy falks, three or four feet high, garnifhed with pinnated leaves; and from between the leaves proced long fikikes of beautiful red howers, fuccreded by jointed fred-pods.

Culure. . The tirl fpecks being a native of hot climates, requires the com no.i culture of atider exotics; the fecond is salily raifed from feed in any of the common bordore, and is very ornamental.

HEEL, in anatomy, the hind part of the foot. See Anatomy, no 66.

Hefi of a Hory, the lower hinder part of the foot comprehended briween the quarters and oppofite to the toe. The locel of a horfe fhould be high and large, and one fude of it thould not rife higher than the othempon the paftern. To recover the heds of a horfe that is huof bound, you thould take out his fole and keep his lietls very wide, by which they will be reltored in a munth.
Hefe of a Horfemar. This being the part that is armed whit the fpur, the word is ufed for the fpur itfelf; "Thas horfe muderilands the heal well." 'To ride a hurie from one neel to anothitr, is to make him go fideways, fometimes to one heel and fometimes to another.

Heel, in the fea-language. If a thip leans on one fide, whether the be aground or afoat, then it is faid fine huels a-llaboard, or a port; or that the heels uffwards, or to the thor ; that is, inclines more to one fide than to another.

JiEeliER, or Bhooly. HEEL Cock, a fighting cock, that itrikes or womads mach with his fpurs.

The malters know turh a cock, even while a chicken, by the faking of his two hetls together in his goius.

HEEM (John David), an able painter, born at Utrecht in ioot. He excelled in parating flowers,

## H E I

akirk fruit, vales, and inflruments of mufic, which be performed in fuch a perfect manner, that a perfon was apt to attempt taking them in his hand. His colouring is agrecable, and the infects in his pictures appear alive. He died at Antwerp in 1674 .

Cornelius de HEEA, his fon, was alfo a good painter, though inferior to his father.

Heemskirk. See Hemskirk.
HEGIRA, in chronology, a celcbrated epoch a. mong the Mahometans. The word Arabic, formed of הנר, hagiral, fight ; of to fly, quit one's country, family, friends, \&e.

The event which gave oecafion to this epocha, was Mahomet's flight from Meeca. The magitrates of that eity, fearing his impoftures might raife a fedition, refoked to expel him: this, accordingly, they effected in the year of our Lord 622, on the evening of the 15 th or 16 th of July. See Arabia, $n^{\circ} 44$.

To render this epocha more creditable, the Mahometans affect to ufe the word Begira in a peculiar fenfe for an act of religion, whereby a man forfakes his country, and gives way to the violence of perfecutors and enemies of the faith: they add, that the Coranites, being then the ftronget party in the eity, obliged their prophet to fly, as not being able to endure his abolining of idolatry. This flight was not the firft of Mahomet's, but it was the moll famous. It happened in the $14^{\text {th }}$ year from his afluming the eharacter of prophet and aputle, and promulgating his new religion.

The orientals co not agree with us as to the time of the hegira. Among the Mabometans, Amafif fixes it to the year of Chrift 630 , and from the death of Mofes 23+7; and Ben Caffem to the year of the world 58co: according to the Grect computation, among the Chritians, said Ebn Batrik refors the liegira to the year of Chinit G14, and of ahe cleation 614.

Khondemir relates, that it was Omar, the fecond caliph, that firit ettablithed the hegira as an epocha, and appointed the ycars to be numbered from it : at the time he made this decree, there were already feven years clapfed. This eftablifhment was made in imitation of the Chrittians, who, in thofe times, reekuned their years from the perfecution of Discletian.

But there is another hegira, and that catlier too, though of lefs eminence. Mahomet, in the 14th ycar of his niffion, was obliged to relinquif Medina: the Coraflites had all along oupofed him very vigoroufy, as an innovator and dillurber of the public peace; and many of his difciples, not enduring ta be repated followers of an impoltur, defired leave of him to abandon the city, for fear of being obliged to renounce their religion. This recreat makes the firt hegira. Thefe two hegiras the Mahometans, in their language, call hegiratan.

The years of the hegira confift only of 354 days. To reduce thefe years to the Julian kalendar, i. e. to find what Julian year a given year of the hegira anfwers to, reduce the year of the hegira given intudays, by multiplying loy 354 , divide the product by 305 , and from the quotiene fubtract the intercalations, i. $e_{0}$ as many days as there are four years in the quotient; and laftly, to the remainder add $6: 2$. See Year.

HEIDEGGER (John James), was the fon of a clergyman, and a native of Zurich in Switzerland, where he married, but left his country in confequence of an it-

## If E I

trigue. Having had an opportunity of vifiting the prin. Heidegger. cipal cities of Europe, he acquired a tafte for elegant and refined pleafures, as they ate called, which, united to a flrong inclination for voluptuoufnefs, by degrees qualified him for the management of public amufements. In 1708, when he was near 50 years old, he came to England on a negociation froun the Swifs at Zurich ; but, failing in his cmbaly, be entered as a private foldier in the guards for protection. By his fprightly cogaging eonverfation and infinuating addrefs, he foon worked himfelf into the good graces of our young people of fathion; from whot lie obtained the appellation of "the Swifs Count." He had the addrefs to procure a fubleription, with which, in 1709, he was enabled to furnifh out the opera of "Thomyris," which was written in Eurlith, and perfurmed at the queen's theatre in the Haymarket. The mufic, however, was Italian; that is to fay, airs felected from fundry of the foreign operas by Bunoncini, Scarlatti, Steffasi, Gafparini, and Albinoni. Heidegger by this performatree alone was a gainer of 500 guincas. The judicious remarks he made on feveral defects in the conduct of our operas in general, and the hints he threw out for improving the entertainments of the royal theatre, foon eftablifhed his character as a good crizic. Appeals were made to his judgment; and fome very magniicent and elegant decorations intro. duced upon the flage in confequence of his advice, gave fuch Iatisfacition to Geurge II. who was fond of operas, that, upon being informed to whofe genius he was indebted for thefe improvenients, his majelty was pleafed from that time to countenance him, and he foon obtained the chief management of the operahoufe in the Haymarket. He then fet about improving another fpecics of divertion, not lefs agreeable to the king, which was the mafquerades, and over thefe he always prefided at the king's theatre. He was likewife appoisted malter of the revels. The nobility now cateffed him fo much, and had fuch an opiminn of his tafte, that all Iplondid and elegant entertainmenis given by them upon particular oceafions, and all private affemblies by fubfeription, were fubmitted to his direction. From the emoluments of thefe feveral employments, he gained a regular confiderable ineme, amounting, it is faid, in fome years, to 50001 . which he fpent with much liberality; particularly in the maintenance of a fomewhat too luxurious table; io that it may be faid he raifed an income, but never a fortune. At the fame time lis charities ought not to pafs t:moriced, which were frequent and ample. After a fuecefsful malquerade, he has been known to give away feveral hundred pounds at a time. "You know poor objects of diftrefs better than I do," he would frequently fay to a particular aequaintance; "be fo kind as to give away this money for me.", This well known liberality, perhaps, contributed much to his carrying on that diverion with fo little oppolition as he met with. He disd in $1-1+1$, at the adran. cod age of 90 years.

As this perfun was long the Arbiter Elegantiarum of England, and is alluded to in many publieations of lis time, fome account of him, it was thought, might be here expected : but to add all the aneedotes that have appeared concerning him, would enlarge this article beyond the limits to which it is intitled. One

IIe then
or two of the mon remarkable, however, are fubjoined in a note (A), as they may afford entertainment to many of our readers.

HEIDENHEIM, a town of Germany, in Swahia, and in the territory of Brentzhall, with a handfome palace or cafte, belonging to the houfe of Wirumberg. E. Long 10. 19. N. Lat. q $^{8 .} 37$.

IHEIDLLEEERG, a confiderable and populons town of Cermany, capital of the Lower Palatinate, with a celcbrated univerfity. It is noted for its great Ion, whel, hohis seo hogtwads, genemaly kept full of gool Rhanifh winc. It Itands in a pleafant rich country, and was a famons feat of karning : but it has undergone fo many calamities, that it is nothing now to whet it was formerly. It was firtl reduced to a heap of ruins in 1622 by the Spaniards; and the rich library was tranfported partly to Viema, and partly to the Vatican at Rome. After this it enj yed the benefits of peace, till the Proteltant cketoral honfe became extinct, and a bloerly war, enfued, in which nont only the cattle was ruined, but the tombs and bodies of the electors wete flamefully violated and pillagod. Tais happened in t 693 ; and the people of the 1 ahatinate were obliged to leave their dwellings, and to go for refage into foreiga eountries. To add to thefe
misfortunes, the clector refided at Manhim, and carried moit of the people of ditinction along with him, fo that it is uncertain whether Heddeberg will ever recover iffelf or not, though they have began to rebuild fome of the fortifications. The great ton was broke to pieces in 1693 by the Freach, and at great expenec in 1729 was repaired. The town lands on the river Neckar, owr which there is a handfome bridge. E. Long. S. 48. N. Lat. 49. 25 .

HEIGHL', in general, liguties the difference betwicen the ground and the top of any object medured perpendicularly.

HELLA, a town of royal Prufia, in Caflubia, feated at the mouth of the river Villua, on the Bastic Sca, and fubject to Poland, 12 miles nurth of Dantzic. E. Lons. 19.25. N. Lat. 54. 53.

HEILEGEN-hate, a feaport town of Germany, in Lower-Saxony, and in Wa feria, feated on the Baltic Sea, over aguint the illand of Lermerna. E. Long. 11. ${ }^{1} 5$. N. Lat 57.30.

HEINECCIUS (John Goticb), one of the great. of civilians of the 1 th century, was born at Eitenberg, in the principality of Altenburg, in 1681 . Af.
cinetken, ter having fudied at Gollar aod Leipfick, he was deHeingus. figned for the miniftry, and began to preach; but dif. liking that profefion, he laid it alide, and applied himfelf entirely to the Andy of philofophy and the civil law. In tyic, he became profeffor of philofuphy at Hall; and in $\mathbf{1 7 2 1}$, lie was made profeflor of cisil law, with the title of cownfllor of the court. His great reputation made the Atates of Friefland insite him to Francker in 1724; but three years after, the king of Piuffa prevailed on him :o accept of a proforimmip of law at lirancfort on the Oder, where he dillirgnined hinfelf till the year 173.3. Becoming again protefor at Hill. he remaned there till his death, which happoned in 1741, notwithtanding lis being invited to Marpurg, Denmark, and three academies in Holland. He wrote many works, all of them much eftetred. The principal are, i. Antiquitatwn Ronanarum jurishrudentiam ithuflrastium fyntazma. It was this cxcellesi abridgement that gave rife to his reputation in foregn countries. 2. Elencnta juris cirilis fccurdum ordinem infiturionum $\forall$ pandesarum. 3. Fundamenta fyli cultioris. 'lhere are few works fo ufeful as this for forming a I atin tyle. 4. Elementa philsfophie raionalis \&orolis, quibues framifla biloria phitafoptica. 5. Hilloriz juris civilis Romani ac Germanici. 6. Eiementa juris naturiz $\begin{gathered}\text { sen. }\end{gathered}$ tium, \&ic.

HEINETKEN (ChriPian), ar cxtrantlinary child, the rrodigy of the Nonth, was born at Lubeck in 1721. He fpoke his maternal tongue fuenty at to mouths. At one year old, he knew the principal events of the pertateuch; in two months more, he was mater of the entire hiftory of the Old and New Teftaments; at two years and an hall, he anfwered the principal quettions in geografoy and in ancicnt and modern hiftory; and be fpoke Latin and Fiench with great facility before the commencement of his fourth year. His conflitution wa to delicate, that he was not weaned till a few months before his death. M. Martini of Lubec pubithed a pamphlite in 1,30 , in which he endeavoured to give natural reafons for the extra. ordinary capacity of this infant, who died in his fifth year.

HEINSIUS (Danied), profeffor of politics and hi. flory at Leyden, and libration to the unverlity there, was born 2: Gand in Flanders in 1580 . He became a fcholar to Jofeph Scaliger at Leyden, and was ineebeed to the enconragement and care of that great man for the perfection to which he attained in literaturc, end which at the beginning of his life there was little reafon to hope from li:m. He diltingnifhed himfelf as a critic by his labours on many claffeal authors; and was highly lonoured as well abroad as at home: Gufavus Adolphus king of Siveden gave him a place a. mong his counfellors of flate; the republic of Venice made him a knight of the urder of St Mark; and pope Urban VIII. made him great oflers, if he would come, as lie cxpreffed it, " to refcue Rome from barbarifn." He died in 1606 , leaving feveral works of his own, both in poctry and prose.

Hensucs (Nicholas), the fon of Daniel Heinfus, was born at Leyden; and became as great a Latin poet, and a greater critic, than his father. His poems have been feveral times printed, but the bett editien is that of Amflerdam in 1666 . He gave cdisions of fe. veral of the clafics, with no:es; his Claudian is dedi.
cated in a Laiin poern to queen Chriftina of Sweden, and his Ovid to "1huanus. At his death, which happened in 168:, he difclaimed all his works, and exprefed the utmont regret at having left behird him fo many " monumemts of his ranity." as he cailed them. He was as much dittinguilhed by his great employ. ments in the Aate, as by his talents, learning, and gool qualities.

HEIR, in law, fignifies the perfon who fucceeds ancther by cefcent to lands, temements, and hereditaments, being an eftate of inheritance, or an ettate in fee; becaufe nothias palfis by right of inheritance but infle. See the arriches Consanguiniry, Descent, Fre, Succession; and Iaw, i-dxxui. \& chxax. at fo.

HFIR-Apparerit, is a perfon to called in the lifecius of his anceftor, at whole death he is lieir at lax.

HERR-Prefumption, is one who, if the anceilor moult die immediatcly, word, in te eprelent circumitances of things, be lus heir ; butwhote right of inheritance maj be defeated by the contingeney of fuace warcr lieir being birn.

HFIR-Joom, (formed of heir and the Saxon loom, denoing limb or members) in our law-bouks, firmtics fuch goods and perfomal chattels as are not inventuried after the ouner's duccale, but neceflaty come to the heir along with the houfe.

Heir loom comprehends divers implements; as tables, preffes, cupboasds, bediteads, furnaces, wainfcot, and fuch like; which in furse countries have befonged to a houfe for certain defents, and are never iavento. ried after the deceale of the owner, as chattels are, bat accrue by cuttom, not by conmon law, to the heir, with the houfe itfelf. The ancien: jewels of the crown are held to be leir-lnoms, and are not devifable by will, but defeend to the next fuecertor.

HEIRESS, a female heir to one who has an ethate in lands, \&c. Ser llemp.

ItEikSHW mowreles, in Sot, law, the beft of cortain kinds of moveableg, wheh the heir of line is insitled to take, bufides the herivable eratte. See

HEISTER!A, in botary: A genus of the monogynia order, belonging to the decandia clals of plants; and in the matural method ranklug under the 12 th order, Holoraces. 'l'be calyx is quinquetid, the petal: five; the fruit is a plam on a very large colourd calyx.

HEI.ENA, or St IIE\&ENA, an imand in lae A:lantic Ocean, belonging to thic Lnglint Eatl Ludia company, and lituated in W. Longs 6. 32. S. I.at. 36. The greaten length of the ifiand is aboat cight miles, and its circumference about 20 . It hath fome high momtains, particularly one called Dians's frak. which is covered with woods to the very top. Usher hills there are which hear evident marks of a volcanic origin: and fome haoc huac rocks of lava, and a kind of half-vitrited flags. The couniry, dewordinet to Mr Fortter, has a fine appearance; the forl is in inamy places a rich mould, from ix so sen inches deep, and a variety of plants thave in it luxuriantly. He found many plants bere which be had not obterved in other parts of the world. Amonir thefe were fome caided by the natives cobluge tros, gumberes, and ral avash. The former thaicin mond fixes; but the datier are al-

Lielena. ways found on the ridges of hills, where the foil is dry. The cabbage tree has rather large leaves; but after many inquiries Mr Fortler could nut find that it was ufed for any other purpofe than that of fuel, and no reafon could be affignoed why it lad obtained that name. It malt not be confounded with the cabbage-tree of America, India, and the South Sea, which is a fpecies of patm.

The ifland is haid out entirely in gardens and pafturage. Peaches are the only European fruits that thive here. Cabbages and other greens, which thrive extremcly well, ane devoured by caterpilars; and every fpecies of corn is deltroyed by rats. All the paftures were over-run with furze; which, though in our country a very ufctefs and even pernicious plant, was of fingular advantage to the inhabitants of St Helena. Before the introduction of that plant, the ground was parched by the intenfe ieat, and all kinds of grafs and herbage were thrivelled up. But the furze-bulhes, which throve as it were in defpight of the fun, preferved a degree of moillure in the ground ; by which means the grafs fprung up vigoroufly, and the country became covered with a rich and beautiful fod. The furze is now no longer warted, and the pcople affiduounly root it out for fuct. The number of people on Si Helena does not exceed zooo perfons, including 500 foldiers and too flaves: and it is taid that the number of females born on the ifland confiderably exceeds that of the males. By the arrival of the India fhips, which they fupply with refrefments, iney are in return provided with all forts of manufactures and other necelfaries: and the Company annually order one or two of their fhips to touch there in their way to India, in order to fend them a fufficient quantily of European goods and provifions. Many of their flaves are employed in catching fifln, which are very plentiful; and, by the help of thefe, together with their poultry, cattle, roots, and falt provifions, they fubfitt throngh the year. Their life (fays Mr Forfter) feems to pafs alorg very happily; free from the multitude of cares which dillrefs their countrymen in England, and bleffed with quiet and content.

St Helema was finf difcovered by the Portuguefe in 1502, on St Heter's day; whence its name. They ftocked it with different kiuds of ufeful animals; but whether they ever fettled a coluny on it or not, is uncertain. The Portuguefe having either abandoned or never taken puffifion of it, the Dutch became its mathers; and kept 1 offeflion of it till the year 1600 , when they were drivin out by the Englin. In 1673, the Duth h touk it by furpife; but a fhort time after it was recovered by the brave captain Munden, who alfo took three Dutch Ealt Indiamen then lying in the harbunir. On this occafion the Hollanders had fortuied the landing place, of which there is only one on the inand; and erected batteries of great guns to prevent a defent: but the Englifh hasing knowledge of a fmall creek, where only two men abrealt could crecp up, clinbed to the top of the rock in the night; and appearing the next morning behind the batteries, the I utch were fo terrified, that they threw down the ir arme, and furrendeted at difcretion. This creck has been fince fortificd, and a battery of large canmon placed at the entrance of it; fo that now the iflaud is
rendered perfeetly feeure againt all regular approaches or fudden attacks.

HELEN, (in fab. hift.) the daughter of Tyndarus and Leda, was married to Mieuclaus king of Sparta, but was theten from him by Thefeus, 1235 B. C. She was reftored foon after; but carried off again by $\mathrm{P}^{2}$ aris, the Trojan prince; which occafioned the famous Trojan war. See Trox.

St Helen's. Sice Hellens.
HELENILM, eastard sun-flower: A genus of the polygamia fuperflua order, belongi in :o the fyugenetia clafs of plants; and in the natural method ranking under the $49^{\text {th }}$ order, Compsfta. The receptacle is naked in the middle ; under the radius paleaceous; the pappus confills of five thort awns; the caly $\mathbf{x}$ is fimple and multipartite; the forets of the radius femitrifid.

Species. 1. The autumnale, with fpear-fhaped rarrow leaves. 2. The latifolium, with pointed, fpearfhaped, fawed leaves.- Both thefe are natives of North America, where they grow wild in great plenty. They rife to the height of feven or eight feet in good ground. The routs, when large, fend up a great number of Alalks, which branch toward the top; the upper part of the flalk futtains one ycllow flower, fhaped like the funflower, but much fmaller, having long rays, which are jagged pretty deep into four or five fegments.

Culture. Thefe plants may be propagated by feeds, or by parting their roots; the latter is generally practifed in this country. The beft feafon to tranfplant and part the old roots is in Octuber when their leaves are pall, or in the beginning of March jult before they begin to fhoot. They delight in a loil rather moift than dry, provided it is not too lirong, or does not huld the wet in winter.

HELENUS (fab. hift.), a celebrated foothfayer, fon of Prianı and Hecuba. He was greatly refpected by all the Trujans. When Deiphobus was given in marriage to Heten in preference to himfelf, he refolved to leave his comery, and retired to mount Ida, where Ulytfes took him prifoner by the advice of Calchas. As he was well acquainted with futurity, the Grecks made ufe of prayers, threats, and promifer, to induce him to reveal the fecrets of the Trojans; and either the fear of death, or gratification of refentment, feduced him to difclofe to the enemies of his country, that Troy could not te taken whill it was in poffictlion of the Palladium, nor before Polydectes came from his retreat at Lemnos and affited to fupport the fiege. After the ruin of his country, te fell to the flare of Pyrrhus the fon of Achilles, and laved his life by warning him to avoid a dangerous tempett, which in reality proved fatal to all thofe who fit fail. 'This endeared him to 1 'yrrhus; and he received from his hand Andromache the widow of his brother Hector, by whom he had a fon called $C_{e}$ ftrimus. This marriagre, according to fome, was confummated after the death of Pyrrhus, who lived with Andromache as with a wife. Heknus was the only one of Priam's fons who furvived the ruin of his country. After the death of Pyrrhus he reigned over part of Epirus, which he called Cbaonia in memory of his brother Chaon, whom he had inadvortently killed. Helenus rectived Nineas as
ielepolis he voyaged towards Italy, and foretold him fome of the calamities which attended his fleet. The manner in which he received the gift of prophecy is douotful.

HELEPOLIS, in the ancient art of war, a machine for battering down the walls of a place befieged, the invention of which is afcribed t, Demetriu; Po-liorcetes.-Diudorus Siculus fays, that each fide of the Helepolis was 40 ; cubits in breadth and 90 in height; thast it had nine ttages, and was carried on four ftrong folid wheels cight cubis in diancter; that it was armed with large battering rams, and had two roofs capable of fuppreing them; that in the lowe ftages there were different forts of engines for calling ftones; and in the middle they had large catapulas for difcharging arrows, and finaller onts in thofe above, with a number of expert men for working all thefe machines.

HELIADES, in mythology, the daughters of the Sun and Clymence, according to the poets They were fo afflited, as they fay, with the death of their brother Phaeton, that the gods, moved with compaffion, transformed them into poplars on the banks of the river Eridanus.

HELIEA, in Grecian antiquity, was the greatert and mont frequented court in Athens for the trial of civil affairs. See Heliaste.

HELIACAL, in aftronomy, a term applied to the rifing and fetting of the llars; or, more itrictly fpeaking, to their emerfion out of and immerfion into the rays and fuperior fplendor of the fun.- 1 flar is faid to rife heliacally, when, after having been in conjunction with the fun, and on that accuunt invilible, it comes to be at fuch a ditance from him as to be feen in the morning before fun-rifing; the fun, by his apparent motion, receding from the ftar towards the eaft. On the contrary, the tecliacal fetting is when the fun approaches fo near a flar as to hide it with his beams, which prevent the fainter light of the tar from being perceived; fo that the terms apparition and occultation would be more proper than rifug and jetting.
HELIANTHUS, the great sunflower: A genus of the polygamia. fruftanea order, belonging to the fyngenefia clats of plants; and in the natural method ranking under the $49^{\text {th }}$ o der, Compoyfux. The receptacle is paleaceous and plane; the pappus diphyllous: the calyx imbricated: the fcales Randing a little out at the tops. 'There are 12 fuecies, moft of which are now very common in our gardenz, though all of them are natives of America. They are all very hardy, and will profper in almoft any fiil or fituation. They may be propagated cither by feeds or by parting thcir roots.

HELLASTA, in antiquity, the judzes of the court Helied. Thay were fo called, accurding to fome anthurs, from : Gieck word which hgutices ts affemble in a great numbler; and, according to vilhers, from another wn which fignifies the fun, b waufe they beld their .ffot...es in an op "place. They compofed not onis t're moll numerous, but has wile the moft inpurtan of :l henenian tubuals; tor their province was cither thexplatione obluace laws, or to give new vigour and authanity to thofe which wat'ren violated. Tte Tra farmetwe convoked the aT: wbly of the Heliatize, ula hi formutione asow, wated to soce, fometines to 1500 , julges. Mr blancuard is of yi.
nion, that, to make this number, the Thefmothete Heliafte. fometimes fummoned thiofe of each tribe who had late quitted the public ofices which they had exercifed in another court.

However that may be, it appears that the affemblics of the Heliafte were not frequent, as they would have interrupted the jurifdiction of the itated tribunals and the common courfe of affairs.
The Thefmuthete paid to each member of this affembly, for his attendance, three omoli: which are equal to two Roman fefterces, or to half a drachina. Hence Ariltophancs corms them the brothers of the tribundus. They were likewife condemoed to pay a fine if they came tos late; and if they did nut prefent thenfelves till after the orators had be suan to fpeak, they were nut admitted. Thais atten lance was requited out of the public trafury, and their pay was called mijftos beliagtious.
The affembly met, at fint, according to Ariltophanes, at the rifing of the fun. If the judtecs were obliged to meet under cover on account of if 1 and frow, they had a fire; but there is nur a parige in any ancient anthor-which informs as of the place where thefe affemblies were held cither in the rigorous or in the mild feafons. We only learn, that there was a double enclofure aromd the affinbly, that it might not be dilurbec. The firtt was a kind of arborwork, from fpace to fpace, feparated by duors, over which were painted in red the ten or twelve firl letters of the Greck alphabet, which diretied the entrance of the oficers whe compofed the trihunal, eash of them entering under the letter which ditinguifhed his tribe. The beaules of the cuart, to whon they fhowed the wands which had been fent them by the 'Thefnuthete as a fummuns to meet, ceramined its marl, to fee if it was authentic, and then introduced them. The focund inclofure, which was at the diltance of 20 feet from the former, was a rope or cord; that the people who thood round the fint inclofure, and were detions to fee what panfed within the fecond, might nut be prevented from gratifying their curiulty at a proper dillance. Thus the attention of the jalges was not interrupted by the concourfe of the multitude, manay of whom were licated by visws of interell or of party.

To each of the members of the afiembly were diftributcd two pieces of copper ; one of which was perforated, not curtainly that it mighe be dillinguifh d from the other by fecling. for thefe affemblies inet at the rifing and were diffulved at the fetting of the fun. Thofe picces of copper had been fubllituted for little feathells, which were at tirll in ufe. The king was prefent at the altembly, at whofe command it had been fummuncd. The Thefmuthetie read the names of thofe v:luo were to compofe it, and each man took his plase as he was callerb. The Thefinothete were then fent for, whofe function it was to obferve prodigies and to fuperimend the facrifices; and if they gave their fanction, the detiberations wese begun. It is well known, that the onti cers called Exegete were oftea corrupted by thos who were interefted in the debates of tie a flembly; and wat they : xcited fich tumults as were raifed by the R.anan tris mal ia the pupular alfemblies consuked by the commo.
Of all the monnents which remain relating to the Hoinabic, the moth curious is the vath which thofe judges

11:"isae jubges took before the Thefmothete: Demolthenes Leve hath prefervel it in his oration againt Timocrates, who having been bribed by the : who had been intutted with the efiects taken on board a velfel of Namertis, ani refufed to give an aceonat of them, get a law paffed, by which an enlargement was granted to prifoners for public debes on riving bail. Demothones, in making his oration againf that law, creders the ents of the lfalialte to be read aloud, as a perpethal ansiliary to his arpuments, and happily cal onated tointortt the mobletule and inflame their pathons. "ihis nath we hall quote, thit our readers may how how refpertable a thibunal that of the H ebiafize was, and the importane of their deciftons.
"I will findre according to the laws and dectees of the perple of Abthens, and of the fenate of 500 . I will nevergive my vote for the elablihment of a tyrant, nor of an chyarehy. Nor will I evor tive my approbation en an opinion prejudicial to the liberty or to the mion of the people of Athens. I will not feeond ahofe ferons il to may propufe a reduetion of private debts, or a ditaibution of the lands or houfes of the Athenians. I will not recal exiles, nor endeavour to procure a pardon for thofe who thall be condemned to die. Nor will 1 force thofe to retire whom the laws and the fuffrage of the people thall permit to remain $j$ in their country. i will not givemy vote to any canthdate for a public function who gives not an accomit of lis, conduct in the office which he las previoully thlt, d; nor will 1 profance to follit any trut from the commonwealth without fubjecting myfolt to this condition, which 1 mean as obligatory to the mine archous, to the chief of religions matters, to thole who are bal. fotal on the fame day with the nine archons, to the herahd, the ambaftutor, atd the ether ofliears of their cout. I will not fufior the fame man to bold the fame
 f säl not axcept any prifent, either iny felf or by anoliter, cither dasetly or inditectly, as a mamber of the Ildiallie afternbly. I fobmoly declare that I am 30 yeara uld. I will be equally sttentive and inpartial is the accufer and the accufed; I will give iny fencence figonathy ascording to evidunce, Illms I lwear, by Suptot, by Neptume, and Ceres, to ade. And if l vidate any of my engagemente, I inprecate from the fe deitics nit on shyfif and moj fanily ; and 1 requet them "" crant me every kind of protperity, if 1 am fatufnit tomy oath."

The weded flond perufe what follows this oath to fee with whar cloquence Demolhenes avails himfelf of it, and how he applis its principles to the caute whel lie drfends.

Here we lave one of the motives of the mecting of this atco bly, stritute informs 16 uf another; which Fas by the i ublic atalority depued to them, to dret a magithrate in the room of one dead. It is luppriling, that Whafaides, wo enters for often into details, gives tas (ne) forfoctar acombt of alis affembly. All that he

Whe race twly Diogenes Inertins, in lis life of Sthos, that to wo betore onc of thefe Helime aftem. Lhes itat Mintrobes prefortod himtelf, covered with swonds ant centufichs (for thus be had treated him. Ged and the mater mhinh dow has car), to excite the $N=150$.
indiguation of the pople againt his preterded enemies, who, j alons, as he alleged, of the lopularity he had acquired by afferting the rights of his poorer fellos citizens, in oppofition to the men in power. had attacked him whike he was lumting, and had wounded him in that barbarons maner. His d=fign fucceeded: a guard was appointed him; by the afilt ance of which he acquired the fovereignty or tyranny of Athens, and kept it 33 years. 'the power of the affembly appeared renarkanly on that oceation; for Solon, who vas prefen:, oppofed it with all his eftorts, and did not fucceed.

As to the manner in which the jutges gave their fuffages, there was a fori of veffe! covered with an ofer mat, in which were placed two ume, the one of copper, the other of wood. In the lid of thefe urns there was an oblong hole, which was large at the top, and grew narrower downords, as we fee in fome old boses of our churches. The fuffrages which condemned the acculed peifon were thrown into the wooden urn, which was termed furios. That of copper, named akion, received thole which abfolved him.

Ariftetle obferves, that Solon, whofe aim was to make lis people happy, and who found an ariltocracy eltablifhed by the election of the nine archons (anauad officers, whofe power was almoit abfolute), tempered their fovereignty, by inttituting the privilege of appealing from them to the people, who wre to be affembled by lot to give iheir fuffrage: after having taken the oath of the Heliatte, in a place near the Panathenaum; where liffus had, in former days, calmed a fectition of the people, and bound them to unanimity by an oath. It has likewife been remar'sed, that the god Apollo was not invoked in the oath of the Hsliatter, as in the oaths of the other judges. We have sberved, that he who took the oath of the Heliatla, engaged that he would not be compted by folicitation or money. 'Whofe who violated this patt of their oath were condemmed to pay a fevere line. The decemvirs at Rome made fuch corruption a capital crime. But Alconius remarks, that the punifoment denounced agaiatt them was mitigated in later times; and that they were expelled the fenate, or banifhed for a certain time, according to the degree of their guit.

HELICON, in ancient geograply, the name of a monntain in the neighbourhood of Parnaflus and Cytheron, facred to A pollo and the mufes, who are thence called Frlicoukhs. It is fitusted in Livadia, and now callud Zagare or Zageyd- Mrlicon was one of the moll fertile and woody momatains in Grece. On it the frait of the adrachenus, a fipecies of the arbutes or of the Rrawbery-twe, was ancommonly fweet; and the julabitants allimed. that the plants and roots were all fricndly to man, and hat cven the ferpents had their pulfon weakened by :ls: innoxious quatities of their food. It approached lamathas on the north, where it tonched on Phocis; and refembled that mounsain in loftinets, estent, and magnitude.-. Iftre was the thaty grove of the mafis and titir images: with thatues of Apollo and Bacthos, of L inus and Orphens, and the illatrions poets who liad recited their werfes to the harp. Armong the tripods, in the fecond century, was that confecmet' by Il, foul. On the lett-hand going to the grove was the fomman Agampe; and about twenty lladia, or two mides and a half, ligher up, the viclet. piéans with games called Muf ac. The vallies of Helicon are deferibed by Wheler as green and flowery in the fpring; and enlivened by pleafing cafeades and ftreams, and by fountains and wells of clear water. The Beotian cities in general, two or three excepted, were reduced to inconfiterable villages in the time of Strabo. The grove of the mufes was plundered under the aufpices of Conflantine the Great. The Heliconian goddeffes were afterwards conlumed in a tire at Conftantinople, to which city they liad been removed. Their ancient feat on the mountain, Agrnippe and Hippocrene, are unafcertained.
HELICONIA, in botany; a genus of the monogynia order, belonging to the pentandria clafs of plants. The fpatha is univerfal and partial; there is no calyx; the corolla has three petals, and the nectarium two leaves; the capfule is three-grained.
helicteres, the screprtree: A genus of the decandria order, belonging to the gymandria clafs of plants; and in the natural method ranking under the 37 thorder, Columnifers. The calyx is monoplyylons and oblique; there are five petals, and the neetarium contits of five petal-like leaficts; the capfules are intorted or twilted inwards. - There are four ipecies, all natives of warm climales. They are flrubby plants, rifing from five to fourteen feet in height, adorned with fluwers of a yellow coluur. They are propagated by feeds; but are tender, and in this comery muft be kept in altove during the winter.

HELIOCARPUS, in botany: A genus of the digynia order, belonging to the dodecandria clafs of plants; and in the natural method ranking under the 37th order, Columnifere. The calyx is tetraphylluus; the petals four ; the tyles fimple; the capfule hilocular, compreffed, and radiated lengthwife on each lide.
hellocentr RiC latitude of a Planet, the inclination of a line drawn between the centre of the fun and the eentre of a planet to the plane of the ecliptic.

Helocevitikic Pluce of a Planet, the place of the ecliptic wherein the planer would appear to a fipectator placed at the centre of the fun.

HELIOCOMETES, a phenomenon fonctimes obferved about fun-fetting; being a large luninoustail or column of light proceeding from the body of the fun, and dragging after it, not unlike the tail of a comet ; whence the name.
helionorus of Phoenicia, bifhop of Trica in Theffaly, better known by the romance the compofed in his youth intitled Fethiopics, and relaing the amours of Theagenes and Chariclea. Some fay he was depofed by a fynod becaufe he would not coufent to the fuppreffing that romance. The fable has a moral tendency, and particularly inculeates the vitue of challity. As it was the filt of this fpecies of writing, he is ityled the Father of Romances. He was alfo a good Latin poet. He lived in the tha century.
HELIOMETER, formed of nnos finn, and $\mu$ ' $\beta=I$ neafure, the name of an inltrument called alfo afrome er, invented by $M$ Bouguer in $17+7$, for meafuring with particular exactnefs the diameters of the ilars, and efpecially thofe of the fun and moon.
This inflrunient is a kind of telefcope, confiting of two object glafies of equal focal ditance, placed one of them by the lide of the other, fo that the fame eysVol. VHI. Patt I.
glafs ferves for both. The tube of this indlrument is Elcliome of a conic form, larger at the upper end, which receives the two object-glaftes, than at the lower, which is funiflaed with an cye glafs and micrometer. By the conftruction of this inltrument two diftinet imagez of an object are formed in the focus of the eyc-glafs, whofe dittance, depending on that of the two objectglafles from one another, may be meafured with great accuracy: nor is it neceffary that the whole dific of the fun or moon come within the field of view; fince, if the innages of oully a fmail part of the dife be formed by each object-glafs, the whole diameter may be ealily computed by their pofition with refpect to one another: for if the object be large, the images will approach, or perhaps lie even over one another; and the object-glaffes being moveable, the two images may always be brought exactly to touch one another, and the diameter may be computed from the known dillance of the ceutres of the two glaffes. Beffes, as this inftrument has a common micrometer in the focus of the eye glafs, when the two images of the fun or moon are made in part to cover one another, that part which is common to both the images may be meafured with great exactnefs, as being viewed upon 3 gronnd that is only one half lefo luminous than itfelf; whereas, in gencral, the heavenly bodies are wewed upon a dark ground, and on that account are imagined to be larger than they really are. By a fmill addition to this inltrument, provided it be of a moderate length, M. Pougucr thouglit it very polfible co mesfure angles of three or four degrees, which is of particular confequence in taking the diflance of flars from the moon. With this initmment M. Bouguer, by repeated ubfervation, foum, that the fun's vertical diameter, tho' fomewhat dimimilled by the altonomical reftaction, is longer than the horizontal diameter; and, in afcertainiag this phemomenon, he alfo found, that the upper and loweredges of the fun's dife are not fo equally dofined as the other parts; on this account his image appears fonewhat exterded in the vertical direction. This is owring to the deconpolition of lighe, which is known to conlil of rays dif. thently refrangible in its paffage through oir atmosphere: Thus the bhe and vio'et rays, which proced from the upper part of the dife at the fame time with thofe of other col urs, are fomewhat more refrakted than the others, and thersfore fetm to us to have pro. ceeded from a ligher point ; whereas, on the contrary, the red rays procecting from the lowse edge of the dife, being leforifracted than the others, feem to proceed from a lower point; to tha: the vertical didneter is es. tunded, or appears longer, than the horizontal diameter.

Miscrengtun Savery difeurered a bmilar nechod of improving the nicrometer, which was commanieated to the Ropal Society in $17+3$. Suchacametre.

HELAOPFLLA, in borany: A gemus of the fitiquofa onder, belunging to the tetradyuania clafs of piauts; and in the hatural incthod anking under the 2.gth order, Silquefia. 'tiletre are two nectaria reciurvated towards the velicular bafe of tin calyx.

HELIOPIHOBL, a name given to the whie negroes or allhinos, from their avelion to the light of the fun. See Alemo.

HELIOPOLIS (anc. geog.), fo called by Herodotus and Diodnus Sieulua, by Mufes $O_{n}$, and in Joremata Bodlyemes; a city of Egypt, to the funci-calt of the Detta, and can of Nematio; of a very old
${ }_{3} \mathrm{C}$
Itaading,

Mavice Aandisy, its origin terranating in frble. Itere ftood the waple of the fun, hede in religious beneration. The city llood on an extraordinary moumt, but in Strabo's time was delulate. It gave name tot the $\mathrm{N}^{\circ}$ omos Hail poilis. - Theme wa atother Meltiodis in Culofyria, uedr the finings of the Orontes; fo called from the werferp of the fun, which was in great voguc ower all Syria.

Ill: 10SCOPL, is optice, a fort of tedicure pe. culia:! hated for vicuing the fan without hamtarg the cyes. Sce Telescape

I!EIfosTATH, in optics, an intrunsent invented by the fat katnu Dr S. Gravetande; who gave it this name from its fsime, as it were, the bas of the fun in an horizontal directionacrufs the dark chamber all the while it is in uf. Soce Oprics (Indox.)

HELIOTROPE (Ladscosian), amung the ancients, an inlturent or madine for thowing when the fan arrived at the trepies and the equinoctich line. This name was alfo ufed for a furs dial in general.

Ielrotrope is alfoa precious tone, of a green colour, fteaked with red veins. Pliny fays it is thus called, tecaule, when caft into a viflel of water, the fun's rays falling thereon feem to be of a blood colour; and that, when out of the water, it gives a faint reflection of the figure of the fun : and is proper to obferse eclipfes of the fun as a haliofeope. The hatiotrope is alfo callet oriental jufier, on account of its ruddy fpots. It is found in the Ealt Indies, as alfo in Ethipia, Germany, Bohemia, \&c. Some have alcribed to it the faculty of rendering people invilible, like Geres's ring.

Ileliotroplum, turnsole: A genus of the polygynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 4 the urder, Aferifchuz. The corolla is falver-fhaped nd quinquetid, with leffer dants interjected alternately; the throat elofed up by fmall arches formed in the corolla itklf. 'There are a number of fecies, all of them natives of warm countries. Only one, called the tricoctum, grows in Curope; and is a native of France, Spain, and Italy. It is only remarkable for the property of its berries, of which an account is given under Colour-Muhing, $n_{i}^{c}{ }^{6} 6$.

HELIX, in geometry, a fpiral line. Sce Spiral. *-The word is Greek, Enes, and literally fignities "a wrearh or winding;" of exioew invelvo, "I environ."

In architecture, fome authors make a diference between the helix and the fyiral. A fairecafe, according to Daviler, is in a hetix, or is helical, when the Atats or fteps wind round a cylindrical newel; whereas the fpiral winds round a cone, and is continually approaching nearer and nearer its axis.

Hebix is afo applied, in architecture, to the cauli. cules or little volutes under the flowers of the Curinthian capital; called allo urill.s.

Hebty, in anatomy, is the whole circuit or extent
of the auricie or botcer of the ear outwards. In op. [oftion to whicl, the inaur prouberance hurounded thereby, and anfwering thereto, is called ankilix. Sue Aximony, n tft.

Helux, the Shail, in zoology, a genus belongins to the order of verumes teflacea. The mell confils of On: finiral, bittle, and alnoll diaphanous valve; and the aperture is sarrow. There are 60 Species, prin. cipaily ditinguifhed by the Ggure of their thatls. It bey ate of various Szes, ficmothat of a fmath apple tol. © than half a per. Some of them live on hand, frequent. ing woods and saven: or inhabiting clefts of lucks and dry fand but.s. Obers of them are aquatic, inhinitng ponds, cotp rivere, and the uccan. "Me principil Soccics a!e,

1. The junthim, with a viok coloured hedh, is remarkable for the extreme thinnefo of its texture, which breaks with the la ate prifure, and feems therefore entirely calculated to kcep the open fea, or at leat to thun rocky Mores. It inhabits the lias of Europe, efpecially the Mediterrantan; thole of Alia and Africa; and alfo the ccean. The living animal, when tou het, exfudes a juice which ftains the hands of a violet colour Dr Ilawkefworth, in his asconnt of Cooke's voyage. mitakes this the ll for that which yielded the forsa a of the ancients. Int whouver looks irto Pliny, can never have the leaft ilca that the thin Sheld aforementioned could be the fame with it. They had feveral Thulls which yieded the parple dye: but thefe were all rock holls *, and vely different both in fisure and. See buse hatdnefs from the little helix jacintha; whach is not imumand catculated for the neighbomhood of rocks, as already Murex. mentioned. T"id. Plin. lib. v, cap 1. and lib. ix. cap. 60, Ca. S.e allo Don Ame. Ulioa's Voyage to Sunti America book iv. ch. 8.
2. The ponatia, or exotic fuail, with five fpirea, mottremartably ventricos, and fafciated with a lighter and a deeper brown, is a native of France, where it inhabits the woods; but has been naturalied in England, where it inhabits the woods of the fouthern courties. l: "as introduced, as it is faid, hy Sir Kenem Disby; whetner for intdical purpofes, or as food, is metrtain: iradition fays, that to cure bis beloved wife of a decay was the object. They are quie confined to our fouthern courties. An attempt was nade to bring them invo Northamptouhire, but they worild not live there. - Thefe are ufed as a fond in feveral parts of Europe during Lent; and are preferved in an elcargatoire, or a large place boand in, with a floor covered half a foot deep with heobs, in which the foails nefle and fatten $\dagger$. - They rere alfor a favomite difh t Astfon with the Romans, who had their cohlearia, a nurfery himilar to the above. Fulvias Ifir pinus $\ddagger$ was the firlt \& Pliny, $d$ inventor of this lusury, a little before the civil wars ${ }^{c} 56$. . between Cetar and Pumpey. The fanils were fed with bran and fedden wine. It we condd credit Varroll, $\|$. iii. they grew folarge, that the the lls of fome would hoid c. it. ien quarts! People need not admire the temperance
 of only a lettuce a piece, three fatila, two eggs, a barley cake, fweet wine and frow,-in cafe his fnails bore any proportion in tize to thole of Ilirpinus. - Its name is derived not from any thing relating to an orchard, but from raux, an operculum, it having a very frong one. 'This feems to be the feceies deferibed by

## H E L

Itelir Pliny, lib. viii. c. 39. which be fays was fearce; that it covered itfels with the operele, and lodged under ground; and that they were at filt found only about the maitime Alps, and more lately near Velitra. [Sce Plate CCXXXIV. the figure half the nutural fize.]
3. The hortentis, or gavden frail, is in form life the latt, but leis, and not umbilicated and clouded, or mottled with browns. It abounds with a viferd flimy juice, which it seadily gives out by boiling in milk or water, fo as to render them thich and glutinous. The decoctions in milk are apparently very nutritions and demaleent, and have been recommended in a thin acrimonions thate of the humours, in confumptive cafes and conaciations.

The eyes of fails are lodred in their horns, one at the end of each horn, which they can retract at fleafurs. The manner of examining the fe cyes, which are four in number, is this: when the horns are out, cut off nimbly the extremity of one of them; and placing it before the microfope, you may difenver the black fpor at the end to be really a femiglubular eye.-The diffection of this anmal is vely curious; for by this means the microfrope not only difcovers the lieart beating jalt againlt the round hole nearthe neck, which feems the place of tefiration, but alfo the liwer, foleen, fomael, and intellines, with the veins, arteries, momh, and teeth, are plainly uffervable. The guts of this creature are green, from its eating of helbs, and are branched all over with line capillary white veins: the monch is like a hare's or rabbit's, with four or lix needle-teeth, refemblug thofe of leeches, and of a fubfance like hern. - Snails are all hermaphrodites, having both fexes united in each individual. They la; iheir cggs with great care in the earth, and the young ones are batched with thells complettly formed. Cutting off a fnail's head, a little done appears, which is fuppefed to be a great dieuretic, and good in all nephritic diforders. Immediately under this fone the heart is feen beating; and the aumicles are evidently dillinguithakle, and are membranous, and of a white colour; as are alfo the veffels which proceed from them.

Snails difcharge their excrements at a hole in their neck; they alfo breathe by this bole, an! their parts of gencration are fittated very near it. The penis is very lons, and in mape refembles that of a whale. In the procefs of generation, it his been oblesved, that with the male and female part there ithes, at the aporture of the neck, a kind of fipear, faped like the head of a lance, and terminating in a very acnte puint: and when the wo fuails turn the clefts in then uecks to. wards each other, the fpear ifining from one pricks the other, and theneither drops to the ground or is carried of by the faxil it has pricked. This frail iuttantly withdraws, but foon after rejoins the other, which it picks in its turn: and ufter liveh mutual punctare, the copulation never fails of being eonfummated. Shails are faid to couple three times at the dillance of about fifteen days from edch wher, nature producing a ne: Spear for each time of copulation, which latts ten or twelve liours. At the end of about eighteen days they bring forth their eggs by the apertme of their neck.

So fmall an aninial as the finat is not frec from the plague of fupporting other fimailer animals on its body; atid as in cther anmals we find thefe fecondary ones either living only on their furface, as lice, \&c. or only
in the intedines, as worms. it is wey remarkable that this creature infetls the fnail in both thefe manners; being found fometimes on the furface of its body and fometimes within its inteflines. There is a part of the common gaiden fanil, and of other of the like kinds, commonly called the collar. This furrounds the necix of the fuail, and is confiderably thick, and is the only part that is vifible when the animal is retired yuictly into its thell. In this flate of the animal thefe infects which infelt it are ufually feen in confiderable numlers mareling about very nimbly on this patt: befides, the fuail, every time it has occation to open its anus, gives them a place by which to enter into its intedines, and they offen feize the opportunity.

Suails are great dell royers of fruit in our gardens. efpecially the better forts of wall.fruit. Lime and athes fprinkled cu the ground where they moll refort will drive them away, and deftroy the yonng brood of thom: it is a common practice to pall off the frait they have hitten; but thix mould never be done, for they will eat no other till they have wholly eat ure this if it be left for them.

HELL, the place of divine punifhment after death.
As all religions have fuppofed a future fate of exif. ence after this life, fo all have their hell or place ot torment in which the wicked are fuppofed to be punithed. The hell of the ancient heathens was chivided into two manfons; the one called Ely/um, on the right lind, pleafint and delightful, appuinted for the fouls of good men; the other called Tartara, on the left, a terion of mifery and torment appointed for the wieked. The latter only was hell, in the prefent reltrained fenfe of the word. See Elssius.

The philofophers were of opinion, that the infernal regions were at an equal dillance from ail the farts of the earth; reverthelefs it was the opinion of fome, that there were eertain paffages which led thithor, as the river Lethe near the Syites, and the Achernfan carc in Epirus. At Hermoine it was thuught, that there was a sery thort way to hell; for which reafon the people of that country nower put the fare into the months of the dead to pay their palfage.

The Jews placed hell in the center of the earth, and belicwed it to befituated under waters and mountains. Aceording to them, there are three paflages lealing to it: the frett is in the widdernefs, and by that Korah, Dathan, and Abiram, defeended into hell; the fecond is in the fea, becaufe Joman, who was thirown into the fea, cried to God out of the belly of hell ; the third is in Jerufalem, becaufe it is faid the flue of the loord is in Zion, and his furmace is in Jerufakn. They likenife acknowledged feven degrees of pain in hell, beeaufe they find this place called by feven difterene names in feripture. Though ehey believed that intidels, and perfons eminently wicked, will cuntinue for ever in hill ; yet they maintained, that esery Jew who is not infected with fome herefy, and has not acted contrary to the points mentioncd by the rablins, will not be punithed therein for any other crimes above a year at moll.
'The Mahometans believe the eternity of rewards and r. iihments in another life. In the Koran it is fad, that hell has feven gates, the firll for the Maffumane, the fecond for the Clirslians, the third for the Jews, the fourth for the Sabians, the fifth for the Magians,

He1 the fixth for the Payans, and the feventh for the hy. pocrites of all religions.
smorg Cliritians, there are two controverted que. ftions in refard to hell; the one concerns locality, the other the duration of its torments. 1 . The locality of hatl, :ind the eality of its fire, began firll to be controverted 1: Origen. That father, interpreting the fripture accunt metaphorically, makes hell to confit, not in external punifhments, but in a confcioufnefs or fonfe of gillt, and a remembrance of paft peafures. Atnong : e moderns, M . F Whithon advanced a new loporestis. According to him, the comets are fo many " clls appointed in their orbits alternately to carry the damaded into the confines of the fun, there to be for encol by its violent heat, and then to return with the beyond the mb of Saturn, there to Aarve thea in thefe cold and difmal regions. Another modern antur, mu fatisfied with any hypothelis hitherto adranced, aflygas the fian to be the local hell. 2. As th ine fecond quettion, viz. the duration of hell torments, we have Origen again at the head of thofe who deny that they are eternal; it being that father's opinion, that not only men, but devils, after a due courfe of punimment luitable to their refyefire crimes, Hall be pardoned and rellored to lheaven. The chief principle upon which Origen built his opinion, was the nature of punithment, which he took to be emendatory, applied only as plyfic for the recovery of the patiem's health. The chief objection to the eternity of hell torments among modern writers, is the difproportion between temporary crimes and eternal pu. nimments. Thofe who maintain the affirmative, ground their opinions on \{eripture accounts, which reprefont the pains of hell under the figure of a worm which never dies, and a fire which is not quenched; as alfo upon the words, "Thefe thall go away into everlating punihment, but the righteous into life etermal."

HELL INICES of Nitylene, a celtbrated Creek hiftrian, bonn before Incrudotus, Gourifhed about $480 \mathrm{~B} . \mathrm{C}$. He wrote a hiftory of the ancient kings and founders of cities, but which hath not come down to u .

HELLAS, (anc. geog.), an appellation compriling, according to the more ancient Greeks and Romans, Achait and Pchoponelus, but arturds refrained to Achaia. It was bounded on the weft by the river Achelous, on the nortin by mounts Othrys and Octa, on the call Ly the Egean fea, aud on the fouth by the Saronic and Corimelian bays, and by the iallmus which joins it to Peluponnefus. It was called Hellas, from Hellen the fon of Deucalion; or from Hellas, a diftrict of Theffaly; whence flellenes, the geatilitious name, denotins Grecks. Now called Livechia.

HELLE, (fab. hift.) a daughter of Athamas king of Thebes by Nephele. She fid from her father's boute with lier brother Phryxns, to avoid the cruel oppreflion of her mother-in-law Ino. Aecording to fume accounts the was carried through the air on a goldea ram which lear mother had received from Neptune, and in her paffage the became giddy and fell from her feat into that part of the fea which from her received the name of Hillifont. Others fay that the was carried on a cloud, or rather upon a fhip, from which the fell into the fa and was druwned. l'herxn; after he had
given his fifter a burial on the neighbouring coafts, gurfued his journey and arived in Colchis.

HELLEBORE. See Helliborus.
White-Helffeore. See Veratrum.
HELLEBORUS, helleboze: A genus of the polygy nia order, belonging to the pentandria clats of plants; and in the natural method ranking under the 2Gthorder, Multifligus. There is no calyx; but five or more petals; the nectaria are bilabiated and tubular; the capfules poly fermone, and a litile ereet.

Species. The moof remarkable fpecies of this plant is the niger, commonly called Chriblmas rofe. It hath roots compofed of many thick flethy fpreading fibres, crowned by a large clatter of lobed leaves, conititing each of feven or eight obtufe flehy lobe, united to one foot-Ralk; and between the leaves feveral thick flefly flower-Halks three or four inches high, furmounted by lar se beautiful white flowers of five roundith petals, and numerous filanents, appearing in winter, a. bout or foon after Chriitmas.

Culure. This plant may be propagated either by feeds or parting the roots. It profpers in the open borders, or may be planted in pots to move when in bloom in order to adom any particular place; but it alway flowers faisett and mult abundantly in the front of a warm funny border. The plants may be removed, and the roots divided for propagation, in September, October, or Nuvember; but the fooner in autumn it is done, the ftronger will the plants flower at their proper fafon.

Ufes. The root of this plant was anciently ufed as a cathartic. The talte of it is acrid and bitter. Its acrimony, as Dr Grew obferves, is firit felt ou the tip of the tonguc, and then fpreads itfelf immediately to the middle, withont being much perceived in the intermediate part. On chewing the root for a few minutes, the tongue fee:ns henumbed, and affected with a kind of paralytic llupor, as when burnt by eating any thing too hot. The fibres are more acrimonious than the head of the root from whence they iflue. Black hellebore root, taken from 15 to 30 grains, proves aflrong eathartic; and, as fuch, has been celelurated for the cure of maniacal and other diforders proceeding from what the ancients called the ctralilis; in which cafes, medicines of this kind are doubtlefs occalionaliy of ufe, though they are by no means poffefled of any fpecific power. It docs not however appear, that our black hellebore acts with fo much violence as that of the ancients; whence many havc fuppofed it to be a different fipecies of plant: and indeed the deferiptions which the ancients liave left us of their lellebore, ao not agree with thofe of any of the forts ufually taken notice of by modern totanills. Another fpecies has been difcovered in the eattern countries, which Touncfort dittinguifhes by the name of bellelorus niger orientalis, amplifjima folio, caule prealto, flore purpurafente, and fuppofes to be the true ancient hellebore, from its growing in plenty about mount Olympus, and in the inand of Anticy ra, celebrated of old for the produc. tion of this antimaniacal drug: he relates, that a fcruple of this fort, given for a dofe, occafioned convulfions.Our hellebore is at prefent looked upon principally as an alterative; and in this light is frequently employed, in fmall dofes, for attenuating vifcid humours, promoting the uteriue and urinary difcharges, and opening

## II E I.

inveterate oblluctions of the remoter glands. It often proves a powerfal emmeragogue in plethoric habits, where itcel is ineffectual or improper. In fone pasts of Germany, a feecies of blacts hellebore has been made ufe of, which freq ennuy produced sident, and fometimes deleterious, eflets. It appars to be the fetid kind of Linnæ", called in lenshifh jeatle curt, fetterwort, or bafard holletore. The ronts of this may be diftinguifaed from thofe of the true kind, by their being lefs black.

HELIEN, the fon of Dencalion, is faid to have given the name of Hellenilts to the peop.e before called Greeks, 1521 B. C. Sec Greece.

HELLENISN, in maters of languaze, a phrafe in the idiom, genins, or confruction of the Greck tongue.

This word is only ufed when fpeaking of the anthors who, writing in a different languare, exprefs themifelves in a phrafeology peculiar to the Greck.

Hel, LENISTMC lavguage, that ufed by the Grecian Jews wholived in Egypt and other parts where the Greck tongue provaled. In this language it is faid the Suptuagint was written, and alfo the books of the New Teftament ; and that it was thas denomi. nated to hoow that it was Greek filled with Mebraifins and Syriacifns.

HELLENISTS (Hellenjfe), a term occurring in the Greck text of the New Teftament, and which in the Englifh vertion is rendered Grecians.

The critics are diviled as to the fignitication of the word. Eecumenius, in his Schelia on Acts vi. 1. obferves, that it is not to be undertsod as fignitying thofe of the religion of the Crecke, but thofe who fooke
 gate verfion, indeed, render it like onrs, Graci; but Mefleurs Du Port Royal more aceurately, Yuifs Grecs, Greek or Grecian Jews; it being the Jews who fpoke Greek that are here treated of, and who are hereby dillinguifhed from the Jews called Hobrews, that is, who fpoke the Hebrew tongue of that time.
'The Helleni!ls, or Grecian Jews, were thofe who lived in Egypt and other parts where the Greek tongue prevailed. It is to them we ove the Greek vergon of the Oid Teflament, commonly called the Sepruggint, or that of the ferenty.

Salmafius and Voffus are of a different fentinent with regard to the Hellenills. The latter will only have them to be tho fe who adhured to the Grecian interells.

Scaliger is reprefonted, in the bealigerana, as afferting the Hellenitts to be the Jews who lived in Greece and other places, and who read the Greek Bible in their fynagogue, and ufed the Greek language in faeris; and thus they were oppofed to the Hebrew Jews, who performed their public workhip in the Hebrew tongue ; and in this fenfe St Paul fpeaks of himfelf as a Hebrew of the Hebrews, Phit. iii. 5. i e. a Hebrew both by nation and language. The Hellenilts are thus properly diltinguithed from the Hellenes or Greeks, mentioned John xii. 20. who were Grecks by birth and nation, and yet profelytes to the Jewith religion.

HELLENODICF, Exp\%nsoxat, in antiquity, the directors of the Olympian games. At firlt the ${ }^{\text {+2 }}$ was only one, afterwards the number increaled to two and to three, and at length to nine. They affembled in a place called Enanusuxaco, in the El:an Gorum, where

## 397 ] H E L

they were obliged to refide ten months before the ce. Hellefpent lebration of the games, to take care that fuch as offered themfelves to contend, performed their woyuuveis. $x \times$, or preparatory exercifes, and to be inftrueted in a! the laws of games by certain men called nopozenaxir, i. e. " keepers of the laws." And the better to prevent all mijut practices, they were farther obliged to take an oath, that they would act impartially, wonld take no bribes, nor difonver the reafon for which they dilliked or approved of any of the contenders. At the folem. nity they fat naked, having before them the victurial crown thll the exercifes were finithed, and then it was prefented to whomfoever they adjudsed it. Nevertheleff, there lay an appeal from the hellenodice to the Olympian femate.

HELI,ESPONT, a narrow Arait between Afia and Europe, near the Propontis, which reccived its name from Helle who was drowned there in her voyage to Colchis. It is celcbrated for the love and death of Leander, and for the bridge of boats which Xerxes built over it when he invaded Greece. The fully of this great prince is well known in beatiog and fettering the waves of the fa, whofe impetuolity fettered his fhips, and rendered all his labours ineflectual. It is now called the Daydanelles. It is about 33 miles long, and in the broadett parts the A fiatic coalt is atout one mile and a half diftant from the European, ana only half a mile in the narrowedt, according to modern inveftigation, and the cocks are heard crowing from the oppofite thores.

HELLEN'S (St) a town of the Ine of Wight, in Ealt-Medina, has a oay which runs a confiderable way within land, and in a war with France is often :he flation and phace of rendezvous for the royal mavy. At the mouth of the bay is that cluller of rucks called the Mixen. It had an old church fituated at the ex:remity of the coaft, which was endangered to be wafled away, as was a great part of the church-yard, which oecationed a new church to be built in 1719. The priory to which the old church belonged is now converted into a gentleman's feat ; is in a remarkably: pleafant lituation, and commands a fine profpect of Portfonouth and the Koad at Spithead. Si Helu's appears to have been of more contideration in former times than at prefent.

HELAS, a long and flat piece of timber, or an af. femblage of feveral pieces, futpended alons the hind. part of a hip's dlern-poll, where it turns upon hinges to the right or left, ferving to direet the courfe of the veffel, as the tail of a lifh guides the body.

The helm is ufually compofed of three parts, viz. the rudder, the tiller, and the wheel, except in fmall veffels, where the wheel is unneceffary.

As to the form of the rudder, it becomes gradally broader in proportion to its diftance from the top, or to its depth under the water. The back, or inner part of it, which joins to the flern-poft, is diminithed into the form of a wedge throughout its whole lengtl:, fo as that the rudder may be more cafily turned from one fide to the other, where it makes an obtufe angle with. the keel. It is fupported upon hinges; of whi he chofe that are bolied round the flern-poll to the afierextremity of the lhip, are called googings, and are farnithed with a large hole on the aterepart of the !1- was polt. The other pats of the hinges, which zto bolted

Hedm. on the latk of the rudder, are called phatis, being fron catindrical pins, wheh enter into the googings, and rett upon them. The length and thichucts of the rudder is nearly equal to that of the itern-poll.

The mdder is urned nonon its hinges Ey means of a long bar of timber, called the filler, which is tixed horizontally in its upper end withia the veffel. 'I'he movements of the tiller to the risht and left, accordingly, dircet the efforts of the ruder to the government of the hip's courfe as the adrances; which, in the fea-langrage, is called ficting. The operations of the tiller are guided and affited by a fort of tackle, communicating with the thip's lide, calleal the billorrope, which is ufually compofed of mantred rope yarns for the purpofe of tracerfing more readily though the blocks or pullies.

In order to facilitate the management of the helm, the tiller rope, in all large veffls, is wound about a wheel, which acts upon it with the powers of a crane or windlafs. The rope employed in this fervice being conveyed from the fore end of the tiler $k$, to a fingle block $i$, on each fide of the thipt, is farther commusnicated to the wheel, by means of two blocks fufpended near the mizen mait, and two holes immediately above, leading up to the wheel, which is hixed upon an axis on the quarter-deck, alnof perpendicularly over the fore end of the tiller. Five turns of the tillerrope are ufually wound about the barrel of the whed; and, when the helm is amidmip, the middle turn is nailed to the top of the barrel, with a mark by which the helmfman readily difcovers the fituation of the helm, as the whed turns it from the larboard to the larboard fide. The fookes of the wheel generally reach about eight inches beyond the rim or circumference, ferving as handles to the perfon who fleers the veffel. As the effect of a lever iacreafes in proportion to the length of its arm, it is evident that the power of the helmfinan to turn the whed will be increafed according to the length of the fpokes beyond the circumference of the barrel.

Plise
CCXXVI.

When the helm, inflead of lying in a right line with the keel, is turncd to one lide or the other, as in BD , fig. 1 . it receives an immediate thock from the water, which glides along the fhip's bottom in running, aft from $A$ to $B$; and this fluid puthes it towards the oppofite fide, whillt it is retained in this pofition: fo that the llern, to which the rudder is confined, receives the fame impreffion, and accordingly turns from B to $b$ about fore point $c$, whill the head of the flip paffes from $A$ to $a$. It muft be obferved, that the current of water falls upon the rudder oblique$l y$, and only flrikes it with that part of its motion which acts according to the tine of ircidence, pufhing it in the direction NP, with a force which not only depends on the velocity of the Chip's courle, by which this current of water is produced, but allo upon the extent of the fine of incidence. This force is by confequence compored of the fquare of the velocity with which the fhip advances, and the fquare of the line of incidence, which will neceftarily be greater or fmaller according to cheuntances: fo that it the veffel runs three or four times more fwiftly, the abfolute thock of the water upon the rudder will be nine or 16 times ftronger under the fame iocidence: and, if the inci-
dence is increaled, it will yet be augmented in a greater proportion, becaufe the fquare of the tine of incidence is more entarged. This imprefion, or, whit is the fame thing, the power of the helm, is always very fecble, when compered with the weight of the veltel: but as it operates with the force of a long lever, its efforts to tura the fhip are extremely advantageous. For the helm being applied to a great diftance from the centre of gravity $(G$, or from the point about which the vefful turns horizontally, if the direction PN of the impremion of the water upon the rudder be prolonged, it is evident that it will pa?s perpendicularly to K . widely diftant frons the centre of gravity $G$ : thas the abfolute effort of the water is very posiful. It is not therefore furprifing, that this machine imprefles the fhip with a condiderable circular movement, by pufhins the liern from is wa and the head from A to a; and even much farther whild fte fails with rapidity, becaufe the effect of the helm always keeps pace with the velo. city with which the reffel a lvances.

Amongit the foveral angles that the rudder makes with the ked, there is always one polition more favourable than any of the others, as it more readily produces the defired effect of turning the mip, in order to change her courfe. To afcertai: this. it mut be confidered, that if the obliguity of the rudder with the ked is greater than the ubtufe anyid A1BD, fo as to diminith that angle, the action of the water upon the rudder will increafe, and at the lame time oppofe the courfe of the thip in a greater degree; becrufe the angle of incidence will be more cpen, fo as to prefent a greater furface to the fhock of the water, ty oppofing its palfage more perpendicularly. But at that time the direction N?' of the effort of the halm upon the thip will pals with a fmaller diflance from the centre of gravity $G$ towatds $R$, and lefs approach the perpendicular NL, according to which it is abfolutely weceflary that the power applied thond ack with a grester effect to turn the veffel. Thus it is evident, that is the obtufe angle A MD is too much inclufed, the greateft impulfe of the water will not counterbalance the lofs fullained by the diftance of the direction $\triangle P$ from N1., or by the great obliquity which is given to the fame direction NP of the abiolute effort of the helm with the ket AB. If, on the contrary, the angle $A B D$ is too mach opened, the direction $N{ }^{2}$ of the force of the ation of the helin will become more allvantageous to turn the veflel, becaufe it will approach ncancr the perperdicular N1.; fo that the line proslonged from NP will increafe the line GR, by removing $R$ to a greater diliance from the centre of grasity $G$ : but then the helm will receive the impretan of the water too obliquely, for the angle of incidence will be more acute: fo that it will only prefent a fmall portion of its breadeh to the fhock of the wa. ter, and by confequence will onty receive a fecble effort. By this principle it is cafy to conceive, that the greatef dilance $G R$ from the centre of gravity $G$, is not fufficient to repair the diminution of force occafioned by the too great oblipuity of the fhock of the water. Hence we may conchode, that when the water either ftrikes the helin too directly, (or tow ob)liquely, it lofes a great cieal of the eflect it ought to produce. Between the two extanes thate is there-

Hsim. fore a mean pofition, which is the mot favourable to its operation?.

The diagonal NP of the rectangle IL reprefents the abfolute direation of the effort of the water upon the hem. Nl expreffes the portion of this effort which is oppofed to the Rip's head way, or which puthes her allern, in a disection paralls to the kecl. It is eafily perceived, that this part NI of the whole power of the
 is prolonged, it appears thit its cirection approaches t) a very fmall diflance GV from the centre of gravity $G$; and that the arm of the lever $B N=G V$, to which the force is applied, is not in the whole more than equal to half the breath of the radder: but the rela. twe foree N 1 .. which aets perpendicular to the keet, is extrencly diferent. If the firt NI is atmoll welef, and even pernicious, by retarding the velucity; the lecond NL is capable of a vety great cficet, becanfe it operates at a coafiderable diftazce from the centre of gravi:y G of the fhip, and acts upon the arm of a lover GE, which is very long. Thus it appears, that between the effeets NL and NI, which refult from the abfolute effort NP, there is one which always oppofes the thip's courfe, and contributes litile to her motion of turning; whild the other produces only this moveneer: of rotation, withoot operating to retad her velocity.

Geoméricians have determined the moll advantage. ons angle made by the helm with the line proiunged from the keel, and fixed it at $54^{\circ} 44^{\prime}$, prefuming that the fhip is as narrow at her a satime-dine, or at the line deferibed by the furface of the water round her buntom, as at the keel. But as this fuppofition is atiolutely falfe, indmuch as all veffils augment their breadth from the keel upward to the extreme breadeh, where the floating line or the highef water line is:trminated; it follows, that this angle is too large by a certain utaber of degrees. For the rudder is impref. fed by the water, at the leight of the foating line, more directly than at the keel, be caufe the fuid exactly follows the horizontal outhines of the bottom; for that a particular pofition of the halm migh: be fupp fed neceffary for each diferent incidence which it encounters from the keel upwads. But as a midale polition may be taken between all thefe points, it will be futficient to conlider the angle formed by the fides of the Ship, and her axis, or the middle line of her lengith, at the furface of the water, in onder to determine atier. nards the mean point, and the mean angle of inc.dence.

It is evident that the angle $54^{\circ} 44^{\prime}$ is ton open, and very unfavourable to the illip's head-way, becaufe the water acts upon the rudder there with tuo great a tine of incilence, as being equal to that of the angle which it makes with the line prolunged from the ketl below: but abose, the thock of the water is almoit perpendicular to the rudder, becaufe of the breadth of the buttom, as we have already remarked. It then the rudder is only oppofed to the fluid, by making an angle of $45^{\circ}$ with the line prolonged from the kel, the im. preflon, by becoming weaker, will be lefs oppofed to the thip's head-way, and the direetion NP of the abfulute eflort of the water opon the helm drawing nearer to the lateral porpendicular, will be placed on re advantageounf, for the reafons above mentivned. On
the other hand, experience daily tefifies, that a hip Helm. fleers well when the rudder nakes the angle DDE c qual to $35^{\circ}$ orly.

It has beets already remarked, that the iffect of moving the whech to govern the liedm increafes in proportion to the length of the fposes; and fo great is the power of the wheel, that if the helmfnem cmploys a force upon its fyekes equiralut to 30 prounds, it will produce an cflect of go or 120 pound upon the tiller. On the contrary, the action of the water is collected into the middle of the brealth of the rudder, which is very narrow in comparifon with the koorth of the tilier; fo the cllurt of the water is wery liste removed from the fulcrum D upon which it tums; whereas the tiller furms the armo of a lever 10 or 15 thacs longer, which alfo increafes the power of the hetmfnan in the fame propmention that the tiller bears to the lever upon which the impulfe of the water is dirested. This farce then is by confequance 10 or 15 times Aronger; and the effort of 30 pounds, which at frit gave the helmfman a power equal to yo or 120 pounds, becomes accomulated to one of 9,0 or 1800 pounds 1 pon the rodder. This advantage then arifes from the mortnefs of the lever poon which the action of the water is im. prefied, an I the great conparative length of the tiller, or lecicr, by which the radder is governed; together with the additional puwer of the wheel that directs the movements of the tiller, and fill farther accunulates the power of the helmafann over it. Such a domonAtration ought to remose the furprife with which the prodigious effect of the helon is fometimes confidered. from an inattention to its mechanifm: for we need orly to obferve the preflure of the water, whichats at a great diftance from the centie of gravity $G$, about which the alip is fuppofed to turn, and we thall eation perceive the difference there is between the effort of the water againtl the helmfman, and the eficet of the fame inpulte againf the veffel. With regard to the perfon who thecrs, the water acis only with the arm of a very fhort lever NB, of which 1 b is the fulcram: on the contrary, with regard th the fhip, the force of the water is inprefled in the dirction AP , which paftes in a great didance from $G$, and atts upm a very lun $\mathrm{g}_{\mathrm{g}}$ lever EG, which readers lhe athon of the rudder extrencly powsful in curning the ofld; for that, iti d lage hip, the rudder rectios a flock from the bater of 2-00 or zisco pomid, which is frequently the cate what fie lats at the rate of theee or four hagues by the huar ; and his force being applied in E., p. rina, ICO or 110 fect didant fromethe centre of gravity (f, will operate upon the fhip, to tan her abous, wita 275,000 or 308,000 pounds; whith, in the later calic, the hehnfman acto with an effort which cxcects not 32 pounds apon the fockes of the whed.

After what has been faid of thec hetm, it is eafy to judnc, :hat the more a thip incroais her velosity with regard to the fea, the mure powernal will he the effect of the ruder ; becaufc it acta againt the water with a foree, which increafes as the fquare of the fuifterefs of the fluid, whether the frip advances or retreats; or, in other words, whether the has head way or fern-way ; with this ditlination, that in thefe two circumitanees the effeets will be contrary. For if the vefid retreats, or muves allera, the helin will be impreffed from 1 to $N$; and indead of being pulhed, according to NP, it

## H E L [ 400 ] H F L

Helmet will reccive the cffort of the water from N towards R ; fo that the ftern will be tranfported to the fame movement, and the head turned in a contrary direc-
tion

When the helm operates by itfelf, the centre of rotation of the fhip, and her muvement, are determined by ettimating the force of this machine; that is to fay, by multiplying the furface of the rudder by the fquare of the fhip's velocity.

There are feveral terms in the fea-language relating to the helm; as, Bear up the belm; that is, Let the Ship go more large before the wind. Hilm a mil /bip, or right the helm: that is, Keep it even with the middle of the fhip. Port the helm Put it over the left lide of the fhip. Starboard the belm, Put it on the right fide of the fhip.

HELMET, an ancient defenfive armour worn by horlemen both in war and in tournaments. It covered both the head and face, only leaving an aperiure in the front fecured by bars, which was called the aifor.

In atchievements, it is placed above the efcutcheon for the principal ornament, and is the true mark of chivalry and nobility. Helmets vary according to the different degrees of thole who bear them. They are alfo ufed as a bearing in coats of arms. See Heraldry.

HELMINTHOLITHUS, in natural hifory, a name given by Linnæus to petrified bodies refembling worms.

Of thefe he reckons four genera. 1. Petrified lithophyta, found in the mountains of Sweden. 2. Peirified fhells. 3. Pctritied zoophytes. 4. Petrified reptiles.

HELMONT (John Baptill Van), a celebrated Flemifh gentleman, was born at Bruffels in 1577. He acquired fuch fkill in natural philofophy, phytic, and chemillry, that he was accounted a matician, and chrown into the inquifition: but having with difficulty jultified himfelf, as foon as he was releafed lee retired to Holland; where he died in 1644 . He publifhed, 1. De magnetica corpormm curatione. 2. Felriam docirina inaudita. 3. Ortus medicin.e. 4. Parodosa de aquis iperdanis; and cther works, printed tugether in one volume flio.

Helmont, a finall town in the Netherlands, in Dutch Brabant, and capical of the dithict of Peeland, with a grood calle. It is leated on the river $A_{a}$ in E. Long. 5.37. N. Lat. 51. 31.

HLLAS'TAD'T, a town of Germany, in the duchy of Bruafwick, built by Charlemague, in E. Long. 11 . 10. N Lat. 52.20.

Helmstadt, a ftrong maritime town of Sweden, and capital of the province of Holland, feated near the Bahic Sea; in E. Long. 21. 5. N. Lat. 56.44

HELONiAS, in botany: A genus of the trigynia order, belonging to the hexandria clafs of plants; and in the natural method ranking under the toth order, Coronarie. The corolla is hexapetaluas; there is no caly $x$; and the caplule is trilocular.

HELOISE, famous for her unf urtunate affection for her tutor Abelad, and for her Latin letters to him after they had retired from the world. She died abbels of Paracket in 1163 . See Abelard.

HELOS, (anc. geog), a maritime town of Lacons, fituated betwen l'riogfus and Acria, in lauN. 150 .
fanias's time in ruins. 'The dillrict was called Helotea, and the people Helotes, Helotie, Helei, and Heleate, by S:ephames; and Ilux, liy Livy. Beines lubdued by the Lacedxmonians, they were all reduced to a Itate of public flavery, or made the flaves of the public, on thefe conditions, viz. that they weither could recover their liberty nor be fold out of the territory of Sparta. Hence the term uxarnurw, in Harpocration, for being in a ttate of flavery; and hence allo the Lacedxmonians called the flaves of all nations whatever belotcs. Heloficus is the epithet.

HELOTS, in Grecian antiquity, the flaves of the Spartans. See Helos. - The freemen of Sparta were forbidden the exercile of any mean or mechanical employment, and therefore the whole care of fupplying the city with neceffaries devolved upon the Helots.

HeLsinburg. See Elsimburg.
HELSINGIA, a province of Sweden, bounded on the north by Jempterlat:d and Medelpadia, on the ealt by the Bothnic gulf, and on the fouth and weft by Dalec, rlia and Geftricia. It is full of mountains and forelts, and the inhabitants are almoft contlantly employed in hunting aud lifhing. It has no cities : the principal towns are, Hudwickvald, Alta, and Dilibo.

HELSINGIC character, a peculiarkind of character found infurihed on Itones in the province of Hellingia. The Runic and Helfingic characters may be eafily transformed into each other.

HELSTON, a town of Cornwall in England, feated on the river Cober, near its influx into the fea. It is offe of thole appointed for the coinage of tin, and the place of alfembly for the welt divifion of the fhire. By a frant of Edward 111. it has a market on saturday, and fairs on March ${ }^{1} 3^{\text {th, July } 20 t h, ~ S e p t e m b e r ~ g t h, ~}$ November 8:t, the lecund Saturday lefore St Thomas's day, and the Saturday before Midlent-Sunday, PalmSunday, and Whit-Munday. It had formerly a priory and a catlle, and fent members to parliament in the reign of Edward 1. but was not incolporated till the ${ }^{2} 7$ :h of queen Elizabeth, who appoinced a mayor, to be chofen on September 29. and four aldermen, who are to be of the common-councilmen, and to chufe 24 alfitlants; it was re-incorporated Angult 16.1774 . Here is a large market-honfe and a guild-hall, and four Itreets that lie in the form of a crofs, with a little channel of water running through each. the fleeple of the church, with its fire, is go feet high, and a fea-mark. A little beluw the town there is a tolerable good harbour, where feveral of the tin- fhips take in their lading. King Juhn exempted this place from paying toll any where but in the city of London; and from being impleaded any where but in their own borough. It contains about 400 huufes, is well inhabited, and fends two members to parliament.

HELVELLA, in botany; a genus of the natural order of fungi, b, longing to the eryp.oramia clafs of plants. The funcus is of the flape of a top.

HELVETIC, fomething that has a whtion to the Switzers, or inhabitants of the Sivifs cantons, who were anciently called Helvetii. - The Helvetic body comprehends the republic of Swizerland, confiting of 13 cantons, which make fo many particula commonwealths. By the laws and culloms of the Helvetic body, all differences between the leveral thates and reputlics are to be decided willin themfelves, without the intervention 1

## H E L

Alvetii of any foreign power. The government of this body is chiefly demacratic, with fome mixture of the arillucratic.

HELVETII, a penple of Eelgiea, in the neighbourhood of the Allobroges and the Proviacia Romana; famed for bravery and a turn for war. Called Civitas Helvetia, and divided into four Pagi or Cantons; fi'uated to the fouth and weft of the Rhine, by which they were divided from the Germans; and extending towards Gaul, from which they were feparated by mount Jura on the weft, and by the Rbodanus and Lacus Le; manus on the foutli, and therefore called a Gallic nation (Tacitus, Cæfar, Strebo, Ptolemy Pliny.) Formerly a part of Celtic Gaul, but by Augullus affigned to Bclgica.

HELVETIUS (Adrian), an eminent phyfician, born in Holland. After having fludid phyfic at Leyden, he went to Paris, where he acquired great reputation in his profeffion. He introduced in France the ufe of ipecacuanla in the cure of dyfenteries; a remedy which he at firft kept fecret, but was ordered to make it public, and on that account received a gratification from the king of 1000 louis dors. He was made infpector-general of the hofipitals in Flanders, phyfician to the duke of Orleans, regent of France, 8 ce ; and died at Paris, in 1727 , aged 65 . He wrote a treatife on the molt common difeafes, and the remedies proper for their cure (the beft edition of which is that of 1724 , in two volumesoctavo); and other works.
Helvetius (J:hn-Claude), fon of the above, was born in 1085, and died in 1755. He was firft phyfician to the queen, and gratly encouraged by the town as well as court. He was, like his father, infpectorgeneral of the military linfitals. He was of the Academy of Sciences at Paris, of the Royal Society in London, and of the Academies of Pruffia, Florence, and Bologne. He is the author of I. Idée Générale de P'íconomie animale, 1722, Svo. 2. Principia Phyfico- Merlica, in tyronum Medicine gratian confiripta, 2 vols. 8 vo.

We may jult mention alfo, that he is the fatber of the Monf. Helverius, who wiote the celebrated bnok Del'Efprit; and whom Voltairc calls "a true philufopher;" but whofe book was Aigmatized by the authors of the Fournal de Trevoux, and fuppreffed by the goyernment.

HELVICUS (Chritopher), profeffor of divinity, Greek, and the Oriental tongues, in the univerfity of Giffen, died in the flower of his age in 1617; after having publimed feveral books, and projected more. The Hebrew language was fo familiar to bim, that he fpoke it as fluently as his mother tongue. He was not only a good grammarian, but alfo an able chronologer. His chronological tables have been greatly efteemed, though they are not free from errors.

HEIVIDIANS, a fect of ancient heretics, denominated from their leader Helvidius, a difciple of Auxentius the Arian, whofe diftinguifhing priaciple was, that Mary, the mother of Jefus, did not continue a virgin, but had other children ly Jofeph.

HELVOET-sluys, a fea-purt town of the United Netherlands, feated on the ifland of Voorn, in the province of Holland, and where the Englith packetboat always gocs. It is but a fmall place, confíting only of a handfome quay, and two or three little Vol. VIII. Part II.

## H E M

Areets. But it is very well fortified, and efecmed the hemath fafet harbour in the country. The largett men of war may come up to the middle of the town: and yet it has hut very little trade, becaufe the merchants choofe to live higher up the country. E. Long. 4. ○. N. Lat. 5 1. $4+$
hemath, or Hanath, (ane. geog.), the name of a city (whofe king was David's friend, 2 Sam. ix.) to the fouth of Lebanon; from which a territory was called Nomath, on the north of Canaan and fouth of Syria, as appears by the fpies, Nunb. xiii. ' Kings viii. Ezek. xlvii. Whether one or more cities and di. Atricts of this name lay in this traty, neither interperters nor geographers are agreed. The eallern part was called Hemath zola, 2 Chiron. viii. unlefs we fuppofe that there was a city in Zobn of this name fortified by Solomon. In defining the boundary of PaleHline, it is often faid, from the entering of Humath; as a province to be entered into throngh a llrait or defile. And if there was fuch, the next quetlion is, From what metropolis it was called Hemath? Antioch, capital of Syria, is fuppofed to be called Homatb or Amatha, (Jomathan, Targum, scc.) ; and again, T.fikkaria, (Jufephus.) Both were to the north of Ietbanon; confequently not the Henath of Scripture, the immediate boundary of Palefline to the north, and lying to the fouth of Lebanon.

## hematites, See Hematites.

HEMELAR (John), an eminent antiquarian, and canon of Antwerp, in the 17 th century, was born at the Hague; and wrote a work, entitled, Expofitio Numifnatum inpseratoram Romanorum a Fulio Cafare ad Herachim ; which is very farce, though it bas had feveral edtions.

HEMEROBAPIISTS, a fect among the ancient Jews, thus callicd from their wahing and bathing every day, in all feafons; and performing this cufom with the greated folemaity, as a religious rite neceflary to falration.

Epiphanius, who mentions this as the fourth herefy among the Jews, obferves, that in other points thefe hereties had much the fame opinions as the Seribes and Plarifees; orly that they denied the refurrection of the dead, in common with the Sadducees, and retained a few other of the improprieties of thefe latt.

The fects who pafs in the Eait under the denomination of Sabians, calling themfelves Mendit fiabi, or the difioples of $\mathcal{F o l n}$, and whom the Europeans entitle the Chrifiums of St $\mathcal{F}$ ohn, becaufe they yet retain fome knowledge of the gofpel, is probably of Jewilh origin, and feems to have been derived from the ancient Hemerobaptifts; at leaft it is certain, that that John, whom they confider as the founder of their fect, bears no fort of fimilitule to John the Baptif, but rather refembles the perfon of that name whom the ancient writers reprefent as the chief of the Jewifh Hemerobaptifls. Thefe ambiguous Chriftians dwell in Perfia and Arabia, and principally at Baffora; and their ruligion confift 8 in bodily wahiugs, performed frequently, and with great folemnity, and attended with certain ceremonies which the prictls mingle with this fupertitious fervice.

HEMEROBIUS, in zoology: A genus of infects of the neuroptera order; the characters of which are
thefe.

## II F. M [ 402] H E M

I!errevoal thete. The mouth is furnilhed with two teeth; the paland ithe antennx are brifly, and longer than the brealt. There are 15 feccios, principally dillinguithed by their culours. - This infect takes the name of bemercbius from Cexsily ite hormefs of its life, which, however, continucs fe- seral cays. la the tate of larva it is a great devourer of phant lice, for wheh is lashad beftowed upon it the appeitation of ïn of the plant-Fice. "1he hemerobii, even
to lee that there were no enemies dying in wait to furprife them.

Hemerodromi were alfo a fort of couriers amoze the anciesis, who only trarslled oue day, and then delisered their packers or difpatches to a freth man, who run his day, an 1 to on to the end of the journey. The Greeks had of thete fort of couriers, which they derived from the Pertizas, who were the inventors therevt, as appears from Herudotus. Angutus had the lame: at kall he ellablifhed cuariers, wno, it they did not relieve cach other from day to day, yet did it from face to fpace, and that ipace was nut very great.

HEAIEROT'KOPHIS, in antigity, a meafure of capoilty, the fame with the chenix. It was fo called from is holding one day's food. The word is com-

HEMII, a word ofed in the compolition of divers terms. It fugnifits the fame with $f=$ or derit, viz. " haif;" being an abbreviature of , No-5 berai/ys, which dignifics " the fame." The Greeks retrenched the lati fyllable of the word wito in the cumpolition of words; and after their example, we have done 60 too in molt of the compounds borrowed from them.

HUMMCRANLA, in medicine, 2 〔pecies of cephalalyia, or head.ach; wherein only one lide of the head: is affected; and owing to a congetion of blood in the veficis of that half.

HEMICICLE, H\&mictcliem, compounded of raror: baff, and xurass cirdr, a femicircie.

Femacyele is particularly applied, in architecture, to vaults in the cradle form: and arches or freeps of raules, conatituing a perfé femicircie. Tu contraft an arch of hewn fone, they divide the hemicycle into So many vonToirs; taking careta make them a uneven number, that there be no joint in the midule, where the kuy-itone thull be. Sec Key and Bridge

Hemicychuem was alfo a part of the orcheita in the ancient theatre. Sialiger, however, oblerves, it was no Ianding part of the orchetra; being only ufed in dramatic pieces, where forme perfon was fuppolet to be arrived from fea, as in Plamtus's Rudens.
'Ihe ancients had alio a fort of fun-dial, called kem: ev.Trum. It was a concave femicircle, the upper end or cufp where of locked to the north. There was a Atyle, or gnomon, ifiuing from the middle of the bemicycle, whereof that puint corrciponding to the cemtre of the hemicycle reprefented the centre of the earth; and its thacor projeted on the concarity of the bemi. cycle, which reprelented the face beeween une tropic and another, the lon's deslination, the day of the mooth, hour of the day, \&c.

HEMIMER1S, in botany; a genus of the angio. Spermia order, belonging to the didynamia clats of plants. The capfule is bilocelar, winh ont of the cells more gibbous than the other: the corolla is wheelsaped; with one divilion greaicr, and iuverie beart. Maped; the interdice of the divitioas nectar bearing.

HEMILNA, in Roman antiquits, a liquid roeature, which, according to Arbutbout, was equal to half a wine-pint Englin realure; its contents being s.Si8. solid inches.

HEMIOBOLON, a weight often mentioned by the ancient writers in medicine, and exprefing the half of their obolua, or the tweifid part of a cram, that is, five $\mathrm{g}_{\mathrm{ta}}$

Accorkiaghy in the year $1-8-$, a bouaty of throcpeace per fione was allowed on all the temp taifed" is Eag. land; and probably with a view to eatoarage the growth of Eaglith hemp, ducies hate beca latid oo
that which comes from abroad. Drefled hemp in a Britihh thip pays z1.4s. per cwt. import duty; in a foreign one 21. 6 s .9 d .; and in both cafes a drawback of 11.19 s . is allowed. Undrefed hemp in a Britith fhip pars 3 s .8 d ; and in a foreign one 3 s .11 d . In beth cales the drawback is 3 s. 4 d . The export of Lutinh bemp is free.

The ufual height of the plant when growing is from five to fis feet, but this varies very confiderably according to circumilances. That which is cultivated near Bifchwiller in Alface is fomctimes more than 12 feet high, and upwards of three inches in circumfereace, the flalks being fo deeply rooted that a very ftrong man can fearce pull them up. Mr Arthur Young, in a tour through Catalonia in Spain, fays, that where the country is well watered, the crops of hemp are extraordinary; and that the plants generally rife to the height of feven feet. In Italy bemp is generally cultivated, though the Bolognefe only can pretend to any fuperiority in the management of it. It is there fown upon their beft lands, which are rich ftrong loams; and on which they are at all pofflible pains to procure a fine friable furface. For manure they ufe dung, pieces of rotten cloth, feathers, and hom ns brought from Dalmatia. The plant, however, may be cultivated upon ground of every kind ; the poorer land produ. cing that which is finer in quality though in fmaller quantity; whereas ftrong and rich land produces a great quantity, but coarfer. It does not exhault the land un which it grows like flax, whenee it is probatle, that if properly manared, and care taken in the cultivation, it might be found to fuperfede flax entirely. A Suffex manufacturer, who writes on this fubject in the Annals of Agriculture, informs us, that it may be raifed for many years fucceflively on the fame ground, provided it be well manured. An acre requires from nine to twelve pecks, according to the nature of the foil; the latter being the molt ufual, though a variation in the quality of the foil makes an alteration both in the quantity and quality of the hemp. An acre produces on an average $3^{5}$ or $3^{8}$ tlons. The abbé Brulle, in a Treatife upon the Culture and Management of Hemp, printed by order of the lords of the committee of council for trade and foyeign plantations, informs us, that the feafon for fowing it extends from the 25 th of March to the 15 th of Jone. The feed ought always to be fown thin, not exceeding two buhels to an acre; and if you have the adrantage of a drill plough, titll lefs will arsfwer. As there are two kinds of hemp, the male and female, of which the former only produces feed, fome regard muft be had to this circumftance. In Suffex the male and female are polled together about 13 weeks after the fowing, but in the fens they are frequently feparated. This ball method is recommended by the abbe Brulle, who, for the more eafy accomplifhment of it, ditects that litile patbs mould be made kigthwife through the fild at about feven feat difance from each other, to allow a paffage for the peifon who pulls up the female hemp from among the other; the latter requiring to ftand more than a month after for the purpofe of ripening the fecds. The female hemp is known to he tipe by the fading of the flowers, the falling of the farina feeundans, and fome of the flatks turning yelbw. After the whole of this kind is pulled, it mutt
he manufactured according to the directions to be aftcrwards given, and ought to be worked if poflible while green; the hemp thus produced being much finer than that which is previoutly dried. The reafon of this is, that the plant contains a great quantity of glutinous matter; which being once dried, agglatinates the fibres in fueh a manner that they can never be afterwards perfectly feparated. The female hemp, however, is always in fmaller quantity than the mate; and therefore where the crop is large, it will be imporfible to work the whole as falt as it is pulled or cut. It is known to be ripe by the fems becoming pale; but it mult be remembered, that hemp of any kind will be much lefs injuree by pulling the plants before they are ripe than by letting them fland too long.

The male hemp being ftripped of its leaves, \&c. as afterwards dirccted, will foon be dry for floring by the heat of the atinofphere, though fometimes it may be neceltary to ufe artificial means; but where thefe are ufed, the utmolt care mult be taken, hemp when dry being exceedingly inflammable. The fored or dried hernp mult be theeped and treated in every otber refpect as though it had been green; whence it is evident that this operation ought never to be ufed but in cafes of neceflity. It is likewife impofible to make hemp which has been dried previous to its being feeped fo white as that which has been worked green.

With regard to the perfecting of hemp.feed for a Mitrs $n$ H: fubfequent feafon, it would feem proper to fet apart a bandry, piece of ground for this purpofe; for M. Aimen, from 40 plants raifed in the common way, had only a pound and an half of feed, though the plants from which it was taken might be deemed fine; whereas, from a fingle plant which grew by itfelf, he had feven pounds and an half. Some are of opinion, that by putting the clufters which contain the hemp-feed to heat and fweat, the quality is improved; as many of thofe feeds which would otherwife wither and die, may thus arrive at perfection. This, however, feens to be very problematical; as there are no experiments which fhow that feeds, when feparated from the vegetable producing them have any power of meliorating themfelves.

After the hemp is pulled, it muft be taken in large handfuls, cutting of the roots (though this is not abfolutlly neceflary), the leaves, feeds, and lateral branchcs, being dreffed off with a wooden fword or ripple. It is then to be made up into bundles of twelve handfuls each, in order to be iteeped, like flax, in water. This, or fomething limilar, is abfolutely ncceflary, in order to feparate the bark; which is properly the hemp, from the reed or woody part. In Suffolk, this operation is called zuater-velting; but fometimes a mere expofure to che air is fubltituted in its place, turning the hemp frequently during the time it is expofed. This is called dew-retting; but the former method is miverfally deemed preferable. Such hemp as is defigned for feed is feldom water-retted, though in the opinion of the manufacturer already cuoted, it would be better if it were fo. Dew-retted hemp is generally flacked and covered during the winter; in January and February it is fpread upon meadow land, and whitens with the froft and fnow; though it is always much inferior, to the other, and proper for coarfer yarns only.

The length of time required for fteeping hemp is. various,

## H E M

rarious, and a complete knowledge of it can only be attained by practice. In Suffolk it is ufual to continue the immerfion four, five, or fix days; fanding water is preferred, and the fame water will fleep hemp three times during the feafon, but the firlt has always the belt colour. The abbé Brulle prefers clear and running water, efpecially if overhung with trees. The bundles are to be laid crefswife upon each other, taking particular notice of the manner in which they lie when put in, that they may be taken out without difficulty. His time of lleeping is from lix to 11 days; and here we muft ubferve, that it is much better to let it remain too long in the water than ton fhort a time. The flenderelt hemp requires the mofl foaking. The operation is known to be finithed by the reed leparating eafily from the bark.

After the hemp is thoroughly fleeped, the next operation is to feparate the bark from the reed or woody part; and this may be done in two ways, viz. cither pulling out the reed from every falk with the hand, or drying and breaking it like thix. The abbé Brulle is verf particular in his directions for this latt operation, wbich he calls reeding, and which may be performed cither in a trough under water or upon a table. The whole, however, may be reduced to the following, wiz. preflug down the bundles cither in the trough or on a table by proper weights, to keep the hemp lleady on the middle and top end. Then beginning at the upper part of the bunde, pull out the reeds one by one. As you proceed, the rind which remains will prefs clofely upon the remaining unreeded hemp, and keep it more Ready; fo that you may take two, fuur, or even fix falks, at at time. The weight is then to be removed frore the top, and all the pieces of reed which remain thete having broken off in the former operation, are to be taken out. Lally, the middle weight is to be taken off, and any fimall pieces which remain there taken out. If the reeding is performed on a table, the bucde mull be weeded frequently, though nightly; a continual dropping of water would perhaps be the befl method.

After the hemp is reeded, it mult next be freed from the mucilaginous matter with which it ftill abounds. This is done by pouring water throngh it, fqueezing out the liquid after every affufion, but taking care nut to let the threads twift or entangle each other, which they will be very apt to do. The abhe is of opinion, that foft foap fhould be diffolved in the laft water, in the proportion of an ounce to three pounds of dry hemp; which though not abfolutely neceffary, contributes much to the foftening and rendering the hemp eafy and pleafant to drefs.
Hemp is broken by machinery, after being tleeped, in a manner fimilar to flax; but the inftruments ufed for this purpofe in Suffolk are all worked by the hand. That which breaks in the operation is called /iorts, and is about half the value of the long hemp. The beit water-retted hemp fells for about 8 s . 6 d . per Aone; the other kind from one to two fhillings lower.

Beating of bemp is the next operation, which formerly was performed entirely by hand, but now in moft places by a water mill, which raifes three heavy beaters that fall upon it alternately; the hemp being turned all the while by a boy in order to receive the Arokes equally. The finer it is sequired to make the

The hemp thus manufactured is fold to fpinners, who reel their yarn as follows.

| 2 Yards make | - | 1 thread. |
| :--- | :--- | :--- |
| 40 Threads |  |  |
| 20 Lea. |  |  |
| 3 Skains | - | 1 Rain. |
| 1 | chue of 480 yards. |  |

It is next detivered to the bleachers, who return it bleached on receiving 20 or 21 clues for every 120 bleached. The prices of the liemp-yarn are as follus:

$$
1 \text { Clue from a pound - } 7 \mathrm{~d} \text { or } 6 \frac{1}{5} \mathrm{~d} \text {. }

3 from do. $\quad 12 \mathrm{~d}$.
Cbinefe He,up, a newly difenvered fpecies of Canabis. of which an aceount is given in the 72 d volume of the Philofophical Tranfactions p. 46. In that paper M: Fitz Gerald, vice prefidene of the focicty for encouraging arts, mentions his having received tha feeds from the late Mr Elliot; which being fown, according to his directions, produced plants $1+$ fee: high, and nearly feven inches in circumference. Thefe being pulled $u_{p}$ in November, and Aleeped for a fortnight in water, were placed againt a fouthern wall to dry. After this the hemp was found to feparate calfly from the woody part; and fo great was the pruduee, that 32 plants yielded three pounds and a quarter. In confequence of this fuccefs, Mr litzgerald applied to the directors of the India company to procure fome of the feeds from China; which being complied with, the fociety were furnithed, in 1785 , with fome more of the feeds, which were diftributed to feveral of the members; but, notwithtanding their endeavours, few of the plants appear to have ripened their feeds in this country. Two of the fpecies of hemp, tied by the duke of Northumberland, wofe to the height of 14 feet feven inches, and would have been much larger, had they not been hurt by an high wind: another kind arofe only to that of three feet and an half, the Rem about the lize of a common wheat fraw; but though it howered well, did not produce any feed. Thefe kinds were fown in an het-bed where the heat was very Atrong, on the $14^{\text {th }}$ of April. They appeared above ground in four days, and were tranflanted into pots on the 25 th. They were the: pat under an hot-bed frame where the heat had been gone off, to harden them for the natural ground, in which they were planted on the zoth, by turning them whole out of the pots; letting them, three together, be planted at two fect diltance every way; covering them at times for about ten days, until they were fuppofed to be rooted. Only a few feeds were preferved from phants which had been kept contantly in a ltove.
Other trials were attended with little better fuccefs; but, in 1786, the Rev. Dr Hinton of Northwold near Brandon, made a fuceeffful experiment with fome feeds he received from the feeretary of the fociety. They were fown on the $7 \%$ th of May, and ap:

## H E M [ 4CE ] H E N

erimp peared on the filh of June. The plants were few 11 and fickly; and notwithtanding fome fine thow.

He defigned and drew correetly, and his pietures hare Hemikr a trong effect from his accurate management of the chiaro obicuro. Some of his pictures have fuffered from untkilfisl cleaners, and many things are fold as his which difhonour him; but his genuine works, woll preferved, have a clearnefs and force equal to any of the Flomifh artits.

Hemsкекск (Egbert), called the Toung, was the difciple of Peter Grebber, but imitated the manner of Brouwer and of the elder Hemikerck. He was born at Haenkm in 1645 , but iettled at London, where for a long time his works were exceedingly etteemed, though they are now much funk in their value. He had a whiunlical imagination, and delighted in comporing uncominon and fanciful fubjects; fuch as the temptation of St Anthony, noturnal intercourfes of witches and fpectres, enchantments, Sc. which he executed with a free pencil and a fpirited touch. It was cuttomary with him to incrojuce his own portrait among the converfations he defigned; and for that purpofe had a fmall looking-glafs placed near bis.cafe. He died in $170+$

Hev-Misuldfoil, in agriculture, a term ufed by the hubbandmen in Northumptonthire, and other counties, to exprefs a black, hollow, fpongy, and mouldering earth, ufually found at the bottoms of hills. It is an earth much fitter for grazing than for corn, becaule it will never fettle clofe enough to the grain to keep it fufficiently teady while it is growing up, without which, the farmers obferve, it either does not grow well; or, if it feem to thrive, as it will in fome years, the growth is rank, and yields much traw, but little ear. It is too moilt, and to that is principally to be attributed this rankuets of the crop in fome years; and the occafion of its retaining fo much moitture is, that it ufually has a bed of Aliff clay, which will not let the water run off into the under frata.

In fome places they alfo give this name to a black, rich, and denfe earth, with itreaks of a whitilh mould in many parts. This fort of hen-mould is ufually found very rich and fertile.

HENAULT (Charles John Francis), was fon of John Remi Henault lord of Mouffy, and born at Paris in 1685. He early difcovered a fprightly benevolent difpofition, and his paretration and apenels foon ditionguithed itfelf by the fuccefs of his fuctics. Claude de Lifle, father of the celebrated geographer, gave hin the fame leffons in geography and hintury which he had before given to the duke of Orleans afterwards regent; and which have been printed in leven volumes, under the title of "Abridgment of Univerfal Hiftory." On quitting college, Henaelt entered the Oratory, where he foon atzached himfelf to the thudy of eloquence: and, on the death of the Abbe Rene, reformer of La 'Trappe, he undertook to pronounce his panegyric; which not meeting the approbation of father Mafilion, lie quitted the Oratory after two years, and his father bought for bin, of marefchal V:lleroi, the " licutenance des chatfes," and the govermment of Corbeil. At the marfhal's he furned connections, and cven intimate friendilips, with many of the nobility.

## H E N

maol. and paffed the early part of his life in agreable amufements, and in the livelicet company, without having his religious fenciments tainted: He affuciated with the wits till the difpute betiseen Rouffeau and de la Motte foon gave him a dirgult for thele trifling fucieties. In 1707 , lie gained the prize of eloquance at the French Acadeny ; and anocher next year at the academy des jeux floraux. About this time M. Reaumur, who was his relation, came to Paris, and took leftons in geonetry under the fame matter, Guinée. Ifenault introduced him to the Abbé Bignen, and this was the firft flep of his illullriuus courfe. 101763 he brought a tragedy on the hage, under the diguiled name of Fufelicr. As he was known to the public ouly by fome fighter pieces, "Curnelia the Viftal" met with no better fuccefs. He therefure lucked it up without printing. In his uld age his paffiun for thefe fubjects seviving, and Mr Horace Walpole being at Patis in 1768 , and liaving furmed a friendhip with him as one of the molt a midble men of his nation, obtained this piece, and had it printed at a prefs which he had at his country feat, frum whence a beautiful edicion of Lucan had before iffued. $\ln 1751$ M. Hedault, under a borrowed name, brought out a iecond tragedy, intituled, "Marius," which was well received and printed. He had been admitted counfellur in parliament in 1706 , with a difpenfation on account of age; and in 1710 prefident of the firlt chamber of inquefls. Thefe important places, which he determined to fill in a becoming manner, engaged him in the mott folid Itudies. The excellent work of M. Domat charmed him, and made hime eager to go back to the fouutain head. He fpent feveral years in making himfelf malter of the Roman law, the ordonnances of the French king, their cuftoms, and public law. M. de Murville, procureurgeneral of the great council, being appointed ambaflador to the Hague in 171S, engaged M. Henault to accompany him. His perfonal merit foun introduced him to the acquaintance of the moft eminent perfonages at that time there. The grand penfionary, HeitrLius, who, under the exterior of Lacedemonian fimplicity, kept up all the haughtiocfs of that people, folt with bin all that hauteur which France it ifelf had experienced from him in the negociations of the treaty of Utrecht. The agitation which all France felt by Law's fyllem, and the confequent fending of the parliament into exile, was a trial to the wife policy of the prefident Henault. His friend hip. for the firfl prelident, De Mefmes, led him to fecond all the views of that great magiftrate: he took part in all the degociations, aud was aoimated purely by the public good, withuut any private adrantage. On the death of the cardinal du Buis, in 1723, he fueceeded in his place at the French Aca demy. Cardinal Fleury recommended him to fucceed himfelf as direetor, and te pronounced the eloge ol M . de Malezieux.

Hillory was M. Henant's favourite fludy; not a bare collcetion of dates, but a knowledge of the laws and manzers of nations; to obtain which he drew inftruction from private converfations, a method he fo ltrongly recommends io his preface. After having thus difculfed the moft important points of our public law, he undertook to collect and publith the refult of his inquiries, and he is defervedly accounted the firl framer of chronological abridgemeats; in which, withour topping at detached

facts, he attenfs on'y to thofe which form a chain of Henanse. events that perfect or alter the government and charac. ter of a nation, and traces only the fprings which exalt or humble a nation, extending or contracting the fpace it occupies in the world. His work has had the forthene of thofe literary phenomena, where novely and inerit united excite minds eager after glory, and fire the ardour of young writers to prefs after a guide whomfuw can overtake. The firt edition of the work, the refult of 40 years reasiing, appeared in $1 / 7+4$, under the aufpices of the chancellor Dagueflean, with che modeft tille of an Effixy. The fucceis it met with furprifed him. He made continual improvements in it, and it has gone through nine editions, and been tranhated into lalian, Etuglifh, and German, and even into Chinefe. As the beft writiugs are not fecure from criticifon, and are indeed the only vues that deferve it, the author read to the academy of Belles leettres a defence of his abridgenent. All the ages and events of the Frencls motarchy heing prefent to his mind, and his imagination and memury being a vait theatre whereon he beheld the diferent movements and pares of the acturs in the fevcral revolutions, he determined to give a fpecimen of what palt in his own mind, and to reduce into the form of a regular drama, one of the periods of French hiftory, the reign of Francis 11. which, though happy only by being flort, appeared to him one of the molt important by its confequences, and inofl eafy to be confined within the flage buunds. His friend the chaucellor highly approved the plan, and wilhed it to be primted. It accordingly went thruagh five editions: the harmony of dates and facts is exactly ubferved in it, and the palions interefted without offence to hifloric truth.

In 1755, he was chofen an honorary member of the academy of Belles Letrres, being then a member of the academies of Nanci, Berlin, and Stockhotm. The queen appointed him fuperintendiant of her houfe. His natural sprightliaefs relieved her from the ferious attendance ou his private morning lectures. T'he company of perfons moft diftinguithed by their wit aud, birth, a table more celebrated for the choice of the gueits than its delicacies, the little comedics fuggetted by wit, and executed by reffections, united at his honfe all the pleafures of an agreeable and innocent life. All the members of $\mathrm{cl}_{1}$ is ingenious fociety contributed to render it agreeable, and the prefident was nut behind any. He compufed three cumedies: La Prtite MaiJon, La Faloux de Soi neme, and Le Fieveil d' Epimenide. The fubject of the laft was the Cretan philofupher, who is pretended to have flept 27 years. He is introduced fancying that he had nept but one night, and attonithed at the change in the age of all around him : he miltakes his miftrefs for his mother; but difcovering his miltake, offers to marry her, which the refufes, though be fill cuntinues to love her. The queen was: particularly pleafed with this piece. She ordered the prefident to reftore the philofopher's miftrefs to her former youth : he introduced Hebe, and this epifode produced an agreeable entertainment. He was now in fuch favour witi her majelly, that oa the place of fuperintendant becoming vacant by the death of M. Bernard de Conbert matter of requelts, and the fum be had paid for it being loft to his family, Henault folicited it in favour of feveral perfons, till at lat the
queen befowed it on himelf, and confented that he thould divide the profits with his predecellor's widow. On the gucen's death he held the fame place under the dauphinefs.

A delicate conftitution made him liable to much illnefs; which, however, did not interrupt the ferenity of his mind. He made feveral journeys to the waters of Plombieres: in one of thefe he vilted the depofed king Staniflous at Luneville; and in another accompanied liis friend the marquis de Pauliny, ambaffador to Switzerland. In 1763 he drew near his end. One morning, after a quiet night, he felt an oppreffion, which the faculty pronounced a fuffocating cough. Hlis confeflor being fent to hin, he formed his refolution without alarm. He has fluce faid, that he recollected having then faid to himfelf, "What do I regret:" and called to mind that faying of Madame de Sevigne, "I ledve here only dying creatures." He received the facraments. It was believed the next night would be. his lat: but by noon next day he was out of danger. "Now (faid he) I know what death is. It will not be new to me any mure." He never forgot it during the following feven years of his life, which, like all the relt, were gentle and calm. Full of gratitude for the Gavours of Providence, refigned to its decrces, offering to the Author of his being a pure and lincere devotion; he felt his infumities without complaining, and perceived a gradual decay with matated firmocts. He died Dee. 24.1771, in his 86th year. He marsied in 1714 a daughter of M. le Bas de Montargis keeper of the royal treafure, \&c. who died in 1728 without leaving any iffue.

HENDECAGON, in geometry, a figure that hath elcyen fides and as many angles.

HENED-PENNY, in our old writers, a cuftomary payment of money inftead of hens at Chriftmas. It is mentioned in a charter of king Edward III. Mon. Angl. tom. ii. p. 327. Du-Cange is of opinion it may be ben-fenny, gallinagium, or a compofition for eggs; but Cowel thinks it is mifprinted bened-panmy for bevect penny, or bead penny.

HENLEY, a town of Oxfordhire in England, feated on the river Tliames, over which there is a handome bridge. It fends malr, corn, and other things, to London in barges. W. Long. O. 40. N. Lat. 51.34.

Henley, a town of Warwickfhire in England, feated on the river Alne, in W. Long. 1.45. N. Lat. 52.18.

Henley (John), better known by the appellation of Orator Henley, a very fingular character, was born at Melton-Moubray, Leicefterfhire, in 1691. His father, the Rev. Simon Henley, and his grandfather by his mother's fide (John Dowel, M. A.), were hoth ricars of that parifh. Having paffed his exercifes at Cambridge, and his examination for the degree of B . A. with the particular approbation of Mr Field, Mismales, and the mafler of the college, he returned to his native place, where he was firlt defired by the truftees of the frool in Mclton to affit in, and then to take the direction of that fehool; which he increafed and raifed from a declining to a flourifhing condition. He effaWifhed here a practice of improving elocution by the public fpeaking of paffages in the claffics, morning and afternoon, as well as orations, sic. Here he was invited

NO 151.
by a letter from the Rev. Mr Newcombe to be a can. didate for a fellowhip in St John's; but as he had long been abfent, and therefore leffened his perfonal intereft, he declined appearing for it. Here likewife he began his "Univerfal Grammar," and finifhed ten languages, with differtationsprefixed, as the moll ready introduction to any tongue whatever. In the beginning of this in. terval he wrote his poem on "Ether," which was approved by the town, and well received. He was ordained a deacon by Dr Wake, then bifhop of Lincoln; and after having taken his degree of M. A. was admitted to prieft's orders by Dr Gibfon, his fucceflor in that fee. He formed an early refolution to improve himfelf in all the advantages of books and converfation the moft effectually, on the firt opportunity, at London. But lie laid the bafis of future proficiency in affiting at the curacy of his native town; where he preached many occafional fermons, particularly one at the affizes at Leicef. ter : he then gave a voluntary warning for the choice of a new matter and curate, and came to town recommended by above 30 letters from the moft confiderable men in the country, both of the clergy and laity; but againtl the inclination of his neighbours and his fchool, which was now, as from his firft entrance upon it, ftill advancing : and his method being eftablifhed and approved, one of his own fcholars was appointed to fuc. ceed him. - In town he publifhed feveral pieces, as a tranflation of Pliny's Epifles, of feveral works of Abbé Vertot, of Montfancon's Italian Travels in folio, and many other lucubrations. His mof generous patron was the earl of Maeclesfield, who gave him a benefice in the country, the value of which to a refident would have been above 8ol. a year; he had likewife a lecture in the city; and preached more charity-fermons about town, was more numeroully followed, and raifed more for the poor children, than any other preacher, however dignified or dillinguifhed. But when he preffed his detire and promife from a great man of being fixed in town, it pafted in the negative. He took the people (it feems) too much from their parifl-churches; and as he was not fo proper for a London divine, he was very welcome, notwithflanding all difficulties, to be a rural paftor. But it was not for a fecond ruftication, as he informs us $\dagger$, that he left the fields and the fwains of + Orat Areadia to vifit the great city: and as he knew it was Tranfe as lawful to take a licence from the king and parlia. P. 12: ment at Hicks's-hall as at Doctors Commons (fince the minifterial powers of this kingdom are and ought to be parliamentary only), he freely, without compulfion, or being defired or capable of being compelled to refide in the country, gave up his beneflee and lecture, certainties for an uncertainty; believing the public would be a more hofpitable protector of learning and fcience, than fome of the upper world in his own order.

Mr Henley, in anfwer to a cavil (that he borrowed from books), propofed, " that if any perfon would fingle out any celebrated difcourfe of an approved writer, dead or living, and point out what he thought excellent in it, and the reafons; he wonld fubmit it to the world, whether the mofl famed compofition might not be furpaifed in their own excellency, either on that or any different fubject."

Henley preached on Sundays upon theological matters, and on Wednefdays upon ali other fcicnces. He

## H E N

declaimed fome years againft the greateft pcrlons, and occafionally, lays Warburton, did Pope that honour. The poet in return thus blazons him to infamy:
"But, where each fcience lifes ite modern eype,
"Hitory her pot. Divinity hisfige,
"Whilc proud lhit, fophy repines to fow,
" 1)flonen fight ! lis hreches rent below;
"Imbrownd with native limnze, lo Hentey fands,
"Tuning his voice, and balaucing his hands.
"How fluent nomfenfe trickle, from his t ngue!
"How fweet the periods, r.cither faid ner funp!
"Still brak the liencl.cs, Henley! with thy firain,
"While Kemuet, Hare. and Gilfons preach in vain.
"O grest reftorer of the goid ol ifage,
"Preacher ac onse and Zany of chr age!
"O worthy thou of 玉egypis wife abodec,
"A decent prie? where monkies were the gods!
"But Fate with butchers ylac'd diy prieftly @all,
"Meck modern farth to miurder, hacli, and maul:
"And Lade the live to crown Briamia's rraife,
"In Tuand's, Tindal"s, and in Weolfon's days."
This extraordinary perfon (who died October 14. 1756) Aruck medals, which he difperfed as tickets to his fubleribers: a flar riling to the meridian, with this motto, Ad fumma; and below, Inveniam vium, aut ficiom. Each auditor paid is. He was author of a weekly paper called The Hyp Doctor, for which he had rcol. a year given him. Henley ufed every Saturday to print an advertifement in the Daily Advertifer, containing an account of the fubjects he intended to difeourfe on the enfuing evening at his oratory near I.incoln's.inn-fields, with a fort of motto befors it, which was generally a fneer at fome public tranfaction of the preceding week. Dr Cobden, one of Geo. Il.'s chaplains, having, in $17 \not+8$, preached a fermon at St James's from thefe words, "Take away the wicked from before the king, and his throue fhall be eftablifted in righteoufnefs;" it gare fo much difpleafure, that the Doctor was fruck ont of the lift of claplains; and the ncxt Saturday the following parody of his text appearcd as a motto to Henley's advertifement:
"A way with the wicked before the king,
"And away with the wiked belind hiar;
"His throne it will bero
" with righecufncte,
"And we fla: linow whice of in 1 him."
His andience was generally compcied of the loweft ranks; and it is well known that he even collected an infinite number of thoe-makers, by announcing that he could teach them a fpeedy mode of uperation in their bufinefa, which proved only to be, the making of floes by eutting off the tops of ready-made bouts.
henna, or Alhenna. Sce lawsonia.
HENNEBERG, a connty of Germany, in the circle of Franeonia. It is bounded on the north by Thuringia, on the wefl by Heffe, on the fouch by the bithoprick of Wertfourg, and on the eaft by that of Bamberg. It abounds in mountains and woods; and it is populous, and pretty fertile. Mainiagen is the capital town.

Henneberg, a toun of Germany, in the circle of Franconia, which gives tille to a county of the fame name with a cafle. E. Long. 9.17. N. Lat. 50. 40.

HENNEBON, a town of France in Bretagne, in the diocefe of Yannes. It is inhalited by rich merchants, and is feated on the river Blavet, in W. Long. 2. 13. N. I.at. $47.4^{8}$.

HENOTICUM, ( ${ }^{\text {morterer. }}$ q. d. "reconciliative;" of rosis "I unite"), in church hiftory, a famous edict of the emperor Zeno, publifited A.D. $4^{82}$, and intended Vos. VIII. Part II.

409 ] $\mathrm{H} \quad \mathrm{N}$
to reconcile and reunite the Eutychians with the Ca. Hen-icians tholics. It was procured of the emperor by means of Acacius, patriarch of Conflantinople, with the affitt. anee of the friends of Peter Mongus and Peter Frullo. The tling of this edict lies here; that it repeats and confirms all that had been enacted in the councils of Nice, Conftantinople, Ephefus, and Chalcedon, again!t the Arians, Neftorians, and Eutyclians, wichout making any particular mention of the council of Chalcedon. H is in form of a letter, addreffed by Zeno to the bihops, priefts, monks, and people of Egypt and Libya. It was oppofed by the catholics, and condemaed in form by pope Felix II.

HENRICIANS, in ecelefialtical hillory, a feet fo called from Henry its founder, who, though a mouk and hermit, undertook to raform the fuperfition and sices of the clergy. For this purpofe he left Laufanne in Switzerland, and removing from different places, at length fettled at Tholoufe in the year $1: 47$, and there exercifed his minit rial function, till being overcome by the oppofition of Bernard abbot of Clairval, and condemned by pope Eugenius III. at a council alfembled at Rheims, be was counmitted to a clofe prifon in $11 \neq 8$, where he foon ended his days. This reformer rejected the baptifm of infants; feverely cenfured the corrupt manners of the clergy; treated the fellivals and ceremonies of the church with the utmofl contempt, and held clandeftine affemblies for ineulcating his peculiar doc. trines.

HENRY, or CApe-Hexry, the fouth cape of Virginia, at the entranee of Chefapeak-bay. W. Long. 74. 50. N. Lat. 37. 0.

Hexry, the name of feveral emperors of Germany, and kings of England and France. See Enolano, France, and Germany.

Heniry IV. emperor of Germany in log 6 , Ayled the Great, was memorable for his quareds with pupe Gregory II. whom as one time he depofed, for having prefumed to judge his fovereign; but at another, dreading the effects of the papal anathennas, he had the weaknefs to fubmit to the moft humiliating perfonal folicitations and penances to obtain abrflution; which impolitic meafure increafed the power of the Pope, and alienated the affections of his fubjects: thus circumftanced, he reaffumed the hero, but too late; marched with an army to Rome, expelled Gregory, depofed him, and fet up another pope. Gregory died foon after: but Urban II. and Palcal 11. fucceffively, excited his ambitious fons, Conrad and Henry, to rebel againft him, and the latter was crowned emperor by the title of Henry V. in tro6; and he had the inhumanity to arreft his father, and to deprive him, not only of all his dignities, but even of the neecflaries of life. The unfortunate Henry IV. was reduced to fueh extremities (after having fought 62 battes in defence of the German empire), that he folicited the bifhop of Spire to grant him an underchaunter's place in his cathedral, but was refufed. He died the fame year at Liege, aged 55 , a martyr to the ignorance and fuperitition of the age, and to his own blind confidence in favourites and miltrefles.

Henry IV, king of Franee (in 1589) and Navarre, juflly fyled the Grat, was the fon of Anthony de Bourbon, chief of the brancly of Bourbon (fo ealled from a fief of that name which fell to them by marniage with the beirefs of the eftate). His mother was 3 E

## II E N

the deughter of Ifeny d'Albert, Ling of Navarc; a woman of a mafeuline genits; intrepid, fimple, and ruftic in her manners, but decply velfed in pelities, and a zalous Protellant. Iurefecing that his party vould want fuch a protector (for lier haffand was a weak indolens frince), me andertook thic care of the cducation of the young hero: his dict was coalfe; his dothes neat, but phain; he always went bre headed; foe fent him to fhool wish the otare chidite of the fame age, and accultomed him to chimb the rocks and neighboung mountains, according to the cultom of the comatry. He was born in 1553: and in 1569, the Welly year of his age, he was daclared the D.fenter and Chief of the Protellants at Rochelle. The peace of St Germain, concluded in 1570 , recalled the lords in the Protellamt intereft to coart; and in 15721 lenry was marricd to Margaret de Valois, filter to Charles $1 \mathbf{\lambda}$. king of France. It was in the midh of the rejoicings for thefe nuptials that the horrid maffacre of Paris took piace. Henry was reduced, by this infernal Aroke of falie policy, to the altcrative of changing his retigion or being put to death: he chafe the former, and was detained prifoner of thate thee years. In 158 , he made his efcape; put himfelf at the head of the Huguenot party, expofing himfelf to all the rifks and fatignes of a religious war, often in want of the neceflaries of life, and induring all the hardhips of the common foldier: but be gained a victory this rear at Courtras, which ettablifhed his reputation in amm, and enderred lim to the Protellants. On the death of Henry 111. religion was urged as a pretext for one half of the officers of the French army to reject him, and for the leaguers not to acknowledge him. A phantom, the cardinal de Bourbon, was fit up againt him; but his mol formidable rival was the duke de Alayenne: howerer, Henry, with few friends, fewer important placcs, no money, and a very fmall army, fupplied every want by his activity and valour. He gained feveral vietories over the duke; particularly that of Ivri in 1590 , memorabic for his heroic admonition to his foldiers: "If you love your enfigns, rally by my white plume, you will always find it in the roat to honcur and glory." Paris leld out againt Bm, notwithilanding his fucceffes; he took all the Cuburbs in one day; and might have reduced the city by famine, if he had not humanely fuffered his own amy to relieve the beliegot; yet the bigoted friars and prieths in Paris all turned fuldiers, except four of the Mendicant order; and macie daily military reviews and proceflions, the froord in one hand and the crucifis in the other, on which they made the citizens fwear rather to die with famine than to admit Henry. The farcity of provifions in Paris at laft degenerated to an univerfal famine; bread had been fold, whillt any remained, for a crown the pound, and at lath it was made from the bones of the charnel-houfe of S : Innocents; human flefi becaine the food of the obflinate Parifians, and mothers ate the dead bodies of their children. In fine, the duke of Mayenne, feeing that neither Spain nor the league would ever grant him the crown, determined to affit in giving it to the lawful heir. He engaged the llates to hold a conference with the chicfs of both parties; which endad in Henry's abjuration of the Proteltant religion at St Dennis, and his confecration at Chartres in 159.3 . The following year Paris opencd its gates to him; in

159", the cuke of Mayenne was pardoned; and in $150^{8}$, peace was cencluded with Spain. Henry now thowed himfer doubly worthy of the throne, by his cncourasement of commence, the has aros, wid manufatuies, and by his patronage of :nen of insenuity and found leaning of every comatry: but though the fermentations of Romith bigotiy were celmed, the leaven was not dellroyed; fearce a year palfed withont feme atternpt heing made on this real father of his people; and at hat the monfer Ravallac thabbed him to the heart in his coach, in the Areets of P ?ais, on the 14th of May 1610 , in the 57 th year of his age and z2d of his reign.

Henry VIll. liag of England, was the fecond fon of Henry VII, by Elizabeth the eldett daughter of Edward IV. He was born at Greenwich, on the 2sth of June 149 g . On the death of his brother Arthur, in 1502 , he was created prince of Wales; and the following year betrothed to Cutharine of Arragon, prince Arhan's widow, the Pope hrving granted a difpenfation for that purpofe. Henry Vllf. acceded to the throne, on the death of his father, the z2d of April 1509 and his marriage with Catharine was folemnizad about two muaths after. In the beginning of his reign he left the government of his kingdom entirely to his minitters; and fpent his time chicfly in tournaments, balls, concerts, and cher expentive amufernents. We are told that he was fo extravagant in his pieafures, that, in a very thort time, he entirely diffipated $1,800,0001$. which his fa. ther had hoarded. This will feem lefs wonderful, when the reader is informed, that gaming was one of his favourite diverfons. Neverthelefs he was not fo totally abfribed in pleafure, but he fuund leffure to facrifice to the refentenent of the people two of his father's minillers, Empfon and Dudtcy. A houfe in London, which had belonged to the former of thele, was in 1510 given to Thomas Wolfy, who was now the king's almoner, and who from this period began to imfinate himfelf into Herry's favour. In 15:3, he became prime manler, and from that moment governed the king and hingdom with abfulute power. In this year Herry declared war againt France, gained the battle of Spurs, and took the towns of Teroucme and Tournay ; but before he embarked his troops, he beheaded the earl of Suffolk, who had been long emonfined in the tower. In 1521, he facrificed the dake of Buckingham to the refentment of his prime miniter Wolfey, and the fame year obtained froni the Pooc the title of Defencicr of the Faith.

Heary, having been 18 years married, grew tired of his wife, and in the year : 527 refoled to obtain a divorce; but after many fruitlefs folicitations, linding it impolfible to perfuade the Pope to annul his marriage with Catharine, he efpoufed Ann Bullen in the year 1531. During this interval his favourite Wolfey was difgraced, and died; Henry threw of the Papal yoke, and burnt three Proteftants for herefy. In 1535, he put to death Sir Thomas More, Finer, and others, for donying his fupremacy, and fupprefled all the lefier monafterics.

His mott facred majecty, having now poffefted his fecond queen about five years, fell violently in love with lady Jane Scymour. Ann Bullen was accufed of adultery with her own brother, and with three other petfons: fite was behaded the roth of Mays
$: 536$

## $\mathrm{H} \mathrm{E} \mathrm{N} \quad[4 \mathrm{II}] \quad \mathrm{HEE} \mathrm{N}$

Terrys 1536. He married Jane Seymore the day following. In 1537, he put to death five of the nuble fanily of Kildare, as a terror to the Irifh, of whofe difloyaley he had fome appretenfions; and in the year fullowing he executed the marquis of Exeter, with four other perfons of diftinction, for the fole crime of correfponding with cardinal Pole. In 15.38 and 1539 . he fupprefed all the monaterics in England, and feized their revenues for his own ufe. The queen having died in childbed, he this year marricd the princefs Ann of Cleves: but diliking her perfon, immediately determined to be divorced; and his oblequious parliament and convocation unanimoully pronounced the marriage void, for reafons too ridiculous to be recited: but this was not all; Henry was fo incenfed with his minitter and quendam favourite, Cromwcil, for negociating this match, that he revenged himflif by the hand of the executioner. Yet this was not the only public murder of the year $15+c$. A few days after Cromwell's death, feveral ferfons were burnt for denying the king's fupremacy, and other articles of herefy.

His majelly being once more at liberty to indulbe himfelf with another wife, fised upon Catharine Huward, niece to the duke of Norfolk. She was declared queen in Augult $154^{\circ}$; but they had been privately marricd fone time before. Henry, it feems, was fo entirely fatisfied with this ledy, that he daily blefed God for his pref, $n$ felicity ; but that felicity was of fhore duration: he hod not been married above a yeat, before the queen was accufed of frefount proftitution, both before and fince her marriage: he confelled ber guilt, and was beheaded in February 1542. In July $15+3$, he married his fixth wife, the lady Catharire Parr, the widow of Jom Nevil lord Latimer, and lived to the year 1547 without committing any more flagrant enormities: hut fuding himfelf now approach towards diffolution, he made his will; and, that the lat feene of his hemight tefemble the rel, he determined to end the tragedy with the muter of two of his befl friends a mill modl faithful fubjects, the duke of Norfoik and bis fon the earl of Surrcy. The earl was beheaded on the 10 th of Janury; and the duke was ordered for exccution on the 2 gth, but furtunately efaped by the king's death on the $28 \%$. They were condemned without the hadow of a crime; but Henry's political reafon for putting them to death, was his apprehenfion that, if they were fuffered to furvice him, they would counteract fume of his regulations in religion, and might be troublefome to his fon. Henry dicd on the ESth of Jamary 15t7, in the $\mathfrak{g}$ Gh year of his age, and was buried at Windfor.

As to his character, it is petty obvious from the facts above related. Lord Iferbert palliates his crimes, and exaggerates what he calls his virtues. Bifhop Eurnet fays, "he was rather to be reckoned among the great than the grool princes." He afterwards acknowledges, that "he is to be numbered among the ill princes:" but add, "I cannot rank him with the worte." Sir Walter Raleigh, with infinitely more jultice, fays. "If all the pictures and patterns of a mercilefs prince were lof to the worid, they might again be painted to the life cut of the hifory of this king." He was indeed a mercilefo tyrant, a fourvy politician,' a foolifh bigor, a horrible affafin. Sce England, $n^{2} 253-292$.

Hesay of Ihmulinglon, an Englih hitorian, of the 12 th century, was canon of Linco!n, and afterwards archereacon of Huntingdon. He wrote, t. A hittory of Ens!nd, which ends with the year 115 t . 2. A continuarion of that of Bele. 3. Ciranological tables of the kings of England. 4. A fimali treatife on the contempt of the world. 5. Seseral bonks of epigrams and love-verfes. 6. A poern on herb; ; all which are written in Latin.-His invocation of A pollo and the goddefes of 'Tempe, in the exordium of his poem on herls, may not be unacceptable as a fpecimen of his poctry.

> Vath ma, me paresa, he brum Plathe eepryor, Voffue, quaber rchanamt Jempee jucuri, D. $r$ ! Si muth ferta priun hedera fleren e paratia, Eicee meos florts, livte parita ficu.

Iff.vrr of Sulu, in Latin de Sergufn, a famous civilian and canobist of the $13^{\prime h}$ century, acquired fuch reputation by his learning, that he was called the fource aril fitendor of the luru. He was achbihop of Embrun about the year 1258 , and cardinal bilhop of Ollia in 1262. He wrote $A$ fumpary of the canon ant civil hase; and a commentary on the book of the docretals, compofed by order of Alexander IV.

Manar the Minttrel, commonly called Blind Harry, an ancient Scoteith auzhor, diflinguifhed by no particular fu:name, but well known as the compofer of an hillorical poem reciting the atchicvencents of Sir William Wallace. This poenı continued for feveral centuries to be in great repute; but afterwards funk into neglect, until very lately that it has been again releafed from its obfcurity by a very neat and cotreat edition publinhed at Perth under the infecetion and patronage of the earl of Duchan.

It is dificult to afcertain the precife times in which this pott lived, or when he wrete his hithory, as the two authors who mention him fpeak fonsenlat difierently. Dempter, who wrote in the begiming of the lall century, fays that he lived in the year 1361 : but Major, who was burn in the ytar I + flo, fays that he compofed his book curing the time of his infancy; which we munt therefore fuppofe to have been a feas years pollerior to $1++^{6}$; for if it had been compofed that very ycar, the circumfance would probably have becn mentioned. As little can we Euppole, from Mr Dempiter's words, that Henry was borm in 13 万o; for thuyg he fays that he fitus in that year, we ment naturally inagige rather that he was then come to the years of maturity, or began to diftinguih himfelf in the world, than that he was only born at that time. The author of the differtation on his life, prefixed to the new edition of the poem, endeavours to reconcile matters in tha following manner: "It is not indsed impoffible that he might be born in or about that yedr ( 1 j 6 t$)$. In the time of Major's infancy he might be about 83 years of age. In that cafe, it may be fuppofed that it was the work of his old age to colloct ar: put in order the detachod pieces of his Hiary of Wallace, which he had probably compofed in thofe parts of the conntry where the incidents were faid to have happened!."

We are entirely ignorant of the family from which Henry was defcended; though, from his writings, we thould be led to fuppofe that he bad received a liberal cducation. In them he difeovers fome knowied re in
divinity, clufical hiftury, and aftronomy, as well as of the langliages. In one place he boatts of his celibacy, which ferms to indicate his having engaged himfelf in fome of the religious orders of that age. From what Major fays further of him, we may fuppole his profelli on to have beea ihat of a travelling bard; though it does not ap ear that he was 0illed in mulic, or had :w other prefeffon than that juit mentionce. His beins blind from his birth, indeed, makes this not impl jodble; thoush even this circumblance is not ineonfilent with the fuppolition of his being a religions mendicant. "The particnlars (fays Mijor) which he leard related by the volgar, he wrote in the valgar serfe, in which he sxeclical. By reciting his hifturies before princes or great mers, he ganed his food and rament, of which he was worthy." It is thus probable that he would be a frequent vilitor at the Scotifh court ; and would be mad: welcume ly thofe great fanilies who couk boait of any ailiance with the hero himelf, or took pleafuse in learing his exploits or thofe of his comfanions.

With regard to the authenticity of his hiftories, Major infom us only that "he does not believe every thing that lie finds in fuch writings;' but fiom other tellimonies it appears, that he confulted the very belt anthoritics which could at that time be had. 'Though, aecording to the molt early account of Henry, it appears to have been at leall 56 yeaus after the death of Wailace that Henry was born; yet he is faid to have confulted with feveral of the defeendants of thofe who had been the companions of that hero while he atchiered his mofe cllebrated expluits, and who were 1 ill capable of afertaining the veracity of what he publifh. sd. The principal of thefe wese Wallace of Craigie and Liddle of that Ilk ; who, he fays, perfuaded him to omit in his hiftory a circunttance which he ought to have inferted. Belides thefe, he confulted with the principal people of the kingdom; and he utterly difclaims the idea of having adhered entirely to any unwritten tradition, or having heen promifed any reward for what he wrote. His chicf authority, according to his own account, was a Latin hitory of the exploits of Sir Willian,, written partly by Mr John Blair and partly by MI 'Thomas Gray, who had been the companions of the hero himelf. Henty's account of thefe two authors is to the following purpole: "They be came acquainted with Wallace when the latter was only about 16 years of age, and at that time a Atudent at the fehool of Dundee ; and their acquaintance with him continued till his death, which happened in his 2 2th year. Mr John Blair went from the fchools in Scotland to Paris, where he fludied fome time, and received prietts orders. He returned to Scotland in 1206, where he joined Wallace, who was bravely alferting the liberties of his country. Mr Thomas Gray, who was parfon of Libberton, joined Wallace at the fame time. 'They were men of great wiffom and integrity, zealous for the freedom of Scotland; and were prefent with Wallace, and aflilling to him, in molt of his military enterprifes. They were alfo lis feiritual counfellors, and adminiftered to him godly comfort. The hiftory written by thefe two elergymen was at tetted by William Sinclair bithop of Dunkeld, who had himfelf been witnels to many of Wallace's actions. The bifhop, if he had lived longer, was to have fent

## 4121 <br> H E N

thin book to Rome, for the purpofe of obtaining the fanction of the pope's anthority."

The book which IAenry thus appeals to as his principal authority is now lolt, fo that we have no opportunity of compaing it with what he has written. 'lhe charact:r given by Dempiter of Henry, however, is more favourable than that by Major. He tells us, that " he was blind from his birth; a man of fingular happy genius; he was indeed another Homer. He did great honomr to his native country, and raifed it above what was common to it in his age. He wrote, in the vernacular visf, an elaborate and grand work, in ten books, of she deeds of Wrlliam Wallace." In this account there is a millake; for the poem contains eleven or twelve books: but Demptier, who wrote in a foreign country, and liad not a printed copy of Henry's work by him when he wrote his culogium, is excufable in a mitake of this kind.

With regard to his poctical merit, it muft undoubtedly rank very far below that of Homer; whomindeed lue feareely refembles in any ocher refpects than that he went ahout, as Homer is faid to have done, reciting the exploits of the heroes of his country, and that he was blind. In this lat circumbance, however, he was till worfe than Homer; for Henry was born blind, but Homer became blind after he had been advanced in years. Hence Henry, ev<n fuppofing his genius to have been equal to that of Homer, mut have lain under great difadvantages; and thefe are very evident in his works. The deferiptive parts are evidently delicient, and the allufions taken principally from the way in which nature affects thofe fenfes of which he was poffeffed. Thus, fpeaking of the month of Mareh, he calls it the monlt of right dige/hion, from the fuppofed formontation then begua in the earth. Of April he fays that the earth is then able, or has obtained a power of producing its different vegetables; and of this productive power he afpears to have been more fenfible than of the effects which commonly trike us mult cenfibly. "By the wotking of nature (lays he), the fichs are again clothed, and the woods aequire their worthy weed of green. May brings along; with it great celeftid gladnefs. The heavenly hues appear upon the tender green." In another place lie deferibes the deity of fome river, whom he calls $N$ ymphurus, "buildiag his bower with oil and balm, fulfilled of fweet odour." By reafon of thefe difudvantages, he feldom makes ufe of limilies with which Homer abounds fo much; and few miraculous interpolitions are to be found in his poein, thongh the prophecies of Thomas Lermont, commonly called The Rbymer, and a prophetic dream of Wallace himfelf, are introduced, as well as the gholt of Fawdon, a traitor who had joincd Wallace, and whons the latter in a lit of paffion had killed. In other refpects, the fame inextinguihable thirf of blood which Homer aicribes to his hero Achidles is aferibed to Wallace, though in all probability the mind of Wallace was too much enlightened to admit of fuch fentiments. A valt degree of courage and perfonal ftrength are afcribed to him, by means of which the exploits of the whole army are in effect transferred to a dingle perfon. As long as he is inveited with the command, the Scots are victorious and irrefiltible; when deprived of it, they are enllaved and undone. After Aruggling for fome time againd an inveterate

## H E N

and poverful faction, difdaining to feign fubmiflon, he is taken by treachery, and dies a martyr to the freedum of his country. The poem, on the wholc, is valuable, on account of our being able to trace, by its means, the progrects which the Englilh language had made at that time in Seotland; the manners of the Scots in that age; as the favourite drefs of green which at that time was the talle of the inlinbitants of Scettand, \&e. With regard to the authenticity of his relations, it is impoffible to fuppofe any orlur thing than that they are partly ture and party fali.. The generat thread of the thory may undoubtedly be looked upen to be genuine, thougln emberlified with poctical fictions and exaggerations; and his conllant appeals to the book alrcady mentiuned, though it is now lont, mull be looked upon as a frong tectimnny in his favour: for we cannot fuppofe that at the time hie lived, when we may fay that the tranfastions which he relates were recent, he would have had the confidence to appeal to a book which had not been generally known to have on cxillence; and its being now loft can never be any argument againft it, when we confider the dificulty there was of preferving books before the invention of printing; the confutions in which scoutand was frequently involved; and that the exploits of Wallace, who mult be fuppofed to have been a kind of rival to the great Bruce, could not be fo agreeable to the court as thofe of the more fucceffful licero; and therefore the liflory of them might be fuffered to fall into oblivion, though written in clegant Latin, white a molt ridiculuus poems in that language on the battle of Bannockburn has been preferved to this day.

Hensr Prince of Walss, eldett fon of king James VI. of Scotland by his queen Anne fiflr of the king of Denmark, and one of the molt accomplifhed princes of the age in which he lived, was born on the 1gth of Fetruary 159+. The birth of the prince was annomernced by enbaffies to many furcign powers, with invitations to be prefent at the ceeremony of his baptifm, which was thus delayed for a conididerable time. Mr Peter Young, who, along with the celbbrated George Buchanan, had been preceptor to his majelly, was fent to the courts of Denuark, Brunfwic, and Mecklenburg, the duke of Mecklenturg being great.grandfather to the prince by the mother's fide; the laird of EaR Weens to France and England; and Sir Robert Keith, and captain Murray provoll of St Andrew's, to the States General, who at that time were flruggling againlt the Spanith tyranny, and not yet declared a free flate. All thefe ambarfidors were cordially received, and otlers appointed in return except by the courts of France and England. Henry IV. at that time king of France, though the Scots anbarfador had formerly been one of his own fervants, neither made any prefent, nor appointed an ambalfador. Quncen Elizabeth had defigned to act in the fame manner till the heard of the behaviuur of tienry; after which the honoured Janies by appointing an ambaflador of very lingh rank, Rebert earl of Suffex. This ambaffador, howeser, was fo long of making his appearance, that the queen inagined tie ceremeny would be over before his arrival; for wisch reafon the ferit a meflige to the earl, conmmanding hima in that cafe not to enter Scutland nor deliver lier piefent. But James had becu -more obfiquious; and not caly delaycd the ceremony
till the Englin ambaffidor arrived, but dikinguifhed him from the reft by having a canopy carried over his head at the procecfinon, fupported by the lairds of Cefsford, Buccleugh, Duddope, and Traquair. The cc$\mathrm{r} / \mathrm{m}$ Jny was performed with grcat maznificence; after which the anthafudsrs prefented thatir gilts. That from the United States was the mot valumble. It confled of two grild cups worthte, fos crowng, with a box of the fams mexal, weighing in all about too ounce, containing befides the grant of a penfirm of 5000 Ilorins annally to the prince for life. The Englihh ambaffador gave a cupboard of place curiuminy wronght, and valued at 30001 . Aerling; and the 13 nitith ambaffador two gold chains, one for the queen an! another for the prince. 'The baptifm was celletratal on the Guth of September 152t, and the chill named Frederick-Henry and Henry-Erederick.
The young prince was now ermmitted to the care of the earl of Mar, who was affifed in chis imperrtan: clarge by Annabe lla countefs dowaztr of Mar, dau; hter of William Muray of Tullhardiuc, and paternat anceflor of the prefent duke of Athol. This lady was remarkable for the feverity of hes temper, fo that the pince met with little inaluggence while under her tuition; notwithlanding which, he flowed great afte Cion for his governefs all the time fhe had the care of him. Next year, however (1595), the quen engaged the chancellor, lord Thirlettase, in a fcheme to get the prince into her own power: but the king having found means to difluade her najechy foom thi attempt, hosiscd afterwards fuch marks of difpleafure to the clancellor, that the latter fell into a languilling diforder and dieit of grief.
In his fixth year prince Henry was committed to the cire of Mr Adam Nexton a Scotfinan, eminently Nkilled in moft branches of hiterature, but particularly ditinguifhed for his knowledge of the Latin language. Under his tuturage the pince foun mide great powgrefo in that language, as well as in other branches of know. ledge; infomuch that before he hal completed his fixth year his father wrote fur his ufe the treatife intited Baffition Doron, thought to be the bent of all his works.
In his feventh year, priuce Henry began his corrcfpondence with foreiga powcrs. His hirl lethes was to the States of Holland ; ia which he expreftid liis regard and gratitude for the good opinion they had conceived of him, and of which he hat been informed by feveral peffuns who thad vifited that country: concluding with a requel that they would make ufe of his interet with his father in whatever he could ferve them, promifing alfo his fervice in every other refpect in which he could be weieful, until he flould be able to give farther intances of his good-will and alfection.
At this early. period the prince began to add in lis literary accomplifhments fone of the more martial kind, fuch as riding, the execrefe of the bow, pike, \&c. as well as the ufe of fire-arms; and indeed fuch was the attachment he flowed throughout his whole lifetime to military exercifes, that had he attained the ycars of maturity, there can fcarce be a doubt that he would have diftinguidhed Limfelf in a molt eminent manner. In all his cxerceifce he made furprifing progrefs; and not ouly in thofe of the military kind, but in fir ing, dancing, \&e. Da his sinuth birth-iay he feat a itates in Latin to the king, informing llin, tlat he liad read

 Fibles，and wo books of Ciccrés Epidio：and that now he thought himferf carable of performing forne－ thimy in the commendatos kind of epidtes．IIs ace complifhentes were foon fooken of in fueign countries ： and thefe，alonr with the genem！infucion that Janes favoured the Catholic pariy，probably induced pope Clement Vlll．to make an attempt to get him bito his hands．With this vicw he propoled，that if James would entent him with the education of the youns prince，he would adrance fuch fums of money as womd effectually ellablifh lam on the throne of England．＇Ihis happened a liette hefore the death of Elisabeth；but James，not withllanding hisambition to poficis the crown of England，of which he was not yet altogether certain， whatoont the temotation．He aileged，that it wond be unoutual for lim，as a father，to allow his fon to be biouthe ap ia the belief of a doctrine which he himfelf did not believe：an！even thongh he hould act in his private capaciey in fish an unnatural manner， he could not anfwer for it to the nation，he being heir apparent to the crown，and the kingdom at harge much interetted in whatever concerned him．On the death of the queen of England，James was obliged to leave Sothand in fuch hatte，that he had no time to take a perfona！lave of his for，and therefore did fo by letter，which was anfwered by the prince in Latin． The queen，however，who had been delired to follow the king to London in three wecks，bat to leave the prince in Scethand，thon oht proper to makc another attempt to get her fon into her own power．With this view the took a jouncy to Stiring，where the prince reficed，but was unpofed in her detigus by the friends of the honfe of Mar；and this affected her fis much，that the mifearied of a chidd of whech the was then pregnant．The king，bearing of this misfortune， ordered the prince to be delivered to his mother ；bet refued to inflit any punifhnent on the earl of Sar， which the queen infilkel upon，that nobleman having been with the king at London，and entirely imocens of the whole aftar．Intead of punifhing him，there fore，he cauled him to be acquitted by an ate of the public council at Stinling：inve！ted him with the order of the salter：made him a gant of fereral abbey and other church bunds；and raifed him to the pott of lor 1 high treafurer after the difgrace of tine cant of $S$ mer－ fet：in which employment he enntinued till he could no longer perform the duties of his oftace through age and intirmity．

In the month of July this year（ 1603 ）prince Heury was invelted with the order ef the garter；after which！！e was profented to the queen in his robes，and grenty commended by all who faw him on account of his mojeltic carriage and religious behaviour at the altar，as well as the quicknets of his underftanding and ready anfwers．Diang obliged in leave London on account of the plague，he retired to Otelands，a royal palace near Weybridge in Surry，where a fepa－ rate houlehold was appointed for him and his fater Elizabeth．＇1he appointencos confiled at tirt of 70 forvants，of whom 22 were to be abow thats and +0 below．la fome wedes the ammer wab aumented to 104，of whom 51 were abowe kairs and 53 below ；but before the end of the yar they were aug mented to L4t，of whom 52 were above thats and 85 below．
 in siurey，ind from thence tor Hiampon Cinlet，where Hentey，ind rom thence tor Hamptan Cinlet，where tomal to his houfe at（）echants，his fervants having all this time been kept on board－veapce．

In the teath year of his are，Henry began to fove a wonderfal defiee of becoming mater of ali thofe aecomplifments which ase neceflary to condtutue a geat prince．Writhont detiling from his attembon to polite literastre，be applied himelf in the not all ha－ ous manner to dre krooftge of naval and mititary affars．To give him the tirl rudments of the fomer， a froall veffic was conll racted 28 fete long and 12 lomach， cunomfy paintad and carved；on buard of which be embonked with fevord of the principal nobility，and falludown as rar as Pau＇；Wharf，where，with the ufual ceremonic：he bapiaced it by the name of the Difdran． Mr i＇tit the buiker of this fhip was recommended to the plince by the ath adritat in fuch itrong terms， that his highoels twot him immediately into his fer vice， and contintad his favar to him as lons as he lised．＂

Irince Henry now began to thow himfelf equaliy a patron ef miliary men and of learoing．His martial difpofition inducei ！em to take notice of Colonel Ell－ mondes，a brave Beots offeer in the Duich lewnice， who had raifed hemfele folely by his metir．Tos him he applied for a luit of armour to be fent over from Holland：but though the Colonel executed his com－ mition，he reaped nos beneat from his highnefs＇s fa－ vonr，dying in athort time after the armour was pur－ chafed，before he had any oppertunity of fending it over．In matters of literature the prince appears to lave been a very geod judge．He patronifed divines， and appears to have been naturally of a religious turn of mind．His attachnent to the Proteftant religionap－ pears to have been exceftive；as it never was in the power of the queen，who favoured the catholic party， to make the leatt imprefion upon him．Her machina－ tions for this purpofe were difeovered by the French amballador：who，in a letter dated Jmae 7 th 160 ， informed his matter of them，and that the Spanards were in hopes of being able by her means to alter the religion in Eagland，as well as to prejatice the prince againd France，which the queen daid the hoped that hor fon wouk one day be able to eonquer like another Henry $V$ ．By another ketter，of date zad October the fane year，the ambafador，after taking notice of the queen＇s immoderate ambition，adds，that the wed all herefferts to eormpt the mind of the prince，by fat－ tering his pafions，diverting him from his otudies，and reprefonting to him，wat of contempt to his father，that learning was iuconiflent with the character of a great general and congeeror；propofing at the fame time a marriare with the iafanta of Smin．Notathattandias thefe remon！！rance；howerer，the prince continued to behave as ufual，and to patronife the learned no lef； than before．Ha prefented John Johilon，one of the kins＇s profefors at $S t$ Antrew＇s，with a diamond，for having dediented to him an Mitorical Deteription of the lings of Scotland from the foundation of the mo－ uarchy to that tine；after which the profefior added a carmon enconiogliens，which was trawfited to his highaels in November $\mathbf{1} 605$ ．May other zuthors alfo fourht and obtained his countenance． $\mathrm{l}_{1} 1606 \mathrm{Mr}$ John Bund uhared his edition of Horace into the

## H E N

ary. world with a polite dedication to the prince, whom he highly complinents on account of the progrefs he had made in leaning. la 1609 a took was fent over to him from Prance by air Geurge Carew, the Piritifh ambanlador there, tending to diprove the ductrine of the Catholics concorning the church of Rome being the lirt of the Chriftian clateches. The fame year the learned Thomas L.jdyat publifined his Eimentusio Temforum, which appeared under the patonage of the prince; and with this performance his highands was fo t.ell pleafed, that he took the author into his famiay to read to him, and made hire his chronographer and cofmographer. Paul Buys or Dutias alfo fent him a letter with a dedication of the fecoad part of his l'andects; in which the beltows upon him the highell complinicnte on the great expectations which were formed of him, and of the hopes entertained by the reformed Cheithan churches that he would prove a powcifulfupport to their caufe, and antagonit to the errors of Rome. In Gs, Dr Thooker, in his dedication of an Anfwer to Becanus a Jefoit, who had written againll a piece done by his majely himfelf, Ayles his highnefs " the Mrecenas of all the learned" Another treatife againft the fame Eecanus was alfo printed this gear, and dedicated to the prince.

Many other authors, whom our limits will not allow us to take notice of, were fond of dedicating their performances to his hiphofs: nor was his correfpendence kefs extenfive than his crudition. We have already taben notice of his having written his tint public letter to the Attes of Holland. He was congratuated by the elector paiatine, aitcowards married to the princefs Dilizabecth, on the difoovery of the gunpawder-plot. On the fame occation aforo lond Spencer wrote him a letter, accompanying it with the preient of a fwordand target ; " inftruncons (fays he ) he to be about you in thofe treachermus times; fiom the which, I truft, God will ever protect your molt royal father, \&ec." Previons to this he had correfponded in Latin with the doge of Venice, the landgrave of Hoge, and the king of Denmark: in French with the duke of bavoy. and in Latin with the duke of Brunfwic and Uladilans king of Poland; befides a number of other eminent perfons too redions to enumerate.

The great accomplifmens of llenry foon canfed him to be taken antice of by the mall enineme princes in Eurnpe. In 1606 Ihena IV. of France arcerad his ambaffador to pay him tpecial regard un all occafons. He dafucd hien likewite on tabue the prince in the name of the dark hin, aterwardo Inouis $\mathbf{X 1 1 1}$. and to inform him of the regard the later lad for him. A meffage was alfo fout by the fame ambafiadur to M. de St Anthoine, appointed to be riding mafter to his highnefs, enjoining him todohisdut! in that ofice; and affriughim that his majelty would be as mach pleafed with it as if the fervice had been done to himfelf. To thefe meltayes the prince returned very proper anfwers; and aficrwards performed his exercile ia the oiding. fchool beGore the ambaflador himfelf, that the latter might fend an account thereof to his malter. On this occation he mounted two horfes, and acquitted himele fo well that the ambaffador, in a luter to M. de Villenoy, the French fecretary, gave him the chatafer of "a prince who promifed very mueh, and whofe friendhip could not but be one day of advantage." Having then
fet forth the propuicty of cultivating a good underfanding with him, he tells the fecretary, that the dauphin might make a reiorn for fome dogs which the pince had feat him, by a fuit of arroutr well gile arted cnamented, together with jillois and a fuon, of the fame kind ; affo two honfes, one of them a babb.This year alio the prince wo.ited on i.is uncle the king of Denmark, who had come to Fingland on a wift to Fing James; and this monarch was fo much plealed with his company, that he prefonted him at jarting with his vice-admiral and belt fyghing mip, valued at no lefs than 25001 . alfo with a rapier and hanger, valued at zoco marks. 'I he fates of Holland werecyually ready to how their attachment. On the 25 th of Alsgelt this year they fent a letier to the prince in French, accompanied with the prefent of a fet of table-linen, which they thought, as being the produce of their own country, would be agrecable to him; and they requented his lowe and favour towards their flate. in return for which the pronifed to be always ready to now their resard for lum, and to do him all poffible fervice; as the ambaffador himfelf was ordered more particulary to declare. About this time the prince himielf wrote a ketter to Henry IV. acknowledging the kindnefs which his majelty had thown him for feveral years, and confmed of late bi the latter offering him under his own royal hand his ficudmip and that of the cauphin.

White james was this year employed in lunting, the lisench ambaflador, who had been obliged to quit London on account of the plague, took frequent opportunties of wating upon his highnefs, as did alfo the Spanifn ambaffador, whofe oftafible rafon was to inforn: lim about fume horfes which were to be font him from Spain. The prince's partiality towards France, however, was fo evident, that the Freneh amballador, in a letter dated 3 ult October 1 (ioG, mentions, that "as far as he could difcover, his lighnels"s inclination was entirely towards France, and that it would be wrot:g to neglect a prince who promiled fuch great things. Nore of his pleafures (continued he) favour the leitt of a chidd. He is a particular lover of horfes. and whatever belongs to them: but is not fond of hunting; and when he goes io it, it is rather for the plafure of galloping than that which the dogs give lim. He playswilhigly enoughattenne, and another Sectilla divition tery like mall; but this always with perfons edder than himfelf, as if he defpifed thofe ot his oun axe. He !!udics two hours adday, and cmploys the rett of his time in tolfing the pike. or leaping, or thooting with the bow, or throwing the bar, or vault. ing, or fome wher exereife of the kind, and he is nevor idle. He thows hindelf likewile very good-natured to his dependents, fupports their interefts againtt any perfons whatever, and puthes whatever he andertakestion them or others with fuch geal as gives fuccols to it. For, beffecs his exerting his whole Atrength to compars what he delires, he is already feared by thole who have the management of affairs, and efpecially by the carl of Salibury, who appears to be greatly apprehenfive of the prince's afcendant; as the prince, out the other lind, foows little cflecm for his lordfhip." In this letter the ambafeder further gees on to remark, that fonc of the prince's attendants had formerly been made to expect penfions from France; and

The ry. he was of opinion that they onght to be gratificd on account of the interett they had with the prince. He adds, hat the queen had lefs affection for Prince Henry than for his brother the duke of York, afterwards Charles I.: which the prince feemed to have difeovered, and fometimes ufed exprefions to that purpofe : that the king alfo fecmed to be jealous of his fon's accomplithnonts, and to be difpleafed with the quick progreds lue made.

In 1607 the prince received the arms and armour which Henry IV. fent him as a prefent ; and thefe bering accompanied with a letter, the prince returned an anfwer by a Mr Dunglas, who was introduced to the king of France by the ambuffador Sir George Carew. His majelty, contrary to cultom, opened the prince's letter immediatcly; and was fo much furprifed at the beauty of the character, that the could not be fatistied that ic was the prince's hand until he compared the fignature with the ret of the writing. In his letter to the Britilh court on this occafion, the ambaffudor fets forts in frong terms the affection exprefed by the French monarch for the prinee; "accounting of lim as of his own fon, as he hoped that his good brother of great Britain would do the like of the dauphin." The Erench anbaflador alfo gave a character of his highnefs amilar to that aheady mentioned; remarking, that the prince had great accumplifhments and courage; would foon make himfelf talked of, and poffbly give jombouly to his father, and apprehentions to thofe who had the greateth afeendant at court." With regard to the pedions to inis attendants, he was at finll of opinion that they ought to be granted; but afterwards altered his mind, perceiving that there was little probability of the prince being influenced by any of his attendants, as he was much more inclined to be guided by his own judgment than by the fuggeltions of others. -In the month of July this year the Dutch ambaffadors cante recommended to P'rince Hury by the States, who wrote to hin that they had ordered their ambaffadore to kifs his higheefs's hands on their part, and cefired him to continue his frieudhip to their republic, and to allow their ambaffadors a favourable audience, and the fame credit as to themfelves.

All this attention paid him by foreign powers, all his attention to his own improvements in learning and the military ant, and all the temprations which we annot but fuppofe a youth in his exalted flation to hate been expofed to, feem never to have thaken the mind of this magnonimous prince in the lealt, or to bave at any time made bim deviate from the ftrict line ef propricty. We have already mentioned his attachment to the Protefant religion; and this appears not to lave been grounded upon any prejudice or opinion inculcated upon his iafant mind by thofe who had the care of him, but from a thorough eonviction of the truth of the pinciples which he profeffed. On the difcovery of the gunpoweder-plut, he was fo imprefled with gratitude tonards the Supre:ne Being, that he never afterwards omited being prefent at the fermon preached on the occafion. In his , qth year the pince flowed Jimfulf capable of dillinguifling the merit of religious difeondes, and paid particular regard to fuch divines :i6 were mont remarkable for the ir larning and abili. ties. Among others, he honoured with his attention the learned and eloquent Mr Jofeph Hall, then retor NJ 15 t .

6
of Halltead in Suffolk, afterwards dean of Worecter, and fucceflively binop of Exeter and Norwich. His highnefs was fo much pleafed witla a hook of Medita. tions publifhed by that divine, that he prefted him to preach before him; and having heard two of his fer. mons, he engaged him as one of his dhaptains; invi. ting him afternards to fay confantly at his court, while the other chapains waited only is their turns; promiting, moreover, to obtain from the king fuch preferments as thould fully fatisfy him. Mr Hall, how. ever, from a reluctance to leave his new patron Lord Denny afterwards earl of Norwich, did not accept of thefe honourable a ad advantarcous propofals.

In his family the prince took the umot care to preferve decency and regularity. He ordered boxes to be kept at his three houfes of St James's, Richmond, and Nonfuch, for the money tequired of thofe who were leard to fwear; the fines levied on fuch offenders being given to the poor. He had, indeed, a particular averfion to the vice of fwearing and profanation of the name of God. When at play, he never was heard to do fo; and on being afked why he did not fwear at play as well as others ? he anfwetd, that he knew no game worthy of an oath. "I'ue fame anfwer he is faid to have given at a humting match. The flag, alonoft quite fpent, croffed a road where a butcher was paffing with his dog. The flag was inftantly killed by the dog; at which the huntfmen were greaily offended, and en. deavoured to irritate the priace againg the butcher: but his highneis anfwered coolly, "What if the buteher's dog killed the tlag, what could the butcher help it? They replied, that if his father had been fo ferved, he would have fworn fo that no man could have endured. "Away," cricdthe prince, "all the pleafure in the world is not worth an oath."

The regard which Prince Henry had for religion was manifell from his attachnent to thofe who behaved themfelves in a religiuns and vituous manner. Among thefe was Sir John Harrington, whofe father hal been kuighted by queen Elizabeth, and created by King James a baron of England in 1603 by the title of Lard Harington of Exton in Rutiand. He was entrulted with the care of the Princels Elizabeth after her marriage with the clector palatine, whom he attended to Heydelberg in 161 , and died at Wrorms on the 2 tht $^{\text {th }}$ of Augut following. His fon, who in the year 1604 had been created knight of the Bath, was as foon as he came to the years of diferetion remarkable for his piety ; infomuch that he is faid to have kept an exact diary of his life, and to have exa. mined himfelf every week as to the progrefs he had made in piety and virtue, and what faules he had committed during that time. He was affable and cour. teous to all, and remarkable for his humanity to thefe in diltrefs; all which good qualities fo endeared him to the prince, that he entered into as ftrict a friendthip with him as the difproportion between their tha. tions wowd allow. There are flill feveral letters extant which pafled between them, chiefly upon claflical fubjeets. This worthy and accomplithed nobleman died in February 1614.

In has friendhip Pince Henry appears to have been very fincere, and inviolably attached to thofe whom he once patronifed. He had a grtat regard for the unfortunate Lady Arabella Stewart, filter of Henry Lord

Dandey,

Fenry. Darnley, the king's father; and there is fill extant a letter from this lady to the prince in return for forme kindnefs he had beftowed on a kinfinan of hers at her recommendation. He expreffed much compaffion for her misfortunes; the having excited the king's jealoufy on account of her marriage with Mr William Seymour, afterwards earl and marquis of Hertford, and reftored in 1660 to the dukedom of Somerfet. But on her attempting to efcape from the houfe in Highgate where the was contined, and to go abroad with her huband, his highnefs expreffed fome refentment againt her; though in all probability his apprehenfions, as well as thofe of the king, were illfounded.

As early as the year 1605 , the prince, though then only in his ith year, manifelled his gratitude and attachment to thofe who had ferved him, in the inflance of his tutor Mr Newton already mentioned. That gentleman had been promifed by his majelty the deanery of Durham upon the demife of the archbilhop of York. On this promife Mr Newton had reliced for two ytars; and as foon as the prelate died, his highnefs took care to put the king in mind of his promife; in confequence of which, Mr Newton was inflalled in his office on the 27 th of September 1606.

Mr Pctt, the gentleman who firlt inlructed the prince in naval affairs, having been involved with many others in an inquiry concerning their conduct in their refpective employments in the royal navy, the prince thowed a laudable delire of protecting their innocence. The inquiry was fet on foot by the earl of Northampton, lord privy feal and warden of the cinque ports, who had received a commiffion from the king for the purpofe. It was carried on by his agents, however, with fuch violence and malice, as not only occafioned great trouble and expence to the parties concerned, but almoft ruined the navy, befides augmenting his majefty's expences much more than formerly. MrPett's trial began on the 28 th of April 1609 ; at which time the reports being very favourable to him, the king determined to examine into the ftate of the matter himrelf. For this purpole he went to Woolwich on the 8th of May, attended by the prince; and appointed Sir Thomas Chaloner, his highnefs's governor, and Mr Henry Briggs then profeffor of geometry in Greflam college, to decide the controverfy which was then agitated ahout the proportion of the thips. The meafurers declared in favour of Mr Pett ; on which the prince exclaimed, "Where be now thofe perjured fellows, that dare thus to abufe his majefly with falfe informations? Do they not worthily deferve hanging?" During the whole time he food near Mr Pett to encourage him ; and when the king declared himfelf fatisfied of his innocence, the prince took him up from his knees, exprefling his own joy for the fatisfaction which his father had received that day; protefting that he would not only countenance Mr Pett for the future, but provide for him and his family as long as he lived.

The courage, intrepid difpofition, and martial turn of this prince, were manifet from his infancy. It is related of Alexander the Great, that at a very early
 ther's grooms in the breaking of his favourite horfe Bucephalus. An anecdute fomewhat fimilar is reVol. VIII. Part II.
corded of Prince Henry. He was hardly ten years of age, when he mounted a very high-fpirited horfe, in fpite of the remonltrances of his attendants; 「purred the animal to a full gallop; and having thoroughly wearied him, brought him back at a gentle pace, afiing his fervants at his return, "How long fhall I continue in your opinion to be a child?" From the very firf time that he embarked on board the fmall veffel formerly mentioned, he continued to pay the utmof attention to naval affairs. In Auguit 1607, he vilited the royal navy at $W$ solwich, where he was received by Mr Petr, and conducted aboard the Royal Anne, where he had 31 large pieces of ordnance ready to be lired. This was done unexpectedly as foon as the prince reached the poop; at which he exprefled great fatisfaction. After vifiting the dock-yard, and furveying what was done of a fhip then building for himfelf, he went afhore, and having partaken of are entertainment prepared for him by Mr Pett, he was by lim condusted to the mount, where the ordnance were again charged and ready to be placed for firing. The prince infifted upon an immediate difcharge, hut fuffered himfelf to be perfuaded againtl it by Mr Pets'a reprefentation of the danger of firing fo many ordnance loaded with thot while his highnefs Atood clofe by: on a fignal given by him, however, by holding up his handkerchief, after he had removed to a proper diflance with his barge, the ordnance were difcharged as he had delired. In his 16 th year he paid feveral vifits to Woulwich, in order to fee the above mentioned Thip which was building for limfelf. When finifhed, it was the largeft that had ever been feen in Ergland: the keel being 1 it feet in length, and the crofs-bam 44 feet; carrying 64 pieces of great ordnance; the burden about ifoo ton; and the whole curiounly ornanented with carving and gilding. His highnefs having recived this thip in a prefent from his majeity, went to fee it lanched on the $24^{\text {th }}$ of September b 6og. The narrownefs of the dock, however, having prevented its being done at that time, the prince, who Itaid behind the relt of the company in order to prepare for the ceremony next morning, returned by three o'clock through a Itorm of rain, thunder, and lightning; and ltanding on the poop while the fhip was launched, gave it the name of the Prince $R$ oyal.

In 1611 his highnefs made a private vilit to Cliatham, where he firtt went on board the Prince Royal, and afterwards from thip to Mhip; informing honfelf particularly of every thing of moment relating to the tate of all the different fhips, and even pinusecs lying there at chat time. Next day he went by water up to Stioud; where, contrary to all the remonitrances of his attendants, he caufed the orduance to be flot over his harge. From Stroud he went to Gravefend, where the magiftrates received him with a difcharge of all their fmall-arms and the ordnance of the blockhoules.

About the middle of January 1612, Prince Henry ordered all his najefty's mater-1hipwrights and builders to attend him to enfider of a propolition concerning the building of thipz in Itcland made by a Mr Burrel. Some of his propolitions were, that he fhould build any hip from 100 to 600 ton , with two decks and an half, at the rate of five pounds per ton; that he would build any thip from 600 to 1000 in
$\qquad$

Hicrry. with three whole decks, at the rate of feven pound per ton ; that he thould huild a fhip of foo toa within a certain time, \&ic. Nir P'tt was emploved to fee that this contract was fulfilled on the part of Mr Burrel. Among the prince's papers, a lift of the royal navy was found : feer his death, with an account of all the expances se litting out, inanuing, ike. which muat now be a counted a valuable addition to the naval hiftory of thofe times. His pallion for raval aidiurs naturally led him to a dehre of making geegrephical dif. covelice; of which, however, miy two intances have reablel our times. One was in 1607, when he received foom Mr limial his gumacr, who dad been employed by the Virgimia sompany, a dranght of Jimes's river in that country, with aleter dace! $22 d$ June the fame year. In this letter Mr T'indat remarks, that his fellow-adventurers had difowerel that river; and that no Chrikian had ever been ther before ; that they were fafcly arrived and fetted; that they found the country very fruitful; and that they had taken a real and public poflefion in the name and to the nfe of the king his highnefs's father. The other inftanee was in the year 1612 , the fame in which be died, when he employed Mr 'lhomas Button, an emincut mariner, to go in ghet of a north welt paflage. Mi Buten accordingly fet fal with two thips named the Ryolution and Diforory; the fame delgnatums with thooe in which the lave Captain Conk made his laft voyage. Both of them were vichualded for 18 months; but wintering in thefe northern regions, they did not return tinl after the princt's deceafe, fo that Captain Buton was never fent on another voyage: neverthelefs, he returned fully convinced of the exiftence of fuch a paflage; and even told the celebrated profeflor Bricga of Gretham college, that he had convinced the king of his opinion.

The martial dilpofition of the prince, which was confpicuous on all occations, eminently difplayed itfalf on the occetion of his being invelled in the principality of Wales and duchy of Cornwall, which took place in the year 1610 . Previous to this coremony, he, under the name and character of Maliades lord of the illes, caufed a challenge to be given, in the romanric thyle of thofe times, to all the knights in Great Britain. The challenge, according to cutom, was accepted; and on the appointed day, the prince, affitted orly by the duke of Lenox, the earls of Arundsl and Southampton, Lord Hay, Sir 'Thomas Somerfet, and Sir Richard Prellon who inftructed his highnefs in arms, maintained the combat againt 56 earls, barons, knights, and efquires. Prince Henry himfelf gave and reccived 32 pulhes of the pike, and about 360 firokes of fwords, performing his part very gracefully, and to the admiration of all who faw him, he being wot yet 16 years of age. Prizes were beftowed upon the carl of Montromery, Mr Thomas Darry, and Sir Kobert Gordon, for their belaviour at this combat. The cerenony of infallation was performed on the $4^{\text {th }}$ of June ifro, at which time every kind of magnificence was difplayed that could be devifed. Anmong other pagcants ufed on this oceafion was that of Neptone riding on a dolphin and making fpeeches to the prince; alfo of a lea.groddefs upon a whale. After the ccremony if: prince took his place on the left hand of his majdily; fitting there in his royal robes,
with the crown on his head, the rod in one hand, and in the other the patent creating him Prince of Wales and duke of Cornwall. A public att was then read, tellifying that he had been declared prince of Great Britain and Wales. He was afterwads ferved at table with a magnificence not unvorthy of royaley ittelf; the whole concluding with a grand mafquetale and tournament.

In one inflance, the extreme defire which Prince Henry had of being inflructed in military affairs, carried hum beyond thofe bounds which European nations luve puferibed to one another. In 1607 the prince de Joinvill, brother to the dike of Guife, came to Enytand, having been oblized to leave France in confequence of his having made love to the cantefs de Nomet the king's millefs. After having beca for a few weeks magnificently entertained at court, he departed for Fiance in the beginning of June. The prince took an opportunity of fending to Catais in the train of the prince an enginetr in his own fervice, who took the opportunity of examinmg all the fortifications of the town, particnlaly thofe of the Rix-banc. Tinis was diforered by the French ambaflidor, who immediately gave notice of it to court, bus excufed the prince, as fuppofing that what he had done was more out of curiolity tian any thing elfe; and the court feemed to be of the fame opinion, as no notice was ever taken of the affair, nor was the fricudhip betwixt ling Henry and the prince in the fmalleft degree interrupted. The martial difpulition of his highuefs was greatly encouraged by fome people in the military line, who put into his hands a paper intitled "Propofitions for War and Pcace." Nutwithtanding this title, however, the aim of the author was evidently to promote war rather than peace; and for this the following arguments were wifed. 1. Neceflity; for the prefervation of our own peace, the venting of factious fpirits, and inftucting the people in arms. 2. The benefits to be derived from the fpoits of the enemy, an augmentation of revenue from the conquered countries, \&c. This was anfwered by Sir Robert Cutton in the following manner. 1. That our wifelt princes had always becn inclined to peace. 2. That foreign expeditions were the caufes of invafions from abroad and rebellions at home, endlefs taxations, vaffalage, and danger to the fate from the extent of tertitory, sic. It does not appear, however, that the prince was at all moved by thefe pacilic arguments : on the contrary, his favourite diverfions were tilting, elargiug on horfeback with piftols, \&c. He delighted in converting with people of ikill and experience in war concerning every part of their profeffion; caufed new pieces of ordvance to be made, with which he learned to fhont at a mark; and was fo careful to furnifh himfelf with a breed of good horfes, that no prince in Europe could boaft of a fuperiority in this refecet. He was folicited by Sir Edward Conway to direct his attention to the affairs of the continent, where Sigifmund III. of Poland threatened, in conjunction with the king of Denmark, to attack Guftavus Adophus the young king of Sweden; bur the death of the prince, which happened this year, prevented all interference of this: kind.

To his other virtues Prince Henry added thofe of frugality without avarice, and generofity without ex-

## H E N [ 419 ] H E N

Heary. travagance. As early as the year 1605 he began to fhow all attention to his intereft as duke of Cornwall, and to take proper meafures for fecuring his revenues there. In $16 i o$ he fettled and appointed the officers of his houfehold, making his choices with the greatelt prudence, and giving orders for the management and regulation of his affairs with all the wifdom and gravity of an old counfellor. Some lands were now allotted to him for his revenues; and inftead of diminifhing his ineome during the fhort time he was in poffeflion of them, they were found at his death to be fome thoufands of pounds better than when he obtained them. At this time he fhowed much relustance to gratify any of his fervants except by promifes, as not thinking limfelf yet authorifed to give any thing away: but a fhort time before his death, he conferved penfions on fome of them ; and there is no reafon to doubt, that had his life been prolonged he would have reward. ed thein all according to their merit.

Though Paince Heary never interfered much in public bufinefs, yet in any litele tranfactions he had of this kind, he always difplayed great firmnefs and refolution, as well as abfolute propriety of conduct. In a letter from Sir Alexander Scton, earl of Dunfermling, he is commended for the firmneís and refolution with which he repelled the calumnies of fome who "had rathly, and with the highet intemperance of tongree, endeavoured to wound the Seottifh nation." liy this he alladed to fome very grofs and feurrilnus invectives thrown out againit the whole body of the Seots by Sir Chriftopher Pigot, in a debate in the houfe of commons on an union between the two kingcoms. This gentleman declared his allonifhment at the propolal of uniting a good and fertile country to one poor, barten, and in a manner difgraced by nature; and for atociating rich, frauk, and honeit inen, with fuch as were beggars, prond, and generally traitors and acbels to their kings; with many other Mameful expreffions of the fame kind. His majelly was highly offended with the whole conncil; and Sir Chrittopher, after being obliged in parliament $t$ oretract his words, was expelled the houle and imprifoned; in confequence of which, the king was addreffed by the flates of Sco:land, who thasked him for the zeal he had manifelked for the honnur of the country. In another inllance, where the prince wihed Mr Fullertom, a Scotfman, to fuperfede Sir Robert Car, one of the attendan:s of his brother the duke of York, contrary to the inclination of the king and earl of Salibury, his highnefs carried lis point by perfuabing Sir Rubert of himedf to give up the place in quedtion.

Under this year, 1611 , the elegant Latin hiforian of Great Britain from 1572 to 1628 , Kobert JuhnIton, plaees a thory, which, though unfuppoited by any authurity but his own, and improbable in it [ilf, mult not be emicted here. The prinee, aecording to this writer, requefted the king that he might be appointed to prefide in the conncil. This demand was feconded by the king's favourite Car, Vifeount Rochetter, who urged his majelly to lay his fon's petition before the council. But the earl of Salifbury, jcalous of the growing power of Rochefter, and a thorough mafler of artilice and ciffimulation, ufed all his efforts to defeat whatever meafures were propufed by his rival: and being akked foon after his opiaion upon this point,
whether it was for the public interel that the prince thould prefide in the council? anfwered, that he thought it dangerous to diside the government, and to inveit the fon with the authority of the father. Many others of the privy council having delivesed their upinions on the fame queltion, that of the easl of Salifbury was adopted by the majority. But his lordmip foon took an opportunity, in a fecret conference with the prince, to lament his own fituation, and to perfuade his highnefs that Lord Rochefter had the oniy influenee in the palace, and privately counteracted all his deligns. 'The prince, on his part, refented the denial of his requef, and his exelufion from public bulnuefs. It was not long before L,ord Rochelter difcovered the earl of $\mathrm{Sa}_{3}$ lifbury's practice againfl him with the prince; to whom he therefore went to clear himfelf. But his high. nefs turned from him with great indignation, and would not hear his juititieation. The queen likewite, highly difpleafed with the vifeount, refufed to fee him, and lought all means of letening his power. This forwardnefs imputed to the prince by the hillorian, is endeavouring to intrude himfelf into the managemene of public alfairs, is nut (as Dr Birch remarks) at all fuitable to the charatter of his highnef, or to any other accounts which we have of him; nor ought it to be believed upon the credit of a writer who eites no authority for it, nor indeed for fearee any other affertions in his hiltory, how extraordinaty foever they appear to be, and who frequently ventures to enlarge upon fubjects which it was impoffible for him to have known. However, it is not much to be doubted, that the prince had no great clecm for Lord Rocheller, whofe rife to the power of a favourite and a minilter he fo much dilliked, if we may believe a fatirical wri-
ter of Memoirs*, that he was reported cither to have flruck his lordhip on the back with a racket, or very hardly forborne it. And another hitis.rian, not much ifs fairied Arthur Wire to ings betwixt the prince and the vifenont; and that Sir fect. 38 . Janes Elphinfton obferving his highnefs one day to be p. sim. difcontented with the vifcount, cffered to kill him; for Reign of which the prince reproved him, and faid that if there $K$ Jamoss $i$. were caufe he would do it hindelf. But to wave fuch very fufpicions authorities, it will be fufficient, in order to judge of his lighnefs's opinion of the rifcount, and his adminiftration at the very height of it, to hear what himfelf fays in a letter to Bir Thomas Edmondes of the 10th of September 1612: "As matters go now here, I wit deal in no bufneftes of importante for fome refpects."

It is not to be fuppoled but that the marriage of a prince fo accomplifhed and fo much adinired would engage the attention of the public. This was indeed the cale. 'lhe queen, who farourd the interelt of Spain, propofed a match with the infanta, and the kiag of Spain himfelf feemed to be inclined to the match. In 1611 a propofal was made for a double marriage betwixt the prince of Wales and the eidef dangliter of the houfe of Savoy, and between the prince of Savoy and the La'sy Elizabeth; but thefe overtures were very coolly received, being generally difagreeable to the nation. Sir Walter Raleigh, at that time prifoner in the Tower, wrote two excellent treatiles againft thefe matches; in one of which he Ayles the prince The mof excellem and lopeful, as he does aino in the in-
tro-

Henry. tradution to his Obfervations on the royal navy and fea-fervice. Ahout the year $16: 2$, his marriage became an objeft of general attention. In this affair the king feems to hare inclined to match his fon with the princefs who promifed to bring the largelt dowry: the nation at large to have been infnenced by motives of religion; and the prince himfelf to have remained entirely paffive, and to have been willing to beftow his perfon with the moll perfect indifference on what foever princefs thould be chofen for him. This appears from a letter to the king dated 5 th October 1612, in which he confiders the match with the fecond princefs of France as in a manuer concluded. Propofals had indeed been made of fending her over to England for her education, the being only nine years of age at that time; but Villeroy the French miniter was of opinion, that this ought to be delayed for a year longer. The reafons affigned by the prince for willing her coming to England at that time were merely political: 1. Becaufe the French court, by having the princefs in their power, might alter her mind as they pleafed; 2. That there would thus be a greater likelihood of converting her to the Proteltant religion; and, 3 . 'That his majelty's credit would be better preferved when both daughters (the eldell being promifed to the prince of Spain) flould be delivered at the fame time, though the conclufion of the one marriage might be much later than of the other. With regard to the exercife of her religion, the prince expreffed himfelf rather in fevere terms, wihing his majefly only to allow her to ufe it in "her moll prisate and fecert chamber." He then argues with the molt philofophic indifference of the proprity of a match with the French prineds rather than with one of the houfe of Savoyi: concluding at latt in the following words; " If I have incurred in the fame error that I did latt by the indifference of my opinion, I humbly crave pardon of your majefty, lolding it fitter for your majefty to refolse what courfe is moft convenient to be taken by the rults of the ftate, than for me who am folittle acquainted with fubjects of that nature : and belides, your majent may think, that my part to play, which is to be in luse with any of them, is not yet at hand." On the whole, it appcared, that there never was any ral defign in the king or prince to bring this matter to a conclufion; and that the propofd had been made only with a view to break off the match of the eldeft daughter with the prince of Spain, which could not now be done.

Prince Henry, notwithfarding his indifference in natrimonial matters, applied himfelf with the utmo.t affiduty to his former employments and exercifes, the cominual fatigue of which was thought to impair his health. In the Igth year of his age his conftitution feemed to undergo a remarkable change : he began to appear pale aud thin, and to be more retired and ferous than ufual. He complained now and then of a yiddincfs and heavy pain in his forehead, which obliged him to dtroke up his brow before he put on his bat: he frequently bled at the nofe, which gave great relief, though the difcharge ftopped fome time before his death. Thefe forebodings of a dangerous malady piere totally neglected both by himfelf and his attendants, tven after he began to be feiced at intervals with fainting fits. Nowithftanding thefe alarming $\mathrm{f}_{\mathrm{y}} \mathrm{mp}$.
toms, he continued his ufual employments. On the arrival of Count de Naffau in Eingland, he waited upon him as thongh nothing liad been the matter; and when the fubjeet of the princefs Elizabeth's marriage came to be canvaffed, he interelled himbell deeply in the affair, and never defifted till the match with the elector palatine was concluded. In the beginning of June 1612 , the prince went to Richmond, where he contiused till the progrefs; and notwithttanding the complaints above mentioned, he now took the opportunity of the neighbourhood of the Thames to learn to fwim. This practice in an evening, and after fupper, was difcommended by feveral of his attendants; and was fuppofed to have ftopped the bleeding at the nofe, from which he bad experienced fuch falutary effects. He could not, however, be prevailed upon to difcontinue the practice; and took likewife great pleafure in walking by the river.fide in moon-light to hear the found and echo of the trumpets, by which he was undoubtedly too much expofed to the evening dews. 'I'hrough impatience to meet the king his father, he rode 60 miles in one day; and laving retted himfelf during thic night, he rode the next day $3^{6}$ miles to B.Jvoir Callle, where he met the king at the time appointed. During the heat of the feafon alfo he made feveral other fatiguing journeys, which mult unduubtedly have contributed to impair his health. At the conclufion of the progrefs, he gave a grand entertainment to the court from Wednerday till Sunday evening, when the king and queen with the principal nobility attended at fupper. Next day he haftened to his houfe at Richmond, where he cxpected the elector palatine, and began to give crders for his reception, alfo to take meafures for rewarding his fervants. To fome of thole he gave penfions, and promifed to gratify the reit as foon as poffible. From this time, however, his health daily declined. His countenance became more pale, and his body more emaciated: he complained now and then of drowfinefs; which frequently made him alk his attendants concerning the nature and cure of an epidenic fever, probably of the putrid kind, which at that time prevailed in England, and was fuppofed to have been brought thither from Hungary. He now began frequently to figh, as is ufual for perfons aflicted with diforders of that kind. The malady increafed in the beginning of October, though he ufed his utmof endeavours to conceal it, and occupied hinfelf as ufual ; only that now, inttead of riling early in the morning as before, the would commonly keep his bed till nine. On the loth of that month he had two fight fits of an ague, which obliged him to kecp his chamber; and on the ${ }^{1} 3^{\text {th }}$ his diftemper feemed to be augmented by a violent diarrhœa, which, however, gave fo much relief next day, that he infilted upon being removed from Richmond to $S t$ James's, in order to receive the elector palatine. On lis arrival there, forne of his attendants began to be alamed by the figns of ficknefs which appeared upon him, though he himfelf made no complaint, and even allowed his phyfician to go to his own houfe. The elector arrived on the itht, and the prince waited upon him at Whitchall ; but his difeale had now gained fo much ground, that his temper underwent a very confoderable alteration, and he becane petvilh and difcontented with almoll crery thing:

## H E N

neverthelefs he itill continued to give orders about what related to the ceremony of his fificr's marriage ; and kept company as mucla as he could with the chator and the connt de Nalfau, with whofe conserfation he feemed to be particularly delighted. So great was his activity even at this time, that he played a match at tennis on the $24 t h$ of October. At this time he expofed himfelf in his thirt, feemingly without any inconvenience|; but at night he complained of a greater degree of lafficude than ufual, and ot a pain in his head. Next day, being Sunday, he attended divine fervice, and heard twofermons; after which hedined with his majedty, feemingly with a good appetite, buc the palenefs and glaftly appearance of his countenance was much remarked. About three in the afternoon he was obliged to yicld to the violence of his dillemper; being feized with a great faintnels, fhivering, and head-ach, with other fymptoms of a fever, which from that time never left him. Several phyficians were called; but they differed much in their opinions, if indeed any agreement amonglt them, confidering the ftate of medicine at that time, could have been of fervice. On the firlt of November he was blooded; an operation which Dr Buter one of his phyficians had hitherto oppofed, but now confented to in compliance with his fellows. The impropricty of it was manifeit by the thin and diffolved tate of the blood which was taken away, and fill more by his becoming much worfe next day. As at that time the leruvian bark, the great antidote in putrid difeafes, was unknown, and no proper methods of treatment feem to have been employed, it is not to be wondered that he funk under the difeafe. Among other abfurd remedies nfed on this occation was " a cock cloven by the back, and apulied to the foles of his feet." He expired on the 6 th of November 1612 , at the age of 18 years 8 months and 17 days. On opening his body, the luags were found black, fpotted, and full of corrupted matter; the diaphragm was alfo blackened in many places; the blood-seffels in the linder part of the head were diftended with blood, and the ventricles full of water : the liver was in fome places pale and lead-coloured; the gall-bladder dellitute of bile, and dittended with wind; and the fpleen in many places unnaturally black. His funeral was not fulemnized till the $\mathrm{g}^{\text {th }}$ of December following. Many funcral fermons ware publifhed in honour of him, and the two univerlities publifhed collections of verfes on this occafion. 'I'he moll eminent poets of that age alfo exerted themfelves in honour of the deceafed prince; particularly Donne, Brown, Chapman, Drummond of Hawthurnden, Dominic Baudius of Leyden, \&c.
His highnefs's family continued together at St James's till the end of December 1612, when it was diffolved; and upon the day of their difflutution, Mr Jofeph Hall, his chaplain, preached to them a moft pathetic farewell fermon on Revel. xxi. 3. In this lie speaks of his deceafed mafter in the highet terms of commendation, as the glory of the nation, ornament of mankind, hope of potterity, \&c.; and that he, who was compounded of all lovelinefs, had infufed an harmony into his whole family, which was " the mott loving and entire fellowhip that ever met in the court of any prince." The exhortation, with which the preacler concludcs, is: "Co in peace, and live as

## 421 H E N

thofe that have lof fuch a mafter, and as thofe that Henry. ferve a Mafler whom they canaut lofe."

Prince Penry was of a comely fature, about five feet eight inches; of a tlrong, llaight, well made bouly, with fomewhat broad moulders ans a fmall wait; of an amiable and majeftic countenance: his hair of an auburn colour: he was lony-faced, and had a booad forehead, a piercing eye, a moll gracious finiic, with a terrible frown. He was courteons, loving, and af. fable; naturally modet, and ceen thame-faceid; molt patient, whel, he flowed b sth in life and deat's; flow to anger, fo that even when he was offaded he would govern it and retrain himfelf iof filate. He was mercilul to offerders, after a littio punithment to make them fenfible of their faults. His fentiments of piety were ftrong and habitual; and his zeral for the interells of religion was fuch, that he would, if he had lived, have ufd his endeavours for reconciling the divifions among its profeflors. He ufually rutired three times a-day for his private devolions, and was fearce once a month abfent from the public prayers, where his behaviour was highly decent and excmplary, and his attention to the preacher the moll fined imaginable. He had the greatell titeem for all divines whofe characters and conduct correfponded with their profeflion; but could not conceal his indignation againtt fuch as acied inconfftently with it, and he above all things ablorred flattery and vain-glory in them. He had a thorough deteltation for popery, though he treated thofe of that religion with great courtefy; thowing, that his hatred was not levelied at their perfons, but their opinions. And he was fo immoveable in his attachment to the Proteftant religion, that, not long before his death, as Sir Charles Cornwallis $\dagger$ aflures us, + Dicourfo he made a folemn protettation that he would never of the mop join in marriage with one of a different faith. iltuftrious

The prince was fo exact in all the duties of Prime Fere Sir filial piety, and bore fo true a reverence and roce iorles fpect for the king his father, that though fome- Corn-udlis, times, ont of his own inclination, or by the excite-printed in ment of others, he moved his majclly in fome things the Harrelating to the public, or his own particular interevts, hian mifor thofe of others; yet upon the leall word or look voll. iv. or lign given him of his majelty's difapprobation, he f. 330. would inflantly defif from purfuisg the point, and return either with fatisfaction upon finding it difagrecable to the king, or with fuch a refolved pasisuec that he weither in word or action gave fo mueh as any appearance of being difpleafed or difcontented. He adhered itrietly to juttice oll all occations; and never fuf. fered himfelf to determine rafhly, or till after a due examination of both parties. This love of jullice fhowed itfelf very early by favouring and rewarding thofe among his pages, and other young gentemen. placed about him, who, by men of great judement, were thought to be of the bef behaviour and moft merit. And when he was but a little above five years of age, and a fon of the earl of Mar, fomewhat younger than himfelf, falling out with onc of his liighmets's pagea, did him fome wrong, the priace represed him for it, faying, "I love you, becaufe you are my lord's fon, and my coufin: but if you be not better conditioned, I will love fuch a one better;" naming the child who had complained of him. He was of tingulam

## H E N [ 422 ] H E N

Herry. integrity, and hated fattery and diffmulation; the latter of which he efteensed a bafe quality, efpecially in a prince; nor could he ever conltruin himfelf to treat thof: kindly who did not ceferve his love. A nebleman in the highe fovour with the king had written to him, by fpecial command of his majelty, a ketter, wherein he recommended to his highnefs a mater of very great confequence, to be inlanty anfwe red; and in his fubferiztion had ufed there words, "Jours before all the vorld." His higluefs directerl Sir Charks Cornwallis to draw up an anfwer, who, having written it, added fome words of favour to the noble man to precede the prince's figning. His highnefs having read and confidered the letter, allowed it entirely without alteration: But with regard to the words of fubfription, notwithoanding the great hatte which the difpateh required, he ordered it to be new writeen, and the words objected to by him to be left out : afleging, that he to whom he wrote had deale with him uathuly and unfaithfully, and that his hand thould never atirm what his heart did not think. His temperance, except in the article of fruit, was as eminent as his abhorrence of ranity and oftentation, which began to how themflues when he was very young. When he was taught to handle the pike, and his mater inIructed him both by word and example to ufe a kind of ftatelincts in marching and holding of his hand; though he learned all other things, he would not conform himfelf to that affected fahion: and if fometimes, upon eameft intreaty, he offered to ufe it, he vould laugh at himfelf, and prefently return to his own more modeft and decent manner. And thourg he was a pelfect mafter of dancing, he never practifed it except when he was Itrongly preffed to it. The fame modefy appeared in whatever he faid or did: But it was no impediment to his generous and heroic difpofition, which made him perform all his exercifes beft before much company and the greateft perfonages. His cloaths were ufually very plain, except on occafions of public ceremony, or upon receiving lorcign ambanfadors, when he would aflume a magnificence of drefs, and an air of majetty, which immediately atter he laid afide. Faving onee worn a fuit of Welh frize for a confiderable time, and being told that it was too mean for him, and that he ought not to keep even a rich fuit fo long; his anfwer was, that he was not afhamed of his country cloth, and wifhed that it would la!t for ever.

In guicknefs of apprehenfion and memory few of the fane are ever went beyond this prince; and fewer ditill in a right judgment of what he was tanght. When he began to have lome knowkelge of the Latin tongue, being defired to choofe a motio cut of feveral fentences collected by his tutor for his ufe, after rading ower many eoud ones, he pitched upon that of Sitius Italicus, Fiax mentis bongle giuria. And bing alled by the king one day, which were the belt verfes that be had learned in the hitt book of Virgil's ILneid, he anfwered thefe:

$$
\begin{aligned}
& \text { Fies onat Tucas nobi-, gin juffor alter }
\end{aligned}
$$

Rendin r likewile another verfe of the fame poet, Tios Touisfor mini rulo dicuimine vedur,
the faid he would make ufe of it with this alteration,

lecfodes his knowledge of the leained languages, he fooke the Italian and French; and had made a confidera's progrefs in philofophy, hifory, fortitication, mathematics, and cofmography ; in the two laft of which he was inthrueted by that excellent mathematician Mr Edward Wight. He loved and endeavoured to do fomewhat of every thing, and to be excellent in the mot excellent. He greatly delighted in all rare inventions and arts, and military engines both at land and fea; in fhouting and levelling great pieces of ordnance; in the ordering and markaling of armies; in buitding and gardening; in mufic, fculpure, and painting, in which latt art he bronght over feveral works of great matters from all countries.

He had a jut opinion of the great abilities of Sir Wralter Rakigh; and is seported to have faid, that "no bing but his father would kecp fuch a bird in a cage." And it is affirmed, that his highnefs, but a few momlis before his death, wotamed the lands and calte of Sheshurn in Dorfethire, the confifeated eftate of Sir Walter, with an intention of returning it to him. 'Ihat eminent writer, foldier, and flatefman, had a reciprocal regard for the prince, to whom he had deligued to adderefs a difcourfe "Of the Art of War by Sua," which his highnefs's death prevented the authon from linihing. He had writen likewife to the prince another "Difcourfe of a Naritimal Voyage, with the paffages and incidents therein :" But this has never yet appeared in print. He had alfo interded, and, as he exprefles it, hewn out a fecond and third volume of his General Hiltory, which were to have been directed to his highnefs: " but it has piealed God (fays he) to take that glorious prince out of this world, to whom they ware directed; whofe unfpeakable and neverenough lamented lofs hath tausht me to fay with Job, Forfa of in latum cillara mea, forganam meum in quo. cen flentium."

In the government of his houhold and management of his revenues, thongh he was fo wry young, his example deferved to be initated by all other princes. He not only gave urders, but faw almoft every thing done linfelf; fo that there were farce any of his domellics whom he did not know ty name. And among thefe there vas not one even twifpeeted papitt; his directions being very peremptory for letting down the names of all communicants, that he might know if there were any of his family who did abfent themfeles from the commonion. His family was lange, connk. ing of few lefs than 500 , many of them young gentlemen lorn to great fortuncs, in the prime of theis ycars, when their pathons and appeties were frong, their reafon weak, and their experience little. But his judghent, the gravity of his prinecly afpect, and his own example, were fuffecent reftraints upon them ; his very eye ferved istlead of a command; and his looks alone had more cffect than the fharpeit ieprelenfions of other prinees. If any difputes or contats arofe among his fervants, he would put a thop to then at the beginning, by referring them to fome of his frincipal officers, whom he thought molt intelligene in points of that mature, and to madertland bett what compenation was due to the iugured, and what reproof to the offander; lo that in fo numerous a family there was not fo much as a blow given, nor any quarrel carried to the latt height.

## H E N

Though he loved plenty and magnificence in his houfe, he reflrained them within the rules of frugality and muderation, as we have already noticed. By this economy he avoided the neceffity of being rigirl to his tenants, either by raifing their farms or fines, or feeking or taking advantage of forfeitures, Nor was he tempted to make the profit which both law and right afforded him, of fuch who had in the tine of former princes purchafed lands belonging to his duchy of Cornwall, which could not by law be alienated from it; for he gave them, upon refuming thefe lands, a reafonable fatisfaction. Neither did his economy reftrain him from teing liberal where mesit or ditiref called for it; at the fame time he was never known to give, or even promife, any thing, but upon mature deliberation. Whatever abufes were reprefented to him, he ine ediately redrefed, to the entire favisfaction of the perfons aggrieved. In his removal from one of his houfes to another, and in his attendance on the king on the fame occafions, or io progreftes, he would fufter no provilions or carriages to be taken up for his ufe, without full contentment given to the parties. And he was fo folicitous to prevent any perfon from being prejudiced or annoyed by himfelf or any of his train, that whenever he went ont to hawk befure harvelt was ended, he would take care that none fhould pafs thro' the corn; and, to fet them an example, would himfelf ride rather a furlong abuut.

His fpeech was flow, and attended with fome impediment, rather, as it was conccived, by cuftom and a long imitation of fornc who firll inflrueted him, than by any defeet of nature, as appeared fiom his having much corrected it by ufing at home amonglt his fervants, firt fhort difiourfes, and then longer, as he found himfelf enabled to do it. Yet he would often fay of himfelf, that he had the mull unferviceable tongue of any man living.

He had a certain height of mind. and knew well how to keep his diftance; which indeed he did to all, admitting no near approach either to his jower or his fecrets. He expreffed himfelf, upon occalions offered, to love and efteem moft fuch of the nobility as were mott anciently defeended, and noot nobly and honelly difpofed. He lad an entire affection for his brother the cuke of York and his fiter Elizabeth ; though fometimes, by a kind of rough play with the former, and an appearance of conradicting the lateer in what he difcerned her to defire, he took a pleafure in giving them, in their tender years, fome exctecife of the patience. A writer $\ddagger$ of lefs authority than Sir Charles Cornwallis, from the latter of whom we have thicfe particulars, adds, that the prince feemed to have more affection for his fifer than his brother, whom he would often taunt till he made him weep, telling him. that he fould be a lifhop, a gown being fiteft to hide his lege, which were fuhject in his childhood to be crooked.
With regard to any unlawful paffion for women, to the temptations of which the prince's youth and fituation peculiarly expofed him, his hiftorian, who knew him, and obferved him much, affures us, that having been prefent at great feafls made in the prince's houfe, to which he invited the mon beautiful ladics of the court and city, he could not difcover hy his highnefs's behaviour, eycs, or countenance, the lealt appearance

423 ] H E N
of a particular inclination to any one of them; nor Hencr. was he at any other time wituefs of fuch words or ace. $\underbrace{\text {, }}$ tions as could juitly be a ground of the leatt fufpicion of his virtue: though he coferves, that lome perions of that time, meafuring the prince by themitelves, were pleafed to conceive and tepurt otherwife of him. It is indecd afterted, by the writer of Auticus Coquinaria, believed upon grood grounds to be William Shunder. fon, Efq; author of the "Complete Hiltory oi Mary Queen of Sentlani, and her fon and futceffor King James," that the Prince made court to the Conatefs of Eifex (afterwards divoreed from the lianl, and married to the Vifcount Rocheller), before any other lady then liviag. And Arthur Wilfon mentions the many amorous glances whid the pince gave lier, till difeoverin that the was captivated with the growing fortunes of Lord Rochetter, and gromeded more hopie upon him than the uncertain and hopelets love of his lughneis, he fuon nighted her. -The learnet and pions antiquary, Sir Simonds D'Ewes, in a manufripe life of limfelf written with his own hand, and brought down to the year 1637, is pufitive, that "notwithtanding the incelimathe l'ince IIcury's martial defires and iatiation into the ways of godinefs, the countefs, being fet on by the earl of Northampton her father's uncle, firlt caught his cye and heart, and afterwards proltituted herfelf to him, who tirlt reaped the fruits of her virginity. But thofe fparks of grace which even then began to flow thcir lulle in him, with thofe more heroic imnate qualities derived from virsue, which gave the law to his more advifed actions, foon raifed him out of the flumber of that dillumper, and taught him to reject her following temptations with indenation and fupecalioufnefs." But thefe authorities, Dr Birch obferves, ought to have litile weight to the prejudice of the prince's charadter, againt the direct teitimuny in his favour from fo well-informed a writer as Sir Charles Cornwalls.
The immature death of the prisce concurring with the public apprchentions of the power of the papilt, and the ill opinion which the uation then had of the court, gave inmediate rife to furpicions of its being hafteneed by poifon. And thef fulpicions were heightened by the very little concern hown by fone perfons ingreat fations. "T'o tell you (fays Richard earl of Dorfet in a letter to Sir Thomas Edmondes, of the $23^{4}$ of Nowember 1612) that our riling fun is fet cre feacely he had flone, and that with hima all our ghory lies buied, you know and do lanent as weth as wes, and better than fome do, and more truly ; or eife you are not a man, and fenfible of this kinglori's lofs." And it is certain, that this lufs made fo little impreffon upon the king and his favourite, that the lord vifcount Rochefler on the gth of Nuvemter, three days after it, wrote to Sir Thomas Edmondes to begin a negociation for a marriage between Pince Charles and the fecond daughter of France. Bur the ant Baflador, who had more fenfe of decency, thought it improper to enter upon fuch an affair fo coon after the late prince's death. Mr Beaulieu, fecretary to Sir Thomas Edmondes, in a kiter of the 12 th of November 1612, to Mr Trumbull, then eefident at Brufels, after fyling the prince " the flower of his houfe, the glory of his country, and the admiration of all ftrangers, which in all places had imprinted a great hope on the uninds of

Herry. the well affeded, as it had already ftricken terror into the hearts of his enemies," adds, "who perhaps (for of this lanuentable accident we have yet no particular relation) faring the growing virtaes of that young prince, have ufed the traterous venom of their abominable practices to cut him off in his youth. And this I do not apprehend without caufe, confidering the feveral advertifements which I faw a month ago coming out of England, Holland, and Calais, of Atrange rumours which were in thefe parts, of fome great and imminent practice in hand, for the fuccefs whereof it was written, that in fome places our adverfaries had made folemn prayers: and out of Calais it was efpecially advertifed, that in your parts they were in expec. tation of the death of fome great prince. But alas ! we dit little apprchend, that fuch ominous prognottications would have lighted upon the perion of that vigorous young prince, whofe extraordinary great parts and virtues made many men hope and bekieve, that God hat referved and dellined him, as a chofen inftrument, to be the flandard bearer of his quarrel in thefe miferable times, to work the refloration of his church, and the detlruction of the Romifh idolatry."

With the above notion his royal highnef's mother the queen was peculiarly impreffed, according to Dr Welwood; who, in his Notes on Althur Wilfon's Life of King James I in the Complete Hiltory of England, p. 7 I4. informs us, though without giving any authority, that when tbe prince fell into his talt illnefs, the queen fent to Sir Walter Raleigh for fome of his cordials, which the herfelf had taken fome time before in a fever with remarkable fuccefs. Raleigh fent it, together with a letter to the queen, wherein he expreffed a tender concern for the prince; and, boafting of his medicine, ftun.bled unluckily upon an exprefion to this purpofe, "that it would certainly cure him or any other of a fever, except in cafe of prifon." As the prince took this medicine, and died notwithtlanding its virtues, the queen, in the agony of her gricf, fhowed Ralcigh's letter; and laid fo much weight on the expreffion about poifon, that as long as fhe lived the could never be perfuaded but that the - Courtand prince liad died by that means. Sir Anthony Weldon* Cburzter offugetts that the prince was poifoned. The fame no$R$ Yames, tion is countenanced by Wilfon in his Hittury $t$; and p.77. 8 P. + P.62,63. Whe likewife, in another work, his Alemoirs, after ftyling the prince " the darting of mankind, and a youth of valt hopes and wenderful virtues," remarks, that it was the general rumour at the time of his death, that his highnefs was poifoned; and that there is in print a fermon preached at St James's upon the diffolution of his family, that boldly inlinuated fome fuch thing. By this fermon Dr Welwood mult mean that of Mr Hall cited above; in which, however, at talt as it is reprinted in the London edition of his works in 1617 in folio, there is not to be found any expreffion that carries the leaft infinuation of that kind. The writer of the memoirs adds, that Sir Francis Bacon, in his fpeech at the trial of the carl of Sumerfet, had fome reflections upon the intimacy of that lord with Sir Thomas Overbury, which fexmed to point that way ; there being feveral expreffions left out of the frinted copy that were in the feech. Bifhop Burnet fikewife tells us, that he was aftured by Colouel itus, Nija.
that he had heard King Charies 1. declare, that the prince his brother was poifoncd by the means of the Vifconnt Rochetler, afterwards earl of Somerfet. But it will be perhaps fufficient to oppofe to all fuch fuggetlions the unanimous opinion of phyficians who attended the prince during his fickneits, and opened his body after his death; from which, as Dr Wclwood himfelf obferves, there can be no inference drawn that he was poifoned. To which may be added the authority of Sir Charles Cornwallis $\ddagger$, who was well informed, and $\ddagger$ Lifes above all Iufpicion in this point, and who pronounces $D$ tratb g the rumours fpread of his highuefs's having been poi- Henry, foned vain ; and was fully convinced that his death was natural, and occafioned by a violent fever.

Henry (Philip), a pious and learned nonconformift minitter, was the fon of Mr John Hemry, page of the back ftairs to James duke of York, and was born at Whitchall in 163 t . He was admitted into Weftmin. fter-fchool at about 12 years of age; became the fa. vourite of Dr buthby, and was employed by him, with fome others, in collecting materials for the Greek grammar he afterwards publifhed. From thence he removed to Clirilt-church, Oxford; where, having obtained the degree of mafter of arts, he was taken into the family of judge Puleton, at Emeral in Fhnt fhire, as tutor to his fons, and to preach at Worthenbury. He foon after married the only daughter and heirefs of Mr Daniel Matthews of Broad-oak near Whitchurch, by whom he became poffefled of a competent eftate. When the king and epifcopacy were reflored, he 1 efufed to conform, was cjected, and retired with his family to Broad-oak: here, and in the neighbourhood, he fpent the remainder of his life, about 28 years, relieving the poor, employing the induftrious, inllucting the ignorant, and exercifing every opportunity of doing good. His moderation in his nonconformity was eminnt and exemplary ; and upon all occalions he bore tellimony againtt uncharitable and fchifnatical feparation. In church government he wifhed for archbifhop Ufher's reduction of epifcopacy. He thought it lawful to join in the common prayer in public affemblies; which, during the time of his filence and reftraint, he commonly attended with his family with reverence and devotion.

Hexry (Matthew), an eminent diffenting minilter and author, was the fon of the former, and was born in the vear $\mathbf{5 6 6 2}$. He continued under his father's care till he was 18 years of age; in which time he became well fkilled in the learned languages, e!pecially in the Hebrew, which his father had rendered familiar to him from his childhood; and from firft to laft the Atudy of the fcriptures was his mofl delightful em. ployment. He completed his education in an academy kept at Illington by Mr Doolitile, and was afterwards entered in Gray's-Inn for the fludy of the law; where he became well acquainted with the civil and municipal law of his own country, and from his application ard great abilities it was thought he would have become very eminent in that profeffion. But at length, tefolving to devote his life to the thady of divinity, in 1686 he tetired into the country, and was chofen paAtor of a congregation at Chet' cr. where he lived about 25 years, greatly efteened and beloved by his people. H. had feverat calls fiom Loudon, which he contlantly declined; but was at laft prevailed upon to accept an unanimous
north of Englane. This idea was probably fuggefted by the profperity of the fund which lath almot 30 years before been oflablithed for a provifion to minifters widows, \&ic. in Scotland. But the fituations of the clergy of Scotland were very different from the circumilances of diffenting minifters in England. AnnLities and provifions were to be fecured to the families of diffenters, without fubjecting the individuals (as in Scotland) to a proportional annual contribution, and without fuch means of creating a furd as could be the fubject of an att of parliament to fecure the annual payments. The acuteneis and activity of Dr Henty furmounted thefe difficultics; and, chiefly by his exertions, this afeful and bencvolent inflitution commenced about the year 1;-62. The management was entrufted to him for feveral years; and its fuccefs has exceeded the molt fanguire expectations which were formed of it. The plan itfelf, tow fufficiently known, it is unnecefary to explain minutsly. But it is mentioned here, becaufe Dr Henry was acculomed in the laft years of his life to freak of this iaflitution with peculiar affection, and to renfet on its progrefs and utility with that kind of fatisfaction which a good man can only reccive fron " the labour of love and of good works."

It was prohably ahout the year $17 \sigma_{3}$ that he furft conctived che idea of lis Hiftory of Gleat Britain: a woik already eftablifhed in the public opinion; and which will certainly be regarded ly poferity, not only as a hook which has greatly enlarged the fphere of hiflory, and gratifies our curiofity on a variety of fubjects which fall not within the limits peeferibed by preceding thiftorians, but as one of the moll accurate and authentic repolitories of hifforical information which this country has produced. The plan adopted by Dr Henry, which is indifputably his own, and its pecu. liar advantages, are fufficiently explained in his general preface. In every period, it arranges, under feparate heads or chapters, the civil and military hiftory of Great Britain; the hiftory of religion; the hillory of our countitution, government, laws, and courts of juftice ; the hiftory of learning, of learned men, and of the chicf feminaries of learning; the hiftory of atts: the hiffory of commerce, of thipping, of money or coin, and of the price of commodities; and the hithory of manners, virthes, vices, cuftome, language, drefs, diet, and ampuements. Wider thefe feven heals, which extend the province of an hiftorian greatly heyond its ufual limits, cvery thing curious or interefting in the hifory of any comitry may be comprehended. Bus it certainly requied more than a common hate of li . terary courage to attempt on fo lange a frale a fulyeet fo intricate and extemive as the hiflory of Britain from the invafien of Julins Cefar. That Dr Henry neither overerated his powers nor his indultry, could only have been proved by the fuccefs and reputation of lis works.

But he foon found that his refidence at Berwick was an infuperable obtlacle in the minute refarclies which the csecution of his plan required. Ifis fituation there excluded him from the means of confulting the original autborities; and though he attempted to find accers to them by means of his litcrary friends, and with their affifance made fome progrets in he work, his information was not withflanding fo incomplete, that he found it impofible to profecute his plan

## H E N

Bienry.to his own fatisfaction, and was at hall compelled to rhanquith it.

By the friendhip of Gilbert I. aurie, Efic; late lord provort of Edinburgh, and one of his maja tly's comminfioners of excife in Scotland, who hat married the filler of Mrs Henry, he was remored to Edinburgh in 1765 ; and it is to this cvent that the public are indebed for his profecution of the Hillory of Geat Britain. His accels to the public libravies, and the means of fupplying the materials which thefe did not afford him, were from that time whed with fo much diligence and perfeverance, that the firth volume of his Hillory in quarto was publifled in 1771 , the fecond in 175t, the thind in 1777, the fourth in 1781, and the fifth (which bings down the Hillory to the ace eftion of lienry VII.) in 1785 . The fubject of thefe volumes comprehends the moft intricate and obfcure periods of our hillory; and when we conlider the feanty and featered mareriats which Dr Henry lias digefted, and the accurate and minute information which he has given us under every chapter of his work, we muft have a high opinion both of the learning and induftry of the author, and of the vigour and astivity of his mind : efpecially when it is added, that he employed no amantenfis, but completed the manufcript with his own hand; and that, excepting the fift volume, the whole book, fuch as it is, was printed from the original copy. Whatcuer corrections were made oal it, were inferted by interlineations, or in revifing the proof- hheets. He found it necelfary, indeed, to confine himfelf to a firt copy, from an unfortunate tremor in his hand, which made writing extremely inconvenient, which obliged him to write with his paper on a book placed on his knee inflead of a table, and which unhappily increafed to fuch a degree that in the laft years of his life he was often unable to take his victuals without affititance. An attempt which he made after the publication of the fifth volume to employ an amanuenfis did not fucceed. Never having been accuftomed to dictate his compofitions, he found it impofible to acquire a new habit; and though he perfevered but a few days in the attempt, it had a fenfible effect on his health, which he never afterwards ricovered.-An author has no right to claim indulyence, and is fitll lefs intitled to credit, from the puhlic for any thing which can be afcribed to negligence in connmitting his manuferipts to the prefs; but confidering the difficulties which Dr Henry furmounted, and the zecurate refearch and information which diHisguith his hiftery, the circunflances which have been mentioned are far from bring unintcrelting, and ar uat add confiderably to the opinion formed of his merit among men who are judges of what he has done. He did not profefs to tudy the ornaments of language; but his arrangement is uniformly regular and natural, and his fyle fumple and perfpienous. More than this lee has not atiempted, and this cannet be denied him. He belicud that the time which might be fpent in ponifuing or rounding a fentence was more uffully employed in invelligating and afcertaining a fact: And as a book of fucts and folid information, fupported by authentic documents, his hiftory will thand a comparifon with any other hillory of the fame period.

But Dr Ficnry had other difficulties to furmount dhan thofe which related to the compofition of his
work. Not having been able to trallact with the bookfellers to his fatisfaction, the five volumes were originally publifned at the rifk of the author. When the firlt volume appeared, it was cenfured with an unexampled acrimony and perfeverance. Magazines, reviews, and even newfopers, were filled with abalive remarks and invectives, in which both the author and the book were treated with contempt and ferrrility. When an author has once fubenitted his works to the public, he has no right to complain of the juff feverity of criticifm. But Dr Henry had to contend with the inveterate fcorn of malignity. In compliance with the ufual cullom, he had permitted a fermon to be pulslifhed which he had preached before the fociety in Scotland for propagating Chrithon knowledge in 1773 ; a compofition containing plain grod fenfe on a common fubjeet, from which he espected no reputation. This was eacerly feized on by the adverfaries of his Hitiory, and torn to pieces with a virulence and alperity which no want of merit in the fermon could juftify or explain. An anonymous letter had appeared in a newfipaper to vindicate the Hiflory from fome of the unjuat coufures which had been pablifhed, and afierting From the real merit and accuracy of the book the author's title to the approbation of the public. An anfiver appeared in the courfe of the following week, charging him, in terms cqually confident and indecent, with having written this letter in his own praife. The efforts of malignity feldom fail to defeat their purpofe, and to recoil on thofe who direat them. Dr Henry had many friends, and till lately had not difcovered that he had any enemies. Bat the author of the anonymous vindication was mannown to hin, till the learned and refpectable Dr Macquecn, from the indignation excited by the confident petulance of the anfwer, informed him that the letter had been written by him. Thefe anecdotes are ftill romembered. The abufe of the Hittory, which began in Scotland, was rencwad in fome of the periodical publications in South Britain ; though it is juftice to add (without meaning to refer to the candid obfervations of Englifh critics), that in both kingdons the afperity originated in the fane oprarter, and that paragruphs and cricicifins writtun at Edinburgh were printed in London. The fame Spirit appeared in Strictures publifhed on the fecond and third volumes; but by this tine it had in a great meafure lof the attention of the public. The malevolence was fufficiently underfood, and had long before become fatal to the circulation of the periodical paper from which it originally proceeded. The book, though printed for the author, had fold beyond his moft fanguine expectations; and thad received both praife and patronage from men of the firt literary characters in the kingdom: and though, from the alarm which had been raifed, the hookifilers did not venture to purchafe the property till after the publication of the fifth volume, the work was eftablifhed in the opinion of the public, and at laft rewarded the author with a high degree of celebrity, which he happily lived to enjoy.

In an article relating to Dr Henry's life, not to have mentioncal the oppofition which his Hiftory encountered, would have been both affectation and injultice. The facts are fufficiently remembered, and are unfortunately too recent to be more minutely explained.

That:

Henry. That they contributed at firt to retard the fate of the work is undeniable, and may be told without regret now that its reputation is ellablithed. The book has raifed itfelf to eminence as a lifitory of Gieat Britain by its own merits: and the means employed to obllruct its peogrefs lave orily ferved to enmelfilh its fuccefs.

Dr Henry was no doubt encounged from the firlt by the decided approbation of fome of his literary friends, who were allowed to be the moil comptent judges of his lubjeet; and in particular by one of the moll eminent hithorians of the prefent age, whofe hiflory of the fame periods juilly pofiefies the highocil reputation. The following character of the lintt and fccond volumes was drawn up by that geterleman, amd is well intitled to be inforted in a navative of $\mathrm{D}_{r}$ Heary's life. "Thofe who profefs a high efleem for the firit volume of D : Henry's hillory. I may venture to fay, are almolt as mancious as thofe who have perufed it, provided they be competent juldres of a work of that nature, and are acquainted with the difficulties which attend fueh an undertaking. Many of thofe who had been fo well pleafed with the firt were impatient to fee the fecond volume, which advances into a field more deficate and intenefling; but the Doctor hath fhown the maturity of his judgment, as in ath the reft, fo particularly in giving no performance to the pulblic that might appear crude or hatty, or compofed before he had fully collected and digetled the materials. I venture with great fincerity to recommend this volume to the perufal of every curious reader who defires to know the thate of Geat Britain in a period which has hitherto been regarded as very obficure, ill fupplied with writers, and not poffefed of a tingle one that deferves the appellation of a good one. It is wonderful what an inttructive, and ewon entertaining, book the Doctor has been able to comp, fe foom fuch unpromi. fing materials: Tantum feries jundurdque pollet. When we fee thofe barbarous ages delneated by lo able a pen, we admire the oddnefs and lingularity of the manners, cuftoms, and opinions, of the cimes, and feem to be introduced into a new world; but we are ftill more furprifed, as well as interefted, when we rellect that thofe Arange perfonages were the anceltors of the prefent inhabitants of this ifland. - The oljecet of an autiquary bath been commonly dittinguinhed from that of an hiforian; for though the latter fhould enter into the province of the furmer, it is thought that it hould only be quanto baflu, that is, fo iar as is neceffary, without comprehending all the minute difquifitions which give fuch fupreme pleafure to the mere antiquary. Our learned author hath fully reconciled thefe two charafters. His hitorical narrative is as full as thofe remote times feem to demand, and at the fame time his inquiries of the antiquarian kind omit nothing which can be an object of doubt or cululity. The one as well as the other is delivered with great perfpicuity, and no lefs propriety, whicla are the true ornaments of this kind of writing. All fuperfluous embellifhments are avoided; and the reader will hardly lind in our language any performance that unites together fo perfectly the two great points of entertaimmens and inflruction." - The gentleman who wrote this character died before the publication of the third volume.The prongefs of his work introduced Dr Henry to more extenfive patronage, and in particular to the
notice and efeem of the earl of Marsfield. That rencrable nobleman, who is fo well intitled to the gratitude and adairation of lis counery, thought the merit of Dr Homy's hithosy fo confiderable, that. withont any folicitation, after the publication of the form volume he applied perfonally to his Majefly to beftur on the author fome mark of his royal favour. In con. lequence of this, Dr Henty wis infurmed by a letter from lord Sturmont, then fecictary of tate, of his Majelly's intention to confer on him an anmal penforn for lite of 1001 . "condedering lt swiblinguthed talenta and great literary morit, and the impontance of the very ufeful and laborions work in whid he was fisfe. cefsialig engaged, as tites to his royal conantenance and favour." "The warrant wasiffued on the 2 sth of May :-8:; and his right to the penlion connonenced from the 5 th of april preceding. This peration the enjoyed till his drath, and always confidered it as infer. ring a new obligation to perfevere Ateady in the prow fecution of his work. Frum the carl of Mansfith he received many other teltimonics of elleens buth as a man and as an author, which he was often heard to nention with the moft affectionate gratitude. 'the octaso edition of his hiltory, publilhed in 1789 , was inferibed to his lordthip. The quartu cediciontadbern dedicated to the kins.

The property of the work had hicherto remained with himfelf. But in April 17\$6, when an uetsoo edition was intended, he conveyed the property to Meilrs Cadell and Strachan; referving to homelf what fill remained unfold of the quarto edition, whielt did not then eaceed eighty-one complete lets. A few copies were alterwards printed of the volumes of which the lirlt imprefion was cxhaulted, to make up additional fets: and before the end of 1786 , he fold the whole to Meffrs Cadell and Strachan. By the Brit tranfaction he was to receive Iccol. and by the fecond betwixt 3001 . and 4001 ; about $1+001$. in all. Thefe fums may not be abfolutely exact, as they are fet down from memory; but there cannot be a millake of any confequence on the one fide or the other. -Dr Henry had kept very accurate accounts of the fales from the time of the original publication; and af. ter his lat tranfaction with Meffrs Cadell and Strachan, he found that his real profits had amounted in whole to about 3300 pounds: a lliking proof of the intrinfic merit of a work which had furced its way to the public efteem unprotected by the interell of the boukfellers, and in fpite of the malignant oppolition with which the firt volumes had to ttruggle.

The profecution of his hiltory had been Dr Henry's favourite object for almoft 30 y ears of his lite. He had naturally a lound contitution, ande a more equal and larger portion of animal epirits than is commonly poffefied by literary men. But from the year 1785 his bodily llrength was fenlibly impaired. Notwithilanding this, he perfilted fteadily in preparing liis fixth volume, which brings down the hiftory to the acceffion of Edward VI. and has left it in the hands of his executors. almolt completed. Scarcely any thing remains unlinifhed but the two thort chapters on arts and manners; and even fur thefe he has left materials and authoritico fo diftincily collceted, that there can be no great difficulty in fupplyias what is wanting. It is hoped that this volume may be ready for publication forme cime in

Hoary the winter or fpring 1792 ; and that itwill be fond intit. led to the fame favorathle reception from the public which has been given to the former volumes. It was uritten
under the difadvantages of bad health and great weaknefs ne body. The tremulons motion of his hand had inercafed fo as to sender writing much move ditficalt 10 him than it had ever been : but the vigour of his mind and his ardour were unimpaired; and indepeudent of the gencral character of his worls, the pofthunous volume will be a lalling monument of the frength of his faculties, and of the literary induftry and perfeverance which ended only with his life.

1) r Ilenry's original plan extended from the invation of Britain by the Romans to the prefent times. And men of literary curiofity mult regret that he has not lived to complete his detign ; but he has cerminly finihed the mot difficult parts of his lubject. The periods after the aceefinon of Elward VI. aftord materials more anople, better digeted, and much more within the reach of common readers.

Till the fummer of 1790 he was able to purfue his fudics, though not without fome interruptions. But at that time he loft his health entirely; and, with a conttitution quite worn.out, died on the ${ }^{2}{ }^{2}$ th of November of that year, in the 73 d year of his age. -He was buried in the church-yard of Polmont, where it is propofed to erett a monument to his menory.

HINTINGS, in agriculture, a term uted by the farmers for a particular method of fowing before the plough ; the corn being ealt in a ltraight line jut where the plough is to come, is by this means prefenily ploughed in. By this way of fowing they think they fave a great deal of leed and other charge, a dexterous boy being as capable of fowing this way out of his hat as the moll thilful feedfrian.

EIenting is alio a termufed by the ploughmen, and others, to dignify the two furrows that are turned from one another at the bottom, in the ploughing of a ridge. The word feems to be a corruption of ending, becaufe thofe furrows made an end of plonghing the ridges. The tops of the ridges they call verings.

HEPAR sulphuris, or Liver of Sulphur, a comfination of alkaline falt and fulphur. See CheSAISTRY, $n^{2} 1021-1025$.

By means of the fume arifing on the decompofition of hepar fulphuris ty an acid, Mr Bergman hath found a method of imitating the hot or fulphureous mineral watere, to as great perfection 23 the cold ones are now imitated by fixed air. The procefs contifts fimply in adding the vitriolic acid to hepar fulphuris, and inprecrating water with the peculiar \{pecies of air that arifes from this mixture; in the fame manner as when water is impregnated with the fixed air arifing from the mixture of that or any other acid with chalk. This befatic air, as the author calls it, is very readily abforbed by water; to which it gives the finell, talte, gad all the other fenlible qualities of the fulphureous water. A Swedifh cantharus of ditilled water, containing ${ }^{12 \frac{1}{2}}$ Swedifh cubic inches, will abforb about 60 cubic inches of this hepatic air ; and on dropping into it the nitrous acid, it will appear, that a real fulphur is contained, in a ttate of perfect folution, in this water, to the quantity of eight grains. It does not appear that any other acid, except what the auther
calls the deshlacificated marine acid, will produce this. effeet. - When any particular tulphureous water is to be imitated, we fearee need to obferve, that the faline, or other contents peculiar to it, are to be added to the artificial hepatic svater. Intlead of the liver of futphur, the operator may ufe a mixture of three-parts of fitings of iroa and two parts of fidphur melted together.

It may, perhaps, be thongl:t, that water thus prepared, does not difter from that in which a portion of the hepar fulphuris has been dibleed: but it ap. pears evidently to diller from it in this material eir-cumfance;-that in the folution of hepar fuphuris, the fulphur is beld in folution by the water, through the means of the alkali combined with it: whereas, in Mr Bergman's procels, it does not appear prubable that the hepar fulphuris rifes fubitantialig in the form of air; for, in that cale, its prefence in the hepatic water. might he detected by means of the weakelt of the acids (even the mephitic), which would precipitate the fulphur from it. Nor ean it be fuppoled that any. portion or conttituent part of the alkali itfelf (except a part of its remaining fixed air) can come over. The water, therefore, mull owe its impregnation to the fulphur, raifed, in fome peculiar manaer, into the fate of an elattic vapour; permanent, when tue experiment is made in quicklifver; but condenlible iu water, and rendered foluble in that fluid through the means of fome unknown principle combined with it, and which the author fuppoles to be the matter of heat, combined. with it throngh the medium of phlogitton.

HEPATIC, in medicine and anatomy, any thing belonging to the liser.

Hapatic Air, a permanently elatic fnid, of a very. difagreeable odour fomewhat like that of rotten eggs, obtained in plenty from combinations of fulphur with earths, alkalies, metals, \&c. and lometimes from combinations of alkalies with fubitances which do not ap. pear to contain any fulphur.

The nature of tbis fluid has been-particularly examined by Mr Kirwan, of whofe experimen's we have. an account in the 76 th volume of the Phitolophical Tranfactions, and of which the refults are as follow.

1. By weighing it in a glafa bottle exhautted in the: moft perfect manner by an air-pump, its fpecific gravity is Found to be to that of common air as 10,000 to $903^{8}$.
2. Though inflammable, it never detonates with common air; nor can it be fired in a narrow-mouthed veffel, unlefs mixed with a confiderable proportion of, this air. Mr Scheele found that it would take fire when mixed with two thirds of common air ; but M. Sennebier informs us that it canoot be fired by the electric fark even when mixed with any quantity of. refpirable air. Mr Kirwan found one part of the hepatic air, and one and a half of commenair, to burn blue: without flaming or detonating; and that, during the combution, fulphur is contantly depolited, and a fmell of vitriolic acid perceived. Mixed with an equal part of nitrous air, it burns with a bluih, green, and yellow lambent flame: it depofits fulphur alfo; and in proportion as the latter is depolited, a candle dipped in. the air burns more weakly, and is at lat extinguifhed. Trivo parts of nitrous and one of lepatic dir burn par-
tially with a green fame; the refidum estinguilhing a candle, which reddelis on coming into contact with the atmofphere. One part of common air being admitted to equal parts of nitrous and bepatic air, fol. phur was intlantly precipitated, and the three meafures reduced to 2..t: which hurred on the furface with a greenith flame, but extisguifhed the candle when fuak cecper. Fuur parts of thepatic, with one of common air, burned rapidly with a blue flame; and a raisture of equal parisef cephloginitates and lienatic airs u hich had ilood eight days, went off sith a report like a pittol, and foiritantanoonly that the colour of tice fame could fearcely be difermed.
3. Hepatic air turns the tineture of litous sed, which Bergman fuppofes it woted not do if it were wafhed; but Mr Kirnan funnd nas alseration after paffang two ineafures through water, or centh aficr beit. ing the sir out of water impregns:ed with it. Nay, the fame bepatic air which had once reddencd litmus, cun. tinued to do fo dfeer being put to a fiefor guareity of the tincture.
4. 'There is a confiderable diference in the mifcibilty of heparic air with water accordiog to the materials from which the former is made. By night agitation, water in the tomperature of 660 inbibes two thirds of its bulk of air exsrafed from alkaline or cal. careous hepar by means of marine acid. An equal c!:antity of water diflolves three fourths of its bulk of hepatic air cxtracted by the fame acid from martial hepar ; eight-tenths of that extracted by means of the concentrated vitriolic acid, or the dilute nitrous or faccharine acids in the temperature of $62^{\circ}$; feven-tenths of that extrated by ledative acid; nine-tenths of that made with the ace:ouzacid, and of that alferded byoil of olives; and laftly, is own butk of that produced from a mixture of fogar and fulphar. In general, however, that produced by the greatelt degree of heat fecmed to be the molt ealily milcible; shough in fome infances, particularly that of acetous hepatic air, this does not take place.
5. The union between hepatic air and water is not permanent. Even when the water has been boiled in order to expel the air it naturally contains previons to its union with the hepatic air, the fluid grows very foon turbid, and depofits the hepatic air in the form of fulphur, though the bottle be evor fo well corked, or ftand inverted in water or mercury. The abforption cf the air ty water, however, does not feem to occafion any decompofition in the former, as the quantity left will be abforbed like the former by adding more water. It cannot be expelled from water till it comes near the boiline point.

6: No kind of hepatic air, excepting that produced from charcoal, precifitates lime from lime-water; and even this does it only in a very flight degree, unlefs a large quantity of air pals through a fmall one of water.
7. The moft fenfible teft of the prefence of hepatic air is the folution of filver in the nitrous acid. This, according as the nitrous acid is more or lefs faturated with filver, becomes black, brown, or reddifh brown, by the contact with hepatic air, however mixed with common air or any other permanently elaflic fluid. When the acid is not faturated, or is in large proportion, the brown or black precipitate, which is nothing but fulpburated silver, is redifiolred.
8. All hepatic air fuffers fome diminution by fanding over mercury, and blackens the furface of the metad: particularly that made from charcoal.
0. Mistures of hepatic air with commen, dephlogiflicared, and plulegithicated airs, continned for a long time eithar iotally undiminithed or very little fo, as did thofe alfo with infammable marine acid an and fised air; only blackening the forface of the meroury.
10. Two meafores of hepatic air being ineroduced to two of vitululic air, a whitifh yellow depolision inmediately covered thee top and lides of the jar, and both air's were withotit any agitation reduced eq little more than one meafure. As the glafs, however, was obfeured hy a whitin feurf over its whale infide, it wis found receflary to repeat the experiancit. One cubicirh of hepasic air was then added to fire of sitriolic as: and, in lefs than a minate, without ang : gitation, the fides of the giefs were coucred with a whiti? feum apparently moit, and a diniumtion of more than one ounce nicafure took place. In four hours after, a fecond meafire of hepatic air was introdaced; which was friltawed by a fecond depotition of whitith matter and dimination of the air. Next day three other meafures were added at the interval of four hours between each; when, finding fill a farther diminution, anothce meafure was added oerst daj. The whele quantity of 11 onnce neafures was thus reduced at lath to three, which feemed to be little elfe than phlogificated air. The water in which the fulphur precipitated from the liepatic air was wathed, and appeared to contain fome vitriolic acid and fixed air.
11. A mixture of two meafores of nitrous, and as much hepatic dir, was little alteted at firlk even by agitation ; but, on Alanding 36 hours, both were reduced by fomething more than one thitd of the whole. 'The mercury was not blackened, but particles of yrllow fisphur were depoficed beth upen the fides of the glafs and the furface of the metal. 'The air which remained had fill an hepatic fmell, and was fomewhat more diminiked by water: a candle burned naturally in the anabforbed part. The water had all the propertics of that which had abforbed hepatic air. On adding ninc cubic inches of nitrons air to eight of hepatic, a yellowih cloud inftantly appeared, a Night white fcuin was depolited on the fides of the jar ; and the whole fremed to be diminifhed about two cuhic inches, the temperature of the room being then $72^{\circ}$. In $4^{8}$ hours the whole was reduced to fix cubic inches, and the top and fides of the jar covered with a cake of white fulphur ; the heat of the room being conlantly between 60 and $70^{\circ}$. The refiduum was examined in 24 hours after, and had a pretty $l l$ rong Imell of alkaline ais. A candle burued in it naturally; and it did not affect tincture of litmus, lime-water, o: acetous barytes. It was not affected by any kind of air except the dephlogifticated kind, and this produced only a flight rednels and diminution ; it produced allo a night white precipitate in Colution of filver. Hence it appeared that this was depblogificated nitrows air, or, as onr author thinks, it ought rather to be called deaiditerd nirrous air.
12. Mr Kirwan fuppofing that an uncombined acid in the nitrous air was the caufe of precipitation, he deprived fonte nitrous air of this acid as perfectiy as pas. Eble bofore mixing it with hepatic air; which wiol
$\qquad$ Als. -

## H E P [ 430 ] H E P

Aaratic dore by acmiting allealine air to it, and then waming 1.1:r. being deprived of its acid it loft ahout one fixth of its
hu'k; and it was dimininded by common air in the fame manner that nitrous ain ufumly is. Seven cubic inches of hepatic air were then admitted all at once to eight of the purified nitrous air. No cloud or oher mark of any peceipitation appeared: but in fix hours the whole was reduced to five carbic iaches, the temperature of the room being $76^{\circ}$; but the diminution went no farther in 18 hours after. A much whiter fulphar was depofited than in the fomer experiment; and both in this and the former, that part which was intercepted by the rifing of the mercary betwixt the mutal and the fide of the jur was of a yellow and red hisning colour, andinot black, as that depotited in mercury ufually is. The refotum flathed with fuch viotence as to extioguith a candle dipped into it, the flame being exceedingly white and vivid; thongh it did not detonate in the leall, but rather appeared like dephlogifticated air. 'I he par out of which it had been tranfered hat a frong adkaline factl. It was not in the leaft dimirifhed by nitrousair, cren when heated to 150 degrees. Water poured into the jar in which the fulphur was depolited produced a bluth white cloud in folmtion of filver, though inlipid to the tafte; whence it appears, that whatever this air may be, is had been deacioified by leeparic air thill nore peofectly than that in which a cantle burns naturally, but was by no means dephlogiticated.
13. Perfectly pure alkaline and hepatic airs mixed togethur would probably deftroy each other; but Mr Kirwan never had is in his power to do this entirely. Six meafures of thepatic air from liver of fulphur, and fix of alkaline air, immediately throw up a white cloud, leaving a whitifl feum on the fide of the jar, and are reduced to about one ounce meafure. On adding water this is reduced to sbout one half; and a candle burns naturally in it. 'This refiduum, however, was afterwads found to be only the common air of the veffels.
14. One meafure of oil of vitriol, of the fpecific gravity of 1.863 , abforbed two meafures of hepatic air all to one tenth; the acid being whitened by a copious depoftion of fulphur.
15. A meafure of red nitrous acid, of the fpecific gravity of 1.430 , was introduced to an equal meafure of hepatic air: ud vapours inftantly arofe; and only one-lenth or one iwelfth of a meafue remained in an aerial form ; but as the acid acted on the mercusy, it was nectflary to ufe water, by which the whole was abforbed. No fulphur was precipitated on this occafron. The experiment was repeated in another mannor, but with little fuccefs; to that Mr Kirwan, finding it fo difficult to ufe the concentrated nitrous acid, determined to try its effects upon hepatic air by diluting the acid to fuch a degree that it could not act upon mercury without the aflllance of heat. In this eafe the acid was whitened, cight-tentles of the air abforbed, and the retidnum detonated. A fill greater quantity was abrorbed when the experiment was made with hepatic air made from liver of fulphur; but the rebduom, intead of detonating, burned with a blue and greenifh thame, depoliting fulphur upon the fodes of the jar. This dilute acid abforbed about three
times its bulk of hepatic air ; but on expelling the fome from it again by heat, the lixth part only was obtained, and in this a candle bornet maturally.
16. 'T'wo meafure of alkaline hepatic air wese abforbed ly one of trong manine acid to one fifth of a meafut, after a fight agitation. On adding a third meafure of hepatic air, the whole was abforbed to half a meafure. The fulphur precipitated in this experiment was antracted by the mereury, and blackened it : which did not happen in the former cales, by reafon of the flronger attraction of the acid for the bulphur. The refidum burned as pure hepatic air.
17. Diftilled vinegar abforba atarly its own bulk of hepatic air, and becomes flightly whitened; but bs afitation it may be made to take up about twice its bulk, and then becomes very turbid.
18. One meafure of cautic vegetable alkaii, the fpecific gravity of which was 1.043 , abforbed nearly four meafures of alkaline hepatic air, which rendered it brown at firft, bnt after fome time it grew clear and depofited fulphar, blackening the furface of the mercury.
19. One meafure of cauftic rolatite alkali, of the Specitic gravity of 0.9387 , abforbed 18 of hepatic air. A greater quantity of alkali would abforb more hepatic air, lix mafures of the alkaline air uniting to feven of the hepatic ; and thus the furngth of alkatine Jiquors, and their real contents, maj, according to our author, be determined better than by any other method. The fmoking liquor of Boyle (a ttrong volatile tincture of fulphur) may be eally prepared by putting volatile alkali in the midule vefth of Dr Nooth's apparatus, and deconpoling liver of fulphur, or artiincial pyrites in the lowermoll one by means of marine acid.
20. Olive oil abforbs nearly its own bulk of hepatic air, and grets a greenifh tinge from it.
21. Onl of turpentine abforbs more than its own bulk of this air, but then becomes turbid. A white cloud appears when water is put to the misture.
22. Apirit of wine, of the ipecilic gravity of 0.835 , abforbed neany three times its bulk of hepatic air, and became brown. Thus fulphur may be cumbined with fpirit of wine more eafly than by the method ufed by Count Louragais, the only one hitherto known. Water partly precipitates the fulphur:
23. New milk faredy abforbs one-tenth of its bulk of this air, and is not in the leaft coagulated.
24. With an equal bulk of vitriolic ether the bulk of the air is at firlt increaled; but afterwards one-half is abforbed, and a flight precipitation appears. The fmell is compounded of that of ether and bepatic air; but on adding water it becomes very offenfive, refembling that of putrefying animal fubllances.
25. On adding a meafure and an half of nitrous fo lution of filver to one of hepatic air, the latter was abforbed immediately, and without any agitation, the folution at the fame time becoming black. The remaining air admitted a candle to burn naturally in it. Hepatic air was likewife abforbed, but with more difficulty, and in finaller quantity, by the vitriols of iron and filver; the latter was blackened; the former became white at firl, but darker by agitation; the refiduam burned blue, as hepatic air ufually dies.

## H E P

26. Sulphurated firit of wine precipitates limewater, which highly rectified fpirit of wine will alfo do by itfelf. It alfo precipitates and gives a brown colour to acetous baro. .elenite, which is likewife done by firit of wine : the folution of filver is turned black or brown by it. Sulphur is precipitated from it $\mathrm{b}_{\mathrm{j}}$ concentrated vitriolic acid, which cannot be done cither by the nitrous or muriatic acids.
27. Water faturated with hepatic air turns the tine. ture of litmus red ; does oot affect lime-water ; forms a cloud in the folution of acetous baro.felenite, though not in that of the marine: it does not alter the folutions of other earths. It produces a white precipitate in the folution of vitriol of iron, or folution of that metal in fpirit of falt : in nitrous folution of copper it throws down a brown precipitate, and the colour of the liculid is changed from bluc to green; the precipitate being rediflolved by agitation. In folution of vitriol of copper it forms a black precipitate. It throws down a yellowih white precipitate in folution of tin in aqua-regia; a black one from folution of gold; a red and yellow one from that of antimony; and one of red mixed with white from folution of platina. Black precipitates are formed with nitrous folutions of lead and filver: but if thefe are not perfectly faturated with metal, the folutions will be brown, or reddifh brown, and inay be rediffolved by a. gitation. Nitrous folution of mercury is precipitated of a yellowih brown; corrofive fublimate of a yellow mixed with black, but which becomes white by agitation. Nitrous folution of bifnuth becomes reddith brown, and even affumes a metallic appearance. Solution of cobalt becomes dark; that of arfenic in nitrous acid becomes yellow, mixed with red and white ; forming realgar and orpiment. On dropping iato hepatic water oil of vitriol of the โpecific gravity of 1.863 , the mixture becomes nightly turbid ; but on dropping into it the volatile vitriolic acid, a bluin white and much denfer cloud is formed. A copious white precipitation is occafioned by the llrong nitrous acid, whether pllogiflicated or not ; but dilute nitrous acid produces no change. Green nitrous acid, the fpecific gravity 1.328 , iuflantly produces fulphur. A flight cloud is procuced by frong marine acid; tut neither difilled vinegar nor acid of fugar has any fuch efice. Accordires to Mr Bergman, hepatifed wattr, in a well clofed veltel, wal diffolve irun in a few days; but the experiment did not fucceed with Mr Kirwan, ncither conld he diffolee any other metal in this water, though the fuiphur mited with many of them into an infoluble ma's; whence our author conchudes, that metallic fubftances cannot be found in hepatifed waters.
28. Colourlets alkaline liquors acquire a brownim tinge from hepatic air; the refiduum they leave being of the fame nature with what they abforb. A caullic fixed alkaline liquor, faturated with this air, precipitates barytes from the acetous acid of a yellowith white colour ; decompofing likewife other earthy folutions, and the precipitate varying according to their purity; a tefl which our author fuppofes may be improved to fuch a degree as to fupply the place of the Pruftian alkali. It precipitates alfo folution of vitriol of iron as well as marine falt of iron, of a black colour; but the latter generally whitens by agitation. Solutions of filver and lead are alfo precipitated black with fome mix-

43 ] H E P
ture of white: that of gold is alfo blackened; and folu- Heparic tion of platina becomes brown. Solutions of copper Air. let fall a reddifl black or brown precipitate. Sublimaie $\underbrace{\text { _an }}$ yislds a precipitate partly white and black, and partly orange and grcenith. A nitrous folution of ardenic forms a yellow and orange precipitate; and that of regulus of antimony in aqua resia, an orange precipitate mixed with black. Nitrous iolution of zinc yicids a dirty white precipitate; that of bifmuth a brown mixed with white; and that of cobale a brown and black precipitate. Prufian alkali yields a purple precipicate, which is cafily rediffolved. Tincture of radifhes, wir athior's telt for alkalies, was turned greci.
22. On adding a few grains of iron, copper, lead, tien, zinc, bifmuth, regulus of antimony, and arfenic, to a folution of liver oi lin! phur, all the metals were found io attract fulphur from the fixed alkali, excepting zinc and sin. Jron, arfenic, regulus of antimony, and lead, were mof altered; copper next, and bifmuth the leall. No part of the metals appeared to be diffolved.
30. Water laturated with the condenfed refiduum of alkaline and hepatic air, i. c. with the purctt volatile liver of fulphur, does not precipitate niarine folenite. though it forms a fight brown and white cloud in that of marine baro-felenite. It throws down a black precipitate in folution of vitric! of iron, and a black and white one in that of marine falt of iron; but by agitation this become entirely white. Vitriol of copper, and nitrons falt of the fame metal. are both precipitated of a brown and red colour. 'lin diffolved in aqua-regia yelds a yellowith precipitat:; gole, a dilute ycllow and reddim brown ; patina, a Heflecolonred precipitate ; and regu. lus of antimo:iy, a yellowih red. Silver is precipitaied black, as well as lead, from the nitrons and acetows acids. Corrolive fublimate becane red for a moment ; but in a little time its precipitate appeared parely black and partly white. A dimilar precipitate is afforded allo by the nitrous folution of titmuth; but partly mised with a reddill-brown colour, and lias fomethink like. wite of a me:allic appearance; the precipitate of cubalt is black, or decp brown. Solutions of arfenic yield precipitatcs of a yellow colour, and more or lefs red; thofe. of zinc of a ditty white. - All thefe colours, however, vary, as the liquors are more or lefs faturated previous to and wifer their mixture, and the time they havenoud together.

From there experiments Mr Kirwan concludes, that herpatic air confils merely of fu!pluer rarefied by elementary lire, or the matere of heat. Some have fuppuleo that it confitts of liver of fulphur itfolt wolatifed; but this ourauthor denies, for the following reafons: 1. It is evidently, tho' weakly, acid; reddening litimus, and precipitating acetous baro- felenite, though nowe of the other folutions of carths. 2. It may be extracted from. ma:erials which either contain no alkali at all, or next. to none: as iron, fugar, oil, charcoal, \&cc. 3. It is not decompoled by marine or fixed air ; by which neverthelefs liver of fulphur may be decompofed.

Our author informs us, that he was formerly of opinion that fulphur was beld in folution in hepatic air, either by means of vitriolic or marine air : but neither of thefe is effential to the conllitution of licpatic air as fuch, fince it is producible from materials that contain neither of thefe acids; and from whatever fubflaree

Pirpeic it is obtaned, it alwaysafords the fane charafter, viz. that of the vitriolic acid exceedingly weakened, fach an acid as we may tuppofe fuphur itfelf to be 'l"his fubfance indeed, ceen is its concrete flate, manifelts the propertics of an acid, by uniting with alkalies, calcareous and ponderous carths, as well as with molt metals, which a very weak acid might be furpoled to du.

As phofuhorus bears a coniferable réemblance in its conllitution to fulphar, Mr Kirwan determined to make fome experiments upon it in fimilar circumblances. He therefore gently heated 10 or 12 grains of phofphorus mixed vith about half an ounce of caultic fixed - alkaline folntion in a very fmall vial furnifhed with a bent tube, and received the air over mernury. Two fmall explofions took place on the firlt application of heat, attended witl a jellow flame and white froke, which penetrated throngh the mercury into the receiver. 'Tlis was followed by an equable production of air; but at laft the phofphorus began to fwell and froth up, burt with a loud explofion, and a violent flame im. mediately iflued from it. Only about eight cubic inches of air were obtained. Thele were but very fichtby diminifhed by agitation in water; after which a cloudinefs took place, but the air foon recovered its tranfparency. Water impregnated with it nightly reddened rincture of litmus, but did not affect Pruftian alkali. It had no effect upon the nitrous folutions of copper, lead, zinc, or cobalt; nor on thofe of iron or tin in marine acid and aqua-regia; nor on the vitriolic folutions of iron, copper, tin, lead, zinc, regulus of antimony, arfenic, or manganefe; nor on the marine folutions of iron, copper, lead, zine, cobalt, arfenic, or manganefe. The nitrous folution of tilver was precipitated of a black colour, and the vitriolic of a brown: nitrous folution of mercury, made without heat, precipitated a brown or black powder; but vitriol of mercury firlt became reddifh, and afterwards white: corrofive fublimate a ycllow mixed with red and white. Gold diffolved in aqua-regia is precipitated of a purplith black, and in the vitriolic acid of a brownifh red and black; but regulus of antimony diflolved in aqua-regia is precipitated of a white colour. Nitrous folution of bifmuth let fall a lediment at lirlt white, and afterwards brown; viriol of bifmuth and marine falt of bifmuth were alfo precipitated brown, the latter being redifolved by agitation. Nitrous folution of arfenic alfo became brown, but the precipitate was rediffolved by agitation. On imprecsmating water with this air, without allowing the air to burn over it, the liquid fcarcely made any alceration in siture of litmus, nor did it precipitate lime-water ; but caufed a black precipitate in folution of filver; a white one in folution of regulus of antimony in aqua-reria, and a whitifh yellow one in that of corrolive fublimate.

On letting up a meafure of water to this air, and throngh that fonte bubbles of common air, every bubble flamed, and prodiced a white fmoke until about half the quantity of common air was introduced that had been ufed of phofphoric; but without any apparent inercafe of the original buik. The fame produced a fmall commotion each time, and fmoke defeaded after the inflammation into the water; the sinoke fill continuing to be produced on the introduccion of common air, after the flame had ceafed. BubDes of phofphoric air, efoaping through mercury in. $\mathbf{N}^{2}+51$.
to the atmophere, Aume, crackle, and fmell, exantly like the electric fpark. This property of phofphoric hepatic air was known to M. Gingembre in the year 1783.

On letting up half a meafure of nitrous to one of phofphoric air. a white fmoke appeared, with a very hight dinimution; the tranfarency being foon reftored, and a night fcum depofited on the fides of the jar. No fmoke or dimitution was produced liy adding another ha!f meafure of nitrous air; but on adding wa. tor, and agitating the air is it, much more was abforbed. On turning up the jar, the nitrous air firft efcaped in form of a red rapour, and this was followed by a whitih fmoke. 'Ile water had a phofphoric fincll, and precipitated the folution of fliver brown.

An equal meafure of a!kaline air fcarce diminimed phofphonic air; and on adding water, little more feemed to be taken up than the alkaline air, though a fmoke apptared on surning up the jar, but without :ny flame. Water thus impregnated fmelled exactly like onions, and turned the tincture of radibaes green. Solution of filver was precipitated of a black oolour; that of copper in the nitrous acid, of a brown; the precipitate being rediflolved by agritation, and the liquor then affuming a green colour. Corrofive fublimatc let fall a ychlow precipitate mised with black. Iron was precipitated white both from the vitriolic and marine acids; but a pale yellow folution of it in the nitrons acid was not affeeted, and a red folution in the fame acid was only clotied. Regulus of artimoly was precipitated of a white colour from aquaregia, cobalt of a night reddifh from the nitrous acid, and bifmeth of a brown colour from the fame. Neicher the nitrous fotutions of lead or zine were affected; nor thofe of tin in the marine acid or in aqua-regia. Fixed air, mixed with an equal proportion of phofphoric airy produced a white fmoke, fome diminution, and a yellow precipitate. On agitating the mixture in water the fixed air was taken nip all to one-tenth ; the retiduum fmoked, but did not take fire.

Some preatifate fer fe being introduced to a [mall portion of phofphoric air, the former foon grew black, and a white finoke appeared. In two days the precipitate became folid, acquiring a pale white colour, mining like fteel. 'The air loft it infammability; though Mr Kirwan fuppofes that this might be owing to fome other caufe : for two days after this air was made, a yellow faum was obicrved on the lides of the jar in which a quantity of it had refted all night over water; and the fpontaneous inflammability was lol next morning. The temperature of the air was then $53^{\circ}$; and when it inflamed before $65^{\circ}$.

From thefe experintints our anthor concludes, that phofphoric air is nothing elfe but phofphorus itfelf in an acrial ftate; differing from fuluhureous or hepatic air in this, that it requires much lefs latent heat to throw it into an acrial itate, and therefore may be difengaged from tixed alkalies without any acid.

Hepatic air may be obtained in a great number of different ways, and from a varicty of fubftances. The moft comrion method in which it has been procured, is by decompoling the hepar fulphuris or combination. of fulphur and lised alkaline falt by means of an acid. Mr lirwan has esamined the circumftances attending the formation of liver of futphur ; mating his firft ex.

## H E P

periment by melting together equal parts of the mineral alkali and flowers of fulphur in a covered crucible. On dightly heating the mixture, it emitted a bluifh fmoke, which gradually became whiter as the heat was augmented; and at laft, when the bottom of the crucible became flightly red, the fmoke was perfeetly whice and inflammable. To inveltigate the nature of this fmoke, a pure fixed alkali was made by deftagrating equal parts of cream of tartar and nitre in a red-hot crucible in the ufual way. This alkali, in a very dry flate, was mixed with a fmall quantity of fowers of fulphur, and the mixture diftilled in a finall cuated retort; the air being received over quick filver.

On the firll appplication of heat, one cubic inch and an half of flightly phlogillicated air was obtained, but without any fixed air. This was the common air contained in the veffels, but altered by being in contact with the alkali and fulphur. On augmenting the heat, about 18 inches of air were obtained, of a reddith colour, feemingly a mixture of nitrous and common air ; acting nightly on mercury. After this, 20 cubic incles of the fame kind mixed with fome lix:d air were obtained. Thefe were fucceeded by $6+$ inclies of fixed air almolt perfectly pure. The bottom of the retort was now red-liot ; fome fulphur was fuhlimed in the neck; and when all was cold, an hepar fulphu. ris was found in the bu'b.

Frons this experiment Mr Kirwan concludes, that the blue fmoke above inentioned confins chiefly of fixed air and the white of fulphur; but that neither hepatic nor vitriolic air are formed menlefs the retort be large enough to admit as muchair as is neceffary for burning part of the tulphur. He concludes alfo, that hepar fulphuris will yield no hepatic air unlefs with the help of an acid; "and I believe this ( fays he) to be true, when the experiment is made in the dry way, and nearly fo in the moill way: for having added 200 grains of futphur to a concentrated folution of Arong canflic regetable alkali by a ltrong and long-continued heat, I obtained only one cubic inch of hepatic air ; yet it is well known, that a drong folution of liver of fulphur conttantly emits an hepatic fmell, even in the tomperature of the atmofphere; and the fublance fo eniated contains as much hepatic air as difcolours filver and lead, and even their folutians; which hows that an incomparably fmall quantity of this air is fufficient to produce the effect. To difeover whether this extrication of hepatic air might be caufed by the depofition of fixed air from the atmofphere, 1 threw fome pulverifed calcareous hepar into aerated water, and by the application of heat endeavoured to obtain hepatic air, but in vain: and indeed the very circumflance that the hepatic fmell and its effects are always flrong. eft the firfl inllant that a bottle of the hepatic folution is opened, feems to indicate that fixed air is no way concerned in its production. The bell liver of Sulphur is made of equal parts of falt of tartar and ful. phur ; but as about one- fifth of the falt of tartar confifts of air which ef apes during the operation, it feems that the froportion of fulphur predominates in the refulting conpound; yet, as fome of the fulphur alfo fublimes and burns, it is not eafy to fix the exact proportion. One hundred grains of the bell, that is to fay the reddeft liver of fulphur, afiord with dilute nrarine acid about 40 inches of hepatic air in the tem-

Vol.VIII. Part II.
perature of $60^{\circ}$; a quantity equivalent to about 13 grains of fulphur, as will be feen in the fequel."

Hepatic air is belt produced by marine acid: the concentrated nitrous acid produces nitrous air; but if diluted with 20 times its bulk of water, it produces the hepatic kind by the affitance of heat. Concentrated vitriolic acid poured upon liver of fulphur affords but little hepatic air without the affitance of heat; though it conftantly decompofes the hepar: " and (adds our author) it is partly for this reafon that the proportion of air is fo fmall ; for it is during the gradual decompasition of fulphureous compounds that hepatic air is produced." Hepatic air, but not in a pure flate, is extricated by difilled vinegar; its fimell being mixed with that of the regetable acid. Some quantity of this air is produced by the faccharine acid in the temperature of $59^{\circ}$, and by fedative falt in that of bsiling water or ncarly fo ; but neither the arfenical nor aerial acids produce any.

Having prepared fome hepar fulphuris with an over proportion of fulphur, an hepatic air was procured by means of concentrated vitriolic acid; but fo l.maded with fulphur, that it depofited fome in the tube through which it was tranfmitted, and on the upper part of the glafs receiver. On transferring it to another receiver, though then perfectly clear and tranfparent, in quantity about fix cubic inches, yet next morning it was reduced to one inch, the infide of the glafs being covered with a thick coat of fulphur; the fmall quantity of elallic fluid which remained heing changed from hepatic to vitriolic air. "Hence (Gays Mr Kirwan) it appears, fift, that a fpecies of daftic fuid may exit in a llate intermediate bctween the aerial and vaporous, which is not permanently tlaflic like air, nor immediattly condenfed by cold like vapour; but which, by the éradual lofs of its fpecific heat, may be recuced to a concrete form. 2. That fo large a quantity of fulphur may be combined with vitriulic air, es to enable it to exhibit the properties of hepatic air for fome time at lealt. A mixture of three parts of pulverifed quicklime and one of fulphur, heated to whitenefs in a covered crucible for one hour, became of a flony hardnefs; and, being treated with marine acid, afforded hepatic air. On heating a piece of this fone in pure water, it becomes bluifh; and hence the origin of blue marles generally found near hot fulphurated waters. A calcareous hepar may alfo be formed in the moir way."

Magnefia deprived of its fixed air, and heated in the fame manner with fulphur, afforded no hepatic air. It was procured, however, from a mixture of three parts of iron-filings and one of fulphur melted together, and treated with marine acid. This fulphurated iron diffolved in marine acid affords almott entirely hepatic air, and very little of Gle inflammable kind. Equal parts of iron-flings and fulphur ${ }^{\circ}$ mixed together, and made into a pafte with water, after heating and becoming black, afforded hepatic air when an acid was poured on it ; but this was mixed with inflammable air, probablyproceeding from uncumbined iron. Aftera few days this mixture lolt its power of producing hepatic air. Mr Bergman has alfo remarked, that comhinations of fulphur with fome other metals yield hepatic air.

Hepatic air was obtained by pouring fome olive.oil upon a few grains of fulphur, and heating the mixture

Hepatic in a rial with a ben: wbe. It was likewifc ohtained Air. in er at platy from equal parts of fulpluer and pow. dend chatcosl, ont of whith the air had previoufly beca expelled as much ats puftible: "yet (lays our antwor) it is hadly fonfiole to free chareoal wholly fom for ien air, for it foun reattacts it when expofed t) tive atmofplate."

Bis zrans of pyrophorus mixed with alum and fuzer effivefe whith marize acid, and dinded two cubic inches and an half of hepenic air. 'lhis pyrophorus had been made fix years bef re, ard was kept in a qube hemetically fealed, ant? for feneral fummers ex. pofal to the light of tie lun. It was fo combuthble, that fome gation of it took fire while it was introduced into the vial ont of which the hepatic air had becn ex. peited.

A mixare of two parts of white fugar (previounly melted in order to free it of water) with one part of fulphot, when beated to about 600 or 900 degrete, Enve out hepatic air very rapidy. 'lais air had a fonell very much refembling that of onions, but contained wither fixed air nor any other acid. Sugat and fulphur melted together gave on no hepatic air when treated with acids. WVater, fpirit of wine, and marine acid, decompufe this mixture, dullulving the figar, and leaving the futphur.

Twelve grains of fuphur heated in a retort. fill d with metallic inflammble air, aforded no hepatic air; thoush the etort imelled of it when cold, and hor fome time after.

Eighteen grains of liver of fulphur exponed for four days to fix cubic inches of fixed air, the thermometer at $70^{\circ}$, was fomewhat whitued on the furface: the air not having an lepatic fmell, but rather that of bread. It feemed to have taken up fome fulpher, which was fopated by lime-water. It was not in the lata diminimed; and the tefore feems to have received an addition of hepatic air, or rather of fulphur.

On exponng a quantity of fu!phureo-mantial pate to fixed air for tive days, the latter was not at all diminilhed, but rectised a night addition of inflammable air. The palte ifflf, taken out of thi air and expofed to the atmofphere, hated very ltrongly.
'lhere grains of fulphur expofed to twelse inches of marine air was not diminifhed in four days. On adding a cubic inch of water to this air, it was all abforbed to one jneh, which had an liepatic fmetl, as had alfo the water, the latter cridently containg fulphur.

Hepatic air is found naturally in coal-pits, and has been difeosered by Mr Bergman to be the principle on which the fulphureous properties of many mineral waters depend. There is alfo great reafon to think that it is the peculiar production of the putrefaction of m ny, if not all, animal fubllances. Rotten eggs and cormpted water are known to emit this fpecies of air, and alfo to difcolour metallic fublanecs, in the fame manner. MI. Viellard has lately dreovered feve. ral other indications of this air in putrelied blood. In the soth wotume of Philofophical Traniactions, p. 391. 1)r Crawford gives an account of fone experiments, from which it appears, that a kind of hepatic ain is contained in the virus of cancers. Having obtained a portion of this ichor from a cancerous breath he divided it into three parts, which were put into fepdrate vials after being properly diluted with water. 'I'o one
of thefe he added fome veretable fixed oigali, 10 another a litite concentrated viriolic acid, and to the thid fome fyrup of violets. No change was produced by the recectable alkali; but on the additan of the acid, a deep brown coleur was p odnced, and a brins ederrefence touk place, at the fame time that the pecular odour of the cancerous mather was greatly augmented, and difisfers itfelf to a conlickerable ditane. is frint green colour was cermmunated to the thind portion shich had the fyrup of violets.

As the cancerous matier on which the fopsperiments were made had been previously kept fame days, Dr Crawford fufpected that it might thus have acguined its alkaline propenty; as M1 Geluer bas thown, that animal fublances, when wewly putrelied, do nut contain any alkali. He repeated the experment, therefore, on fome mater recently procured from a cancerous penis. A manifed aforwefonc: thou ghtefs than the foreguing, allo tork place in tha cate: the liquor acquircal a brown colour, and the fetor increafed. A portion of the lame mattor, diffufed ehrough cillilled water, enmmanicated a green colonr as before; but in fome cafes the change was featcely paresptible, th ough in all the experiments which wete made the exillence of an alkali one way or other was manifthed.

The air extricated from the canconons matter feemed by its fachl to refemble roten eggs more than any other fpecies; but to inveltigats the matier fully, fome portion of the virus was diffuted throm th elifilied water, the liquor filtered, and a fmall quantity of nutrous folution of ilver dropped into it. An afh coloured precipitate foon appeared diffufed lise a cluad thronsth the liquid, and at the end of two hours the colour of the mixture was changed to a deep brown. 'lhe fetid f:nell was now rendernit much fainter, and wasentirely defloyed by an addition of concemtrated nitrons acid, or by dephlogiticated fpirit of fatt; either of which fubttances would alfo have dellroged the fmell of hepatic air.

On akding the vitriolic acid to common pus, no cffervefence was producat, nor was the colvar of the liquor chanved, ncither did any fentible precipitation take place tor feveral hours. On repesting the expesiment, however, with matter ob:ained from a vonereal bubs, the liquid became aightly turoid on the addition of nitrated liluer, and at the cond of two herrs it had acquined a brownith colt. The fame ellets took place with the mater which ifliced trom a carious bone; but in borh cales the precipitation was much lefs than with the cancerous matter.

To procure fome quantity of the air in its leparate fate, a grantity of rddith cancerous matter was mixed with about thrice its weight of dithlled water. On adding a litte vitriulic acid to this mixture, an effervefeence enflued, and the air was received in a vial over mercury. When one-half of the metcury was expelled from the vial, the latter was inverted over diltilled water ; and the portion of mercury that remaned in it being fuffered to defeend, and the water to rife into it place, the vid was clofely corlsed. The air and water were then britkly agitated together; and the vial being a fecond time inverted over dititled water, the corlf was removed. It now appeared, by the height to which the water rofe, that part of the air: had been abrorbed; and on dropping in a litele nitra. tじd

## H E P

lepatic
ted filver into it, a purplifh cloud, inclining to red, was produced. In this experiment, the change of colour was at firt feareely perceptible, but became very diftinct in a few minutes. The quantity of acial fluid, however, which can thus be extricated by the addition of acid without heat is not very confiderable: if heat be applied, a larger quantity of elaftic fluid will be produced, having the fmell of cancerous matter; but in that cafe it will be mixed with vitriotic acid air.

To obtain this air in as pure a flate as poffible, a portion of the cancerous virus, properly diluted with diflilled water, was introduced into a finall vial, a litcle vitriohic acid added, the veffel filled with diftilled water, and a crooked tube alfo filled with water fitted to its neck. The extremity of the tube being then introduced into the neck of a bottle inverted in water, and the flame of a candle applied to the bottom of the vial, air began to rife in white bubbles, having a very fetid fmell limilar to that of cancerous matter; and the water impregnated with it occalioned a dark brown precipitate in a folution of nitrated inver. On feparating the crooked tube from the vial, a very offenfive white vapour, refembling in fincll the air produced in the furegoing experiment, arofe from the mixture, and continued to afcend for near half an hour. A portion of the liquor filtered, and mixed with a little concentrated nitrous acid, had its fmell entirely dellroged; a fight effervefence beins produced, and a flaky fubtance feparated from the hquor and Hoating through it.

On examining the alkaline matter which had been feparated from the cancerous virus, it was found, as had indeed been concluded a priort, to be the volatile alkali. It feemed probable that this alkali was united to the fixed air with which the cancerous matter was impregnated, becaufe the peculiar finell of the matter was greatly augmented by the adeition of the vitriolic acid; and this was confinmed by the following experiments.

1. A portion of cancerous matter was diffufed through ditilled water, and diftilled in a fmall retort with a graduated heat until the buttom of the veftl became red hot. The common air, which firte came over, was greatly impregnated with the fmell of the cancerous matter: however, its qualities were not greatly impaired by the teft of mitrous air ; two meafures of it, with one of nittous air, occupying the fpace of little lefs than two meafures. When the water began to boil, a large quantity of aqueous vapour arofe; which, as foon as it came into contact with the air, produced a white fmoke. The fmell was now perceived to be fimilar to that of builed animal fubllances; but no permanently elaflic fluid was mixed with the aqueous vapour. When the greater part of the water was evaporated, the jar containing the lirt portion of air was removed, and the neck of the retort introduced beneath an inverted veflil tilled with mercury. A confiderable quantity of air imelling like burnt bones was nuw extricated, which was mixed with a yellow empyetumatic oil. On agitating fome of it with water, part of the air was imbibed. Nitrated filver, dropped into the watcr thes impregnated, produced a seddifh precipitate.
2. One meafure of the air obtained in the foregoing
experiment was mixed with an equal quantity of alkaline air. In three hours the whole occupied only the bulk of one meafure and two-tenths, and an oily feum was now left upon the inner furface of the tube; and in eight days the interior furface of the tube was covered with flender films of a yellowifh colour fipread irregularly upon it. The upper furface of the mercury within the tube was corroded; in fome places having a reddifh bunifhed appearance, in others it was changed into an afh-coloured powder interfperfed with brown fpots. On removing the tube from the mercury, the air that remained in it had a ftrong fetid fmell, effembling that of burned bones.
3. T'o difcover whether other animal fubltances yield an aerial lluid fimilar to that produced from the cancerous virus, a portion of the flefh of the neek of a chicken was dillilled in a fmall coated glafs-retort till it became red hot. A thin phicgm of a yellowih colour firlt came over: this was fuceeeded by a yellow empyreumatic oil; and at the fame time a permanenty claitic fluid, freelling like burned feathers, beran to be difengaged. A hip of paper tinged with litmus, and reddened by acetous acid, being held over this fluid, prefently became blue. The remainder of the air was very fetid, and highly intlammable. By agitation in water one half of it was ablorbed ; the remainder was inflammable, and burned firlt with a fight explofion, and afterwards with a blue lambent flame. On dropping a nitrous folution of filver into the water impregnated with this air, the mixsure depolited a brown precipitate.
4. On treating putrid real by ditillation with a graduated lieat, the products were found to be nearly dimilar to thole already mentioned. The air obtained was highly inflammable, about one half of it was abforbed by water; and the liquid thus impregnated let fall a brown precipitate on the addition of nitrous folution of filver. On adding fome depllogiIticated marine aci.1 to another portion of this liquor, a brilk effrevefence took place, and a whitilh gatatinous matter was feparated: and this fubltance being cvaporated to drynefs, became black on the addition of the concentrated vittiolic acid. On agitation with water, part of the air was abforbed as in the former experiment, and the remainder burned with a lambent flame. This air, however, extricated from patrid veal, had lefs of an empyrcumatic frell than that which was difengaged from froth animal fubllances, being rather like that of putefying animal matters.

From thefe experinents our author concludes, that the air extracted from animal fubitances conlith of two didtinet lluids, the one fuluble and the other infuluble in water. The infuluble part burns with a lambent llame, and has all the charatters of heavy inflammable air: but the foluble part refembles that which is produced fiom cancerous matter by the vitriolic acio; having a fetid odour, secompoling nitrated lilver, combining with caullic volatile alkali, and poffeflug many of the properties of common hepatic air. In many particulars. however, the enimal hepatic air differs from the comano. The fmell is confiderably different, and in the decompolition of animal hepatic air no fulphur is feparated, but a kind of flaky inatter which is evidently an animal fubllance, as turning black by the vitriolic acid. The following expeiment is a dective

Hepatic Air.

Hepalie proof that no fulphur is contained in animal hepatic Air. air. "Equal parts of pure air, and of air extricated from freth beef by ditillation, were fired by the electric hock in a ftrong glafs tube over mercury. A litule difitild water was then introduced through the mencury into the tube, and was agitated with the air which it contained. A pottion of this water being filtered, and a fmall quantity of muriated barytes being dropped into it, the misture remained perfectly tranfparent. Hence it appears, that the air extricared by diftillation from frelh beef does not contain fulphur, as that fubtance would have been chatrged by barning into the vitriolic acid, and the muriated barytes would have been decompofed. The fanes experiment was frequently repeated with air extricated by diatillation from the putrid as well as from the freth mufcular fibres of animals; but in no inftance could the leall veltige of vitriolic acid be difcovered.
5. To analyfe in a more perfect maner thefe kinds of anmal aits, and to determine their products when combined with pure air, about an ounce of the tean of frefh mutton was expofed to a red heat in a fmall coated glafs retort. Very near one half of the air produccd towards the end was abforbed by water, and two thinds of that which came over about the middle. A feparate portion of the air, difengaged towards the end cf the dillillation, being allowed to remain over mercury for feven hours, it was found gradually to diminifh in bulk; and a huid, having the colour and fnell of a thin enupyreumatic oil, was collected at the bottom of the jar. This apptarance, however, is not conftant: the air, when placed over mercury, fometimes diminifhes, and at other tires retains its original bulk. Only one-tighth part of this air was ablorbed by water. "Hence (ays the Doctor) it appears, that a portion of the air extricated from animal fubHances by heat, refembles a fpecies of haspatic air which was tirlt difcovered by Mr Kirwan, and which exifts in an intermediate flate betwcen the aerial and the vaporous: this fluid not being permanently etaftic like air, wor immediately condenfed by cold like vapour, but gradually affuming the nonelallic form, in confequence probably of the iendency of its feveral parts to unite with une another:".
6. To determine the propotion of fixcd air contained in that prodaced fiom the lean of animal fubflances, a quantity of air extracted from mutton was received over mercury in a large vial with a narrow neck. When the vial was little more than haif filled, the remaining portion of the mercury was difplaced by introducing water that had been previoufly boiled. The sial being then clofely corked, the air and water were brikly agitated together; and the liquor, thus impregnated with the foluble part of the animal air, was put into a vial to the bottom of which heat was applied. Thus a part of the air was again difengaged, and received in a tube inverted over nercury; and the procefs continued till the liquor no longer rendered fime-water tuitid. On agitating the air a fecond time with water, and comparing the bulk after agitation with that before it, it appeared that the quantity ablimbed was about one-furth part. From this experiment al. fo it apptared. that aninal hepatic air, when once abforbed by water, is not capable of being ayain difen. gaged by a boiling heat; for alter the fised air
had all been expelled, the liquor was made to boil
nearly for half an hour, but no permanently elallic fluid could be difengaged: that portion of elalic whi could be dinengaged : that portion of the liquor which remained had a faint yellow colour, and fmetled ftrongly of animal hepatic air, depofiting alfo a brown precipitate upon the addition of nitrated filver. "It appears therefore (fays the Doctor), that the folable part of the air difengaged from animal fubftances by heat, cenfitts of three diltinct fluids; of alkaline air, fixed, and animal hepatic air. It feemed extremely probable, that thefe three aerial fluids, nowly combining together, formed the oily empyreumatic fubflance which was collected at the bottom of the jar, while the air was undergoing the diminution defcribed above. In this conclufion I was confirmed by trials that were made with the empyreumatic oil that came over in the latter part of the difillation: for when it was examined by chemical tetts foon after it was obtained, it was found to contain fixed air, volatile alkali, and animal hepatic air."
7. $1^{10}$ determine the products refulting from the combultion of pure air with the animal hepatic air, one portion of the air extracted from the lean of mutton was agitated with water, the other was not One meafure of the former was introduced over mercury into a ftrong glafs tube, and then mixed with one meafure and an half of pure air. A fmall thock being made to pafs through it, a violent explolion took place; and the fpace occupied by the air in the tube was reduced from an iuch and two tenths to nine-tenths of an inch. On agitating the refiduun with water, fixtenths were abforberl; and the portion abforbed appeared to be tixed air by its precipitating lime-water. Five parts of nitrotis air being mixed with an equal quantity of the infoluble reliduum, a diminution of three parts took place; whence it appears that onefifth of the infoluble reinduum was pure air. Hence it afpears that fixed air was produced by the indanmation of dephlogiticated and animal hepatic air.
S. One meafure of that postion of animal air which had not been agitated with water was mixed with a mealure and an lalf of pure air, and fired by the tlectric thock. Previous to the deflagration, the two airs occupied the fpace of 1.15 inches, but afterwards it was itduced to 1.1. On agitation with watcr, about one-third was abforbed; a portion of the infoluble refidurm burned with a faint blue flame.
9. As it appeared from thefe experiments, that a measure and an half of oephlogifticated air was not fufficient to faturate one of the animal air that had not becn agitated with water, the experiment was repeated in the following namar. Two parts of pure air, with one of the arimal kind, occupied the fpace of eighttenths of an inch; but when fired by the electric thock, the refiduom flood at a little lels than half an inch; and this refiduum was almolt wholly abfurbed on agis taion with lime-water. By a fubfequent trial it was found, that nearly one-half of the aninal air ufed in this experiment was foluble in water. When equal parts of pure and animal air were burned together, 2 conlicuable incieafe of bulk almuft invariably took place; and when the animal was to the pure air as 21 to 15 , the bulk of the mixture was increated one half. The refiduum of the air was inflanmable.
10. To mustigate the caule of this augmentation

## H $\quad \mathrm{E} \quad \mathrm{P}$

patic of bulk, three meafures of animal were mixed with two of pure air; and feveral Itrong electric thocks were made to pafs through the mixture, but without being able to fet it on fire. On adding half a meafure more of pure air, it took fire; and the bolk was a ngmented from . 9 to 1.3 inclit9. 'Three meafures of the refiduum were then mixed with three of pure air, and the mixture fired by the electric flock; the bulk of the mixture being reduced from one incli to 56 . On agitation with lime-water, two-thirds were abforbed, and the remainder confilted almolt entirely of pure air.
11. Having accidentally taken two or three fmall fhocks through fome alkaline air, and not obferving any fenfible increafe of bulk, the Doctor mixed it with an equal quantity of pure air, not apprehending that any decompolition had taken place. Contrary to ex. pectation, however, the two fluids entered rapidly into combination with each other the noment that the electric fhock was made to pafs through them. The jar, which he held loofely in his land, as it was inverted over the jar, was carried obliquely epward with great violence; the Aand of the prime conductor was broken, and the cylinder fhivered into a thoufand pieces. The experiment, however, was afterwards Cafcly repeated with a very flrong apparatus; the jar being preffed down with a plate of iron for the purpofe of retaining it in its place.
"It appeared (lays the Doctor), that when the alkaline and pure air were immediately mixed together, and a fimall thock was made to pafs through thetn, they would not take fire; but when three or four fhocks were previoully taken through the alkaline air, and the latter was afterwards mixed with an equal quantity of pure air, they exploded with great violence. One. fixth of the refiduum was alkaline, the remainder phlogifticated air."

Several other cxperiments are related by the Doctor in this paper, whicia tend to thow that animal litpatic air is extricated in large quantity by the procefs of putrefaction. By diftilling a green cabbage leaf, he alfo obtained an aerial fluid, in mott of its properties refenbling animal hepatic air. The ferid fmell of this gas is deftroyed by fuffering it to remain in contact with pure air for everal weeks; a d fo effectually by the vapour of dephlogiticated marine acid, that he was induced to try the efficacy of this fluid as an application to cancers. In fome cafes it appeared to be of fervice, though fome ulcerated cancers were found fo irritable, that they could bear no application whatever. The liquid itfelf appars to be unfafe when taken inwardly. Dr Crawford having taken 20 drops of it largely diluted with water, found himfelf affected with an obtufe pain and fenfe of conltriction in his flomach and bowels, which refifted the ufe of emetics and laxatives, but gielded to fulphureous water. He found afterwards, that the manganefe whicn lad been ufed in the ditillation of the acid, contained a fmall quantity of lead. He relates alfo, on the auchority of Dr Ingenhoufz, that a Dutchman of his acquaintance fome time ago drank a cunliderable quantity of the dephlogitficated marine acill ; the effects it produced were fo violent, that he narrowly efcaped with his life. Thefe deleterious qualities our author aferiteen to lead; though it can by no means be proved that mangancse
is more innocent : and it is alfo exceedingly prebable that fome of this femimetal rifes in the preparation of what is called the dephlogificated or oxysenated marinc acid.

Heratic Aloes, the infpiffated juice of a fpecies of Aloe.

Hepatic Stont. See Lider Stome.
Hfpatic Water. See Hapak Sulphuris.
HEPATRCA, in botany, a fpecies of Anemone.
HEPATITIS, in medicine, an inflammation of the liver. See Mrinicine. Tudex.

HEPATOSCOPIA (formed of rexp liver. and oxoraw I conffer), in autiquity, a fpecies of diviation, wherein predictions were made by infpecting the livers of animals.

Hepatoscopia is allo ufed as a general name for divination by int ratils.

HEPHAESTIA, in Crecian antiquity, an Athenian feftival in hosour of Vulcan, the chief ceremeny of which was a race wich torches. It wis perfi, rimed in this manaer: The antagnnifts were three young men, one of whom, by lot, took a lighted toreh in his hand, and began his courle; if the torch was extinguined before he finifhed the race, he delivered it to the fe. cond; and he in like manner to the third: the victory was his who firft carried the torch lighted to the ent of the race; and to this fucceflive delivering of the turch we find many alhetions in ancient writers.

HEPHTHEMIMERIS (compofed of eria feren, nusevs balf, and $\mu$ rio part), in the Greck and Latin poctry, a fort of verfe confitting of three feet and a fyllable; that is, of feven half fett.
Such are moft of the verfes in Anacreon:

And that of Ariftophanes, in his Plutus:
ETHOJE untpu jootpot.

They are alfo called trimstri catalegici.
Hepethemimeris, or Hefohicmimeres, is alfo a crefura after the third foot; that is, on the feventh halffoot. It is a rule, that this fyllable, though it be fhort in itfilf, mult be made long on account of the ceflura, or to make it an bepthemineres. As ia that verfe of Virgil.
Et furizs agitaths anor, et ion cia virtur.

It may be added, that the cefura is nit to be on the fifth foot, as it is in the verfe which Dr Harris gives us for an example:
Wic tavas ni cam mulli fuluts Hy cintio

This is not a hepththemimeris cxiura, but a henneamimeris, i. e. of nime half feet.
 verfes that were lung or played on feven chords. that is, on feven different notes. In this fenfe it was applied to the lyre when it had but feven things. One of the intervals is alfo called an beptachord, as containing the fame number of degrces between the extremes.

HEPTAGON, in geometry, a figure confintig of feven lidez, and ds many angks. In fortification, a place is termed an lichagon, that has feven baftions for its defence.

HEPTAGONAL sumbers, in arithontic, a fort of pulygonal numbers, wherein the difference of the terins of the comefponding arithmestisal progrefion is

## H E P

En"andris $;$. One of the properties of thefe numbers is, that if If they be muitiplied by 40 , and $y$ be added to the prottea ho duat, the fum will be a fquare number.

HEPCANDRIA, in botany (from etra fotem, and aro a man) ; the feventh clafs in Linneus's fexual method, conliting of plants with hermaphrodite Howes, which have feven damina or male organs. The orders are four, derived from the number of ityles or fomaleorgans.

HEPTANGULAR, in reometry, an appellation given to ligures which have feven angles.

IIEPTARCHY (compounded of the Greck erro, "feven," and af"e", imperium, "government"), a government compofed of fiven pertons, or a country governed by feven perfons, or divided into feven kingdoms.

The Saxon heptarchy included all England, which was eantoned out into leven petiy independent kingdoms, peopled and governed by different clans and colonits; aiz. thofe of Kent, the South Saxons, Weft Saxons, Ealt Saxons. Nothumberland, the Ealt Angles, and Mereia. The heptarchy was formed by degrees from the year 45 , when firl the kingdom of Kent was erected, and Hengit aflumed the title of king of Kent immediately after the battle of lighesford; and it terminated in 827 or 828 , when king Eghert reunited them into one, made the heptarchy into a monarcly, and affumed the title of king of England. It mult be ohferved, however, that though Egbert became monarch of England, he was not perfectly abf lute. The kiugdom which he actually poffeffed c nhifted of the ancient kingdoms of Weffex, suffex, Kent, and Elfex, that had been peopled by Saxons and Jutes. As for the other three kingdoms, whofe inhabitants were Argles, he contented limfelf with preferving the fovereignty over them, permitting them to be governed by kings who were bis valfals and tributaries.

The government of the heptarchy, reckoning from the founding of the king dom of Mereia, the latt of the fertn Anglo-Saxon kingdoms, lafted 243 years; but if the time fpent by the Saxons in their conquets from the arrival of Hengilt in 49 be added, the heptarchy will be found to lave latted $3^{-8} 8$ years from its comnencement to its diffolution. The caufes of the diffolution of the heptarchy were the great inequality anong the Seven hingdoms, three of which greatiy furpaifed the others in extent and power; the default of male heirs in the royal fanilies of all the kingdoms, that of Weffex cacepted; and the coneurrence of various circumflances which combined in the time of Egbert.

HERACLEA, an ancient city of Turky in Europe, and in Romania, with the fee of an archbifiop of the Grecian clurch, and a fea-port. It was a very famous place in former times, and there are thill fone remains of its ancient fplendor. Theodore Lafcaris took it from David Comnenus, emperor of Trebifond; when it fell into the hands of the Genocfe, but Mahomet II. took it from them : fince which time it has been in the polliffon of the 'lurks. It is near the fea. E. Long. 27 f8. N. Lat 40. 27.

HERACLEONITES, a feet of Chritians, the followers of Heracleon, who refined upon the Gnoflie divinity, and mamained that the world was not the immedate prodution of the fon of God, but that he was only the occational caufe of its being created by
the deminargus. The Heracle nites denied the autho. Hesaclet rity of the prophecies of the Old Teftament, main. Heractid taining that they were mere random founds in the air; and that St Jolin the laptilt was the only true voice that directed to the Mefliah.
ihlRACleUM, Madness: A genus of the digynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 45 th order, Unbeclata. The fruit is elliptical, emarginated, compreffed, and hriated, with a thin border. The coolia is diform, inflexed, and emarginated; the involucrum dropping off. There are live fpecies, of which the molt remarkable is the fpondylium, or cow parfnip. This is common in many parts of Britain, and other northern parts of Europe and Alia.-Gmelin, in his Flora Siltrica, p. $21+$. tells us. that the inhabitants of Kamainatka, about the beginning of July, collect the foot talks of the radical leaves of this plant, and, after peeling off the rhind, dry them feparately in the fun, and then, tying them in bandles, dry them carefully in the fhade : in a flort time afterwards, thefe dried Italks are covered over with a yellow faccharine efflorefeence, talting like liquorice: and in this llate they are eaten as a great delicacy. - The Ruflians not only eat the flaiks thus prepared, but procare from them a very intosicating ipirit. They firt ferment them in water with the grater bilbervies (vacinium uliginofum), and then ditil the liquor to what degree of itrength they pleafe; which Gmelin fays is more agreeable to the tafle than fpirits made from corn. This may therefore prove a geod fuccedaneum for whilky, and prevent the confumption of much barley, which ought to be applied to better purpoles.-.S wine and rabbits are very fond of this plant. In the county of Norfulk it is called loge serd.

HERACLIDE, the defcendants of Hercules, greatly celebrated in ancient hittory. Hercules at his death left to his fon Hyllus all the rights and demands which he had upon the Peloponnefus, and permitted him to marry Iole as foon as he came of age. The poflerity of lifercules were not more kindly treated by Eurillheus than their father had been, and they were obliged to retire for protection to the court of Ceys, king of Trachisia. Euritheus purfued them thither; and Ces $x$, afiaid of has refentenent, begged the Heraclidre to depart from his dominions. From Trachinia they came to Atheas, where Thefeus the king of the connery, who had accompamed their father in fome of his expeditions, received them with great humanity, and afiited them againlt their common enemy Euritheus. Luritheus was killed by the hand of Hyllus himfelf, and his children perifhed with him, and all the cities of the Peloponnefus became the undifputed property of the Heraclide. Their tumaph, however, was flort; their numbers were leffened by a pelfilence; and the orack informed them. that they had taken poffefion of the Peloponnefus hefore the gods permitted their return. Upon this they abandoned P'eloponnefus, and came to fettle in the territurics of the Athenians, where $\mathrm{H}_{1}$ llus, obedient to his father's commands, married Iole the dangliter of Eurytus. Soon after he confulted the oracle, ansions to recover the Peloponaefus; and the ambiguity of the anfwer determined him to make a fecond attempt. He challenged to fingle combat A. treus, the fucceffor of Euritheus on the throne of My-
aclites, cenze ; and it was mutually agreed that the unditurnec poffefion of the l'elopran fus hould be ceded to wiofoever defented his adecriay. Ec emessaccepted the challenge for Atreuc, and Lyllius was kiticed an! the Herachine a fecond time dyparted trum lehoporachus. Cleodens the fon of Hyllus urode a chird attempt, and was equally unfucceffult and his ton Aridomachu, fome time after met with the fance ut.fisturable reception, and perined in the field of bute. Aridodems, Iac: menus, and Clarefphontes, the thece fons of Aitomachus, enconraged by the more exprefive word of an oracle, and defirms so revense the death of theit progenitors, affemilicd a numerous force, and with a lle et invaded all Peloponnefus. Their expedition was athended with much fuecefs; and after fome deciive bactles, they became mafiers of atl the peninfula. 'The recovery of the Peloponnefus by the deicendants af Hercules forms an interetting epoch in ancient hiftery, which is univerfally believed to have happened So yeass after the Tro. jan war, or theyo years before the Éhrittian era. 'I his conqueft was totall achicved about J 20 years after the tift attempt of Hy llus, whe was killed about zo years before the Tinjan war. As it uccationed a world of changes and revalutions in the affars of Greece, infonuch that ficarce a llate or people but were turned upfide down thereby, the return of the Heraclide is the epocha of the begiuning of profane hitory: all the time that precoded it is bubsed fabulous. Aceordingly, Ephorus, Cunannus, Laln henes, and Theopompus, unly begin thar hitores from hence.

HERACLIDES of P vore, a Greek philofopher, the difiple of spemipy ne, and afterwards of Aratotes, flourifhed aboas $336 \mathrm{lB}, \mathrm{C}$. Hos sanity prompted him to defire one of hio frimens to put a lerpent into his bed juft as he was dead in order to raife a belief that he was afecoded to the heavens amorg the guds; but the cheat was difoovered. All his works are boll.

HERACLITUSS, a famous Ephetian philofopher, who flourifhed abont the 6y:th Olympiad, in the time of Darius Hyftafpes. He is taid to have contimally bewailed the wicked lives of men, and. as often as he came among them, to have fallen a-weeping ; conerary to Democritus, who made the follies of mankiad a fubject of laugher. He retised to the temple of Diana, and played at dice with the bos sthere; faymy to the Ephefitus who gathered foun: him, "liorit of men, what do ye womiter at? 1s it not better to do thus than to govern you?" Darus wrote to thas philefopher to come and live with him ; but he refuled the offer: at laft, out of hatred to mankind, he retired to tho mountains, where he contracted a dropfy by living on herbs, which deffroyed him at 60 years of age. His writings gained him fo great reputation, that his fullowers were ented Heraclitians. Laertius furaks of a treatife upon nature, divided into three bouks, one con-
cerning the univerfe, the fecond pulitical, the third Horaclius, theological. "lth book be cepefited in the temple of Herald. Diana: and it is Cuid, that lie allested to trote adrearely, lell it fruuld be read by the villat, and become cun. temptible. The fundamental doctran" as brie prillefo. phy wors, that tire is the punciple of at thistes; and the ancient phitulopthers tate colicomen and prefe, wed adnirable apop,hehegros of thes phill.f.aico.

HERICl.ILS, cimperor of the sal, a ycmowred wartior, died A. l). Gt'. He carried on lens and bloody wars with the Sistacens, by wh nu he was alv moll always deleated. Sex Araisa, M: 67-03.

HERALD, fays Vertegan, is drived frurn the Suxon word Hordazit, and by athreviat:on hatat, which in that larguage fugnities the champin of an army ; and, growiug to be a neme of affece, it was given 20 him who, in the amy, had the f pecial charce to denounce war, to challenge to battle and combat, to proclam peace, and to execute martial meffores. Hut the buthefs of herads with us is as follows, lie. To manhal, or 'er, and conduet all rogal caralcandes, cercmunics at curonation:, royal marriages, in Rallations, creations of cukes, maiquifes, earls, vifounts, barons, baronets, and dubbing of knights; embafties, funcral procelli-ns, declarations of war, proclamations of peace, \&e.: To record and blazon the arms of the nability and gentry; and to regulate any abufes therein through the Ererifh duminions, under :he authority of the Liarl Murfhal, to whom they are fubfervient. The alice of "'indfor, Cheter, Richmond, Somerlet, York, and lancaller heralds, is to be affilants to the bimgs at arms, in the different branclacs of their uffice ; and they are luperior to each other, according to creation, in the abose order.

Heralds wete formerly held in much greater cheem than they are at prefont; and were created and chriftewed by the king, who, pouring a gold-cup of wine on their head, gave them the herald-name: but this is row done by the earl marthal. They conld not arrive at the dignity of herald without having been feven years purfuivant ; nor cou'd they quit the office of herald, but to be made king at arms.

Richard 11[. was the lirft who formed them, in this kingdom, into a college; and afierwards great privileges were granted them by Edward VI. and Ihilip and Mary.

The origin of heralds is very ancient. Stentor is reprefented by Homer as herald of the Grecks, who had a voice louder than 50 men together. The Greeks called them xnpuxrs, and wanounaris ; and the Romans. fociules. The Romans had a college of heralds, appointed to decide whether a war were jut or unjuit; and to prevent its coming to open hoftilities, till all means had been attempted for deciding the difference in a pas cific way.

14efinition, čibin. \&ic. dry.

Arms, or coats of arms, are licreditary marks of honour, made up of lixed and deternined colours and figuref, granted by fovereign princes, as a reward for military valour, a thining virtue, or a fignal public fevice ; and which ferve to denote the defcent and allance of the barer, or to ditinguifh lates, cities, focicties, Ac. civil, ceclefatical, and military.

Thus beraldry is the feience, of which arms are the proper object ; but yet they differ much both in their origin and autiquity. Heraldry, according to Sir George Mackenzic," as digelted into an art, and fatjeeted to rules, mutt be aferibed to Charlemaign and Frederick Bartarofla, fur it did begin and grow with the fendal law." Sir John Ferue is of opinion, that we did borrow arms from the Exyptians; meaning, from their hieroglyphicks. Sir Willian Dugdalc mantions, that arms, as marks of homour, were firtt ufed by great commanders in war, neceffity requiring that their perfons hould be nocitied to their friends and f. llowers. The learned Alexander Nifhet, in his excclient fyfem of heraldry, fays, that arms owe their rife and beginning to the light of nature, and that figns and marhs of honour were made ufe of in the firit ages of the wonld, and by all nations, however fimple and illiterate, to diftinguith the noble from the ignoble. We find in Homer, Virgil, and Ovid, that their heroes had divers firures on their fhields, whereby their perfons were diftinctly known. Alexander the Great, defirous to honour thofe of his captains and foldiers who had done any glorious action, and alfo to excite an emulation among the relt, did grant them certain badges to be borne on their armour, pennons, and banners; ordcring, at the fame time, that no perfon or potentate, through his empire, fhould attempt or prefume to give or tulerate the bearing of thefe figns upon the armour of any man, but it fhould be a power referved to himfelf; which prerogative has been claimed ever fuce by all other kings and fovereign princes within their dominions.

After thefe and many other different opinions, all that can be faid with any certainty is, that, in all ages, men have made ufe of figures of living creatures, or fynbolical figns, to denote the bravery and courage either of their chief or mation, to render themfelves the more terrible to their enemies, and even to dittinguifh themfelves or families, as names do individuals. The famous C. Agrippa, in his treatife of the vanity of feiences, cap. 8. has collected many inftances of thefe marks of diftinction, anciently borne by kingdunis and! Itates that were any way civilized, viz.

| :--- |

The taf is fill borne in the arms of his prefent Britannic Majeीy. As to hereditary arms of families, William Cambden, Sir Henry Spetman, and other judicious heralds, agree, that they began no fooner than towards the latier end of the 1 th century. Acoording to Father Menctrier's opiuion, a French writer whote authority is of great weight in this matecr, Henry HOifdeur (the Falconer) who was raifed

Lio 15.

## $L \quad D \quad R \quad Y$.

to the imperial throne of the Weft in 920 , by regula. Heredit ting tournaments in Germany gave occafion to the arms, eilablithment of fanily-arms, or hereditary marks of honour, which undeniably are more ancient and better obferved among the Germans than in any other nation. Morcover, this lall author afierts, that with tournaments fiff came up coars-of-arms; which were a furt of livery, made up of feveral litts, fillets, or narrow pieces of ftull of divers colours, from whence came the fefo, the bend, the pale, \&c. which were the original charges of family-arms; for they who never had been at tournaments, had not fuch marks of dittinetion. They who inlilted themetves in the Croifades, took up alfo feveral new ligures hitherto unknown in armorial enfigns; fuch as alerions, bezants, efcalop-hells, martlets, \&c. but more particularly crof. fes, of different culours for dilitinction's fake. From this it may be concluded, that heraldry, like mot human inventions, was infenfibly introduced and cllablifhed; and that, after having been rude and unfettled for many ages, it was at laft methodifed, perfeeted, and fixed, by the Croifades and tournaments.
'Thefe marks of honnur are called arms, from their being principally and firt worn by military men at war and tournaments, who had them engraved, emboffed, or depicted on Mields, targets, banners, or other martial inflruments. They are alfo called coats-of arms, from the cultom of the ancients embroidering them on the coats they wore over their arms, as heralds do to this day.

Arms are diflinguithed by different names, to denote the caufes of their bearing ; fuch as,

| $\quad$ A |  |
| :--- | :--- | :--- |
| Of Dominion, |  |
| Of Pretenfion, | Of Patronage, |
| Of |  |
| Of Conceffion, | Of Family, |
| Of Community, | Of Alliance, |
| Of Succifion. |  |

Arms of dominion or fovereignty are thofe which emperors, kings, and fovereign thates, do conllantly bear; being, as it were, annexed to the territories, kingdoms, and provinces, they potleis. Thus the three lions are the arms of Eng'und, the fleurs.de-lis thofe of i rance, \&sc.

Arms of pretenfion are thofe of fuch kingdoms, provinces, or territories, to which a prince or lurd bas fome claim, and which he adds to his own, although the faid kingdoms or territories be poffefled by a foreign prince or other lord. Thus the kings of England have quartered the arms of lrance with their own, ever fince Edward III. laid claim to the kingdom of France, which happened in the year 1330 , on account of his being fon to Ifabulla, filter to Charles the Handfome, who died without iffue.

Arms of encefion or augmentation of honour, are either entire arms, or die one or more figures, given by princes as a reward for fome extraordinary fervice. We read in liftory, that Robert Bruce, king of Scotland, allowed the earl of Wintoun's anceflor to bear, in his coat-armone, a crown fupported by a fword, to fhow that he, and the clan Scaton, of which he was the head, fupported his tottering crown. The late Queen Anne granted to Sir Cloudelly Shovel, rearadmiral of Great Britain, a cheveron between two fleurs-de-lis in chief, and a crefeent in bale, to denote 6

three great vietories he had gained; two over the French, and one over the Turks.
Arms of community, are thofe of bifhoprics, cities, univerfities, academies, fucieties, companies, and other bodies corporate.

Arms of patronage, are fuch as governors of provinces, lords of manors, patrons of benefices, k. c . add to their family-arms, as a token of their fuperiority, rights, and jurifdiction. Thefe arms have intruduced into heraldry, caftles, gatcs, wheels, ploughs, rakes, harrows, \&c.

Arms of fanily, or faternal arns, are thofe that belong to one particular family, that dittinguifh it from others, and which no perfon is fuffered to affume with. out committing a crime, which fovereigns have a right to reftrain and punifh.

Arms of alliance, are thofe which families, or private perfons, take up and join to their own, to denote the alliances they have contracted by marriage. This fort of arms is either impaled, or borne in an efcutcheon of pretence, by thofe who have marricd heireffes.

Arms of fuceffion, are fuch as are taken up by them who inherit certain effates, manors, $\mathbb{Z} c$. either by will, entail, or donation, and which they either impale or quarter with their own arms; which multiplies the titles of fome families out of neceffity, and not through eftentation, as many imagine.

Thefe are the eight claffes under which the divers forts of arms are generally ranged; but there is a fort which blazoners call affimprive arms, being fuch as are taken up by the caprice or fancy of upftarts, though of ever fo mean extraction, who, being advanced to a degree of fortune, affume them without a legal title. This, indeed, is a great abufe of heraldry; and common only in Britain, for on the continent no fuch practice takes place.

We now proceed to confider the effential and integral parts of arms, which are thefe:

The Escutcheon, The Charges, The Tinctures, The Ornaments.

## C HAP. I.

## Of the Shield or Escutcheon.

The Shield or Efcutcheon is the field or ground whereon are reprefented the figures that make up a coat of arms: for thefe marks of diftinction were put on bucklers or thields before they were placed on banners, flandards, flags, and coat-armour ; and wherever they may be fixed, they are ftill on a plane or fuperticies whofe form refembles a mield.

Shields, in heraldry called efcutchions or fiutitheons, from the Latin word fcutunt, have been, and fill are, of different forms, according to different times and nations. Amunglt ancient fields, fome wore almoft like a horfe fhoe, fuch as is reprefented by $n^{\circ} 1$. in the figure of Efcutcheons; others triangular, fomewhat rounded at the bottom, as $n^{\circ} 2$. The people who inhabited Mefon tarria, now called Diarlich, made ufe of this fort of finicle, which it is thought they had of the Trojizns. Sumetumes the thield was heptagonal, that is, hid foren fides, as $n^{\circ} 3$. The frill of this fhape in laid to have teen wfei by the famous triunvir M. Antony. 'That of knigh's-banneret was fquate, like 2 banner, as $1^{\circ}+$. As to modern efcutcheons, thofe of

Vol.VIII. Part II.
the Italians, particularly of ecelefiaftics, are generally oval, as n. 5. The Englifh, Frencl, Germans, and other nations, have their efcutcheons formed diferent ways, according to the carver's or painter's fancy: fee the various examples contained from $n^{2} 6-16$ of the figure. But the efcutcheon of maids, widuws, and of fuch as are born ladies, and are married to private gentlemen, is of the form in a lozengs: See $n^{\circ} 17-20$. Sir George Mackenzie mentions one Mutiel, counters of Strathern, who carried her arms in a lozenge, anno 128 , which fhows how long we have been verfant ia heraldry.

Armorits diftinguih feveral parts or points in efcutcheons, in order to determine exactly the pofition of the bearings they are charged with; they are here denoted by the firft nine letters of the alphabet, ranged in the following manner:

$$
\begin{aligned}
& \text { A - the dexter chief: } \\
& \mathrm{B} \text { —the precife middle chirf. } \\
& \mathrm{C} \text { —the finiter chief. } \\
& \text { D- the hanour point. } \\
& \mathrm{E} \text { ——the fofs print. } \\
& \mathrm{F} \text { ——the nombril point. } \\
& G \text { - the dexter bafe. } \\
& \mathrm{H} \text { —the precife middle bafe. } \\
& \text { I-the finifler bafe. }
\end{aligned}
$$

The knowledge of thefe points is of great importance, and ought to be well obferved, for they are frequently occupied with feveral things of different kinds. It is neceflary to obferve, that the dexter fide of the efcutcheon is uppofite to the left hand, and the finiter fide to the right hand of the perfon that looks on it.

When natural bodies, fuch as animals, plants, celefial bodies, $\dot{\alpha} c$. are introduced into coats of arms, they frequently retain their natural colours, which is expreffed in this feienee by the word proper.

Befides the five colours above mentoned, the Englith writers on heraldry adnit two others, riz.
$\left.\begin{array}{l}\text { Orange, } \\ \text { Bloud-colour, }\end{array}\right\}$ termed $\left\{\begin{array}{l}\text { Tenny. } \\ \text { Singuine. }\end{array}\right.$

But thefe two are rarely to be found in Britifh bearings.

Thele tinctures are reprefented in engravings and 3 I
drawing <br> \section*{\section*{C H A P. II. <br> \section*{\section*{C H A P. II. <br> <br> Of Tinctures, Furs, Lines, and Dif-} <br> <br> Of Tinctures, Furs, Lines, and Dif-}

FERENCES. .

## Sect. I. Of Tinaures.

By tindures is meant, that variable hue of arms which is common both to fliclds and their bearings. According to the French heralds, there are but feven tinetures in armory; of which two are metals, the other five are colours.

|  | The Metals are, |  |
| :---: | :---: | :---: |
| Gold, Silver, | $\} \text { termed }\{$ | Or. Arsent. |
|  | The Colours are |  |

drawings (the invention of the ingenious Silvester Petra Sanka, an Kalian author of the lat century) by dots and limes, as in fir. ii. $n^{\prime \prime} 1-9$.

Ur o is expreted by dots.
dryer needs no mark, and is therefore plain.
dix 60 , by horizontal lines.
Gibe:, by perpendicular lines.
For, by diagonal limes from the dexter chis to the linker bate points.
Forever, by diagonal lines from the handler wide to the elexter hale points.
Sole, by perpendicular amd hasizotal lines erefong each other.
Trine, by diaconal lines from tile finite chide to she dexter bale points, Laverki by horizontal lines.
Sumstave by lias arming cache other diagonally from desterto finiller, and from finite to dexter.
Sir (itorge M lienzie observes, that "Some fanstaftic heralds have blazoned not 0 dy by the ordinary colours and metals, but by Rowers, days of the wreck, parts of a man's body, \&e. and have been contemned for it hey the herald of all nations. Yet the Englif lave fo tar owned this fancy." (the mot judiciuns ce f them, as $\operatorname{Mr}$ Catwight and others, reprobate it as absurd), "that they give it for a rule, that the coats of sovereigns mould be blazoned by the planets, tho me of noblemen by precious tones; and have fuited them in the manner here fer down:

| Or | Topaz | Sol. |
| :--- | :--- | :--- |
| Argent | Pearl | Luna. |
| Sable | Diamond | Saturn. |
| Guics | Ruby | Mars. |
| Azure | Sapphire | Jupiter. |
| Vert | Emerald | Venus. |
| Purpure | Amethyst | Mercury. |
| Cranny | Jacinth | Dragon's-head. |
| Sanguine | Sardonic | Drdgon's-tail. |

: Parsi I crave leave to fay, that thefe are but mere fan ins; and are likewife unfit for the art, for the de Teutons: I it, The French (from whom the English drive their heraldry, not only in principles, but in words of the French language) do not only not ufe the te different ways of blazoning, but treat them on nitiotio =all, The Italian, Spanifh, and Latin hebalds ute mo foch different forms, but blazon by the medinary metals and colours. 3 ably, Art could imitate nature; and as it would be an unnatural thing in common difcourfe not to call red red because a prince wears it, fo it is unnatural to fe the fe terms in heraldry. And it may fall out to be very ridiculous in fore arms: for intance, if a prince had for his arms an ass con. $\%$ ant under his burden gules, how ridiculous would it be to fay be had an aft couchant Mars ?-A hundred other examples might be given; but it is enough to fay, that this is to confound colours with rinarges, and the things that are borne with colours. thy, It makes the art unpleafant, and deters gentlemen from fudging it, and frangers from underfanding what our heraldry is; nor could the arms of our princes and nobility be trampled in this difguife into Latin or any other language. lint that which convines mott that this is an error is, becaufe it makes that great rule unneceflary, whereby colour cannot be

L D R Y. not hold but where metals and colours are exprefted.'

The linglifh heralds give different names to the roundlet ( $\mathrm{n}^{\circ} 10$ ), according to its colour. Thus, if it is

The French, and all other nations, do not admit fuck a multiplicity of names to this byre; but call them Desire $^{\text {af fer an ancient coin track at Conflan- }}$ tinople, once Bysontitm, if they are Or and Torteaus; if of any other tincture, expreffing the fame.
SEct. II. of Furs.

Furs teprefent the hairy kin of certain heats, pres pared for the doublings or linings of robes and garmenes of tate : and as thills were anciently covered with furred takins, they are therefore need in heraldry not only for the linings of the mantles, and other ornaments of the fhitds, but also in the coats of arms themfelves.

There are thee different kinds in general ute, viz.

1. Ermine; which is a tied argent, powdered with black foots, their tails terminating in three hairs. (Fig. ii. $n^{3}$ If.)
2. Cosuter-ermine, where the field is Cable, and the powdering white. (n'r2.)
3. Fair ( $\left.n^{2} 15.\right)$, which is expreffed by blue and white fins, cut into the forms of little bells, ranged in rows oppofite to each other, the bale of the white ones being always next to that of the blue ones. Vair is ufually of fix rows; if there be more or fewer, the number ought to be expreffed; and if the colours are different from thole above mentioned, they mutt likewife be exprefled.

The Englifh multiply the furs, as well as the names of the tinctures, though no other nation has adopted Such varieties. Thus they give us,

1. White, which is the natural colour of the ermine; but it is unfed on no other occalion but in the deferiptins of mantles.
2. Ermines, which is the fame with contra-ermine.
3. Erminois; the field is Or, the powdering Sable, ( $\mathrm{n}^{\circ} 13$.) For the wee of this fur Guillim cites Bard, p. 14. but no foch fur is to be found in Bard.
4. Pan; the field is Sable, the powdering Or, ( $n^{\circ}$ 14.) The French ufe no foch term: but they call all furs or doublings does pones, or perines; which term has polfibly given life to this mistake, and many others, in those who do not understand the French language.
5. Erminites; the lame as Ermine, with the additon of a red hair on each lide of the black. Sir Geo. McKenzie calls thee diltinctions "but fancies, for erminutes dignifies properly lithe ermines."
6. Counter.vair; when the bells of the fame tincture
nes. are placed bafe againf bale, and point againt point, ( $n=15$.
7. Potent countor-fotem, anciently called Vairy.crsasy, as when the tield is filled with crutches or potents counter-placed, ( $\mathrm{n}^{2} 17$.)

It may not be improper to obferve, that the ufe of the tinctures took its rife from the feveral colours ufed by warriors whilt they were in the army, which S. de Petra Sancta proves b; many citations. And becaufe it was the cuftom to embrnider gold and filver onf filk, or filk on cloth of gold and filver, the heralds did therefore appoint, that in imitation of the clothes fo embroidered, colour thould never be ufed upon colour, nor metal upon metal.
Sect. III. Of the Lines ufed in the parting of Fields.
Escutcheons are cither of one tincture, or more thatn one. Thofe that are of one only, that is, when fome metal, colnur, or fur, is fpread all over the furface or field, fuch a tivcture is faid to be predominant: lout in fuch as have on them more than one, as moft have, the field is divided by lines; which, according to their divers forms, receive various names.

Lines may be either flraight or erooked. Straight lines are catried evenly through the efcutchion: and are of four different kinds; miz. a perpendicular. line |; a liorizontal, - ; a diagonal dexter, $\backslash$ a diagonal ifniller, /.

Crooked lines are thofe which are carried unevenly through the feutcheon with rifing and falling. I•rench almorifts reckon is different forts of them; Guillim admits of feven only; but there are iq diflinet kinds, the figures and names of which are as in fig. i. (A), n 1 - 14 . Tiz.

1. The engrailed. 2. The invected. 3. The wavy. 4. The embattled, or crenelle. 5. The nebule. 6. The raguly. \%. The indented. 8. The dancette. 9. The dovetail. io. The grafted. וu. The embattled aronde. 12. The battled embattled. 13. The patee or dove-tail. $1+$. Champaine.

The principal reafon why lines are thus wided in heraldry, is to difference bearings which would be otherwife the fame; for an efcutcheor charged with a chief engrailed, differs from one charged with a chief warr, as much as if the one bore a cols and the other a faltier.

As the forementioned lines ferve to divide the field, it mult he obferved, that if the divifion confitls of two equal parts made by the perpendicular line, it is called faried fer fale; by the horizontal line, farfed per fofs ; by the diagonal dexter, parted per lend; by the diagonal finither, farfed fer lend finifler; examples of which will be given in the fequel of this treatife.

If a field is divided into four equal parts by any of thefe lines, it is faid to be quartired; which may be donc two ways, aiz.

Quartered or parted fer erofs; which is made by a perpendicular and horizontal line, which, crolfing each cther at the centre of the fiedd, divide it into four equal
parts called quarters. See Plate CCXXVII. under lig. i. (A).

Qulartered or parted per foltier; which is made by two diagonal lines, dexter and finifter, that crofs one another in the centre of the held, and likewife divide it into four equal parts. Ibid.

The efoutcheon is fometimes divided into a greater number of parts, in order to place in it the arms of the feveral families to which one is allied; and in this cafe it is called a geneological atchieventent. 'Thefe divifions may confitt of $6,8,12$, and 16 , quarters [as under fig. $i$. (a)], and even fometimes of $20,32,64$, and upwards; there being examples of fuch divilions frequently exhibited at pompous funcrals. An extraordinary intance of shis kind was lately exhibited at the pompous funeral of the late worthy vificountefs Townithend, whofe corpfe was brought from Dublin cattle in Ireland to Rainhamlatl in Norfolk, one of the principal tenants on horfeback carrying before the hearle a genealogical banner, containing the quaterings of his lordihip's and her ladyhip's family, to the amount of upwards of 160 coats. Sir George Borth, rector of the valuable living of Afhton wider Line, bears fix diftinct coatz of arms in his micld; eiz. thofe for Booth, Barton, Venables, Mountfort, Ahton, Egerton; and has befides a right to 37 other coats: but Sir Williant Dugdale very jufty objects to fo many arms being cluthered together in one hield or banner, on accuunt of the difficulty of difeerning and knowing afunder one coat of arms from another.

## Sect. IV. Of the Diferences of Coats of Aims.

Arborists bave invonted divers differences or characteritlical marks, whereby bearers of the fame coat of urms are ditinguithed each from nthers, and their nearnefs to the principal hearer demontrated. Ae. cording to J. Guillim, thefe differences are to be contidered cither as ancient or modern.

Art. : Of Ancient Ditferences.
Those he calls amiend diferences coutith in borchures (A); which is a bearing that gocs all round, and parallel to the boundary of the efcutchcon, in form of a hem, and always contains a lifth part of the field in breadth. Bordates were ufed in ancient times for the dillinguif.ing not ouly of one nation or tuibe from another, but alfo to note a diverfity between particular perfons de. fcended of one family and from the fame parents. This dillinetion, however, was not exprefsly fignified by invariable marks; nor were bordores always appropriated to denote the different degrees of confanguinity: For, as Sir Henry Spelman obferves in his A/pil: in, p. 140, ancient heralds, being fond of perfpicuous differences, ofen inverted the paternal tincture, or fometimes inferted another charge in the efeutelieon, fuch as bends, crollets, cantons, or the like; which incgularity has, 1 fuppofe, induced modern armotife to invent and make nie of others."
'There are bordures of different forms and tinctures, as in the examples, fig. iii.

$$
3 \mathrm{I}_{2}
$$

$$

- (A) Bordures arc Aill introduced into Englifi coats of arms, but for particular reafons, which heralds car: beft xplain. They are by the Erench frequently taken for a principal figure, and nunibered anong the tef of the ordinaries.

No 1 . is "Sable, a Boreure Argent;" borne by the
"'resent Diftemecericht hon. Suckille Tufton, earl of Thanet. - When a

म. :e
ccsivmbavs underthood fo in heraldry, though it be not exprefed; but if it has any uther form, you are to lighify it.
2. 'Gulcs, a Bordure engrailed Argent;" borne by the right hon. Charks Gray, lord Gray.-This is called engrailed, from the French word engrel?, which fignifies a thing the hail has fallon upon and booken of the edges, leaving it with lith fenicircles fluck out of it.

3 "Gules, a Bondure engraild Or:" borne by the right lion. George T'albut, carl of Shrewfory. You mull oblerves that, in a berdure or ordinary formed of thete lines, the points ate reprefented on all hdes towards the field, and the femicircles turned towards the bordure or ordinary.
4. "Argent, a Bordure inve2ted Azure."-This is guite contrary to the latt ; for as the other turns its points from the bordure into the field, fo contrarywife this does, by the inverfion of the points from the tield inio the bordure. Such a charge or any other formed of thele lines is feddom to be met with in Engliih coats of arms.
5. "Gulca, a Bordure indented Argent."-The word indented requires vely little explanation, the figvifeation being obvious to all pertons, from its tigure, which is compofed of tracks refembling teeth, called in Latin dohtes.
6. "Azure, a Bordure Ermine."
7. "Vert, a Bordure Vair."
8. "Ermine, a Bordure compony, or grobony, Or and Sable." This is fo termed from its being cons. pofed of fmall and equal pieces. J. Guillim calls this bordure gabonated, which implies the fame meaning; but the word being obfokete, is not uled by modern heralds.
9. "Quarterly, Azure and Gules, a Bordure compony Argent and Azure;" borne by his grace Hemry Bomerfet, duke of Beaufort, \&c.
10. "Azure, a Bordure counter-compony Argent and Cules."- Obferve, that the counter compony does dways confiltiof two tracks and no more.
11. "Or, a Bordure checky Argent and Sable." This has a great refemblance with the laf bordure, having only one track more; therefore you mult take aare, before you blazon, to number them, or elfe you ray eatily err in taking the one for the other.
12. "Gnles, a Bordure Argent charged with eight 'lrefoils nlipped proper, that is, Vert."-All nations Whe few terms in blazoning bordures; but Eaglifh armoritts, in urder polfibly to raife the dignity of this dicince, have perplexed it, and rendered it unintelligible to all foreigners, by introducing into it feveral myltical names, anong which may be reckoned the following oncs, viz. They call a bordure, if charged with eight dlants, fruice, howers, or leaves, verdoy of fuch vegeSables: or cnaluron of foch binds; cuurny of beats; perFlew of furs; and entoyre of inanimate things of what sind foever.
:3. "Gules on a Bordure Azure, eight Stars Or."
14. "Argent, a bordure compony of the laf and Gul's, the burts charged with Rofer of the fecond,

L D R Y.
barbed and feeded proper." - This bordure is borne by his grace Charles Lenox, duke of Richmond, \&c.
15. "Ermine, within a Bordure engrailed Gulea;" the coat of arms of the right hom. Henry-Benedict Barnewall, vifcount Kingnind, \&sc. of Ireland.-This ancient and noble family is of lirench extraction, and allied to the dukes of Little Bretanne, where the name continues alll in great repute.
16. "Argent, a Liordure Sable charged with cight Befants;" borne ly the right hon. -_Cole, lord Ranelagh, of I teland.
17. "Party per pale Argent and Gules, a Bordure charged with eight Efealops counterchanged;" the coat of arms of the right hon. William Maule, carl of Paumure, \&e. of Ireland This very ancient family is originally French, and derives its furname from the tnwn and lordhip of Maule in Normandy, where the fame arms are fill to be feen in the parifh church.
18. "Azure, a Bordure quarterly, the firlt and fourth Ermine, the fecond and third countur-compony Argent and Azure."
19. "Purpure, a Burdure compony Or and Gules, each of the laft charged with a Befant."
20. "Quarterly Or and Gules, within a Bordure Vert, charged with eight Efcalops Or."

We thall conclude this head with obferving, that a bordure is never of metal upon metal, and feldom of culour upon colour, but rather of the tincture which the principal bearing or charge is of. Thus Sir Dalziel of Glenat, whofe predeceffor was a younger brother of the noble family of Carnwath, las, within a Bordure Argent, the paternal coat of the ancient name of Dalzicl, viz. "Sable, a hanged man with his arms extended, Argent;" formerly they carried him hanging on a gallows. This bearing, though fo very fingular for a coat of arms, was given as a reward to one of the ancellors of the late Kobert Dalziel, earl of Carnwath, to perpotuate the memory of a brave and hazardous exploit performed in taking down from a gallows the body of a favourite and near relation of king Kenneth II. hung up by the licts; which flory is thas related by Alesander Nibet: "The king being exceedingly giteved that the body of his minion and kinfman hould be fo difracefully treated, lie proffered a great reward to any of his fubjeets who would ad. venture to refcue his corpfe from the difgrace his crue!. enemies had unjully put upon it: but when none would undertake this hazardous enterprife, at laft a valorous genteman came and faid to the king, Dalwiel, which dignifies, "I dare;" and he did actually perform that nuble exploit to the king's fatisfaction and his own immortal honour, and in memory of it got the alorefaid remarkable bearing; and afterwards liza polterity took the word $D_{\text {alzid }}$ for their furname, and the interpretation of it, I dare, continues even to this. day to be the motto of that noble farmily." We can, have no better proof of the truth of this tradition than this, that the heads of this ancient family have for many ages carefully retained this bearing without any* alteration or addition.

## Art. 2. Of Modern Diffrrences.

The modern differences which the Englifh have adopted not. only for the diftinguifhing of fons iffued.

## Boriotres

- (G) (3) (0) (3)

1 He AR "000000

(2)

Cimers de.

odern out of one family, but alfo to denote the difference and erence:- fubordinate degrees in each houfe from the original anceftors, are nine, viz

For the heir or firit fon, the Label. ad fon, the Crefcent. $3^{d}$ fon. the Muller. ath fon, the Martlet. $^{\text {the }}$ 5th fon, the Armulet. Gth fon, the Flower-de-luce. 7th fon, the Rofe. Sth fon, the Crofs muline. gth fon, the Duntle Quater-fuil

By thefe differences, the fix fons of Thomas Beauchamp, the 15 thearl of W"arwick, who died in the 34th year of king Edward 111. are dillinguifhed in an old window of the chureh of St Mery at Warwick; fo that although they are called modern diferences, their ufage with the Englifh is ancient.

It muft be obferved, that, of all the forementioned marks of ditlinction, none but the label is affixed on the cuats of arns belonging to any of the royal family; whicls the intreducers of this peculiarity have, however, thouglit proper to difference by additional pendants and dittinit charges on them.

As to the ditinction to be made in the arms of the offspring belonging to each of the above mentioned brothers, it is expreffed by figures on the top and la.e margin of the table contained in fig. iv. For inltance, EXVII The heir or firt fon of the fecond houfe, beareth a crefcent charged with a label during his father's life only. The fecond fon of the fecond houfe, a crefeent charged with another crefeent. The third fon of the fecond houfe, a crefeent charged with a mullet. The fourth fon of the fecond houfe, a crefeent charged with a martlet. 'The fifth fon of the fecond houfe, a crefcent charged with an annulet. The fixth fon of the fecond houfe, a crefcent charged with a flower-deluce; and fo on of the other fons, taking care to have them of a different tincture.

In what part of the efcutcheon thefe differences Mould be borne is not certaln ; for Guillim, Morgan, and others, give us many different examples of their pofition. The honour-point would be the properett place, if the arms would admit of it; but that is not always the cafe, as that part may be charged with fome figure in the paternal coat, which cannot with propriety receive the difference. There are inflanes where thefe are borne as perfect coats of arms, as theexamples fubjoined to the 'lable of Houfes fuffcientiy fhow; which are to be blazoned thus:

The firt is "Azare, a Label Argent."- When fuch a label is borne as a differonce, the pendants, according to G. Leigh, fignify that he is but the third perfon ; the dexter pendant referning to his father, the finitter to his mother, and the middle one to himfelf.

The fecond is "Argent, a Label of five points Azure;" borne by the name of Hentington. If a label has more or lefs than three pendants or points, they are to be expreffed as in the foregroing example.

The third is "Axure, a Crefcent Argent," burne by the name of Lucy. - The reafon G. Leigh affigns for the fecond fon's having a crefeent for a difference is to thow that he fhould increafe the family by adding to it riches and reputation.

The fourth is "Argent, a Mullet Sable, on a Chief Azure, a Fleur-de-lis Or;'" borne by the name of Rogers, in Gloucetterfhire. $\rightarrow$ A mullet or fpur was appointed for the third fon's difference, as the lath
mentioned author fays, to fow that he hould follow Motern chivalry,

Differulles.
The fifth is "Azure, a Fleur de lis Argent;" borne by the right hon. Henry Degby, barow Dighy of Geafhil, in King's couny, Ireland.

Thefe few examples, zmong many more that might be given, demondrate the impropiety of adopting thefe modern differences, as they are called, for marks of cadency to dittinguith the different hranches of a family: for it is impotlible to diltinguith the uncle or grand-uncle from the neplow or grand-neplsew, if each of them are fecond, thind, or fourth lows; and, in the courfe of fucceftion thefe differences would mal. tiply to fuch a number, that it would be inpolfible to delineate them dillinctly in moon cafos. But as they are given by moll of the Englith writers on heraldery, though no foreign nation uics them, it was thoughe proper to infert them here.

Sillers, except of the blood-royal have no other matk of difference in their coats of arms, but the form of the efcutcheon (as obferved before); theteforc they are permited to bear the arms of their father, even as the eldett fon dues after lisf father's deceafe. 'Ihe reafon of which is by Guillim faid to be, that when they are married, they lofe their furname, and receive that of their hufbands.

Next to thefe diminutions, G. Leigh, J. Guillim, and after them Dr Harris in his Lexicen Tectonicum, fet forth at large divers figures, which they pretend were fonmerly added to the coats of fuch as were to be punilhed and branded for cowardiee, fornication, ीander, adultery, treafon, or murder, for which they give them ilhe name of alatements of honour ; but as they produce but one intlance of fuch whimfical bearings, we have not inferted them here. Befries, ams being marks of honour, they cannot admit of any note of infamy; nor would any body now-a days bear then if they were fo branded. It is true, a man may be degraded for divers crimes, particularly liph treaton ; but in fuch cafes the efeutcheon is reverfed, trot upon, and torn in pieces, to denote a total extinction and. fuppreflion ot the honour and dignity of the perfon to whom it belunged.

> CHAP. III.
> of the Charges.

Armorists call a charge whatoever is contained in the field, whether it occupy the whole or only a part thereof. All charges are ditinguifted by the names of bonourdule ordingries, fub-ordinurits, and common charg.s.

Honourable ordinaries, the principal charges in heraldry, are made of lines only, which, according to thei-, difpolition and form, receive different names.

Sub-ordinarices are ancient heraldic figures, feequently ufed in coats of arms, and which are ditinguithed by terms appropriated to each of them.

Common charges are compoted of natural, artificial, and even chimerical things; fuch as planets, creatures, vegetable:, inttruments, Se.

## Secr. I. Of Honouralic Ordinarics.

 the bend funifer has the foap and button; the bar, the chest and barult; the cheveron, a chearonet and couple. clof. All which will be treated of in order.

## Art. I. Of the Chief.

The chief is an ordinary cictermined by an horizontal line, which, if it is of any other form but thraight, mulk be expreffed. It is placed in the upper part of the efonchion, and contaneth in depth the third part of the field. Its diminutive is a fillet, the content of which is not to exceed one fourth of the chief, and fandeth in the loweft part thereof. This ordinary is fubject to be charged with variety of figures: and may he indented, wavy, nebule, \&c. as in the examples, fig. v.
$N^{\circ}{ }_{1}$. is "Or, a Chief indented Azure;" borne by the right hon. Eimund Butier, vifeount Mountgarret, \& c . of the kingdom of Ireland. This great and illuttrious family of the Butlers, fo renownej for the many valiant and loyal perions it has produced, is defcended from the ancieat counts of Brion in Normandy; but fince king Henry II. conforred the office of clisef butcer of lecland upon one of the family, he and his fucceflors have affumed the name of Buthor.
2. "Azure a Chicf engrailed Or."
3. "Argent, a Chief invected Vert."
4. "Vert, a Chicf undy Or."
5. "Azure, a Chicf nebule Argent."
6. "Or, a Chief checky Azure and Argent."
7. "Ermine, a Chicf quarterly Or and Gutes;" borne by the mane of Pecktam.
8. "Argent, a Chicf Sable, in the lower part thereof a Fillet of the Field."
9. "Azure, fretty Argent, a Chief Or ;" borne by the right hon. Hayes St Leger, vifcount Do. neraile, sie. of the county of Cork in IIcland. This ancient and noble family is of French extraction ; and is defcended from Sir Robert Sent Leegére, knight, who, in 1066 , accompanied William duke of Normandy in his expedition into England; and the family have a tradition, that he, with his own hand, fupported the faid duke when he quitted the flip to land in Suffex.

1o. "Argent, on a Clief engrailed Azure, a Tortoife paflant Or;" borne by the name of Dielgood.
11. "Argent, on a Chief Gules, two Spur revels Or;" borne by the right bon. John St John, lord St John of Blethoe, ixe. Of this ancient family, which detive their furuame from a place called $S t$. Yoln in Normandy, was John de St John, Efq; who having a principal employment in the army of the Norman duse, attended him in his expedition into England.
12. "Argent, on a Chief Vert, two Spears Heads creet of the liekd, the points imbrued Gules;" borne
by the right hon. (Feorge Brodrick, Vifcount Middk- 1 m nou ton, \&e. of the kingdons of Ireland. This family is abte Or lincally dekended from George de Brodrick, who cane into Engtand in the reign of William 11.
13. "Or, on a Chief Sabte, three Efcalops of the Field," for the rame of Grabsan; ; and borne quartered in the arms of his Grace Willian Graham, duke, marquis, and eal of Montrofe, Sce with Argeat three Rofes Gules. According to the bcota writers, this great and noble family is defcended from the renowned Greme or Grame. who, in the year fot, was gencral of king Fergus 11 's, amay, and, in +20 , torced his way through the wall built by the Romans hetween the rivers Forth and Clycle to keep out the Scots frona molething them in their poffeffions, and the faid breach has ever fince been called Grame's aitie.
14. "Argent, on a Chief indented Gulcs, three Croffes pattee of the Field;" barne by the right hon. Jolu Purceval, earl of Egmont, \&ec. This very ancient and noble family is furpofed, from circumfances little thort of pafitive proof, to have forung from a younger branch of the fovereign dukes of bretagne in Firance, of the fame name. They were tranflanted into Normandy before the conqueft, poffelfed of great ellates and power, and iovefted with the olfice of chicf butter. Upon the Noman invafion, two of this family came over into Enzland with the Conqueror, from one of which the defeent of the prefent earl of Egmont is deduced by the cicaret and molt indifputable proofs of hittorians and records.
15. "Azure, on a Chief indented Or, three Spurrevels Gules;" borne by the right hon. Charles Moore, carl of Drogheda, \&e. of the kingdom of Seland. 'Ihis noble family, which is of French extraction, came into England foon after the conquet, and made their firlt refidence in the manor of Moore-court, in the county of Kent.
16. "Emine, on a Chief indented Azure, three ducal coronets Ur ;" borne by the name of Leyton.
17. "Azure, on a Chief (Or, thete Martleta Gites," for the name of I'ray; and burne by Sir Cecil Wray, Bart. of Lincolnflire.
18. "Emmine, on a Chief Gules; five Lozenges of the firt ;" borte by the name of Dixin.
19. "Argent, fretty Gules, on a Chief of the fecond, three Leopard's Faces $\mathrm{Or}_{\mathrm{r}}$ "' borne by the right hon. Henry Liddel, lord Ravenfworth. This noble lord is defcended from the ancient lords of Liddlecalle, in the county of Durham, where they have been proprictors of great coal- mines time out of mind.
20. "Emine, a Chief party per pale Azure and Or; on the dexter the Sun in its fple:dor. on the finiller a Crofs pattee Gules." The arms of the lifloptic of Raphoe, in the kingdom of 1reland.

Akt. II. Of the Pale.
The Pale is an ordinary, conlilling of two perpendicular lines drawn from the top to the bafe of the E. fcutcheon, and contains the third midtle part of the fiell. Its diminutives are, the pallet, which is the half of the pate; and the endorfe, which is the fourth part of a pale. This ordinary and the pallet may receive any charge, but the endorfe hould not be charged. The codurfe, befides, is never wied, according to $J$.

Leigh, but to aecompany the pale in pairs, as cotices do the bend; but Sir John Ferne is of a differne opiniun.

Ex. I. "Gulez, a Pale Or;" by the name of Grand-
2. "Party per Pale Argent and Gules, a Pale counterchanzed.
3. "Argent, a Pale between two Eudorfes Cuiks."
$i$ " Patty per Pait, ift, Paly of fix Angentand Sable. 2!. Azure;" horne by the name of Trenikard.
5. "l'aly of fix Or and Azure."
6. "Araent, thirce Pallets undy Satie ;" by the name of Dozures.
7. "Party per l'ate, Argent and Gulcs;" burne by the e ight hun. Jchm Waldegrave, cart Wallegrave, Be. This noble earl is defended from Joln de Wakegrave, who was herifl of Londun in the year 1205, in the leventh year of king John.
8. "Rariy fer Pale indented, Or and Guies:" horne by the right hon. 'Mhomas Bermingham, baron of Athenry, in the kingdom of Ireland. Of this ancient and noble family, which are of Englifh extraction, and took their name from the town of Eerming. ham in the comery of Warnick, was Wilhian de lierminglam, who was poffenied of the town of that thame in the reign of Henry II, whel contiawd ia that family till the reign of IIenry VIII.
9. "Quarterly por Pale dove tail, Gales and Or;" borne by the righe Lom. Thoma Cromkey, hod Monefort, $\mathfrak{c c}$. This woble lond is maternally defumbed from Sir Walter Bronkghe of Bronkeghe, in the connty of Staford, who liourifhed in the reign of kiag john. Sir Thomas Lronicy, another of his lo thipis amethore, was conllituted lord high elanculde of England, 21 Elizabcth; in which poit he cied, 21 E hizabeth.
10. "Argent, a Pale flory counterflory Sable."
11. "Argent, a Pale lozengy Sable;" borne by the naine of Surage.
12. "Argent, a Pale indented Vert;" Lorne Ly the name of Dixon.
13." Argent, on a Pale cugrailed Sabie, birece Crelcents Or:" borne by the name of A/By.
14. "Ermine, on a Pale engrailed azure, three Liou's Heads couped Or;" burne by the name of $i$. enty.
15. "Vert. on a Pale radiant Or, a Lion rampant Sable;" borne by the right tion. James O'Hara, lord Tyrawley, \&ce. in the kingdom of Ireland. This noble lord is defcended from Murefus king of Span, by his eldelt fon Hiberius, who, with his brother Hesemen, eflablifhed a colony in Ireland. Sir Charles O'llara, father to the prefent lord, was created batom of Tyrawley by queen Ame, Jan. 10. 1-0 J, being at that time a lieurcnant-general, and colonal of the royal regiment of fuliteers: and the nesi year was made general in Spain, where this ion, lord Jducs, was wounded at the battle of Almanza.
16. "Azure, a Pallet Argent."
17. "Vert, an Endorfe Or."
18."Argent, on two Pallets Sable, fix Crofs. crofets fitcly Or;" borne by the name of $A$..iunes, of the county of Salop.
19. "Argent, twen Endorfes Glles, i. Chisf three Mulets Sable;" borne by the dame of $V^{\prime \prime}$ uthert.

## I. $D R \quad Y$.

2c. "Azure, on a Fale walled with chree pieces on each lide Or, an Endorfe Sabic;" borte by the name of Sublet de Nojers, a family of cillitution in Fance.
of the I'end.

Art. ill. Of the Bemi and Besd-sinister.
'The Eend is an ordinary formed ly tw., diagomal lines, crawn from the dexter-chief to the fiailerobale; and contains the fifh fart of the field in becosth, if uncharged; but if charged, then the alird. Its diminatives are, the bendet, which is hee halt of a bend; the col! or cotice, when two of them ascompany a bend, Which is the fourth pare of a bend: and the rbisand, the monety of a coll, or the eighth part of the fied.d.
There is alfo the bend-finiter, which is of the fan brewth as the betu, but urawn the contrary way: this is fursivided intus ferape, which is the half of the bend, and imeo a bison, which is the fourtls part of the bend, but does not extend iteff:o the extremitis of the field, there being part of it feen at bothends. See the examples, fig. vii.

Ex. 1. "Argent, a Diend wavy Sable;" horne by Plate the right hon. Joln Wallop, earl of Purtinouth, Se. Coxxix. This notle cant is cefeended from the Wallops of IHampfhire, a sixon family, who were pofitife? of lands to a contideratle walue in the county at the time of tho conquath.
2. "Checky Or, and Azure, a Bend Ermine:" borne by the right Lon. Jolin Ward, vifcomnt Dudley and Ward, sec. The ancettors of this noble lurd were anciently of the county of Norfolk, of which was Simon Ward, who lad large pofmons ia the reiga of 1:dward. and was in Prance and Scotland in the reigns of king Edward I1. and 111 .
3. " izure, a Bend engrailed Asgent, between two Cotices Or ;" borne by the right hon. Matthew Fortefcue, lord Forteficue, as alio by the right hon. Hugh Fortefuk-Aland, baron Forectua, in the kinsdum of Ireland, this latt noblemaa bearing a crefeent in his arms for difference. 'Ilke fanily of Fortefene is defended from sir Richar: le liorte, a perforn of extraurdinary Arength and comare, who aceompanics Wiiliam duke of Normandy in his invafon of lingland; and bearino a trong thield before the duke, at the batele of 1 latlings, lasd three horfes killed under Fin, and from that dienat event the name and moto of the family were aflumbed; for the Latin word fituturn, or the whl French word the " a field" beminal. ded to forle "Atrong," compo"e their nanse; and the rivto is, Forte fictum folus durare.
4. 'Salle, a Bend Argent between two Catices imbented Or;" borne by the name of Fren:h.
5. "Paly of fix Or and Sable, a Bend enunter. changed :" borne by the right hon. Irecterick Calvert, baron Baltimore. The original of this family is from an ancicrit and moble boufe of that farname in the earl. dom of Fianders, whercof Sir Gcorge Calvert, knigh:, among other honousalie empluyments, was fecretary of flate bin king James I. by whom he was created a baron, Feb. 20.1624 , and from whom he had a grant in him, and his heirs, of the province of Maryland and Avalon in America.
6. "Party per Bend crenclle Argent and Gules:" borne by the right l:on. Edmund Boyle, earl of Cork and Orrery, Se. in the kingdom of Ireland. Tlis nothe lord is faid to be defecnded from Sir Philip 5
of he Boyle, a knight of Arragon, who, in the reign of Bend, \&ec. king Henry V1. tilted at a tournament with Sir Jo$\rightarrow$ reph Alltey, knight of the Garter.
7. "Argent, three Bendetets enhanfed Gules:" as the Englint exprefs it, but the phraie cuthaniced is ufed by no other nation. the priper blazon of this arms is, Parted per bend, ill hendy of fix gules, and argent; zd of the tall. Boric by the right hon. William Byrm, lord Byron. From Doouffay bock it appears, that this fanily was poffefed of numerous manors and lands in the reign of the Conquerur; and that Sir John Byron, one of his lordhip's ancethors, attended king Edward 111. in his wars in France.
8. "Ermine, a Bend voided Gulks;" borne by the nanie of Iriton.
9. "Algent three Bendlets wavy Azure;" burne by the name of kritiluakam. $^{2}$
10. "Bendy of fix pieces Arrent and Azure." Ob. ferre that when the fhield is ifled with an equal oumber of ben Jets of mertal and colour, it is called bendy; hut if the number of them is unequal, they are to be hlazoned by the name lenilts, and their number fpeciñed.
11. "Party per Bend Azure and Argent, two Pendlets engraild cuunterchanged;" borne by the name of Frenes.
12. "Quartenly, Or and Gules, a Bend over.all Vair:" borne by his grace Lionel Cranficld Sackville, duke of Dorfet and eatl of Middlefex, \&ic. The aucelturs of this family were lords of the town and feigniory of Sackuille in Normandy, and came over with the Conqueror when he inv3ded England in 1065.
13. "Guks on a Bend Argent, three Trefoils flipped proper;" borne be the right hon. George Wilham Hervey, earl of Briftol, \&ac. This noble lord derives his pedigree from Robert Fizz Hervey, a younger fon of Henvey duke of Orleans, who came weer from France with Willian the Conquerwr.
14. "Argent, on a bend Gules cotifed, Sable, three pairs of Wings confoined of the firt;" borne by the tighe hon. Richard Wingheld, vifount Powerscourt, in the kingdom of Ireland. This moble lord is denominated from the manor of Wingtield in Suffolk, where they had a feat before the Norman conquett, called Wing field-cafle.
15. "Gules. on a Bend contre Ermine curifed Or, three Boars' Heads couped Argent;" borne by the right hon. George Edgcumbe, lord Edgcumbe, \&c. The anceltors of this noble lord received their name from the manor of Edgcumbe in Devonhire. One of this lord's anceltors was sir Richard Edgcumbe, who came over to England with the earl of Richmond, baving a great flare in the vietury he obtained over kirg Richand III at Bufworth, hy which the earl mate hits way to the hrone of England.
15. "Aizat, a Bend thiner Gules."

1-. "Or, a Bendlet Gules."
18. . . .rgent, a Ribtand Gules."-The name of this learing correfponds well with its form, being both long and narrow, which is the fhape of a ribband.

19: " Azure, a Scrape Or." - This bearing, as Guillim ubicrves, is that kind of ornament called now-adays a forf, which is ufed by officers on duty, and ufually worn after the fame manner.

N152.
20. This contaius three Batons. The firt is compony ermine and azure ; fet over the royal arms, for The
and his grace William Fitzoroy duke of Cleveland. The fecond i, compony argent and azure; fet over the royal arime, for his grace isugutus Henry Fitzroy, duke of Grafton. 'The third is gules, charged with three rofes argent, lieded and barbed proper; fet over the royal aıms, for his grace George Beauclerk, duke of St Albans. The grandfathers of thefe noble dukes being natural fons of king Charles [1. is what intites them to the royal arms.

## $A_{r t}$. IV. Of the Fess and Bar.

The Fels is an ordinary which is produced by two parallel tines drawn horizontally acrois the centre of the field, and contains in breadth the third part thereof. Some Englih writers fay it has no diminutive, for the bar is a diftinct ordinary of itfelf.

The Bar, according to their definition, is formed of two lines, and contain; but the fifth part of the field: which is not the only thing wherein it differs from the fefs; for there may be more than one in an efcutcheon, placed in differemt parts thereof, whereas the fefs is limited to the centre-point; but in this the French differ from them. The bar has two diminutives; the barulet, which contains the half of the bar; and the clofet, which is the lalf of the barulet. When the flield contains a number of bars of metal and colour alternate, of even number, that is called barry of fo many pieces, exprefling their number. Sce the examples, Plate CCXXIX. fis. viii.

No 1. is "Argent, a Fefs indented Sable;" borne by the right hon. John Weft, earl Delawarr, \&c. This noble family is defcended from the Welts, a great family in the weft of England; but in the reign of Edward II. they appear to have been feized of manors and lands in the county of Warwick. Sir Thomas de Weft, knight, one of his lordhip's anceltors, being at the battle of Crefly, and there taking John the French king prifoner, had granted him, for tbat remarkable aztion, an augmentation to his atchievement, viz. a crampette or, ditinguihed by the chape of a fword in the middle; the chape being given him by the faid king, as an acknowledgment of his becoming his prifoner: his cognizance was a rofe parted per pale, argent, and gules; which two badges are Itill borne in the atchievement of the prefent lord Delawar.
2. "Argent, a Fefs wreathed Azure and Gules;" borne by the right hon. Juln Carmichach, earl of Hyulford. Of this ancient family, which is faid to afiume their furname from the lands of Carmichael, in the county of Lanurk, in Scotland, where they ftill have their chief fett, was Sir J.hn Carmichael, who accompanir: Act ould eart of Donglas, to the aimitance of Chancs D 1 of Viance, asainh the Englifh: and figntizing his valour at the battle of Banghey in April 1421. and breakine his fpear when the French and seo's fint the viluw, had ferempon added to his parern.l coast, a dexter arm hilding a broken forar, which is now the cre!l of the family.
3. "Party per Fifs Or and Irgent, a Fefs nebule Gules:" burne hy the name of Andefled.
4. "Party per Fefs indented Or and Azure;" borne by the name of Sounders.
5. "Checky
. $7 \% \pi$

Fefs 5. "Checky Or and Azure on a Fefs Gules, a Crefcent argent for difference;" borne by the right hon. Hugh Clifford, lord Clifford, of Chudey. This noble lord is defcended from Watter de Ciifford, of Clifford calle, in the county' of Hereford, who came over into England with the Corqueror ; of which family was fair Rofaorond, millrefs to king Henry II.
6. "Argent, on a Fefs Azure, three Lozenges Or;" borne by the right hon. Batil Ficlding, carl of Denbigh and Defmond. \&e. This noble earl is defeended from the carls of Hapfourg, in Germany. This noble family is of Norman extraction, and derives defeent from de Gaga or Gage, who attended William I. in his expedition to England; and, after the conquell thereof, was rewarded with large grants of lands in the foret of Dean, and county of Gloucefter, near which forelt he fixed his refidence, by building a feat at Clerenwell, in the fame place where the houfe of Gage now flands : he alfo built a great houfe in the town of Citencetter, at which place he died, and was buried in the abbey there. Sir Thomas Gage, the eighth baronct, was created baron of Cafle- Par, and vifcount Gage, 1721.
8. "Gules, on a Saltier Argent, a Rofe of the firit barbed and feeded proper;" borne by the right hon. George Neville, lord Abergavenny, premier baron of England.
9. "Or, on a Saltier Azure, nine Lozenges of the firt ;" the paternal arms of the !ight hon. John Dairymple, earl of Stair, \&c. Of this family, which took their furname from the barony of Dalrymple, ly-
ing on the river Dun in Aynfire, Scotland, was Atm de Dalrymple, who lived in the reiga of Alexander 111 .
10. "Argent, on a Saltier engrailed Sable, nine A nnulets Or:" borne by the name of Iecat.
11. "Gules, a Saltier between four Crefcents Or:" borne as the fecond and third quarters in the coat of arms of the right honourable Ctanles Kinnaird, lord Kinnaird. George Kinnaird, Efq; one of the prefent lord's ancellors, being of great fervice to king Charles II. during the ufirpation of Oliver Cromwell, he was by that prince, at his relloration, made one of the privy council ; and December 29. 1632, created a baron.
12. "Argent, a Salticr engrailed bespreen four Rufes Gules," for Lennos ; and borne as firll and fourth quarters in the coat-of-arms of the right hon. Francis Napie., lord Napier. This family is faid to be defeended from the ancient thanes or flewards of Let!. nox in Scotland, but took their furname of Napier from the following event. King David 11. in his wars with the Englif, about the year 13t4, convocating his fubjects to battle, the earl of Lennox fent his fecond fon Donald, with fuch forces as lisis duty ublifod him; and, coming to an engagenent, where the Scuis gave ground, this Donald, taking his father's itandarit from the bearer, and valiantly charging the enemy with the lennox men, the fortune of the batile changte, and they obtained the viftory; whereupon every ot.e advancing, and reporting their acts, as the cuftom was the king declared they had all behavel valiantly, but that there was one among them who had ma pier, that, is, no equal ; upon which the faid Donald took the name of Napier, and had, in reward for his good fervices, the lands of Gosield, and other eflates in the county of Fife.
13. "Gulcs, a Saltier Or, furmounted of another Vert," for the name of Andrews; and borne by Sir William Ardrewz, bart. of Denton in NorthamptonMire, who is defcended from Sir Robert Andrews of Normandy, knight, who came into England with Witliam the Conqueror. Sir William Andrews, the firt baronet of this Exmily, was created December 11. $16+1$.
14. "szure, a Saltier quarterly cuartered Or and Argent." The arnis of the epifcopal fee of Ba:la an W'ells.-The diocefe of Bath and Wells contains all Somerfethire, except a few charches in Brillol. And in it there are three archedeaconries, viz. thofe of Wells, Eath, ard Taunion. 'I'he number of the parimes is 388, though, according to fome, the total number of the churches and chapels amounts to 503 .
15. "Party per Salkier Argent and Gules, a Saltier counter-clianged."
16. "Party per Pale indented Argent and Sable, a Saltier counter-changed;" burne by the mane of Sate.
17. "Argent, three Saltiers coupcd and engrailcal Satle:" bornc by the namie of Benton.
18. "Argent, a Salticr Gules, and a Chief Ermine;" borne by the right hon. Francis Thomas Fitz-Maurice, earl of Kerry, \&ec. This very anciens and noble family is a branch of the family of Kildare, who are originally defcended from the great duke of Tufcany, and of which was Otho, a noble baron of Italy, whofe fon Walter, attending the Norman sonquerur
inso Rogland, was matc conRable of the caftie of Windior. Raymond, one of the prefont call's dnceftors, ha! a principal hand in the redaction of Ledard 10 the fulfection of Lomey 17. and Dermoid Mac. Carty, king of Corls, fought his aid agsint kis fon Commac Ol, thangh, which he undertook, and dentvered the hing from his rebeilious fon; for which tha: prince rewaded him with a large tract of ha:d in the county of Kerry, where he Setteu his fon Maurice, who grave his name to the county, which lee caltod Com Alanis, and is erjoyed by the pefent canl of Rerry, Who is viforant Clan Manice. Themas the firt cath, and father of the latt, was the 21 it lord Kierry, who was cicated earl January 17.1722.
19. "S:ble, a Saltier Argent: on a Chiff Azure, A.rec Flenededelis Or;" berate by the right hon. Johe: Whelenick, tarl of Upper (Hfory, and baron of Gowan in Ieland. This mot ancient and princely amily in defcended from Heromon, the firlt monarch. of the Miknan race in Ircland; and after they had anmed the furname of Fite Datuck, they were for 2r.5.y ages king of OTury, in the province of Iinker. Pohn, the fart carl of this famity, fuccected his father Ki.hard as Lord Guwran, june 0.1727 , was created can Oetoher 5. 1751, and died $1-59$.
20. "Party pos Pale Argent and Gules, three Salciers connter-changed;" borte by the name of Lene. Thefe arms are allo borne, without tie leaft alteration, ing the name of Stagiman; for which hmilude we can wo otherwifa nccomit, than by fuppoting there has been fome miftake made through many tranferiptions.

## Sect. II. Of Sut-Ordinaies.

Mesides the honourable ordinaries and the diminetions alreaty mentioned, there are other heraldic ofgures, called fuberrdinaries, or ordinaries only, which, hy reafon of the ir ancient ufe in arms, are of worthy bearing, viz. The Gyron, Fianc-quatter, Canton, Paite, Fret, Pile, Onle, Inefeutheon, Treflure, Annulct, lanches, Fafques, Voiders, Billet, Lozenge, Gints, Fuin, Rufre, Mafcle, Papillone, and Diaper. See Plate COXXVII Gig. i. (a.)

The Gyon is a triangular figure formed by tro lines, one chawn dagonally from one of the four anries to the eentre of the fhiclu, and the other is drawneither horiz ontal or perpundicular, from one of the hides of the fhield, meeting the other line at thecentre of the fadd.

Gyronny is haid, when the field is covered with fix, cieht, ten, or welve gyrons in a coat-of arms: but a Fiench auhor would lave the true gyrony to confitit of eght pieces only, as in the fig. which reprefents the coat-cifarns of Flora Campbell countefs of Lowdon, sac. whe ancelfor was created baron of Loudon in siof ty James VT. and eat of the fame place, May 12. 153 , the oth of Charies I.

The Fide-quarter is a fquare figure, which occupies the tipper dexter quarter of the thieid. It is but rarcly currit as a charge. Sileftra Petra Gancta hes given us a few inftances of its ufe.

The Canton is a fquare part of the efeuteheon, Somewhat leis than the quarter, but without any fixed propostion. It reprefonts the banner that was given 8o ancion knights-bannerts, and, gencrally fpeakine, pollefles the deater-chicf-point of tac faider, as in the
fig. ; lut flound it poffefs the finiker corner, which is but follom, it muft be blazoned a canton finilter.
James Coats reckons it as one of the nine honourabie orcinaries, cuntrary to mon heralds opinion. It is ajeded to coatsof-arms of military men as an atsmentation of honour: thus Join Chumhill, baron of Eymouth in Scotland, and one of the ancelturs of the prefent duke of Marlboroush, being lieutenant general to king James II. received from him a canton argent, clarged with the red erofo of Enolatad, added to his paterna' crat, "which is Sable, a lion rampaut Argent."

The pairle is a figure formed by the conjunction of dhe upper half of the fatier with the under half of the rale.

The Fret is a figure reprefenting two little ficks in faltier, with a matele in the centre interlaced. J. Gibben terms it the heralds triwe lovers iatef; but many diffent from his opinion.

IVrety is fait when the field or bearings are covered with a fret of hix, eight, or more picces, as in the fyg. The word foty may be ufec without addition, when it is of eight pisces: but if there be kefs than that number, they mull be fpecified.

The pile, which contifs of two lines, terminating in a point, is formed like a wedge, and is bone engrailed, waty, \&e. as in the fig. It iffues in general from thie chief, and extends towards the bale; yet there are fome piles borne in bend, and iffuing from other pats of the held, as may be feen in Plate CCXXX. fig. xii. $1^{D} 12,8 c c$.

The Otle is an ordinary compofed of two hines going round the fhield, the fame as the bordure, but its breadth is but one half of the latter, and at fome diflance from the brim of the flield, as in the fig.

The Inefcutcheon is a little efutcheon borre within the fhitd ; which, according to Guillim's opinion, is only to be fo called when it is borne fingle in the fefs-point or centre ; fee the fig, on ilate CCXXVII. but modern heralds, with more propriety, give the name of ine utcheon to fuch as are contaned in Plate CCXXX. fig. sii. $\mathrm{n}^{\circ}$ 2. and call that which is fixed on the fefs-pant efiut beon of prosuc, which is to com tain the arms of a wife diat is an heirefs, as mentimed above.

The Treflure is an erdinary commonly fuppoied to he the half of the breadth of an orte, and is genctally borne flowery and counter-fowery, as it is alin very often double, and fometimes ireble. Siee the lig. (Plate CCXXVII.). This dothle trefiure makes part of the arms of Scotland, as marfialled in the royal atchievement, Plate CCAXXiJ. fig. xy. $11^{p}-$ and was grimed to the scots kings by Charkmagne, being then empesor and king of lerace, when he entered intu) a league with Achains king of Scutland, to thow that the French hitics thould defend and guard the Scotioh lion.

The Amukt, or mg, is a woll-known figure, and is $P_{i}$ frequently to be found in arms throuftherery kingdom ceax in Europe.

The Flancher are formed be two eurved lines, or femicircles, being always borne donlie. See the figure. (i. Lecigh olferver, that on two fuch Flanches two fundry cuits may be boms.

The Flafques refemble the flanches, except that the aries circular lines do not go fo near the centre of the fiell; (fee the figure). J. Gibbon wonld have thefe two or dinaries to be both one, and wrote fank; alleging, that the two other sames are but a corruption of this laft: but as G. Leeigh a:d J. Guiltim make them two diftinct and fuburdinate crdinarict, we have inferted them tiere as fuch.

The Voiders are by Guillim confidered as a fubordinate ordinary, and are not unlike the farques (fee the figure), but they occupy lefs of the field.

The billet is an oblong fquare figure, twice as long as broad. Some heralds imigine, that they reperent bricks for building: others tnue properif condider them as reprefenting folecd paptr or letters.

The Lozonge is an ordinaty of four equal and paralled ides, but not rectangular; two of is sppolite ang!es being aciute, and the cobler two obtufe. Its thape is the fame with thofe of our window- clate's, before the fquart cane fo math ia fahion. See the figare.

Gusts, or drops, are rrund at bottom, waved on the fides, and terminate at the tep in point. Heralds inave given them diferent names atcording to their different tinctures: thias, if they are

The Fuflt is longer than the lozenge, having its upper and lower part more acute and harp than the other two collateral middle parts, which acutenefs is occafioned by the thost diflance of the face between the two collateral angles; which fpace, if the futit is rightity made, is always fhortes than any of the four equal geometrical lines whercof it is compofed. See the tig. ibid.

The Ruitre is a lozenge pierced round in the midde (fee the figure). They are called by the Germens ratten. Neneftrier gives an example of them in the arms of Lebaret in France, argent three rullres azure.

The Mafcle is pretty mushlike a logenge, but voidad or perforated through its whole extent, thowing a narrow border, as in the figure. Authors are divided about its refemblarce; fome taking it for the maflif of a net, and others firs the fpots of certain flints found about Rulran; and as no writer has given a clearer account in fupport of this lalt opinion than Colombiere, author of Las scibize Heraldigue, we fhall tranferibe it for the fatisfaction of the curious.
"Rohan (lays he) bears Gules, nine Mafeles Or, 3,3,3. Opinions tave varied very much about the original of the mafele's cr mathes, as being fome what like the mathes of nets: hut for my own part, having often obferved that thofe things which are remarkable and fingular in fome comeries, have fometimes occafioned the lords thereof to reptefent them in their efeutcheons, and to take them for their arms, I ams of opinion, that the lords of Rohan, who, I believe, are the firt that hore the fe figures in their arms, tho' defcended from the ancient kingz and princes of Bretagne, took them, becaufe in the mot ancient vifcounty of Rohan, afterwardy erested into a duchy, there are

## L D R Y.

abundance of fiall Aints, which leing cort in tixn, this figure appears on the infide of them; as alfo the carps, which are in the filh ponds of that duchy, have the fame ratk upon their fales; which, being very extrandinary and peculiar to that country, the ancieat !ords of the fame had gowd reafon, upen ublerving that wonder, to take thofe bigures for their arms, and to tranfmit then to their poterity, giving them the name of $n$ toles, from the Liatin word $m z=\frac{1}{2}$, ingnifying a foo:; whence fone of that houfe have takeo for their motio, Sine nomian maild, tiont i., A mafle withont a fpot."

Pifilone is an exprefturn ufed for a lied or charge that is čreted with figere. like the Seales of a lifh. Mont. lharon orives as an examila of it the arms of Monti Gaknac: Papelnoe d'Argent. The proper term for it in Engerim vould be fallop. wo. $\ell$.

Diaftring is faid of a tivild or charge Gadowed with fourithings or foliage with a colour a little daker than that on which it iswronght. The Germans frequently ufe it: but it docs not enter into the bazming or deferipion of an arms, it only ferves to embellifin the coat.

If the fore-mentioned ordinaries hare any attributes, that is, if they ate cugrailed, indented, wavy, Sc. they mutt be dillinetly fecified, after the fame seanner as the honourable uminaries.

Sice cxamples of fubordinaries, sic. fig. xii.

1. "Gules, an Oric Lirmine;" borne by the name Pher of Alamiramville.
2. "Argcnt, tiree Inefcritheons Guies;" borne by the name of Hay, and the $2 d$ and $3^{4} 4$ quariers in the coat-of arms of the rirfit hon. 'Ihomas Hay, earl of Kinnout, \&ec. - The firt of the name of Hay that bore thefe arms, got them, as Mr Nifect obferves, becaufe he and his two fons, after having defeated a party of the Danes at the tattle of Loncarty, amo प.42, wete brought to the king with their thichds all tained with blood.
3. "Argent, a Fret Sable ;" born by the right hon. Lionel 'Talmith, eal of Dyfart, exc. 'lhis family was advanced to the peerage by King Charles I. in 16.65.
4. "Or, fretty of Guks, a Canton Ermine:" borne by the right hun. Henry Nocl, edrh of Gaintborough, se. 'Ihis nobleman is defcended from - Noel, who came into Eugland with William the Conqueror, and, in confideration of his fervices, oheained a grant of feveral manors and lands of very gieat value. Sir Edward, who was knighted by Kiag James on lis acceffion to the throne, and created a baronet June 29. 1611 , was the firit advanced to the honour of baron Noel, Mareh 23 . 1666.
5. "Girony of cight Fieces Or and Sable ;" the If and th $^{\text {th }}$ quarters of the coat-of-arms of the right hon. John Campbell, earl of Breadalbane, Ec. 'This ancient and roble farnly is defernded, in a regular fucceftion, from Duncan the firit Lord Campbell, aniceftor of the family of Argyll. John, the rirtt earl, is contideration of his perfoual meris, was, from a bato. net, ereated lord Camphell, vifount Cienorchie, a:s carl of Brcada!bane, Jas. 28. 15-\%, by Charles II.
6. "Lozengy Argent and (iuks;" borne by the right hon. George Fitz-ivilliam, earl kitz. William, ※ic. Dhis nuble earl is defended from Sir Wralian

Fit William, marfhal of the army of William the Conqueror at the battle of Haftings in Suffex, by which victory that prince made his way to the throne.
7. "Sable, a Mafcle within a Treflure flowery Argent;" " borne by the name of Hoblethorne.
8. " Gules, three Mullets Or, within a Bordure of The latter, charged with a double Treffure flowery and counter- flowery with Fleurs-de-lis of the firft;" bome thy the noble famly of Sutherland, \&ec. This family, in the pecrage, is among the oldeft in Britain, if not in all Europe; the title of cul being conferted on one of their ancettors in 1067.
9. "Azure, a Pile Ermine," for the name of Hy:be; and is quartered as fift and fourth in the coatof arms of Sir Cyril Wyche, bart.
10. "Or, on a Pile engrailed Azure, three Crofswroflts fitchy of the firt ;" borne ty the name of Rizdon.

1I. "Or, on a Pile Gules three Lions of England between fix Fleurs-de lis Azure;" the firt and fourth quarters of his grace Edward Seymour, duke of tomerfet, Sc. granted him by King Henry ViII. on his marriage with the lady Jane Seymour.
12. "Ermine, two Piles iffuing from the dexter and finifter fides, and mecting in bafe Sable;" for the name of Holles.
13. "Argent, three piles, one iffuing from the Chief between the others reverfed, Sable:" for the name of Hulfe, and borne by Sir Elward Hulfe, bart.
14. "Azure, a Pile wavy bendways Or;" borne by the name of Allbaim. - There is no mention made of its iffuing out of the dexter-corner of the efcutcheon, for this is fufficiently determined by the term benlways.
15. "Or, thrce Piles in Bend, each point enfigned with a Fleur-de-lis Sable;" borne by the name of Norton.
16. "Argent, three Piles meeting near the point of the Bafe Azure;" borne by the name of Bryan.
17. "Party per Pale and per Bend Or and Azure counterchanged;" borne by the name of Fobnfon. This bearing is equal to two gyrons; fere p. 454 col. 1.
18. "Party per Pale and per Cheveron Argent and Gules counterchanged."'

19, "Party per Pale chappé Or and Vert counterehanged." This is a bearing feldom to be met with.
20. "Party per Fefs Gules and Argent, a Pale counterchanged;" borne by the name of Laviler.
Sfct. IIt. Of Common Charges born in Coalt-offarms.
It has been already obferwed, that in all ages men have made ufe of the reprefentation of living creatures, and other fymbolical figns, to diftinguinh themfelves in war: and that thefe marks, which were promifcuoully ufed for hieroglyphics, emblems, and perfonal devices, gave the firl notion of heraldry. but nothing fhows the extent of human wit more, than the great variety of thefe marks of diftinction, fince they are eompofed of all forts of igures, fome natural, others artificial, and many chimerical; in allufion, it is to ne fuppofed, to the ftate, quality, or inclivation of the bearer.

Hence it is, that the fun, moon, fars, comets, meteors, \&c. have been introduced to denote glory, grandur, power, \&c. Lions, leopards, tygers, ferpents, ftags, \&c. lave been employed to fignify courage, Atrength, prudence, fwiftnefs, \&c.

The application to certain excreifes, fuch as war, hunting, mufic, \&c. has furnihed lances, fwords, pikes, arms, tiddles, \&ic. Architekture, columns, cheverons, \&e.; and the other arts feveral things that relate to them.

Human bodies, or ditinct parts of them, alfo clothes, and ormaments, have, for fome particular intention, found place in armory; trees, plants, fruits, and flowers, have likewife been admitted to denote the rarities, advantages, and fingularities, of different countries.

The relation of fome creatures, figures, \&ce. to particular names, has been likewife a very fruitful fource of variety in arms. Thus the family of Coning bears three coneys; of Arundel, fix fwallows; of Urfon, a bear ; of Lucie, three pikes, in Latin tres lucios fifes; of Starkey, a tork; of Catleman, a cafte triple-towered; of Shuttleworth, three weaver's fhutthes, \&ec.

Befides thefe natural and artificial figures, there are chimerical or imaginary ones ufed in heraldry, the refult of fancy and caprice; fuch as centaurs, hydras, phenixes, griffons, dragons, \&ce. Which great varicty of figures dhows the impoffibility of comprehending all common charges in a work of this nature; therefore fuch only fhall be treated of as are moft frequently borne in coats of arms.

## Art. I. Of Natural Figures borne in coatsof arms.

Among the multitude of natural things which are ufed in coats-of arms, thofe molt ufually borne are, for the fake of brevity as wall as perfpicuity, diftributed into the following clafles, viz.

Culdfial figures; as, the fun, moon, ftars, \&c. and their parts.

Effigics of men, women, \&c. and their parts.
ileagls; as, lions, flags, foxes, boars, \&e. and their parts.

Bixils; as, eagles, fwans, florks, pelicans, \&.c. and their parts.

Fi/bes; as dolphins, whales, flurgeons, trouts, \&c. and their parts.

Repilies and infers; as, tortoifes, ferpents, grafshoppers, \&c. and their parts.
${ }_{V}$ egettables; as, trees, plants, flowers, herbs, \&c. and their parts.

Stones; as, diamonds, rubies, pebbles, rocks, \&cc.
Thefe charges have, as well as ordinaries. divers attributes or epithets, which exprefs their qualities, pofituons, and difpofitions. Thus the fun is faid to be in bis glory, cilipfed, sce. The moon, in ber complement, increfocht, sic. A nimals are faid to be rampant, paflunt, 2ec. Birds have alfo their denominations, fuch as clofe, di/played, sce. Fifhes are deferibed to be bauriant, naiant, \&c.

## I. Examples of Celeffiul Figures.

1. "Azure, a Sun in his Glory:" borne by the cc name of Si Clete; and is foand in the forth and fourth hig. quarters

quarters of tie coat-of-arms of the mont noble WilliamJohn Ker, marquis of Lothian, \&c. It is needlefs to exprefs the colour of the fun, nothing being capable to denote it but gold.
2. "Azare, one Ray of the Sun, bendways Gules, between fix Beams of that Luminary Argent;" borne by the name of Aldam. There is no mention made of their iffuing out of the dexter-corner of the efeutcheon; for this is implied in the term bendways, for the reafon mentioned before.
3. "Argent, five Rays of the Suniffuing out of the finiter-corner Gules;" borne by the name of MudtBideler, a family of diftinction in Franconia.
4. "Or, a Sun eclipfed." This bearing is feldom to be met with, except in emblematic or hieroglyphic figures; and might be expreffed Salle, becaufe that hue is accidental and not natural.
5. "Gules, the Moon in her complement Or, illuArated with all her light proper." 'This is fufficient without naming the colour, which is Argent.
6. "Azure, a Moon decrefent proper;" borne by the pame of Delaluna.
7. "Gules, a Moon increfcent Or ;" borne by the name of Defcus.
8. "Argent, a Moon in her detriment, Sable." This word is ufed in heraldry to denote her being eclipfed.
9. "Azure, a Cuefcent Argent;" borne by the name of Lucy. This bearing is alfo ufed as a diffezence, it being affigned to the fecond fon, as beforementioned.
10. "Gules, three Crefcents Argent;" borne by Oliphant, lord Oliphant (at prefent dormant). Amongft the anceftors of this nuble family was David de Oliphant, one of thofe barons who, in 1142, aecompanied King David I. into England with an army, to affit bis niece Matilda againtt King Stephen; but after raifing the fiege of Wincheter, the faid King David was fo clofely purfued, that, had it not been for the fingular conduct of this brave perfon, the king would have been taken prifoner.
11. "Azure, a Crefcent between three Mullets Argent;" borne by Arbuthnot, vifcount and baron Arbuthnot. In the year 1105 , the firt of this family marrying a daughter of the family of Oliphard, fherift of the county of Kineardin, with her he had the lands of Arbuthnot in that county, from whence he took his furname. Robert A rbuthnot was the firt of this family who, for his loyalty to King Charles I. was, Nov. 16. 1641, dignified with the title of baron and aijcount Arbulbnot.
12. "Gules, a Star iffuing from between the Horns of a Crefcent Argent."
13. "Azure, a Star of 16 points Argent;" borne by the name of IHuitfon.
14. "Argent, three Mullets pierced Sabie;" borne by the name of Wollapon.
15. "Azure, fix Mullets 3, 2, 1, Or;" borne by the name of $W$ elf.
16. "Erminc, a Mullet of fix points Gulcs, pierced;" borne by the name of Hefenbul.-When a mulIet has more than five points, their number mult, in blazouing, be always named.
17. "Argent, a Rainbow with a Clowd at each end proper."' This is part of the crefl to the eall of Vol.VMII. Part II.

Hopeton's coat-of-arms, which is inferted in fig. ix. Effigies of $n^{2} 13$. The whole of it is a glube fylit on the top, and above it is the rain-bow, \&c.
18. "Patty per Fefs crenelle Gules and Azure, three Suns proper:" borne by the name of Pierfon.
19." Gules, a Mullet between chree Crefcents Argent;" borne by the name of Dliver.
20. "Gules, a Chief Argent, on the lower part thereof a Cloud, the Sun's refolendent rays inuing throughout proper;" borne by the name of Leefon.
II. Examples of Effrgies of Alen, 太ric and their parts.

1. "Azure, the Virgin Mary crowned, with her Babe in her right arm and a feepire in her left, all Or;" the coat of arms of the biehupric of Salinoury.
2. "Azure, a Prefoyter fitting on a Tomb-fone, with a Crown on his head and Glory Or, his right hand extended, and holding in his left an open Book Argent, with a sword crofs his mouth Gules;" the coat of arms of the biflopric of Chichefter.
3. "Azure, a Bifhop habited in his pontificals, fitting on a chair of Itate, and leaning on the finiter fide thereof, holding in his left hand a Crofier, his right being extended towards the dexter chief of the efeutcheon, all Or, and relting his feet on a cuhtion, Gules, taffeled of the fecond;" the coat of arms of the biMopric of Clogher in Ireland.
4. "Azure, a Bilhop habited in his pontificals, holding before him, in a Pale, a Crucifix proper;"' the coat of arms of the billopric of Waterford in Ireland.
5. "Or, a Man's Leg couped at the midet of the thigh Azure;" borne by the name of IIvddon.
6. "Azure, three finifter Hands couped at the wrilt, and crected Argent;" borne by the ancient family of Malmains.
7. "Argent, three finifter Hands couped at the wrilt, and crected Gules;" borne by the name of May-nard.- By thefe two laft examples it appears, that different coats of arms may be eafly made from the fame figure or figures, by varying the colours only, without the addition of any other charge, counter-changings,
partings, \&cc.
8. "Argent, a Man's Leg erafed at the midd of the thigh Sable;" bcrne by the name of Prime.
9. "Gules, three Legs armed proper, conjoined in the Fcfs-point at the upper part of the thighs, flexed in triangle, garnilhed and fpurred, Or." This is the coat of arms of the Ine of Man; and is quartered by the mot noble John Murray, duke of Achol, titulat lord or king of that ifle.
10. "Gules, three dexter Arms vambraced fefsways in I'ale proper ;" borne by the name of Armplrony. This coat is very well adapted to the bearer's name, and ferves to denote a man of excellent conduct and valour.
"1. "Or, three Legs couped above the knee Sable;". borne by the name of Hofj.
11. "Yert, three dexter Arms conjoined at the foulders in the Fefs. point, and flexed in triangle Or, with fifts clenched Argent;" borne by the name of Tremain.

#### Abstract

\section*{HE R A L D R Y.}

Gerent borne by Blayncy, baron Blayncy of Monaghan, in Ire. annals. land. This noble family is defended in a direct line from Cadwallader, a younger ion of the prince of Wales; and the fort pee was Sir Edward Blayney, knight, who was created a baron by king James I. July 29. ${ }^{6} 62 \mathrm{~s}$. 6. "Argent, three Boars Heads crafed and erect Sable, languid Gules," for the name of Booth. 7. "Azure, three Boars Heads erafed Or;" quarteed by his grace Alexander Gordon duke of Gordon, \&c. Of this great and noble family, which took their Surname from the barony of Gordon in the county of Berwick, there have been, befides thole in North Britain, feveral of great diftinction in Mufcovy; and in the time of king Malcolm IV. HOo, this family was very numerous, and flourished in the county aforefaid. 8. "Argent, three Bulls Heads crated, sable, armed Or:" borne by Skeffington, earl of Maftareene, \&c. of Ireland. This ancient and noble family derives its name from the village of Skefington, in the county of Leicefter, of which place Simon Skeffington was lord in the reign of Edward I. and from him defended sir William Skeffington, knt. made fo by king Henry Til. 9. "Argent, two Foxes courter faliant, the dexter furmounted of the finitter Gules;" for the name of Kadrod-Hard, an ancient British family, from which is defended Sir

Wynn, bart. who bears this quartered, fecond and third, in his coat of arms. 10. "Argent, three Bulls paffant Sable, armed and unguled Or;" for Affley, and quartered by the right hun. Anthony-Afley Cooper, earl of Shafteđury, $\hat{\alpha} c$. This noble earl is defended from Richard Cooper, who flourihed in the reign of king Henry VIII. and purchafed the manor of laulet in the county of Sumerfit, of which the family are fill proprietors. But his anceftor who makes the greatest figure in hiflory is Sir Anthony-AhleyCooper, u ho was created baronAffley of Winbourn April 20.1661, and afterwards call of Shafteßury fibril 23.1672. 38. "Ermine, three Cats parlant in Pale Argent;" for the name of A dams. 52. "Gules, two Grehounds rampant Or, refpecting each other ;" borne by the name of Dogie. 13. "Or, an Ais's Head crafted Sable;" borne by the name of Hackrech. 14. "Gules, three Lions gamb crated Argent;" for the name of $N$ : colligate. 15. "Argent, three Lions Tails erected and erafed Gules;" borne by the name of Cork. 16. "Azure, a Buck's Head caboffed Argent;" lome by Legge, earl of Dartmouth, \&c. This noble family is defended from Signor de Lega, an lilian nobleman, who flourished in Italy in the year 1297. What time the family came into England is uncertain; but it appears they were fitted at Legge place, near Tunbridge in Kent, for many generations; and 'Thomas, one of their ancellors, vas twice lord-mayor of Loncon, vies. in 1346 and 1353 . 17. "Argent, two Squirrels frjant adoffie Gules," for the name of Sarmwell. 18. "Gules, a Goat paffant Argent;" Lone by the name of Baker. 19. "Sable, a Stag flanding at gaze Argent;" borne by the name of Jones, of Monmouthfirre.

Reptiles, going to the Holy Land with Godfrey of Buuillon, Pant, dic deftated and flew in ingle combat the great giant $\xrightarrow{\text { - }}$ Volux, a man of an extraurdinary itature and itrength, who had challenged the bravedt of the Chriltian army. The vifcount having killed him, took his armour, and among it his helmet, the crell whereot was a ferpent fwallowing an infant, worn by him to Itrike termorinto thofe who thould be fo buld as to engage him.
17. "Ermine, a Rofe Gules barbed and feeded proper;'" borne by Bufcawen vitcumt Falmouth, \&c. This noble lord is defcended from Richard Bulcawen, of the town of Bofcawen, in the county of Cornwall, who flourifhed in the reign of king Edward V1. Hugh, the finft peer of this ancient family, was created baron of Bofcawen Rofe, and vifcount Falmouth, on the $3^{\text {th }}$ of June 1720 , 6 th of George I.
18. "Azure, three Laurel-leaves flipped Or;"' borne by the name of Levefon, and quartered by the right hon. Granville-Levefon Gower, earl of Gower, \&ic.
19. "Azure, three Garbs Or;" borne by the name of Cuming. 'Thefe are theaves of wheat; but though they were barley, rye, or any other corn whatfuever, it is fufficient, in blazoning, to call them Garbs, telling the tincture they are of.
20. "Gules, three Cinquefoils Argent;" borne by Lambart, baron of Cavan, \&cc. in Ircland. Of thus ancient family, which is of French extraction, was Sir Oliver, who, in the reign of queen Elizabeth, attending the earl of Effex to Spain, was there knighted by him, and afterwards returning with that earl into Ireland, was, for his fingular fervice in the north againlt O'Neal earl of Tyrone, made camp-matter general, and prciident of Connaught; and February 17.1617, was created lord Lambart and baron of Cavan by king James I.

It mult be obferved, that crees and plants are fome. cimes faid to be tuunked, eradicated, fructuated, or raguled, according as they are reprefented in arms.
Art. 2. Of Artificial Figures borne in Coats of Arms.
After the various productions of nature, artificial figures, the objects of arts and mechanics, claim the next rank. They may be dilltibuted into the following clafies, riz.

Warlike infruments; as fwords, arrows, batteringrams, gauntlicts, helmets, fpears, pole axes, \&c.

Ornaments ufed in royal and religious ceremonies; as crowns, coronets, mitres, wreaths, croliers, Sc.
Arckitcocure; as towers, catles, arches, columns, plummets, battlements, churches, portcullifes, ※̀.
Navigation; as hips, anchors, rudders, pendants, fails, oars, matts, flags, galleys, lighters, \&c.
All thefe bearings have different epithets, ferving either to exprefo their pofition, difpolition, or make: riz. fwords are faid to be erect, pommeled, hilted, \&c.; arrows, armed, feathered, \&c.; towers, covered, embattled, \&c.; and fo on of all others, as will appear by the following examples.
the Bafe Argent, pommeled and hilted Or, a Creicent in chicf of the lecond for difference;" borne by Puwlet, duke of Bolton, \&c. This nuble duke is deicended from Hercules, lord of 'Tournon in Picardy, who came over to England with Jeffrey Plantagenet earl of Anjou, third fon of king Henry II. and among other lands had the
lordhip of Paulet in Somerfethire confersed on him. William Powlet, the firtl peer of this illuitrious and loyal famuly, was treafurer of the houfehold to king licury Vill. and by him created barun St John of Baling, in the county of Southampton, March g. 1538.
2. "Argent, three Battering rams barways in P'de, headed Azure and hooped Or, an Aunulet for difference;" borne by Bertic, earl of Abington, \&c. 'Thie firt of the family of Bertie that bure the title of earl of Abingtun was James Bertie Lurd Norris of Rycote, being created earl, November 30. 1682, by Charles II.
3. "Azare, three left-hand Gauntlets with their backs forward Or;" borne by Fane, earl of Wettmoreland, \&c. 'This noble earl is defeended from the lianes, an ancient family which refided at Badial in Kent, from which defeended Francia Fane, fon and heir of Sir Thomas Fane, knight, by Mary his wife, fole daughter and heirefs to Henry Nevil lord Abergavenay, alterwards created baronefs Defpenfer. The faid Francis was a knight of the bath; and in the reign of king James I. was created baron Burgherfh and earl of Weftmoretand Deember 2\%. 1624.
4. "Azure, three Arrows their points in bafe Or;" borue by Archer, lord Archer, \&c. This noble lord is defeended from John de Archer, who eane over from Normandy with William the Conqueror; and this family is one of the molt ancient in Warwick fhire, being fettled at Umberllade in that county ever lince the reign of Henry Il. His lordhip is the firft peer; and waa created lord Archer and baron of Umberlade by king George II. July 14. ${ }^{17+7}$.
5. "Gules, two Helinets in chief proper, garnifhed Or, in a Bate of a Garb of the third;" borue by Cholmondeley, earl of Chotmondeley, \&c. This noble earl is deliended from the ancient famly of Egerton in Chethire, which flourithed in the time of the conquett, from whom alfo the duke of Bridgewater is defeended. The lirt Engtifh peer of this branch was Hugh vifeount Cholmondeley of Kells, in Leland, who, joining with thofe who oppofed the arbitrary meafures of king James II. was on the acceffion of king William and queen Mary created lord Cholmondeley of Nampt-wich, in the county of Chetter.
6. "Argeut, a Ship with its Sails furled up Sable ;" quartered by Hamiton, earl of Abercorn, \&e. The defeent of this noble fanily is from that of the duke of Hamilton: for Janes, the fourth lord Hamilton and fecond earl of Arran, marrying lady Margaret Douglas daughter of James the third earl of Morron, by her had fonr fons, James, John, Claud, and David; whereof Claud was progenitor of the lord we are now fpeaking of; and in confideration of his merit and loyalty to Mary queen of Scots, James VI. created him lord Pailley in 1591, as alfo earl of Abercorn, baron of Hamilton, \&c. July 10. 1606.
7. "Or, an Anchor in pale Gules;" quartered by the molt noble George Jolinton, marquis of Annandale, \&c. The Johntons are an ancient and warlike fanily, and derive their furname from the barony of Johnilou in Annandale.
8. "Sable, three Spears heads erect Argent, imbrued Gules, on a chicf Or, as many Pule-axes Azure;" borne by King, lord King, \&ic. Peter King, Eiq; the firit lord of this ancient tamily, was chofen recorder of the city of London, July 27.1708 , and on the 12 th of Septembes

September following had the honour of knighthood conferred on him. He was conllituted lord-chiel-jultice of the common-pleas in the firtt year of king George I. 1714; on the 5tb of April Following was fivorn of his majefly's mott hon. privy council; and on May 19. 1723, vas created a peer of this kingdom by the title of lord King, baron of Ockliam.
9. "Gules, threc Clarions Or:" quartered by Carteret, eatl of Granville, \&e. This ancient and worthy family derives its pedigree from Offercy de Carteret, who attended William the Conqueror in his defent upon England, and contributed to the vietory he obtained over king Harold, at Haftings in Suffex, 1066, he had manors and lands in England conferred on him by that prince, as a reward for his eminent fervices. George the hirlt earl was, in confideration of his own merit and the fervices of his ancellors, created a peer of Great Britain, OEwber 19. 1681.
10. "A Argent, a Maunch Sable;" borne by Hallings, earl of Huntingdon, Se. The prefent noble earl is defcended from Hugh de Hallings, a younger fon of the ancient and noble family of the Haftings, earl of Pensbroke, of which family was William de Harkings, fteward of the houfehold to king Henry I.-William, the firlt lord Haftings, was created a baron on July G. 1+Gı, by king Edward IV.
11. "Azure, a circular Wreath Argent and Sable, with four Hawk's Bells joined thereto in quadrature Or ;" borne by Jocelyn, vifcount Jocelyn, sec. This noble family is of great antiquity; for, after the Romans had been malters of Britain 500 years, wearied with the wars, they took their final farewel of it, and carried away with them a great many of their brave old liritifh foldiers, who had ferved them in their wars both at home and abroad, to whom they gave Amorica in France, for their former fervices, which country was from them afterwards called Lithle Britain. It is fuppofed that there were fome of this family amongt them; and that they gave the name of Gocelyn to a town in this country, which aill preferves that name : and it is thought probable that they returned with William the Conqueror; for we find, in so6G, mention made of Sir Gilbert Jocelyn. This prefent nobleman, the firt lord of the family, was created baron Newport, of Newport in Ireland, on Nuvember 29.1743, and vi:count in November 1751.
12. "Cules, three Cowers Argent;" quartered by Fowler, vifcount Afhbrook, \&c. William Fuwler, Efq; was advanced to the peerage by king George II. and created baron of Caftle-Durrow, in the county of Kilkenny, Ottober 27.1733 ; and his fon was created vifcount Aihbrook, of Alhbrook ia Ircland, on Sept. zo. 1751, now extinct.
13. "Gules, two Keys in Saltier Argent, in Chief a Royal Crown proper;" the arms of the archbithopric of Yor's.
14. "Gules, two Swords in Saltier Argent, pom. meled and hilted Or;" the arms of the brhopric of London.
15. "Sable, a Key in Bend, furmounted by a Crofier in Bend finilter, both Or;" the arms of the bihopric of St Afaph.
16. "Gules, two Keys adoffice in Bend, the uppermof Argent, the cther Or, a Sword intergofed
between them in Beod-finiter of the fecond, pomme. Chimerical led and hilted of the third;" the arms of the bifhopric Figures. of Winchefter.
17. "Gules, three Mitres with their pendants Or;" the arms of the bihopric of Chefter.
18. "Sable, three Ducal Coronets paleways Or;" the arms of the bifhopric of Britol.
19. "Gules, a Sword erect in pale Argent, pommel. ed and hilted Or, furmounted by two Keys in Saltier of the lalt;" the arms of the bilhopric of Exeter.
20. "Gules, three Ducal Coronets, Or;" the arms of the bihhopric of Ely.

## Art. 1 li. Of Chimerical Figures.

The laft and the oddeft kind of bearings in coata of arms, is compretiended under the name of chimerical figures; that is to fay, fuch as have no real exillence, but are mere fabulous and fantalical inventions. Thefe charges, griffons, marthets, and unicorns excepted, are fo uncommon in Britifh cuats, that in order to makc up the fame number of examples hitherto contained in each collection, feveral foreign bearings are introduced here; which, however, as they are conform to the laws of heraldry, will alfo contribute both to entertain and inflruct the reader. Thofe molt in ufe are the following, viz.

Angels, Cherubims, Tritons, Centaurs, Martlets, Griffons, Unicorns, Dragons, Mernaids, Satyrs, Wiverns, Harpies, Cockatrices, Phenixes.

Thefe, like the foregoing charges, are futject to various pofitions and difpolitions, which, from the principles already laid down, will be plainly underthood. See the examples, fig. xix.

NO 1. is "Gules, an Angel Itanding affrontée, with his hands conjoined and elevated upon this brealt, habited in a long Robe clofe girt Argent, his Wings dif. played Or;" borne by the name of Brangor de Cerezifia, a foreign prelate, who affitted at the council of Conftance, $1+12$. This example is quoted by Guillim, Seet. I1I. Chap. i.
2. "Sable, a Cheveron between three Cherubim Or;" borne by the name of Chaloner, of Yorkmire and Chefhise.
3. "Azure, a Fefs indented between three Cherubim Argent." Thefe arms were granted to John Ayde, Eiq; of Duddington in Eent, by Sir William Segar, garter.
4. "Gules, a Cherub baving three pair of Wings, the uppermot' and lowernoll counter-crofited Saltier. ways, and the midahunolt difplajed Argent;" bornc by the name of Buocafoco, a foreign prelate. This example is cupicd from Menctrier's MLAbodid du Blafon, p. 120, N viii.
5. "Azure, a Griffon fegreant Or, armed and langued Guls, between three Crifents Argent;" quartered b) Bligh, lord Clifton, \&cc. The ancettor of this noble family, who lised in London, going over to Ireland in the time of Oliser Cromwcll, as an agent to the adventurers there, acquired a grod ctate, and haid the foundation for the grandeu: of the family.
6. "Gules, ihree Marthets Or:" burne by the name of Margill. Guillin obferves, that this bird, whech is reprefinted without feet, is given for a diference to younger brothers, to put them in mind, that, in oidet

Chumericel to raife themlelees, they are to truf to their wings of Figures. land to fet their feet on.
7. "Ayure, three Mullets Argent within a double Treffure counter-flowery $\mathrm{Or}_{\mathrm{r}}$, in the centre a Martet of the lall;" borne by Murray, lord Elibank. Sir Gideon Muray, knighted by king James Vl. by whom he was made treafurer-depute, was third fon of Sir Andrew Murray of Dlackbarony. His fon Patrick, in refpect of his logalty to Charles I. was on May iG. 1628 made a baronet, and in $16_{43}$ created lord Elibank.
8. "Sable, a Cockatrice diplayed Argent, crefted, membreed, and jowllopped Gules."
9. "Argent, a Mermaid Gules, crined Or, holding in her right hand a Comb, and in her left a Mirror, buth proper ;" borne by the name of Ellis.
10. "Argent, a Wivern, his Wings elevated, and lis Thail nowed below lim Gules;" borne by the name of Drakes.
ir. "Or, a Dragon paffant Vert."
12. "Gules, a Centaur or Sagittary in full fpeed reguandant proper." This was the coat of arms of Siephen furnamed of Blois, fon to Adela danglater of Wilham the Conqueror, and of Stephen earl of Biois; and on this defecnt grounding his pretenfion to the crown of England, he was proclaimed king in 1135 , and reigned to the 25 th of Oetober 1154 .
13. "Argent, an Unicorn fejant Sable, unguled and horned Or;" borne by the name of Harling.
14. "Argent, a Dragon's Head erated Vert, holding in his Mourh a finifter Hand couped at the Writt "sules;" borne by the name of IWilliams.
15." Gules, three Unicoms Heads couped Or;" borne by the name of Paris.
16. "Argent, a Wivern volant Bendways Sable;" borme by the name of Regrait.
17. "Apure, a Lion fejant guardant winged Or, his Head encircled with a Glory, bolding in lis forepaws an open Book, wherein is written, Pus tibi, Morce, Equatelifa nous; over the dexter fide of the Book a Sword erect, all proper." Thefe are the arms of the republic of Venice.
18. "Azure, a Bull faliant and winged Or;" horne by the name of Cadent, a fumily of dillinction of l'rovance.

19: "Argent, a Wivern with a human Face affrontéc hooded, and winged Vert;" borne by the name of Suforghti, an ancient and noble family of Luques.
20. "Azure, a Harpy difplayed, armed, crined, and crewned Or." These are the arms of the city of Normberg in Germany:

To the formentioned figures may be added the montegre, an imaginaty creature, fuppofed to lave the body of a tyger with a fatyr's bead and horns; alfo thofe which lave a real exiflence, but ate faid to he endowed with extravagant and imaginary qualities, viz. the fulamander, beaver, cameloon, ic.

> C H A P. IV.
> Of the E:TERNAI ORNANLETS of EscuTGHEONS.

The ornaments that accompany or furround efcutsheens were jutroduced to denote the binth. dignity,
or office, of the perfons to whom the coat-of-arms appertaineth; which is practifed both among the laity and clergy: 'Thofe moft in ufe are of ten forts, viz. Crowns, Coroncts, Mitres, Helmets, Mantlings, Cnapeaux, Wieaths, Crells, Scrolls, Supporters.

## Sect. I. Of Crowus.

The firlt crowns were only diadems, bands, or fillets; afterwards they were compoted of branches of divers trees, and then flowers wete added to them.

Among the Greeks, the crowns given to thofe who canied the prize at the lllhmian games, were of pine; at the Olympick, of laurel; and at the Nemean, of fmallage.

The Romans had various crowns to reward martial exploits and extraordinary fervices done to the republic; for which fee the detached article $\mathrm{C}_{\text {rown }}$ in this Dictionary, and Plate CL.

Examples of fome of thefe crowns are frequently met with in modern atchievements, viz. s. The mural crown in that of lord Montfort, which was conferred on Sir John Bromley, one of his lordfhip's ancettors, as an augmentation to his arms, for his great courage at the battle of Le Croby. Parr of the creft of lord Archer is alfo a mural crown. And there are no lefs than ten Englifh baronets, whofe arms are ornamented with the fame crown. 2. The rissial or roftral crown is ttill ufed with coats-of-arms, as may be feen in thofe of Sir William Burnaby, bait. now admiral of the red fquadron, and of John Clerke, Efc; as part of their crells. 3. Of the cafirmfe or vallary crown, we have inftances in the coat-of-arms of Sir Reginald Graham, and of Ifaac Akerman, Efq. 4. The crett of Grice Blackney, Efq; is encompalled with a civic crown. 5. The radiated crown, according to J. V'orke, was placed over the arms of the kings of England, till the time of Edwand 111. It is titl ufed as a crell on the arms of fome private families; thofe, for example, borne by the name of Whaifich, are ornamented with it. The celeftial crown is formed like the radiated, witl the addition of a ftar on each ray; and is only ufed upon tomb-ltones, monuments, and the like, Others of the ancient crowns are flill borne, as crefts, by feveral families.

But modern crowns are only ufed as an ornament, which emperors, kings, and independent princes fet on their heads, in great folemnities, both to denote their fovereign authority, and to render themfelves more awful to their fubjects. Thefe are the mont in ufe in heraldry, and are as follows:

The imperial crown ( $n^{\prime} 1$. ), is made of a circle of Pl gold, adorned with precious liones and peatls, height- CC3 ened with fleurs de-lis, bordered and feeded with pearls, fig. a raifed in the form of a cap voided at the top, like a crefeent. From the middle of this cap rifes an arched fillet enriched with pearls, and furmennicd of a mound, whereon is a crofs of pearls.

The crown of the kings of Great Dritain (2.) is a circle of gold, borderal with emmine, enriched with peats and precious Hokes, and heightened up with four crofles pattee and four large fleurs-de-lis alter. nately; fron thefe rife four arched diadems adorned with pearls, which clofe under a mound, furmounted of a crofs like thofe at botton. Mr Saudford, in his Gencalogical ifiltory, p. $\mathbf{3}^{81}$. remarks, that Ed.
ward IV. is the firt king of England that in his feal, or on his coin, is crowned with an arched diadem.

The crown of the kings in France (3.) is a circ!e enamelled, adorned with precious ftones, and heirhtened up with eight arched diadems, riling from as many fleurs-de-lis, that conjoin at the top under a double fleur-de-lis, all of grold.

The crowns of Spain, Portugal, and Puland, are all tbree of the fame form, and are, amongtt others, thus defcribed by colonel Parfons, in his Gencalogical Tables of Europe, viz. A dacal coronet, heightened up with eight archeel diadems that fupport a mound, enfigned with a plain crofs. Thofe of Denmark and Sweden are both of the fame form; and coalilt of eight arched diadems, rifing from a marquis's coronet, which conjoin at the top roder a mound enfigned with a crofsbottony.

The crowns of moft other kings are circles of gold, adorned with precious funes, and heightened up with large trefoils, and clofed by four, fix, or eight diadems, fupporting a mound, furmounted of a crofs.

The Great Turk ( + ) hears over his arms a tur--band, enriched with pearls and diamonds, under two coronets, the firlt of which is made of pyramidical points heightened up with large pearls, and the uppermoft is furmounted with crefcents.

The Pope, or hifhop of Rome, appropriates to himfelf a Tiara ( $\mathrm{n}^{\circ} 5$.), or long cap of golden eloth, finm which hang two pendans embroidered and fringed at the ends, fencie of croftes of gold. This cap is inctofed by three marquis's coronets; and has on its top a mound of gold, whereon is a crofs of the fame, which crofo is fometimes reprefented by engravers and painters pometted, recroffed, flowery, or plain.- It is a difficult matter to afectain the time when thefe haughty prelates aflumed the three forementioned coronets. A patched up fucceffion of the holy pontifis, engraved and publithed a few years ago by order of Clement XIII. the late Pope, for the edification of his good fubjects in Great L'itain and Ireland, reprefents Marcellus, who was cliofen bifhop of Rome anno 310, and all his fucceffors, adorned with fuch a cap: but it appears, from very good authority, that Bori-- face VIil. who was elected into the fee of Rome anno 1295. firf compaffed his cap with a coronet; bene. diet X1I. in 1335, added a fecond to it: and John XXIII. in 1411, a third; with a view to indicate by them, that the Pope is the forereigu prielt, the fupreme judge, and the fole leginator amongt Chriftians.

## Sect. II. Of Corcnes.

The Coronet of the prince of Wales, or eldeaf fon of the king of Great Britain ( $\mathrm{n}^{\circ} \%$ ), was anciently a circle of gold fet round with four crolfes-pattee, and as many fleurs-de-lis alternately; but fince the refloration, it has been clofed with one arch only, adorntd with pearls, and furmounted of a mound aod crefs, and bordered with ermine like the king's.

Befides the aforefaid coronet, his royal highnefs the prince of Wales has another diftinguifing mark of honour, peculiar to himfelf, called by the vulgar the prince's arnss, viz. A plume of three ofrich-featlers, with an ancient coronet of a prince of Wales. Under it, in a fcroll, is this motto, Ich Dien, which in the

German or off Saxon language fignifies "I ferve;" Coroxiets. (fee $n^{\circ}$ 6). This device was at firftaken by Ediward $\longrightarrow$. prince of Whales, commonly called the black prince, after the famous battle of Creffe, in $13+6$, where ha. ving with his own hand killed John king: of Bnhernia, he took from his head fuch a plume, and pat it on his own.
The coronet of all the immediate fons and brothers of the kings of Great Britain, is a circle of gold, bordered with ermine, heightened up with four lleurs-de-lis, and as nany crofles-patter alernate, (fee wo 8 ) -The particular and ditinguibing form of foch coroncts as are appropriated io princes of the blondroyal, is defcribed and fettled in a grart of Churies II. the 13 th of lis reign.

The corontt of the princeffes of Great Britain is a circle of gold, bordered with ermine, and heightened up with croftes-pattee, fleurs-de-lis, and Arawberry leaves akernate ( $11^{3} 9$.) ; whereas a prince's coronet has only fleurs-de lis and croties.

A duke's coronet is a circle of gold bordered with ermine, enriched with precious iloaes and pearls, and fet round with eight large itrawberry or parfley leaves; ( $1^{\circ} 10$ ).
A marquis's coronet is a cicle of gold, bordered with ermine, fet round with four Atrawbery leaves, and as many pearls on pyramidical points of equal height, alternate; ( $\mathrm{n}^{2} 11$ ).

An earl's corcnet is a circle of gold, bordered with ermine, heightened up with eight pyramidical points or rays, on the tops of which are as many large pearls, and are placed alternately with as many flrawberryleaves, but the pearls much higher than the leaves; ( $1^{\circ} 12$ ).

A vifcount's coronct differs from the preceding ones as being only a circle of gold burdered with ermine, with large pearls fet clofe together on the rim, without any limited number, which is his preregative above the baron, who is limited; (fee $\mathrm{n}^{\mathrm{O}} 13$ ).

A baron's coronet, ( $\mathrm{O}^{\mathrm{C}} \mathrm{I}+$ ), which was granted by king Charles II. is Corned with lix pearls fet as equal dillance on a gold circle, bordered with ermine, fuur of which only are fern on engravings, paintings, \&e. to thow he is inferior to the vifecunt.

The eldeft fons of peers, above the degree of a baron, bear their fathet's arms and fupporters with is label, and ufe the coronct appertaining to the ir fathen's fecond title; and all the younger fons bear their arms with proper differences, but ule no coronets.

As the crewn of the king of Great Britain is not quite like that of other pocentates, fo do moth of the curonets of foreign notlemen differ a litile foom thofe of the Britith nobility: as for example, the coronet of a French earl is a circle of gold wath is peatls fet on the brim of it; a French vifcount's coronet is a ciscle of gold only enamelled, charged with four large pearls; and a French baron's coronet is a circle of gold enamelled and bound about with a double braceLet of pearls: and thefe coronets are only ufed on Firencla noblemens coats-of-arms, and not worn on their heads, as the Britifh noblemen and their ladies do at the king's coronation.

## Sect. Ill. Of Mitrcs.

Tue archbillogs and bifhops of England and Iretand
land place a mitre over their coats-of-arms. It is a round eap pointed and eleft at the top, from which hang two pendants fringed at both ends; with this differenee, that the bifhop's mitre is only furrounded with a fillet of gold, fet with preeious lones, (ise fig. 23. $n^{\circ} 6$ ). whereas the arehbifhop's iffues out of a ducal coronet, fee fig. 20. $n^{2}$ 15).

This ormament, with other mafquerade garments, is ftill worn by all the archbihops and bihops of the church of Rome, whenever they officiate with folemnity ; but it is never ufed in England, otherwife than on coats-of-arms, as befure mentioned.

## Sect. IV. Of Helmelts.

The Helmet was formerly worn as a defenfive weapon, to cover the bearer's head; and is now placed over a coat-of-arms as its chief ornament, and the true mark of gentility. There are feveral forts, difinguithed, ift, by the matter they are made of; 2dly, by their form ; and, 3 dly, by their pofition.

Ift, As to the matter they are, or rather were, made of : The helmets of fovereigns were of burnithed gold damaked ; thofe of princes and lords, of dilver figured with gold; thofe of knights, of feel adorned with filver; and thofe of private gentlemen, of polifhed fteel.

2 dly , As to their form: Thofe of the king and the royal family, and noblenen of Great Britain, are openfaced and grated, and the number of bars ferves to diftinguin the bearers quality; that is, the helmet appropriated to the dukes and marquifes is different from the king's, by having a bar exactly in the middle, and two on each fide, making but five bars in alll, (fee fig. $21 . n^{\circ} 1$ ). whereas the king's helmet has fix bars, viz. three on each fide, (ibid. n2 7.) The other grated helmet with four bars is common to all degrees of peerage under a marquis. The open faced helmet without bars denotes baronets and knights. The clofe helmet is for all efquires and gentlemen.

3 dly , Their pofition is alfo looked upon as a mark of ditinction. The grated helmet in front belongs to fovereign princes. The grated helmet in probile is common to all degrees of peerage. The helmet fanding direct without bars, and the beaver a little open, Cenotes baronets and knights. Latly, the fideftanding helmet, with the beaver clofe, is the way of wearing it amongt efquires and gentemen. See n० $1,2,3,4$, and 7 , inferted in fig. 21. Ornanionts.

## Sect. V. Of Mantlings.

Mantlings are pieces of cloth jagged or cut inio flowers and leaves, which now-a-days ferve as an ornament for efcutcheons. They were the ancient coverings of helmets, to preferve them, or the bearer, from the injuies of the weather, as alfo to prevent the ill confequences of their too much dazzling the eye in action. But Guillim very judicioully obferves, that their flape mult have undergone a great alteration fince they have been out of ufe, and therefore might more properly be termed four-ijbings that mantlings. See the exainples annexed to the helmets reprefented in fig. 21.

The lirench heralds affure us, that thefe mantlings were originally no other than thort coverings which commanders wore over their belmets, and that, going $\mathrm{N}^{\circ} 152$.
into battles with them, they ofien, on their coming away, brought them back in a ragged manner, occalioned by the many cuts they had reccived on their heads: and therefore the more hacked they were, the more honourable they were accounted; as our colours in time of war are the more efteensed for having been mot through in many places.

Sometimes fkins of beafts, as lions, bears, \&c. were thus borne, to make the bearer look more terrible; and that gave occafion to the doubling of mantlings with furs.

## Sect. VI. Of Cbapeaux.

A Chapeau is an ancient hat, or rather cap, of dignity wom by dukes, generally farlet-coloured velvet on the outfide, lined and turned up with fur ; of late frequently to be met with above an helmet, inftead of a wreath, under gentlemens and noblemens erefts. Heretofore they ware feldom to be found, as of right appertaining to prisate families; but by the grants of Robert Cooke, Clarencieux, and other fucceeding heralds, thefe, together with dueal coronets, are now frequently to be met with in families, who yet claim not above the degree of gentlemen. See the repre. fentation of the chapeau, $n^{2} 5$. fig. 2 t .

## Sect. VII. Of Wreaths.

The Wreath is a kind of roll made of two fikains of filk of different colours twifted together, which ancient knights wore as a head-drefs when equipped for tournaments. The colours of the filk are always taken from the principal metal and colour contained in the coat-of-arms of the bearer. They are ftill accounted as one of the leffer onraments of efcutcheons, and are plaetd between the helmet and the creft; (fee fig. $21 . n^{\circ} 6$ ). In the time of Henry I. and long afte, no man, who was under the degree of a knight, had his erell fet on a wreath; but this, like other prerogatives, has been unfringed fo far, that every body now-a-days wears a wreath.

## Sect. VIII. Of Ciefls.

The Creft is the higheft part of the ornaments of a coat-of-arms. It is called $c r e f f$, from the Latin word crifla, which fignifies comb or tuft, fuch as many birds have upon their heads, as the peacock, pheafant, \&ec. in allufion to the place on which it is tixed.

Crefts were formetly great marks of honow, becaufe they were only worn by heroes of great valour, or Ly fuch as were advanced to forne fuperior military command, in order that they might be the better diftiaguifthed in an engagement, and therely rally their men if difperfed; but they are at prefent confidered as a mere ornament. The crelt is frequently a part either of the fupporters, or of the clarge borne in the efcuteheon. Thus the creft of the royal atchievement of Great Britain is a "Lion guardant crown'd," as may be feen in tig. 21. $n^{2} \%$. The creft of France is a double Vleur de-luce." Out of the many erets borrowed from fuppoters, are the following, viz. The duke of Montagu's, "A Griffon's head coup'd Or, back'd and wing'd Sable;" the malquis of Rockingham's, "A Griffon's head argent, gorg'd with -a ducal corune:;" the earl of Weitmoreland's ; "A Bull's head Argent, py'd Sable, armed Or; and lord 4

Archer's

of the Archer's, which is, "Out of a mural crown Or, a Wyvern's head Argent." There are feveral inftances of crefts that are relative to alliances, employments, or names; and which on that accomt have been changed.

## Sect. IX. Of the Scroll.

The Scroll is the ornament placed above the creft, containing a motte, or fhort fentence, alluding thereto, or to the bearings: or to the bearer'z name, as in the two following intlatices. The motto of the noble eall of Cholmondeley is, Cuffis puifirma virius; i. e. "Virtue is the fafe ot helmet "" on account of the hetmet in the coat of arms. The motto of the right hon. hord Fortefcue is, Forte fcubum falus ducunt; i. e. "A flrong thield is the fafety of the commanders;" alluding to the wame of that ancient family. Sometimes it has reference to neither, but exprefies tomething divine or heroic ; as that of the carl of Scarborough, which is, Murus areus conlientia fanm; i. e. "A good confcience is a wail of brats." Others a arexnigmatical; as that of the royal atchievement, which is Lieu et mon drois, i. e. "Cod and my right;" introduced by Redward III. in $134^{\circ}$, when he affumed the arne and citle of ling of firmue, and began to profecute his claim. Which occationed long and bloody wars, fatal. by turs, to both kingdoms: or that of
the prince of Wales, which is the prince of Wakes, which is ICb" Drea, "I ferve," the origin of which has been already mentioned. Mottos, though hereditary in the familics that firt took them up, have betn changed on fome particular occafions, and wethers appropriated in their itead, inflances of which are fomctimes met with in the hiftory of families.

## Sect. X. Of Sapparicrs.

Supporters are figures flanding on the feroll, and placed at the fide of the efeutcheon; they are fo called, becanfe they feem to fupport or hold up the fhield. The rife of fupporters is, by F. Mencll rier, traced up to ancient tournaments, wheacin the knights caufed their fhields to be carried by fervants or pages under the difguile of lions, bears, grifinns, blackamoors, \&ec. who alfo hild and guarded the efcutcheons, which the knights were obliged to expofe to public view for fome time before the lits were opened. Sir George Mackenzie, who difients from this opinion, fass, in his Treatife on the fience of beroldy, chap. $\times \times x$ i. P. 93 . "That the firt origin and ufe of them was from the cufom which cer was, and is, of leating fuch as are invelted with any great honour to the prince who confers it: thus, when any man, is created a duke. marquis, or knicht of the garter, or any other order, he is fupported by, and led to the prince betwixt, two of the guality, and fo reccives from him the fymbols of that honour a and in remembrance of tbat folemnity, his arms are thereafter fupported by any two creatlues te choofes." Supporters have formenly been taken from fuch animals or hirds as are borne in the nields, and fometimes they have been chofen as bearing fome allufion to the names of thofe whofe arms they are made to fupport. The fepiorters of the arms of Great Britain, fince king James the fitl's acceffion to the throne, are a Lion rampant guardant crozemed Or, oul the dexter folle, and an Unicorn Slogent, crountal, armed, unguled, manch and gorgsel with an im.

Vol. V11L. Part II.
tique Crown, to which a shain is affixed, all Or, on the finiter; as it appears by fig. xxi. $11^{\circ} 7$.
'Ihis lafl figure reprefonts the coat-of arms of the king of Great Britain, or the royal atchievement, as it has been marthalled fince the acceffion of king George I. in 1714, and is thazoned as follows, viz.
ARMS. Quareerly, in the furf grand quarler Gules, three Lions rampant guardant in pale Or, the imperial enfigns of England; inipated with Or, a Lion rampant, zuith in a clouble treffire fluwery and sounticr-flowery Guls, the royal arms of scotland. The feconf is Azure, thrie Flcurs de-lis Or, the arms of Fiance. The third is $A-$ zurc, a Harp Or, Aringed Argent, the enfign of 1 reland. The fourth grasid quarter is Gules, tou Lions pafont suardunt in fale Or, for Brunfwick; impalad suitb $\mathrm{O}_{\mathrm{o}}$ fomee of Hearts proper, a Lim rampant Azure, for $\mathbf{L}+\mathrm{u}-$ nenburgh; zuith grafoed in luafe Gules, a Horfe curren, Argent, for axcient Saxony; and in a Aviell furbout Gules, the Crosun of Charlemagne $\mathrm{O}_{2}$, as arch-treafurer of the empire; the zubole zuithin a Garrier, infuribed arith this mollo, Hona solt qui mal y pensf, as fo. Edereign of that noble order, given by the founder king Eduarí 11.

CREST. On a Helmet full-faced, grateld and furmounted of a Crown, a Lion guardant crownsed Or; the mantings of the lah, and tinings Ermin.
SUPPORTERS. On ihe Dexter fate a Lion ram. Gant suardel Ur, crowned as the Cref. On the SiniberFile an Unicorn Aryont, crowwned, armed, inaned, and unguled Or, gorged scith an antique Crown; a Chain a/fised thereto, regleding orir the butk, and paffing ouer the bind hers of the lid, hoth fandiner on a Soroll inferibed wuith this motho, DIEU ET Mow DRoir, from whichs if we the two Roya! Badses of his Majilly's chief Donrminurs, viz, on the Diseter ilde a Rofe party por Pale Argent and Guls, Ralked and leaved proper for Eugland; and on the SistiMer frle a Thifle proper, for Scotlans; being fo adorn. ed by king James I. upon his fucceeding to the Cromn of Eingland. Asking of Scotland, he bore two micorns, as above, for his fupportcrs; but upon the union of that kingdom with Enrland, tion, he introduced one of the above fupporters on the finitter.fide of the royal atchiercment, and which continues to this day.
$l$ is to be obferved, that bearing coats-of-arms fupported, is, according to the heraldrical rules of England, the prerogative, int, Of thofe called notiles mijores, si\%, dukes marquifes, carls, vifcounts, and barons; zd, Of all knigh:s of the garter, though they thould be moder the degree of barons; $3^{\text {d, Of }}$, $n$ nights of the Bath, who both receive on their creation a grant of fupporters. And, laftly, of fuch kniglits as the king choofes to beflow this honout upon; as in the inHance of Sir Andrew Fountain, who was knighed ly Philip carl of Pembroke, when lord lieutenant of 1 reland, Fountain being then his fecretary; and on his return to England, king Willian granted him fupporters to his arms, viz. two Griffons Gules and Or. in scotland, all the chiefs of clans or names have the prisilege of claiming fuppoters; allo the baronets. But by act of parlizment, toth September 1672 , none are allowed to ufe cither arms or fupporto ers, under a penalty and confifcation of all moveables whercon arms are put, without the lord lyon's au-
thority.

But for the better underitanding of this laft rule, we Of the Rules or Laws of Heral ory.
The feveral efcutcheons, tinctures, charges, and ornaments of coats of-armo, and their various propertics, beine now explained; it may not be improper to fubjoin fuch rules for blazoning the fame, as the ancient ulage and laws of heraldry have eltablithed amongit ns.

1. The furf and moth general rule is, to exprefs one's felf in proper terms, fo as not to omit any thing that ought to be fpecified, and at the fame time to be clear and concife withont tautology; as in Ex. xiv. p. $44^{6}$. and alfo in Ex. ix. p. +53 . wherein thefe expreflions of the Field, or of the Firft, prevent the repetition of the formentioned sincture.
2. One mutt begin with the tincture of the field, and then proced to the principal charges which poffefs the molt honourable place in the thield, fuch as Fefs, Cheveron, \&c. always maning that charge fift which lies next and immediately upon the field; as in Ex. xv. P. $+5^{1 .}$
3. After naming the tincture of the field, the honourable ordinaries, or other principal figures, you mult fpecify their attributes, and afterwards their metal or colour, as in Ex. sui. p. $45^{\%}$.
IV. When an houourable ordinary, or fome one figure, is placed upon another, whether it be a Fefs, Cheveron, Crofs, \&xc. it is always to be named after the ordinary or figure over which it is placed, with one of thete expreflions, furtout, or oricr all, as in Example xx. p. 449.
V. In the blazoning of fuch ordinaries as are plain, the bare mention of them is fufficient; but if an ordinary thould be made of any of the crooked lines mentioned above, its form muft be fpecified; that is, whether it be Engrailed, Wavy, Eic. as in Ex. i. ii. iii. \&c. p. $44^{6}$.
VI. When a principal figure poffefles the centre of the held, its pofition is not to be expreffed: or (which amounts to the fame thing) when a bearing is named, without fpecifying the point where it is placed, then it is underitood to poffefs the middle of the fhield; as in Ex. xv. p. +59.

V11. The number of the points of mullets or ftars mut be fpecified when more than five; and alfo if a mullet or any other charge be pierced, it mult be men. :ioned as fuch, to dittinguifh it from what is plain; as in Ex. xiii. and xiv. p. $457 \cdot$
VIII. When a ray of the fun, or other fingle figure, is borne in any other part of the efcutcheon than the ventre, the puint it iflues from muft be named; as in Ex. iii. p. $457 \cdot$ col. 1.

1X. 'The natural colour of trees, plants, fruits, hirds, \&cc. is no otherwife to be expreffed in blazoning but by the word proper, as in Exam. ii. vii. p. +59 : but if difoloured, that is, if they differ from Heir matural colour, it mult be particularized; as in Ex, i ii. \&e. p. $+5 \%$.
X. When three bigares are in a field, and their poition is not mentioned in the blazoning, they are always undertood to be placed two above, and one beCow ; as fig. xxii. $n^{\circ} 3$.
$X 1$. When there are many figures of the fame fpe-

have inferted examples of the different difpofitions of figures, wherein they are properly reprefented; viz.

Tewo may be ranged in Pale, in Fefs, sic. Sce fig. xxii. $n^{\circ} 1$ and 2.

Three, may be 2 and 1 , as alfo in bend, \&c. See $n^{\circ} 3$ and.+

Four, are placed 2 and 2, or cantoned, as in $\mathrm{n}^{\circ} 5$

Five, 1, 3, 1, in Crols; or 2, 1, 2, in Saltier. Sce $n^{\circ} 6$ and 7.

Six, 3, 2, 1, in Pile ; or 2, 2, 2, Paleways. See $n^{\circ} 8$ and 9.

Eight, in Orle, or on a Bordure. See n ${ }^{\circ} 10$.
Nine, 3, 3, 3, Barways ; or 3, 3, 2, 1, in Pile. See $n^{2} 11$ and 12.

Ten, 4, 3, 2, 1, in Pile; or elie 4, 2, 4, Barways. See $n^{2} 13$ and 14 .

Truelve, are placed 4,4,4, Barways. See $n^{\circ} 15$.
There are other politions called irregular; as for example, when three figures which are naturally placed 2 and 1 , are difpofed 1 and $2,8 \mathrm{c}$. It mult alfo be oblerved, that when the field is flrewed with the fame figures, this is exprefled by the word femte: but, according to a French armoritt's opinion, if the figurcs ftrewed on the field are whole ones, it mult be denoted by the words fons nombre; whereas, if part of them is cut off at the extremities of the efcutchcon, the word femée or fomi is then to be ufed.

## $\mathrm{C} H$ A P. Vl. <br> Of Marshalling Ciogts-of-arms.

By marfalling coats-of-arms, is to be underitood the art of difpoling divers of them in one efcutcheon, and of diltributing their contingent ormaments in proper places.

Various caules may occafion ams to be thus conjoined, which J. Guillim comprifes under two heads, viz. manify $f$ and olfoure.

What this learned and judicious herald means by manify coufes in the marfhalling of coats-of-arms, are fuch as betuken marriages, or a fuvereign's gift, granted either through the fpecial favour of the prince, or for fome eminent fervices. Concerning marriages it is to be oblerved.
I. When the coats-of-arms of a married couple, defcended of dillinet families, are to be put together in one efcutcheon, the field of their refpective arms is conjoined Paleways, and blazoned parted fer Pale, Baron and Fomme, two coats; firfl, \&oc. In which cafe the baron's arms ane always to be placed on the dexter-fide, and the femme's arms on the finitter-fide, as in no 10

1. The coat-of-anms of the rev. Edward Barnard, D. D. chaplain in ordinary to his majelty, provolt of Eton-college, canon of Windfor, Sc. impaled with that of S. Hagatt, his late fponfe.
2. 'The coat-ofarms of the rev. Thomas Dampier, D. D. chaplain in ordinary to his majelly, prebendary of Duham, canon of Windfor, \&c. impaled with that of F. Walker, his fpoufe.

If a widower marry again, his late and prefent wife's
thal. wife's arms are, according to G. Leigh, "to be both placed on the finilter-fide, in the efcutcheon with his own, and parted per Pale. The firft wife's coat thall fland on the Chief, and the fecond on the Bafe; or he may fet them both in Pale with his own, the firft wife's coat next to himfelf, and his fecond outermoft. If he fhould marry a third wife, then the two firlt matches fhall fland on the Chief, and the third flazll have the whole Bafe. And if he tike a fourth wife, Me mult participate one half of the Bafe with the third wife, and fo will they feem to be fo many coats quartered." But it mult be oblerved, that thele forms of impaling are meant of hereditary coats, whereby the hufband flands in expectation of having the hereditary poffeflions of his wife united to his patrimony.
II. In the arms of femmes juined to the paternal coat of the baron, the proper differences by which they were borne by the fathers of fuch women mult be inferted.
III. If a coat-of-arms that las a Bordure be impaled with another, as by marriage, then the Bo-dure mult be wholly omitted in the fide of the arms next the centre.
IV. The perfon that marries an heirefs, inllead of impaling his arms with thofe of his wife, is to bear them in an efcutcheon placed in the centre of his Thield, after the fame manner as the baronet's badge
xii. is marfhalled in $n^{2} 3$. and which, on account of its thowing forth his pretenfion to her eftate, is called an efcutcheon of pretence, and is blazoned furtout, i. e. cver-all, as in the efcutcheon bornc in the fourth quar. ter of the royal atchievement. But the children are to bear the hereditary coat-of-arms of their father and mother quarterly, which denotes a fixed inheritance, and fo tranfmit them to polterity. The firft and fourth quarters generally contain the father's arms, and the fecond and thlrd the mother's ; except the heirs fhould derive not only their ellate, but alfo their title and dig. nity, from their nother.
V. If a maiden or dowager lady of quality marry a commoner, or a nobleman inferior to her rank, their coats-of-arms may be fet afide of one another in two feparate efcutcheons, upon one mantle or drapery, and the lady's arms ornamented according to her title; fee $\mathrm{n}^{\circ} 4$ and 5 , which reprefent the coats-of-arms of Gen. C. Montagu, and lady Elizabeth Villiers vifcountefs Grandifon.
VI. Archbifhops and bifhops impale their arms differently from the forc-mentimed coats, in giving the place of honoun, that is, the dexter-fide, to thie arms of their dignity, as it is expreffed in $n^{\circ} 6$, which reprefent, the coat of arms of Dr Plillip Yonge, lord bimpp of Norwich. It may be ubferved of the above prelates, that they thus bear their amom parted per Pale, to denote their being juined to their cathedral church in a fort of firitual marriage.

Wi:h refpect th fuch armurial enfiyns as the fovereign thin's for to augment a cozt of arms with, they may be maflialled varactus wiys, as maty be lein by the arms of his grace the duhe of Rutlad. iuferted in fig. viii. $11^{\circ}$ 19. and the exampl contained in lig. ail. $n^{\circ} 11$.

To thore augmentations may be adkd, of, The baronet's mark of diftinction, or the arms of the pro-
vince of Ullter in Ireland, granted and made heredi- Marfal. tary in the male line by king James I. who erected ling. this dignity on the 22 d of May 16:1, in the 9th year of his reign, in order to propasste a plantation in the fore mentioned province. This mark is Argent, a finifer Hand couped at the Wrif, and eretaed Gules; which may be borne either in a canton, or in an efcutcheon, as will belt fuit the figures of the arms. See fig. xxiii. no 3. Which reprefents the coat of-arms of Sir Willian Lorrayne, of Kirk-harle, Northumberland, and are thus blazoned: $\mathbb{Q}^{\text {uarterly, }}$, Sable and Argens, a plain Crofs counter-quartered of the Fiell. The Crelt,-A Laurel-tree couped, two tranches Sprout. ing out proper, and fixed to the lower part thereof with a Belt Gules, calged and buckled Or. This, according to tradition in the fanily, was granted for fome worthy action in the field.

2 dly , The ancient and refpectable badge of the molt noble order of the Garter, inlituted by king Edward [II. $13+9$, in the 2 th year of his reign ; and which, ever fince its inftitution, has been looked upon as a great honour beftowed on the nobleft perfons of this nation and other cunntries. This honourable augmentation is made to furround, as with a garter, the arms of fuch knights, and is infcribed with this motto, Honi foit qui mal y penfe: See $\mathrm{n}^{2} 7$. which reprefents the coat-of-arms of his grace the duke of Montaga, earl of Cardigan, baron Brudenel of Stan-ton-Wivil, conllable and lieutenant of Windfor catte, knight of the moft noble order of the Garter, and baronet, prefident of St Luke's Hofpital, and F. R. S.

This nobleman, whofe arms ware Argent, a Cheveron Gules between three Morions proper, has, fince the deceafe of John duke of Montagu, taken the name and arms of Montagu, on account of his being marricd io lady Mary Montagu, youngett daughter and one of the co- heireffes of his grace.
Su far the caufes for marihalling divers arms in one Thield, \&c. are manifel. As to fuch as are called obfiure, that is, when cuats-of-arms are marflalled in fuch a manner, that no probable reafon can be given why they are fo conjoined, they mult be left to heralks to explain, as being the properelt peffons to unfold thefe and other mylteries of this feience.

\end{gathered}
$$

After having treated of the eflential parts of the coats.of-arms, of the various charges and ornaments ufually borne therewith, of their attributes and difpofitions and of the rules for blazoning and mathalling them, we thall maxt deicribe the feveral faneral efentcheons. wiually called batchments; whereby may be known, atier any perfon's dectafe, what rank eather he or the lield when livirg; and if it be a geutleman's hatchment, whether he was a bachelor, maried man. or widuwer, with the like diltiactions for genterewomen.

The hatchment, No 1 . reprefents fucb as arc af. Pioe fixen to the tronts of houfts, whan any of the no. © xis $\times 1 / 1$ binty and gentry dies; the ams thertin beind thuele of a powase hentleman and his wife pasted per parde; the dexiecr tiace, which to Gules, three Bas Or, for

OPtGELE checos.
the huband; having the ground without the efcutcheon black, denotes the man to be dead; and the gromed on the fiaiter-fide being white, lignifies that the wife is living, which is alfo demontrated hy the finall hatchment, $\mathrm{n}^{\circ} 2$. which is here depicted with. out mantling, helinet, and crell, for perficuity's fake only.

When a marifed gentlewoman dies firt, the hatchment is dilinguifhed by a contrary colour from the former; that is, the arms on the finiter fide have the ground withon the efenteheon black; whereas thofe on the dexter fibe, for her furviving hubband, are upon a white ground: the hatchmen of a gentewoman i-, morenver, differenced by a cherub over the arms iaAead of a crett. Sem 3 .

When a hachelor dis s , his arms may be depieted fingle or quarterd, with a ereft ouer them, but never impaled as the two firt are, and all the ground without the efutchicon is alio black. See $n^{6}+$.

When a mad dies, her arms, which are placed in a lozense, may be fingle or quarterd, as thofe of a bachlor: but, intlead of a crelt, have a cherub over them, and all the ground without the efenteheon is alio black. See ${ }^{\circ} 5$.

When a wid wer dies, his arms are reprefented impaled with thofe of his dectafed wife, having a helmet, mantling, and cretl over them, and all the ground without the efutcheon black. Seen 6 .

When a whidow dies, her arms are alfo reprefented impled with thofe of lier deceafed hufband, but incloted in a lozenge, and, inllead of a crell, a cherub is placed over them; ali the ground withont the effutcheon is alio black. See $n^{2} 7$.

If a widower or bachelor flould happen to be the laft of his family, the batchuert is depicted as in $n^{\circ} 6$. and that of a mail or widow, whofe family is extinct by her leath, is depited as in $n^{\circ} 7$. with this difference only, that a death-head is generally annexed to sach hatchment, to denote, that death has conquered all.

By the forementioned rules, which are fometimes neglected through the ignorance of illiterate people, may lee known, upon the fight of any hatchment, what brancic of the family is dead; and by the helmet or cononer, what title and degree the deceafed perfon was of.

## L D R Y.

The fame rules are obferved with refpect to the ef. cutcheons placerl on the hearfe and horfes ufed in pompous funerals, except that they are not furmonated with any crett, as in the foregoing examples of hatchments, but are always plain. It is neceflary, howeves, of crimp thofe of peers with coronets, and that of a maiden lady with a kunt of ribbandz.

In Scothon, a funcral efcutcheon not only fows forth the arons and combition of the defunct, Lut is alio a proof if tice gentiaity of his dufent; and furit perions for whem this ijecies of etentebeon can be made out. are legrally intitled to the charatter of gentleman of blow, which is the highett fpecies of gentity. The Euglith hatchment above deferibed exhibits no more then a right on a cout-of-arms which may be acquires? by purchafe, aud is only the lit: ilep towards cita. blifhing gentility in a fumily.

The tuneral cicutchoon, as exhibited in Scotland, France, and Germany, is in form of a logenge, above fix feet fquare, of thack cioth; in the centre of which is painted, in proper cohours, the complete atchicvement of ille defunct, with all its exterior ormaments and additional marks or badges of honour; and round the fides are placed the fixteen arms of the familice from which he derives his defuent, as far back as the grandather's grandfather, as the proofs of his gentility: they exhibit the armorial bearings of his father atil mother, his two grandmothers, his four greatgrandmothers, aud his eight great-giandmothers mothers; if all thefe families have acquired a legal righe to bear arms, then the gentility of the perfon whofe proof it is mult be accounted complete, but not otherwife. On the four corners are placed mortheads, and the initials of his name and titles or delignation; and the black intertices are femée or powdered with tears, as in the figure, $\mathrm{n}^{3} 8$. which is the efcutcheor of the right hon. James 5 th earl of Balcarras, chicf of the ancient furame of Lindefay.

On the morning of the interment, one of thefe is placed on the front of the houfe where the deceafed lies; and another on the church in which he is to be buried, which after the burial is fixed above the grave. The pall, too, is generally adorned with thefe proofs of gentility, and the horfes of the hearfe with the defunct's arms.

## H E R

EVerallus.
HERAILDUS (Defiderius), in French Herault, a counfellor of the parliament of Paris, has given good proofs of uncommon learning by very different works. His Alverfaria appeared in 1599; which little book, if the Saliterama may be credited, he repented the having publihed. His notes on 'Tertullian's A pology, on Minutius Feclix, and on Arnobius, have been eftemed. He alfo wrote notes on Martial's Epigrams. He difguifed himfelf under the name of David Leidhrefferus, to write a political differtation on the indeperitunce of kinge, fome time after the death of Hen. ry lV. Hs had a controverfy with Salmafus, De jure Altico ar Remano; but did not live to finifh what he had written on that fubject. What he had done,

## H E R

however, was printed in 1650 . He died in June 1649 . Guy Patin fays, that "he was looked upon as a very learned man, both in the civil law and in polite literature, and wrote with great facility on any fubject he pitched on." Daille, fpeaking of fuch Proteftant writers as condemned the executing of Charles I. king of England, quotes the Pacifique Royalen detul, by Herault. This author, fon to our Defiderius Heraldus, was a minilter in Normandy, when he was called to the fervice of the Walloon-church of London under Cha. I. and he was fo zealous a royalift, that lie was forced to fly to France, to efcape the fury of the commonwealths men. He returned to England after the Rettoration, and refumed his ancient employment in the Walloon-

church at London: fome time afier which he obiain. ed a canonry in the eathedral of Canterbury, and enjoyed it till his death.

HERB, in betany; a name by which Linnans de. noninates that portion of every vegetable which arifes from the root, and is terainated by the fructitication. It comprehends, 1. 'lhie trunk, ftalk, or Atem. 2. The leaves. 3. Thefeminnte cexternal pats called by the fame author the fultere or fupperes of plants. 4. The buis, or, ats he allo terms them, the acinterquarters of the future vequetable.

Mera-Cbrifospher. Ses Actea.
Merb-Rolert, (a fpecies (ff (Geraniua); a plant in great reputation with fome farmers on acconnt of its prevailing virtues againt llaling of blood and the blondy-fux in catte, in which cafes it is faid to be the beit among a great variety of mains commonly wied on thefe oceations.

HERBACEOUS pLAvTs, are thofe which have firceulent Rems or flalks that lie down to the ground every year. Of herbrecous plants, thofe are amnual which perifh them and rout and all every gear; biennial, which fublitt by the routs two years; peremial which are perpetuated by their routs for a feries of years, a new them being protuced every fpring.

HERBAGE, in law, fignities the pallure provided by nature for the food of cattle; alfo the liberty to feed cattle in the forelt, or in another perfon's ground.

HERBAL, lignilies a book that treats of the claffes, genera, fpecies, and virtues of plants.

Hergal is fumetimes alfo ufed for what is more ufually called bertus ficus. See Hortus.

HERBELO"' (Bartholonew d'), a French writer, eminent for his oricnial learning, was bara at Paris in 1625. He travelled feveral times into Italy, where he obtained the efteem of fome of the moll learned men of the age. Ferdinand 11. grand duke of Tufcany, gave him many marks of his favour: a library being expofed to fale at Fluseace, the duke defired him to examine the manuferipts in the oriental Janguages, to feleet the belt of them, and to mark the price; which being done, that generous prince purchafed them, and made him a prefent of them. M. Colbert being at length informed of Heblolot's merit, seealled him to Paris, and obtained a penfion for him of 1500 livres: he afterwards became fectetary and interpreter of the oriental languazes, and royal proferfor of the Syriac tongue. He died at l'aris in 1695. His principal work is intided Libuoblueque Orictule, which the firft wrote in Arabic, and afterwards tranflated into French. It is greatly efleemed. M. Herbelot's modelty was exual to his erudition; and his uncommon abilaties were accompanied with the utmont probity, piety, and charity, which he practifed thro' the whole courfe of his life.

HERBERT (Mary), countefs of Pembroke, was fifter of the famous Sir Philip Sidney, and wife of Hen. ry earl of Pembroke. She was not only a lover of the mufes, but a great eneourager of polite literature; a character not very common among ladies. Her brother dedicated his incomparable romance Arcadis to her, from which eircumfance it hath been called The Countefs of Pembroke's Sircalict. She tranllated a dranatic piece from the French, intitled Intonius, a tragedy; though it is faid the was affined by ber lord's

 ed. She died in 1621; and ari cosalter čaracter of her is to be funad in livancis Olbumens memoins of king Jumes I.

Herbert (Elwand), lord Herbert of Cherlary in Shrophire, an eminert Eng!!h writer, was lunin in 1581, and educated at Oxford; aifer which lie tra-
 James J. fert lim anibaffador to Lonis X1II. is helatis of the Protefants wheo were befeged in feveral citics of lirance; and contitued in this fation till he wat $1 c$ called, on account of a difpute betwecn hian and the conllatly de I.tanes. In 1625 he was advaneed $t$, the dignity of a baron in the kingdom of lredand, l.es the tifle of lord Heabert of Calle Mhand; and in 1 ig to dhat of lord I Ierbest of Cherbury in Siaropflaire. After the breaking ont of the civil wars, lie adhered to the pardiament; and in $164+$ obtained a permion, un aceount of his having been plundened by the kiny's forces. He wrote A Hittory of the Life and Reign of Henry VIII. which was greatly admired; a treatife De veritate; and feveral other works. He died at London in $16+3$.

- Lord Herbert (fays Mr Granger) itands in the firt rank of the public mimitters, hitorians, and plailofuphers of his age. It is hard to lidy whether his perfon, his underftanding, or his courage, was the mott extraordinary; ats the fair, the larned, and the brave, held him in equal admiration. But the fante man was wife and capricious; redrethd wrongs, and quarrelled for punctilios; lated bigotry in religion, and was himfelf a bigot to philofophy. Ile expofed himfle to, fuch dangers as other men of courage would lase carefully declined: and called in quallion the fundamentals of a religion which nome lad the hardinefs to difpute be lices himicelf."

Iferbert (Grorge), an Limglih poet and divine. was brother to the preceding. He was born in $15 y 3$.
 public orator of that univerlity, atad afterwards obtained a linecure from the king. In 1626 he waz ced. lated to the prebend of Layton Eeceledia, in the diuceis of Lincoln; aad in 1630 was inducted into the rec. tory of Bamerton, near Surum. 'The great lord Bacon had fuch an opision of his jutgment, that he won!d not fuffer his works to be jorinted before they laak pafied his examiation. Ie wrote a valame bo cio vout poens, called The Tinftere, and anmber inatided The Prigh of ale Temple. 'Lhepious divine chid atoot: the year 1635.

Herbert (William), earl of Pembroke, was born at Wilton in Wilthire, 1580 : and admited of Newcollege in Oxford in 1592 , where he continued about two years. In 1601 , he fueceeded to his father's honnours and ellate; was male K. G. in 1604 ; and gro. vernor of Portimonth lix years after. In 1626 , lic was elected chaneellor of the univerfity of Oxford: and about the fame time made Jord tleward of the king's houfhold. He died fuddenly at his houle ealled Baynard's callle, in London, Aprilic. 1630 ; according to the calculation of his nativity, fays Wood, made feveral years lofune by Mr Thomas Allen of Gloncelle:hall. Clarendun relates conceraing this calculation.

## H E R

Fierbe"t that fome confiderable perfons connected with lord II Pembroke being met at Maidenhead, one of them at
fupper drank a health to the lord fteward: upon which another faid, that he believed his lordfhip was at that time very merry; for he had now outlived the day, which it had been prognonticated upon his nativity he would not outlive; but he had outlived it now, for that was his birtheday, which had completed his age to 50 years. The next morning, however, they received the news of his death. Whether the moble hiforian really believed this and other accounts relating to altrology, apparitions, providential interpolitions, \&c. which he has inferted in his hillory, we do not prefume to fay: he delivers them, however, as if he did not actually difbelicve them. Lord Pembroke was not only a great favourer of learned and ingenious men, but was himfelf learned, and endued with a confiderable hare of poetie genius. All that are extant of his productions in this way were publithed with this title: "Poems written by William Earl of Pembroke, \&c. many of which are anfwered by way of repartec t.y Sir Benjamin Rudyard, with other Poems written by them occationally and apart, $1660,8 \mathrm{vo}$.

Herbirt (Sir Thomas), an eminent gentleman of the Pombrokic family, was born at York, where his father was an alderman. William earl of Pembroke fent him to travel at his expence in 1626 , and he fpent four years in sifiting A fia and Africa: lis expectations of preferment ending with the death of the earl, he went abroad again, and travelled over feveral tarts of Europe. In 1634 , he publithed, in folio, A Relation of fome Years Travel into Africa and the Great Afia, eipecially the Turritories of the Perfian Monarihy, and fome parts of the Oricuzal Indies and Illes adjacent. On the hreaking out of the civi war, he adhered to the parliament; and at Oldenby, on the removal of the king's fervants, by defire of the commiffioners from the parliament, he and James Harringten were retained as grooms of his bed-chamber, and attended him even to the block. At the reftoration he was created a baront by Charles II. for his faithful fervices to his father duriug his two laft years. In 1678 he wrote Threnodia Carolinn, containing an account of the two laft years of the life of Charles 1 . and he af. filled Sir Willim Dugdale in compiling the third volume of lis Mumafficen Anglicanum. He died at Y'ork in 1682, leaving leveral MSS to the public library at Oxford, and cthers to that of the cathedral at York.
herbivorous animale, thofe which feed only on vegetabies.

HERCULANEUM is the name of an ancient city of Campania in Italy, which was deftroyed by an eruption of $V$ 'fuvius in the firt year of the emperor Titus, or the $7 y^{\text {th }}$ of the Chriltian era, and fately rendercel famous on account of the curions monuments of antiquity difcovered in its ruins; an account of which has been publthed by order of the king of Naples, in a work of tix volumes folio.-The epocha of the fonndatiun of Herculaneum is unknown. Dioaytins Hulticarnaffenfis conjectures that it may be referred t.) (io ytars before the war of Troy, or about 1342 years befo. Chritt; and therefure that it laled a buat a deo yars.

The thackuts of the heap of lava and ahes by which the city was overwhelmed, has been much in-
creafed by fiery fireams vomited fince that cataftrophe; and now forms a mafs 24 feet deep of dark grey thone, which is eafily broken to pieces. By its nonadhefion to foreign bodies, marble's and bronzes are preferved in it as in a cafe made to lit them, and exact moulds of the faces and limbs of tatues are frequently found in this fubftance. The precife fituation of this fubterraneous city was not known till the year 1713 , when it was accidentally difcovered by fome labourers, who, in diggring a well, ftruck upon a ltatue on the benches of the theatre. Many others were afterwards dug out and fent to France by the prince of Elbouf. But little progrefs was made in the excavations till Charles infant of Spain afcended the Neapolitan throne; by whofe unwearied efforts and liberality a very confiderable part of Herculaneum has been explored, and fuch treafures of antiquity drawn out as form the moft curious mufeum in the world. It being too arducus a tak to attempt removing the covering, the king contented himfelf with cutting galleries to the principal buildings, and caufing the extent of one or two of them to be cleared. Of thefe the theatre is the molt contiderable. On a balluttrade which divided the orchellra from the Itage was found a row of thatues; and, on each fide of the pulpitum, the equetrian figure of a perfon of the Nonia family. They are now placed under porticos of the palace; and from the great rarity of equettrian ftatues in marble would be very valuable objects, were their workmanfhip even lefs excelient than it is: one of them in particular is a very fine piece of foulpture. Since the king of Spain lett Naples, the digging has been continued, but with lefs fprit and expenditure : indeed the collection of curiofities brought out of Herculaneum and Pompeii is already fo confiderable, that a relaxation of $z$, al and activity becomes excu\{able. They are now arranged in a wing of the palace; and confilt not only of tatues, bults, altars, infcriptions, and other ornamental appendages of opulence and luxury; but alfo comprehend an entire affortment of the domeftic, mufical, and chirurgical infruments ufed by the ancients; tripods of elegant form and exquifite execution, lamps in endlefs varicty, vales and bafons of noble dimentions, chandeliers of the mol beautiful fhapes, pateras and other appurtenances of facrifice, looking-glaffes of polifhed mutal, coloured glafs fo hard, clear, and well Hained, as to appear emeralds, fapphires, and other precious flones; a kitchen completely fitted up with copper-pans lined with filver, kettles, cifterns for lieating water, and every utentil neceflaty for culinary purpufes; fpecimens of various forts of combultibles, retaining their form thourh burnt to a cinder; corn, bread, dif, oil, wine, and flour: a lady's toiler, fully furnithed with cumbs, thinble, rings, paint, eartings, \&c. Among the flaters, which are numerous, conviffeurs allow the greatcll hasie of micrit to a Mercury and a flcepung faun: the butts fill feveral rooms; but very few of the originals whon they were meant to imidate are konwh. The foors are paved with ancient Mufate. Few rare medals have been fond in thefe ruins; the moll cuious is a gold medallion of Auruthas thruck in Sicily in the 15 th year of his reign. The thico paintings, which, for the fake of pefervation, have been torn of the walls and framed and glazed, are to be feen in another past of the palace.

## H E R

" The elegance of the attitudes, and the infinite va. riety of the fubjects (Mr Swinburne obferves), Ramp them as performances worthy of the attention of artifts and antiquarians; but no pictures yet found are maAerly enough to prove that the Grecks carried the art of painting to as great a height of perfection as they did that of flatuary. Yet can we fuppofe thofe authors incapable of appreciating the merits of an $\lambda$ pelles or a Zeuxis, who with fo much critical difcernment bave pointed out the beauties of the works of a Plidias or a Praxiteles, beauties that we have till an opportunity of cortemplating? would they have beltowed equal praifes upon bot! kinds of perfornanaces if cither of them had been much inferior to thic other? ! think it is not probable; and we mult pretiume, that the capital productions of the ancient painters, being of more perithalle matcrials than butts and tiatues, have heen dettroved in the fatal difatercs that have fo often afflicted both Grecee and Italy. Herculancuni and Pompeii were but towns of the fecond arder, and not likely to poffefs the mallerpieces of the great artiths, which were ufually deflined to adorn the more celcbrated temples, or the palacts of kings and emperors." A more valuable acquifition than bronzes and pictures was thought to be made, when a large parcel of manufcripts was found among the ruins. Hopes were tilteriained that many works of the claffics, which time las deprived us of, were now going to be relliored to light, and that a new mine of fcience was on the poiat of being opened. But the difficulty of unrolling the burnt parchiment, of pafting the fragnents on a flat furface, and of decyphering the obfcure ketters, have proved fuch obttacles, that yery little progreff has beca made in the work. A prict invented the method of proceeding ; but it would require the joint labourb of many learned men to carry on fo nice and tedious an operaticil widh any fuccefs. The plan is dropped; and the manufripts now lie in dutty heaps, as ufcleís to the learned world as they had been for the preceding fiventeen centuries.
HERCULES, in fabulous hiflory, a mott renowned Grecian hero, who after death was ranked among the gods, and received divine honours. According to the ancients, there were many perfons of the farne name. Diodurns merntions three, Cicero lix, and fome authors extend the number to no lefs than furty-three. Of all thefe, one generally called the Thoban Hercules, is the molt celebratect; and to him, as may eatily be imagined, the actions of the others have been attributed. He is reported to have been the fon of Jupiter by Alcmena (wife the Amphitryon king of Atgos), whom Jupiter engoyed in the thape of her hulbard while he was abfent; and in order to add the greater Atrength to the child, made that anorous night as long as three. Amphitryon having foen afeer accidentally killed his uncle and father in law Llectry on, was obliged to fy to Thebes, where Hercules was bora. The jealoufy of Juno, on account of her hufband's amour with Alcmena, prompted her to dettroy the infant. For this purpofe fhe fent two ferpents to kill him in the cradle, but young Hercules thaagled then both. He was early inttucted in the liberal arts, and Callor the fon of Tyndiarns taught him how to fight, Eurytus how to thoot with a bow and arrows, Autolicus to drive a chariot, Linus to play on the lyre, and Eumolpus to

## 471 1 H E R

fing. He, like the rett of his illuhriuus contemporarien, BIrentses. Soon after becane the pupil of the centaur Chiron, and under him the perfected and sendered himfelf the motivaliant and accomplithed of the age. In the stin year of his age he refolved to deliverthe weighbom hooci of monnt Cithieron from a luge lion which preyed on the foocks of Amphitı yon his fuppoled father, and which laid wallethe adjacent country. He bent to the court of The fpius king of Thefpis, who fared in the general calamity; and te received here a tender treatinent, and was ent. tertained during 50 days. The 50 daughters of the king became mothers by Hercules duing his fay at Thefpis, and fome fay ,hat it was bliected in one niglit. After he had deftroged the lion of mount Ci theron, he delivered his country from the annal tribute of 100 oxen which it paid to Ergians. Such public fervices became univerfally known; and Creon, who then lat on the throne of "Ihebes, rewarded the patriotic deeds of Herenles by giving him his daughter in marriate, and entrulling him with the guvernment of his kingdom.

Eurytheus, the fon of Amphitryon, having fueceeded his father, foon becanc jealous of Hercu!es; and fearing lett he might by lim be deprived of his crown, left no means untried to get rid of him. Of this Herculcs was not infonlible, becaufe he was perpetually engaging him on fome defperate expedition; and therefore sent to confult the oracke. But being anfwered that it was the pleafure of the gends that lie thould ferve Eurnthens 12 years, he fell into a deep melancholy, which at lall ended in a furious madnefs; during which, among other defperate acions, he put aw'ay his wife Megara, and murdered all the chiddron he had by her. As an expiation of this crime, the king impoted upon him twelve labours furpafling the power of all other montals to accomplith, which neverthelefs our hero performed with geat cafe. The favours of the gods had indeed completely armed him when he undertook his labours. He had icceived a coat of armour and hetmet from Minerva, a fword from Mencury, a horfe from Neptune, a thich from Jupiter, a bow and arrows from Apullo, and from Vulian a golden cuirafs and brazen badkiu, with a celcbrated club of brafs according to the op inton of fomaz writers.

The hirl labour impofed upon hin was the killing of a lion in Nemea, a wond ot Achaia; whof hide was proof agraint any weapon, fo that he was foreed to feize him by the throat and Hrangle him. He carried the dead beaft on his fhoulders to Nyeene, and ever after clothed himfelf with the kin. Eurytheus was fo attonithed at the fight of the beall, and at the courage of Hercules, that he ordered him never to enter the gates of the city when he returned from his expeditions, but to wait for his orders without the walls. He even nade limeflf a brazen veffet into which he retired whenever Hercules returned - The feend labour was to deftroy the I.crusian hydra, which had feven hesds according to Apulludurus, 50 according te Simonides, and 100 accurding to Di.dorus. This celebrated monlter he frith ateacked with his arrows ; but foon atier he cane to a cluffe engagement, and by meatio of his heavy ctub he dettroyed the heads of his, encmy. This, howecer, was productive of no adrantage; for as foon as une hiead was beaten to piices by thie clib, immediately two fprang up; and the labuar

fome toport, carricd him back to hell after he had Lrought him before erarylucus.

Many wher exploits are faid to have been performed by llercules; in paticular, he accompanicd tise Argonauts to Cokhis before he delivered himfelf up to the kins of Alycenx. He afited the gods in their wars agrand the giants, and it wa; thongh him alone that Jupiter obtained a victory. IIe conquered I.aomedom, and pillaged lioy. When luk, the daughter of Eurytus kiag of (lichalia, of whom he was depply enamoured, was reitikd to his entreaties, he beedans the fucy of a fecond fit of infanity, and he murdered Iphitur, the onity one of the fons of linestus who favoured his addreffes to lole. He was fome time after purifed of the murder, and his indanty cealed; but the gods jelfeeuted him, and he west rifited by a dif. order which obliged him to eiply to the oracle of Delphi for ralicf. The colluls with which the Pythia receivel him irritated hin, and he wfolved to plunder Apollo's temple and catry asay the facred tripod. Apollo oppofed him, and a fevere contliet was be gian, which nothing bat the intefference of Jupiter with his thanderbehls could have prevented. He was upon this tuld by the oracle that he mult be fold as a fldve, and remaia three gears in the moit abject fervitude to recoser from his diforder. He complied; and $\mathrm{M}=\mathrm{r}$ cury, by orter of Jupiter, conducted him on Onphate, quech of Lydia, to whom he was fold as a flave. Here he cleared all the cumnery from robbers; and Omphate, who was attonithed at the greathefs of his exploits, maried him. Herentes had Agelaus and Lamon by Omplale, from whom Creefus king of Lydia was defecuded. He became alfo enamoured of one of One phate's female fervants, by whom he had Alceus. After he had completed the years of his flavery, he returned to Peloponnefus, where he re-eftablifhed on the throne of Sparia 'I'zndarus, who had been expalled by Fiippocoon. He becanne one of Dejanira's faiturs, and married her after be had overcome all his rivals. He was oblired to luave Calydon his father-in-law's kingdum, becaule he had inadvertently killed a man with a blow of his litl ; and it was on accunnt of this expullion that he was not prefeat at the bunting of the Calydonian boar. From Calydun he retired to the court of Ceyx king of 'Irachinia. The king received him and his wite with great marks of friendhip, and purified him of the murder which he had committed at Calydon. Hercules was fill mindfal that he had unce hien refufed the hand of Iol: ; he therefore made war againt her father Eurytus, and killed him with three of his fors. Iole fell into the hands of her father's murderer, and found that the was loved by Hercules as much as before. She stecompanied him on mount Cita, where he was going to raife an altar and offer a folemn facrinice to Jupiter. As he had not then the fhirt and tunce in which he arrayed himfelf to offer a facrifice, he fent liehas to Prachin to his wife Dejanira, in order to provide hinfelf a proper drefs. Dejanira had fone time before been attempted by the Cuncaur Netus, as he was ferrying her over the river Enenus; and Hercules beholding it from the frore, had given him a mortal wound with an arrow. Flee monter finding himfolf dying, advifed her to mix fome oil with the bloud which fluwed from his wound,
eiles. and to anoint her huband's fhirt with it, prctending that it would infallibly fecure him from loring any other woman ; and the, too well apprifed of his inconflancy, had actually prepared the poifoned ointment accord-ingly.-Lychas coming to her for the garments, unfortunately acquainted her with his having brought away Iole; upon which fic, in a fit of jealoufy, anointed his mirt with the fatal mixture. This had no fooner touched his body, than he feit the poifon diffure itelf through all his veins; the violent pain of which caufed him to difband his army, and to return to Trachin. His torment ftill increafing, he fent to confule the oracle for a cure; and was anfewered, that be thould caufe himfelf to be conveyed to mount Oita, and there rear up a great pile of wood, and leave the reft to Jupiter. By the time he had ubeyed the oracke, his pains being become intolerable, lie dreficel himfelf in his martial habit, flung himfelf upon the pile, and defired the hyflanders to fet fire to it. Others fay that he left the charge of it to his fon lyiloctetes; who having performed his father's command, had his how and arrows given lim as a reward for his obedience. At. the fame time Jupiter, to be as good as his word, font a flafh of lightning, which confumed both the pile and the hero; infomuch that Iolius, coming to take up his bones, found nothing but afhes: from which they concluded, that he was pafted from earth to heaven, and joined to the gods. His friends thowed their gratitude to his memory by railing an altar where the burning pile had food. Menoctius the fon of Actor offered him a facrifice of a bull, a wild boar, and a goat, and enjoined the people of Opus yearly to obferse the fame religious ceremonies. His workip foon became as univerfal as his fame; and Juno, who had once perfecuted him with fuch fury, forgot her refentment, and gave him lier daughter Hebe in marriage. Hercules has received many firnames and epithets, either from the place where his wormip was eltablithed, or from the labours which he atchieved. His teaples were numerous and magnificent, and his divinity revered. No dogs or flies ever entered his temple at Rome; and that of Gades, according to Strabo, was always forbidden to women and pigs. The Phocnicians offered quaits on his altars; and as it was fuppofed that he prelided over dreams, the fick and inhim were fent to fleep in his temples, that they might receive in their dreams the agrecable prefages of their approaching tecovery. The white poplar was particularly dedicated to his fervice.

It is obferved, that there are none even of the twelve great gods of antiquity that have fo many ancient monuments relating to them as Hercules. The famous flatue of Hercules, in the Farnefe palace at Rome, is well known to the connoiffeurs: this reprefents him refting after the laft of his twelve labours above recited, leaning on his club, and holding the apples of the Hefperides in his hand. In this ttatue, as in all the other figures of him, he is formed, by the breadth of his thoulders, the fpacioufne!s of his cheft, the largenefs of his fise, and the firmnefs of his mufcles, to exprefs flrength and a capacity of endusing great fatigue, which cordituted the chief idea of virtue among the ancient heathens. His other attributes are his lion's k in, his club, and his bow. - Hercules is reprefented by the ancients as an exemplar of virtue:

Vol, VILL. Part II.
howerer, the fiereuics libax, or drunken Hercules, is Hercynid no uncommon figure; and his amours are deferibed both by the poets and artifts. Thus, the Cupids are made to take away lis club, and he is exhinited in the polture of bending under a little bny; by which actions we perceive, that he who conquered all difficuities was a fave to love. His children are as numerous as the labours and difficulties which he underwent; and indeed they became fo powerful foon after his death, that they alone had the courage to invade all Peloponrefus. Sec Heraclidar.

The apotheofis of Hercules, or the eftablimment of his altars in the principal cities of Greece, is liesed ty Trafyhulus 29 years before the taking of Troy.

Hetcules has been particularly honoured by the Greeks under the name of MIUforgetes, "the conductor of the Mufes;" and at Rome under that of Mercules Misforum. He is reprefented on medals with a lyre in his hand; and the reverfe is matked with the figure of the nine Mufes, with their proper fymbols.

Hercules, in aftronomy, one of the conflellations of the northern hemifphere. - The fars in the confellation Hercules in l'tolemy's catalogue are 20; in 'Tycho's, 28 ; in the Britannic catalogue, 113.

Herciles's Pillars, in antiquity, a name given to two lofty mountains, fituated one on the mof fouthern extremity of Spain, and the other on the oppolite part of Africa. They were called by the ancients Abyla and Calpe. "They are reckoned the boundaries of the labours of Hercules; and according to ancient tradition, they were joined together till they were fevered by the arm of the hero, and a communication opened between the Mediterranean and Atlantic feas.

HERCYNIA silva (anc. geog.), the largett of forelts. Its breadth was a journey of nine days to the beft traveller. Taking its rife at the limits of the Helvectii, Nemetes, and Raaraci, it run along the Danube to the borders of the Daci and Anartes, a lengtl of 60 days journey, according to Cerfar, who appears to have been well acquainted with its tue breadth, feeing it occupied all Lower Germany. It may therefore be confluered as covering the whole of Germany ; and moft of the other forets may be confidered as parts of it, though ditlinguimed by particular names: conlequeatly the Hartz, in the duchy of Brunfwic, which gave name to the whole, may be confidered as one of its parts. 'The name Hartz denotes "relinous," or "pinetrees." By the Greeks it is called Orcynius, as a name common to all the forells in Germany ; in the fame manner as Hercynius was the name given by the Ro. mans; and both from the German Marta.

HERD, among hunters, an affemblage of black or fallow beafts in contradiltinction to flock. Sce Flock.-In the hunting language there are various terms ufed for companies of the divers kinds of game. We fay a berd of barts or bucks, a br:y of rocs, a rous of wolves, a riclefs of martens, \& ic.

HEREDITAMENTS, whatever moveable things a perfon may have to himfelf and his heirs by way of inheritance; and whicb, if not otherwife bequeathed, defcend to him who is next heir, and not to the executor as chattels do.

HEREDITARX, an appellation given to whatever belongs to a family by right of fucceftion from heir to heir.

3 N
He .

## H E R

Hereditary. Herfditary is allo figuratively applied to good or ill qualities fuppofed to be tranfmitted from father to fon: thus we fay virtue and piety are hereditary quaJoies in fuch a family; and that in laty the hatred of families is hereditary. And indeed the gout, hing's evil, madnefs, \&c. may really be hereditary difcafes.

HFREDTGAY Right, in the Brition contitution. 'The grand fundamental maxim npou which the jus corome, or right of disecellion to the throne of Brisam depends, sir William Blackstone takes to be this: 'That the crown is, by common law and conllitutional cullom, hereditary; and this in a manner peculia to it lelf: but that the right of inheritance may from time to time sechanged or limited by act of perliament; under which limitations the crown fill continnes lacreditary.

1. The crown is in general hereditary, or defeendible to the next heir, on the death or demife of the latt proprietor. All regal governments mult be either hereditary or elective: and as there is no inflance wherein the crown of Eagland has ever been afferted to he lective, except by the regicides at the infamous and mparalleled trial of king Charles 1 . it muft of confequence be bereditary. Yet in thus afterting an hereditary right, a jure divino title to the throne is by no means intended. Such a title may be allowed to have fubfillad under the theorratic eftablifhments of the chil. dren of 1 fract in Falelline: but it never yet fubfilled in any other country ; fave only fo far as kingdoms, like other human fabrics, are fubject to the general and ordinary difpenfations of Providence. Nor indeed lave a jure divino and an hereditary right any neceffary connection with each other; as fome have very weakly imagined The titles of David and Jehu were equally jure divino as thofe of either Solomon or Ahab; and yet David flew the fons of his predeceffor, and Jehu his predeceffor himfeif. And when our kings have the fame warrant as they had, whether it be to fit upon the throne of their fathers, or to deftroy the houfe of the preceding fovereign, they will then, and not before, poffefs the crown of England by a right like theirs, immediately derived from heaven. The hereditary sight, which the laws of England acknowledge, owes its origin to the founders of our conltitution, and to them only. It has no relation to, nor depends upon, the civil laws of the Jews, the Greeks, the Romans, or any other nation upon earth; the municipal laws of one fociety having no connection with, or influence apon, the fundamental polity of another. The found. we of our Englifh monarchy might perhaps, if they had thought proper, have made it an elective mowarchy; but they rather chole, and upon good reafon, to eftablif originally a fucceffion by inheritance. 'I'his has been acquiefeed in by general confent, and ripened by degrees into common law : the very fame aitle that every private man has to his own eftate. latuds are not naturally defcendible, any more than shrones: but the law has thought proper, for the benefit and peace of the puthlic, to eftablifh hereditary fuccetfion in the one as well as the other.

It mult be owned, an elective monarchy feems to be the mon obvious, and bell fuited of any to the rational principles of govermment, and the freedom of human sature: and accoldiugly we find from hiftory, that, in the infancy and fisf rudiments of almoft cvery tatc,

## 4741 H E R

the leader, chicf magifirate, or prince, hath ufually Héredi tern elective. Aud, if the individuals who compofe that fate could always continne trae to firll prineiples, uminfluenced by pathon or prejodice, umaffaled by corruption, and urawed by violence, clective fucceffion were as much to be defired in a kingdom as in other inferior communitics. The bett, the wifelt, and the bravell man, would then be fire of receiving that crown which his endowments have merited; and the fenfe of an unbialled majority would be dutifully acquiefeed inby the few who were of diferent opinions. But hiftory and obfervation will inform us, that elections of every kind (in the prefent flate of human nature) are too frequently brought about by influence, partiality, and artilice: and, even where the cafe is othtrwife, thefe practices will be often lufpected, and as conllantly charged :Ipon the fuccefsful, by a fplenetic difappointed minority. This is an evil to which all focieties are liable; as well thofe of a private and domettic kind, as the great community of the public, which regulates and includes the rett. But in the former there is this advantage, That fuch fufpicions, if falie, proceed uo farther than jealoufies and murmurs, whin time will effectually fupprefs; and, if true, the injuftice may be remedied by legal means, by an appeal to thofe tribunals to which every member of fociety lias (by beco. ming fuch) virtually engaged to lubmit. Whereas, is the great and independent fociety, which every nation compofes, there is no fuperior to refort to but the law of nature; no method to redrefs the infringements of that lav, but the actual exertion of private force. $A=$ therefore between two nations, complaining of mutua! injuries, the quarrel can only be decided by the law of arms; fo in one and the fame nation, when the fundamental principles of their common union are fuppofed. to be invaded, and more efpecially when the appointment of their chief magillrate is alleged to be unduly made, the only tribunal to which the complainants can appeal is that of the God of battles, the only procefs: by which the appeal can be carried on is that of a civil and inteltine war. An hereditary fucceffion to the crown is therefore now eflablithed, in this and moft other countries, in order to prevent that periodical bloodfhed and mifery, which the hillory of ancient imperial Rome, and the more modern experience of Poland and Germany, may foow us are the confequences of electivo kingdoms.
2. But, fecondly, as to the particular mode of in heritance, It in general correfponds with the feod:path of defcerts, chalked out by the common law in the fucceffion to landed eftates; yet with one or twa material exceptions. Like them, the crown will defeend lineally to the iffue of the reigning monarch; as it did from king John to Richard II. through a regular pedigree of tix lineal generations: As in them the preference of males to females, and the right of primogeniture among the males, are itrictly adhered to. 'Thus Edward V. fucceeded to the crown, in preference to Richard his younger hrother, and Elizabeth his cider fifter. Like them, on failure of the mala line, it defcends to the iffue female; according to the ancient Britifh cuttom remarked by 'Tacitus, Solent fieminarum duqu bellare, af foxum in inferiis non difcernere. Thus Mary I. fucceeded to Edward Vl.; and the line of Margaret gueen of Scots, the daughter of Henry VII.

## $\mathrm{H} E \mathrm{R}$

fon. But among the females, the crown defcends by right of primogeniture to the eldelt daughter only and her iffuc; and not, as in common inheritances, to all the daughters at once; the evident neceflity of a fole fucceffion to the throne having occafioned the royal law of defcents to depart from the common law in this refpect: and therefore queen Mary, on the death of her brother, fucceeded to the crown alone, and not in partnerfip with her fifter Elizabeth. Again, the doctrine of reprefentation prevails in the defeent of the crown, as it does in other inheritances; whereby the lineal defcendants of any perfon deceafed thand in the fame place as their ancellor, if living, would have Aone. Thus Richard ll. fucceeded his grandfather Edward III. in right of his fatber the black prince; to the exclufun of all his uncles, his graudfather's younger children. Lattly, on failure of lineal deftendants, the crown goes to the next collateral relations of the late king; provided they are lineally defeended from the blood-royal, that is, from that royal flock which originally acquired the crown. Thus Henry I. fucceeded to Willian II. John to Richard I. and James I. to Elizabeth; being all derived from the Conqueror, who was then the only regal Aock. But herein there is no objection (as in the cafe of common defcents) to the fucceflion of a brother, an uncle, or other collateral relation, of the hilf.blood; that is, where the relationhip proceeds not from the fame couple of anceftors (which contlitutes a kinfman of the whole blood), but from a fingle anceltor only; as when'two perfons are derived from the fame father, 2nd not from the fame mother, or aice verfa: provided only, that the one anceftor, from whom both are defcended, be that from whofe weins the blood royal is communicated to each. Thus Mary 1. inherited to Edward VI. and Elizabeth inherited to Mary; all born of the fame father, king Henry VIII. but all by different mothers. See the articles Cunsanguinity, Descent, and Succession.
3. The doctrine of hereditary right dots by no means imply an indefeatitle right to the throne. No man will affert this, who has confidered our laws, conftitution, and hiftory, without prejudice, and with any degree of attention. It is nuqueftionably in the brealk of the fupreme legiflative authority of this kingdom, the king and buth houfes of parliament, to defeat this hereditary right: and, by particular entails, limitations, and provifions, to exclude the inmediate heir, and velt the intheritance in any one elfe. This is Rrictly confonant to our laws and conflitution; as may be gathered from the exprefion fo frequently ufed in our ftatute book, of "the king's majetly, his heirs, and fucceffors." In which wee may obferve, that as the word heirs neceflarily impliss an inheritance or bereditary right generally fublilling in the royal perfon ; fo the word fuccefors, diftinctly taken, mut imply that this inheritance may fometimes be broken through; or, that there may be a fuccelfor, without being the heir of the king. And this is fo extremely reafonable, that without fuch a power, lodged fomewhere, our polity would be very dcfective. For, let us barely fappofe fo melancluoly a cafe, as that the heir-apparent Sould be a lunatic, an idiot, or otherwife incapable of reigning; how mifrable would the condition of the
-It is therefore neceefary that this power hould be lodred fonewhere; and yot the iwheritance and regal dignity would be very precarions indeed, if this power were exprefisly and avowedly ludged in the hands of the fubject only, to be exerted whenever prejudice. caprice, or difcuntent, thonld thappen to take the lead. Confequently it can nowlere be fo properly lodged as in the two houfes of parlianent, by and with the confent of the reigning hing; who, it is not to be fuppofed, will agree to any thing improperly prejaticial to the rights of his own defcendants. And therefore in the kins, lords, and commons, in parliament affembled, vur laws have exprefty lodged it.
4. liat, fourthly, However the crown may be limited ur transforred, it thill retains its defeendible yuality, and becomes herecitary in the wesier of it. And bence in our law the king is faid never to die in his political capacity; though, in common wuth other men, he is lubjece to mortahty in his natural: becaufe immediately upon the natural death of Henry. Wiiliam, or Elward, the King furvives in his fuccetlor. For the right of the crown sera, co inh 2uti, upon his heir; cither the bares natus, if the courfe of jefeent remains unimpeached, or the bares fuctus, if the inheritance be under any particular tettemeat. So, that there can be no interregnun, but, as Sir Mathew Hale obferves, the right of fovereignty is fully iurefled. in the fucceflor by the very defent of the crown. And therefore, however acquired it becomes in him abfufutely heredirary, unders by the rules of the limitation it is otherwife ordered and determined: lat the fame manner as landed eflates, to continuc our former comparifon, are by the law hereditary, or decicendible to the heirs of the owner; but Aill there exits a power, by which the property of thofe lands may be tranfferred to another perfon. If this transitir be made fimply and abiolutely, the lands will be hereditary in the new owner, and defcend to his heir at law: but if the transfer be clogged with any limitations, conditions, or entails, the lands muft defcend in that channel, fo limited and preferibed, and no ofler. See Successan.

HEREDITAS jacens, in Scots law. An eftate is faid to be in bercilitafe jucente, after the proprictor's death till the heir's entry.

HEREFORD. which in Saxon fignifies the ford of the army, the capital of Herefordflire in England, fituated in W. Long. 2. 35. N. Lat. 52. 6. It is fuppofed to have rifin gut of the ruins of Kencheler, in its neighbourhood, which Cambden believes to have bern the Ariconium of Antoninus It is very pleafantly fituated among meadows and conifictls, and is almolt encompaffed with rivers. It feems to have oucd its rife, or at lealt its increafe, to the building and dedicating a church there to Ethelbert king of the Eaft-Angles, who was murdered in the neigh. bourhood, and afeerwards taken inco the catalogne of mateyrs ; foon after it became a bifhop's fee, and in confequence of that a conviderable place. In 1055 it was racked, the catledral dellioyed, and its bilhup Ieufuar carricd away captive by Gry fin prince of South Wales, and Algar, an Eiglithman, who had rublled againft Edward the Confeffur. Harold fortified it with a broad and high rampart; and it appears

Hereiond, by Doondday-book, that there were no more than Hercford. 300 men within and without the wall. A very large Ruise. Wret, and the city walled round. The prefent dately
cathedral was founded in the reign of Henry l. by bifhop Reinelm, but enlarged and beautified by his fucceflors. It fuffered much in the barons wars; and was often taken and retaken in the war between king Charles I. and the parliament. 'Whis city is pretty large, and had once tix churches; but two were deftroyed in the civil wars. It is nor very populous nor well built, many of the houfes being old. Its manufactures are gloves and other leathern goods; and its corporation confifts of a mayor, fix aldermen, a highfleward, deputy- lleward, and town-clerk, who have a fword bearer, and four rergeants at nace. Each of the companies enjoys diftinct laws and privileges by their charter, and each has its hall. The cathedral, which was built in 1050, and de!lroyed by the Welih in 1060 , but rebuilt in the reign of the Cunqueror, or, as fome fay, in that of Henry I. is a beautiful and magnificent llucture, but being greatly decayed, part of it was deftroyed by the fall of the tower in September $i \% 86$, and the Ipire on another tower was taken down to be retuilt at the fame time. Here is an hofpital well endowed for 16 puor people ; and two cha-rity-fhools, one fur 60 boys, the other for 40 gitls. 'The chapter-huufe, which was once a very clegant building, built abont the year 1079 , is now in ruins. Here were fomerly two or three priories. Almolt the only drink here is cyder, which is both cheap and grod, the very hedges in the country being planted with apple trees. 'The city gave long the title of earl to the noble family of the Bohuns; then of duke to Henry of Lancalter, afterwards Henry IV. King of England ; ifter him, of arll to Stafford earl of Buckingham ; then of affoun: to D'Evereux earl of ETex, which a collateral bunch of this family fill enjoys, and is thereby the promier vifcount of England.

Herefordoshire, a county of England, nearly of a citcular form, bounded on the eat by Worcefter and Gloncefter, on the Gouth by Monmouthhire, on the weft by Radnorfine and Brecknockthire, and on the sorth by Shropfiire. Its length from north to fouth is 46 mites, its hreadth from ealt to well 40 , and its sircumference 220 . It contains 8 market towns, 87 vicarages, 1,6 parifhes, and 391 vilages, 15,000 houfer, and 97,600 inhabitants. It is divided into 11 hundrods, and fends eight members to parliament, name. by, two knights for the flire, and two for each of the fullowing towns, Hereford, Lemplter or Leominfter, an! Wertly.

The air of this county is allowed to be as pleafant, fweet, and wholefome, as that of any other in Eng. land, there leng nothing either in the fuil or fituation to render it otherwife. The foil throughout is excellent, and inferior to none, either for grain, fruit, or pature, fuppling the inhabitants plenitfully with all the necefares of life : but that by which it is diftin. Guifled from moll others, is its fruit, efpecially appies, of whion it produces fuch cuantiies, that the cyder anade of them is not only fufficient for their own confumption, though it is their ordinary drink, but alfo in a great meature for that of London and other parts. That in falticalar which is made fres the apple called
redleak, is much admired, aud has a body almol Hirenhs equal to that of white wine. The county is we!l fupplied with wood and water ; for, befides letfer Areams, there are the rivers Frome, Loden, Lag, Wye, Wadel, Arrow, Dare, and Monow; the laft of which is large, and all of them are well fored with hifh, particularly the Wye, which breeds falmon. It lies in the diocefe of Hercford, and Oxford circuit.

HERENHAUSEN, a palace of Germany neat Hanover, belonging to the king of Great Britain. Here are ludgings for all the court; and a garden of valt extent, in which are fine waterworks, a labyrinth, and many other curiofities worthy the obfervation of a traveller.

HERENTHALS, a town of Brabant in the Auftrian Netherlands, in the quarter of Antwerp; feated on the river Nethe, in E. Long. 4. 51. N. Lat. 51. 9.

HERESY, in law, an offence againfl Chritianity, confifting in a denial of fome of its effential doctrines, publicly and obltinately avowed; being defined, " fententia rerum divinarum bumano fen $\sqrt{4}$ excogitata, palam Noka et pertinacilter defenfa." And here it mult be Blatk.. acknowledged that particular modes of belief or un. Conmem? belief, not teading to overturn Chriltianity itfelf, or to fap the foundations of morality, are by no means the object of coercion by the civil magiltrate. What doctrimes fhall therefore be adjudged herefy, was left by our old conllitution to the detcrmination of the ecele. fiattical judge ; who had herein a moll arbitrary latitude allowes him. For the general definition of an heretic given by Lyndewode, extends to the fmalle deviations from the doctrines of the holy church: "haroticus ef qui dubitat de fille calbolica. et qui negligit fervar: ea, qua Romana ecclefia glatuit, fou fervare decroverat." Or, as the ftatute 2 Hen. IV. c. 15 . exprelles it in Englifh, " teachers of erroneous opinions, contrary to the faith and blefed determinations of the huly church." Very contrary this to the ufage of the firit general councils, which defined all heretical doctrines with the utmon precifion and exactnefs. A nd what ought to have alleviated the punifhment, the uncertainty of the crime, feems to have enhanced it in thofe days of blind zeal and pious cruelty. It is true, that the fanctimonious hypocrify of the canonilts went at firtt no farther than enjoining penance, excommunieation, and ecclefiallical deprivation, for herefy; tho' afterwards they proceeded boldly to imprifonment by the ordinary, and contifcation of goods in pios ufus. But in the mean time they had prevailed upon the weaknefs of bigotted princes to make the civil power fubfervient to their purpofes, by maling herefy not only a temporal, but even a capital, offence: the Romith ecclefiallies determining, without appeal, whatever they pleafed to be herely, and thifing off to the Secular arm the odinm and drudgery of executions: with which they themfelves were too tender and delicate to intermeddle. Nay, they pretended to intercede and piay, un bihalt of the convicted heretic, ut citra mortis feriablum fontentia circas eum moderetur: well k :owing that at the fame time they were delivering the un!appy victin to certain death. Hence the capital punifhents inflicted on the ancient Dunatills and Manicheans by the emperors Theodotius and Juttinian: hence alfo the conkitution of the emperor Frederic mentioned by Lyndewode, adjudging all perfons with-
out dillintion to be burnt with fire who were convicted of herefy by the ecclefialtical judge. The fame emperor, in another conflitution, ordained, that if any temporal lom, when admoniked by the church, hould neglect to clear his territories of heretics within a year, it thould be lawful for good catholies to feife and occupy the lands, and utterly to exterminate the heretical poffeflors. And upon this foundation was built that arbitrary power, folong claimed and fo fatally ex. erted by the Pope, of difpefing even of the kingdoms of refiactory princes to more dutiful fons of the church. The immediate event of this conflitution was fomething fingular, and may ferve to illuftrate at once the gratitude of the holy fee, and the jutt punifhment of the royal bigot; for, apon the authority of this say confitution, the pope afterwards expelled this very emperor Frederic from his kingdom of Sicily, and gave it to Charles of Aujeu.

Chrillianity being thus deformed by the dicmon of perfecution upon the comtinent, we camnot expect that our own ifland fhould be entirely free from the fame fcourge. And therefore we find anoong our ancient preccdents a writ de baretico comburento, which is thought by fome to be as ancient as the common law iffelf. However, it appears from thence, that the conwietion of herefy by the common law was not in any petty ecelefiallical court, but before the archbilhop himfelf in a provincial fynod; and that the delinguent was delivered uver to the king to do as he flould pleafe with him : fo that the crown had a controul over the fpiritual power, and might pardon the conviet by iffuing no procefs againlt him; the writ de berstico comburendo !exing not a writ of courfe, but iffuing only by the fpecial direction of the king in council.

But in the reign of Henry $1 \hat{y}$. when the eyes of the Chriftian woild began to open, and the feeds of the Proteflant religion (though under the opprobrious name of lollardy) took root in this kingdom; the clergy, taking advantage from the king's dubious title to dcmand an increafe of their own power, ubtained an act of parliament, which tharpened the edge of perfecution to its utmoft keenuefs. For, by that ifatute, the dioce fan alone, without the intervention of a fynod, might convi¿t of heretical tenets; and unks the convict abjured his opinions, or if after abjuration he relapled, the theriff was bound icx effrin, if requited by the bihop, to commit the unhappy victin to the fla:nes, withour waiting for the confent of the crown. By the itatutc 2 Hen. V. c. 7 . lollardy was alfo made a temporal offence, and indictable in the king's courts; which did not thereby gain an exclufive, but only a cuncurrent, juriddiction with the bithop's conlifory:

Afterwards, when the final reformation of religion began to advance, the power of the ecclefiaties was fomewhat muderated; for though what herefy is, was not then precifly defined, yet we are told in fome points what it is not: the thatute 25 Hen . VIII. c. $1+$. declaring, that offences againd the fee of Rome are not herefy; and the ordinary being thereby reftrained from proceeding in any cafe upon mere fulpicion; that is, unlefs the party be aceffed by two credible witneffes, or an indietment of therefy be firft previounly found in the king's courts of cummon law. And yet the fipirit of perfecution was not yer abated, but only diverted into a lay channel. For in fix years afterwards, by

## $4771 \quad \mathrm{H}$ E R

flatute 31 Hen. VIII. c. If the bloody lase of the Mirato. fix articles was made, which eftablithed the fix mole contelled points of pupery, tranfubllantiation, commı. nion in one kind, the celibacy of the clergy, monaltic vows, the facrifice of the mafs, and aunicular conferfion ; which points were "determined and refulved by the moft godly fudy, pain, and travail of his majelly: for which his moft humble and obedient fubjects, the lords foiritual and temporal and the commons, in parliament allembled, did not only render and give unto his highnefs their mont high and lecarty thanks;" but did alfo enact and deelane all oppugners of the fan to be heretics, and to be burnt with lire; and of the five luf to be felons, and to futfer death. The fuine thatute eflablifhed a new and mixed juifdiction of clergy and laity for the trial and conviction of heretics; the refigning prince being then equally intent on deftroning the fupremacy of the bithops of Rome, and efablifhing all other their corruptions of the Chritian uliginn.

Without perplexing this detail with the various repeats and revivals of thefe fanguinary laws in the two fucceeding reigns, let us proceed to the reign of queen Elizaleth; when the reformation was finally cllablithed with temper and decency, unfulled wish party-rancour, or perfonal cajnice and refentmont. By flatute I Eliz. c. I. all former fatutes relating to herefy are repealed, which leaves the jurifdiation of he. refy as it Aoud at comnon law; aiz. as to the infliction of common cenfures, in the eceleffallical cours; and in cafe of burning the heretic, in the provincial fynod only. Sir Matthew liale is indecd of a dificrent opmion, and holds that lieh power refided in the divectan alio; tho' Fie agrees, that in either cafe the writ de berclica conburendo was not demandable of common right, but gramable or otherwife mercly at the king's diferetion. But the principal point now gdined was, that by this flatute a boundary is for the firft time fet to what flath be accounted frerefy; nothing for the future being to be fo determined, but only fuch tenets, which have been herctofore fo declared, 1. By the words of the canonical feriptures; 2. By the firt form general come cils, or fuch others as have only ufed the words of the looly Scriptures; or, 3. Which mall hereafter be fo dectared by the parliamene, with the afient of the clergy in convocation. Thus was therefy refuced to a greater certainty than before; though it might nut have been the worle to have defined it in terms fill more precife and particular: as a man continued flill liable to be burnt, for what perhaps be did not undertand to be hercfy, till the ceclefiatical judre fo interpreted the words of the canonical feriptures.

For the writ de baretico conblurendo remainced atill in force; and we have intances of its being put in execuston upon two Anabaptills in the feventeenth of Ehazabeth, and two Arians in the nimth of James l. But it was totally abolifhed, and herefy again fubjected only to ecclefrattical correction, fro falute anims, by vintue of the llatute 29 Car. II. c. 9 : for, in one and the faine reign, our lands were delivered from the lavery of military tenures; our bodies from abitrary imprifomment by the babeas corpus aft; and our minds from the tyranny of Cupertitious bigotry, by demolihinit this latt badge of perfccution in the Englifh law.

Every thing is now as it thould be, with refpeet to the firitual cognizance, and feiritual puaidunent of, herefy:
herify: unlefs perhaps that the caime ought to be more itritly defined, and no provection permitted, even in the eccletaltical courts, the the tenets in queftion are hep poper authority previoully declared to be heretical. Under thefe reitrictions, it leems neceffary for the fupport of the national religion, that the oflicers of the church flowidd have power to coufure heretics; yet not 10 harafs them with temporal penalties, much lefs to cxteminate or dethoy them. The legillature hath indod thought it proper, that the civil magitrate fhould agtin intorpofe, with regard to one fpecies of herefy, sery prevalent in modern times; for by flatute $y \&{ }^{\text {io }}$ W. 111. c. $3_{2}$. if any perfon educated in the Chrillian seligion, or profefling the fame, hall by writing, printin 5 , taching, or advifed fucaking, deny any one of the perfons in the holy Trinity to be God, or maintain that there ase more gods than one, he thall undergo the fame penatics and incapacities which were jult sow mentivned to be inflicted on apoltafy by the fame Hature.

HERETIC, a general name for all fuch perfons under any religion, but efpecially the Chiltian, as profefs or teach religious opinions contrary to the eltaAlilled faith, or to what is made the flandard of orthodny. See Meresy.

HERETOCIIS, among our Saxon ancellors, fignified the fame with dukes or duces, denoting the commanders or leaders of their armies.

It appears, from Edward the Confeffor's laws, that the tailitary foree of this kingdom was in the hands of the dukes or heretuchs, who were contituted through esery province and councy in the kingdom, being felected out of the principal nobility, and fuch as were morl remarkable for being jafientes, fideles, © animof. Their duty was to Itad and regulate the Euglith armies, with a very unlimited power; and becaufe of their great power, they were elected by the people in their full af. fembly, or folkmote, in the fame manaer as fheriffs where elected.
iferfordin, or Herwarden, a free and imperial town of Germany, in the circle of Wettphalia, and capital of the county of Ravenfberg. Here is a faraus numaery beluaging to the Protetlants of the confenion of Augthurg, whofe abbefs is a princefs of the cmpire, and lias a soice and place in the diet. It is feated on the river Aa. E. Lung. 8.47. N. Lat. 52. 12 .

HERGUNDT, a town of Upper Hungary, remarkable for its rich mines of vitiol. Thofe who work in the mines have built a fubterraneous town, which has a great number of imhabitants. E. Long. 18. 15. N. I.at. 48.30.

IFERIOT, in law, a cuftomary tribute of goods and chattels, payable to the lurd of the fee on the deceafe of the owner of the land. See Tenure.

Heriot is of two forts-siz. 1. Heriot-cullom, where heriuts have teen paid time out of mind by cultom, after the death of a temant for life. In fome places, there is a cullomary compuition in moncy, as 10 or 20 thillings in lieu of a heriot, by which the lord and tewant are buth bound, if it be an undifputably ancient cuftom; but anew compufition of this fort will not bind the reprefentatives of cither party. 2. Heriot-fervice, when a tenant holds by tuch fervice to pay heriot at the time of his death : which fervice is expreffed in the aeed of feofment.- - For this later the lord hall dif-
train; and for the other he flall feize, and not diftrain. Herifoo If the lord purchafe patt of the tenancy, heriot fervice is extinguithed; but it is not fo of heriot-cndom.

HERISSON, in fortification, a beam armed with a great number of iron fyikes with their points outwards, and fupported by a pivot on which it turns. Thefe ferve as a barrier to block up any paffage, and are frequently placed before the gates, and more efpecially the wieket-doors, of a town or fortrefs, to fecure thofe palfages which mult of neceffity be often opened and ft.ut.

HERITABLE rigurs, in Scots law, fignify all rights affecting lands, houles, \&c. or any immoreable fubject.

HERITAGE, in Scots law, lands, honfes, or any immoreable fubject, in contradiftinction to moveables or moveable fuljects. It alfo fometimes fignifies fuch immoveable property as a perfon fucceeds to as heir to another, in contradillinetion to that which he himfelf purchafes or acquires in any other manner, called conqugh.

HERMFA, in antiquity, ancient Greek feftivals in honour of the god Hermes or Mercury. One of thefe was celebrated by the Pheneatx in Arcadia; a fecond by the Cyllenians in Elis; and a third by the Tanagreans, where Mercury was reprefented with a ram upon his fhoulder, becaufe he was faid to have walked thro' the city in that polture in time of a playue, and to have cured the fick; in memory of which, it was cultomary at this fetival for one of the molt beautiful youths in the city to walk round the walls with a ram upon his floulder.-A fourth fellival of the fame name was obferved in Crete, when it was ufual for the fervants to fit down at the table while their mafters waited; a cuftom which was alfo obferved at the Roman Saturnalia.

HERMAN (Paul), a famous botanift in the 17 th century, was born at Hall in Saxony. He practifed phyfic in the ifle of Ceylon, and was afterwards made profeffor of botany at Legden, where he died in 1695 . He wrote a eatalogue of the plants in the public garden at Leyden, and a work intitled Fora LugdunoBatave floris.

HERMANN (James), a learned mathematician of the academy at Bertin, and a member of the academy of fciences at Paris, was born at Batil in 1678 . He was a great traviller, and for fix years was profeffor of ma:hematics at Padua. He afterwards went to Mufcovy, being invited thither by the Czar in 1724. At his return to his native country, he was made profeffor of morality and natural law at Bafil ; and died there in 1733 . He wrote feveral mathematical works.

HERMANNIA, in botany: A genus of the pentandria order, belonging to the monodelphia clais of plants ; and in the natural method ranking under the 37 th order, Colunnificu. The capfule is quinquelocular; the petals at the bafe are femitubulated and oblique.
Species. 1. The lavendulifolia, hath a farubby falk and flender branches, very bufly, about a foot and an half high, fmall, fyear-haped, obtufe and hairy leaves, with clufters of fmall yoflow flowers along the fides of the branches, continuing from June 10 Autumn. 2. The athreifolia hath a fhrubby flalk, and foft woolly branches, growing two fect high, with numerous yellow flowers in loofe fpikes growing at the end of the
branches,
branches, and making their appearance in July. 3. The groffularifolia hath a thrubby llalk and ipreadiner branches, growing three or four fect high, with bright yellow flowers coming out in great numbers at the ends of all the floots and branches in April or May. 4. The alnifolia hath a firubly flalk and branches growing irregularly four or tive feet high, with pale yellow Howers in thort fipikes from the fides and ends of the branches, appearing in April or May. 3. The hyffopifolia hath a fhrubby upright talk, branching out laterally fix or feven feet high, with pale yellow Howers in clufters from the fides of the branches, ‥ppearing in May and June. There are 14 other fpecies.

Culluwe. All thefe planis are natives of Africa, and therefore mull be kept in a green-houfe during the winter in this country. They are propagated by cuttings of their young foots, which may be planted in pots of rich earith any :ime from April to July.

HERMANSI'ADT, a handfome, populous, and ftrong town of Hungary, capital of Trasfilvania, with a bihop's fee. It is the refitlence of the governor of the province; and is feated on the river Csban, in E. Long. 23. Ho N. Lat. 4 6. $25 .^{2}$

HERMANT (Godfrey), a learned dofor of the Sorbome, born at Beauvais in 1617 . He wrote many excellent works; the principal of which are, 1 . The lives of it Athanafius, St Bafil, St Gregory Nazianzen, St Chryfoftom, and St Ambrofe. z. Four pieces in defence of the rights of the univerfity of Pa sis againt the Jefuits. 3. A French tranflation of St Chryfollom's treatife of Providence, and St Baili's $A$. fectics. 4. Extracts from the councils; publithed after his death, under the title of Clavis difciplina cectifiafica. He died fuddenly at Paris in $16 y 0$.

HERMAPHRODITE, is generally undertood to fignify a human creature poffeffed of both fexes, or who has the parts of generation both of male and female. The term however is applied alfo to other animals, and even to plants. - The word is formed of the Greek Espargoitri, a compound of Epurs ATercury, and Apposin Venus; q.d. a mixture of Mercury and Venus, i. e. of male and female. For it is to be obferved, Hermapbroditus was originally a proper name, applied by the heathen mythologitts to a fabulous deitr, whom fome reprefent as a fon of Hermis, Micreury, and Apbrodite, Venus; and who, being defperately in love with the nymph Salmafis, obtained of the gods to have his body and hers united into one. Others fay, that the god Hermaphroditus was conceived as a compofition of Mercury and Venus; to exhibit the union between eloquence, or rather commerce, whereof Mercury was god, with pleafure, whereof Venus was the proper deity. Laftly, others think this junction in. tended to fhow that Venus (pleafure) was of both fexes; as, in effeet, the poet Calvus call Vonus a god.

M. Spon obferves, Hefychius calls Venus Aphroditos: and Theophraltus affirms, that Aphroditos, or Venus, is Hermaphroditus; and that in the ifland of Cyprus fhe has a flatue, which reprefents her with a beard like a man. -The Greeks alio call bsrmagbrodites avogaveror
andragyni, $7 . d$. men-women. See the article Androgyines.

In a treatife by Mr Hunter, in the egth volume of the Phitofophical Tranfa'tion, hermaphrodiees are disided into mazaral and asn ataral or montrous. 'The firfe belongs to the more fimple orders of animals, of which there are a much greater number than of the mare per. fect. The unnatural takes place in cevery tribe of ant. mals having diftinet fex:s, bur is more coinm $n$ in fome than in others. The human fpocies, obr autlor imagrines, lias the fewelt; never having feen them in thac fpecies, nor in logs ; but in the horfe, ftreep, and black catte, they are very fiequent.

From Mr Hunter's acce:nt, however, it does not appear that finch a creature as a perfect hermaphrodite has ever cailled. fill the hernaphodites which he had the opportunity of fering had the aftearance of females, and were gericrally faved as fuch. In the horfe they are very frequent ; and in the nool perfeecof this kind he ever faw, the eelticles had come down out of the abdomen into the place where the udder fhould have teen, and apprared like an uader, not fo pendulous as the fcrotum in the male of fuch animals. There were alf, two nippies, of which horfes have no perfect form; being blendeo in them with the theath or prepuce, of which there was none inere. The ex. ternal funale parts were exactly fimilar to thofe of a perfect female; but inflead of a cummon-fized clitoris, there was one about five or fixs inches dong; whicin when ereet, flood almolt directly backwards.

A foal afs very fimilar to the above was killed, and the following appearances were obferved on diffetion. The tellicles were not come down as in the former, poffibly becaule the creature was too young. It hart alfo two nipples; hut there was no penis pafing round the pubes to the belly, as in the perfect male afs. The external femaie parts were fimilar to thofe of the fheafs. Within the entrarce of the vagina was placed the clitor:s; but much longer than that of a true female, being about five inches long. The vagina was open a litite farther than the opening of the urethra into it, and then became obliterated; from thence, up to the fundus of the uterus, there was no canal. Ac the fundus of the common uterus it was hollow, or had a cavity in it, and then divided into two, viz. a right and a left. called the horrs of the uterus, which were alfo pervious. Beyond the termination of the tho horns were placed the ovasia, as in the true female; but the Fallopian tubes could not be found. - From the broad ligaments, to the edges of which the horns of the uterus and ovaria were attached, there palfod towards each groin a part fimilar to the round liganents in the female, which were continued into the rings of the abdominal mufcles; but with this difference, that ${ }^{-}$ there were continued with them a procels or theca of the peritoncum. limilar to the tunica vaginalis consmunis in the male afs; and in thefe thecx were fours the telticies, but no vafa deferentia could be obfervec. paffing from them.

In moft fpecies of animals, the production of hes. maphrodites appears to be the effict of chance: but in the black cattle it feems to be an eftablithed principle of their propagation. It is a well-knowa. fact, and, as far as hath yet been difcovered, appears.

Hermäthrodie.

## $\mathrm{H} E \Gamma$

Trema. to be univerfal, that when a cow brings forth two Throul:"c. pearance, the cow is untit for proparation, but the
bull-calf becomes a very proper bull. They are known not to breed; they do not even frow the leaft inclina. tion for the bull, nor does the buitever take the leaft notice of them. Among the country people in Enghand, this kind of calf is called a free martin; and this fingularity is jult as well known among the farmers as either cow or bull. When they are preferved, it is for the purpofes of an ox or fpayed heifer; viz. to yoke with the oxen, or fatten for the table. 'They are much larger than either the bull or the cow, and the horns grow longer and ligger, being very fimilar to thofe of an or. The bellow of a free mertin is alfo timilar to that of an ox, and the meat is fimilar to that of the ox or fpayed heifer, viz. much Guer in the fibre than either the bull or cow; and they are mone fufeeptible of growing fat with good food. By fome they are fuppofed to exceed the ox and heifer in delicacy of tate, and bear a higher price at market; this, however, does not always hold, and Mrifunter gives an inftance of the contrary. The Romans, who culled the bull taurus, fpoke alfo of tature in the feminine fender different from cows. Stephe ns obfreves, that it was thought they meant by this word burren cores, who obtained the name becaufe thcy did not conceive any more than bulls. He alfo quotes a paffage from Columella, lil. vi. cap. 22. "And, like the taure, which occupy the place of fertile cows, fhould be rejected or fent away." He likewife quotcs Varro, De re ruflica, lib. ii. cap. 5. "The cow which is barren is called taura." From which we may reafonably conjeelure, that the Romans had not the idea of the circumftances of their production.

Of thefe creatures Mr Hunter diffected three, and the following appearances were obferved in the mott perfect of them. - The external parts were rather fmaller than in the cow. The vagina paffed on as in the cow to the opening of the urethra, and then it began to contract into a fmall canal, which paffed on to the divilion of the uterus into the two horns; each horn paf. fing along the edge of the broad ligament laterally towards the ovaria. At the termination of thefe horns were placed both the ovaria and tefticles, both of which werc nearly about the fize of a fmall nutmeg. No Fallopian tubes could be found. To the tefticles were vafa deferentia, but imperfect. The left one did not come near the tefticle; the right only came clofe to it, but did not terminate in the body called opididymis. They were both pervious, and opened into the vagina near the opening of the urethra.-On the polterior furface of the bladder, or between the uterus and bladder, were the two bags called the ouficuld feminales in the male, but much fmaller than what they are in the bull: the ducts opened along with the vafa deferentia.

Concerning hermaphrodites of the human fpecies, much has been written, and many laws enacted about them in different nations; but the exiltence of them is ftill difputed. Dr larfons has given us a treatife on the fubjest, in which he endeavours to explode the notion as a vulgar error. According to him, all the hermaphrodites that have appeared, were only women whofe clitoris from fome caufe or other was overgrown;
and, in particular, that this was the cafe with an An. gola woman fhown at London as an hermaphrodite fome time ago.

Among the reptile tribe, indeed, fuch as worm?, fnails, leeches, \&ec. hernaphrodites are very frequent. In the memoirs of the French academy, we have an account of this very extraordinary kind of hermaphro. dites, which not ouly have both fexes, but do the office of hoth at the famie time. Such are earth-worms, round-tailed worms found in the int:Atines of men and horfes, land- inails, and thofe of frefl waters, and all the firts of leecbes. And, as all thefe are reptiles, and without boucs, M. Poupart concludes it probable, that all other infects which have thefe two characters are alfo hemaphrodites.

The method of coupling practifed in this clafs of hermaphrolites, may be illuftrated in the inflance of earth-worms. Thefe litle creatures creep, two by two, out of holes proper to receive them, where they difpofe their bodies in fuch a manner, as that the head of the one is turned to the tail of the other. Being thas Itretched lengthwife, a little conical button or papilta is thrull forth by each, and received into an aperture of the other. Thefe animals, being malc in one part of the body, and female in another, and the body hexible withal, M. Homberg does not think it impoffible but that an earth-worm may couple with itielf, and be both father and mother of its young ; an obfervation which, to fome, appears highly extravagant!

A mong the infects of the foft or bonelefs kind, there are great numbers indeed, which are fo far from being hermaphrodites, that they are of no fex at all. Of this kind are all the caterpillars, maggots, and worms, produced of the ergs of flies of all kinds: but the reafon of this is plain; thefe are not animals in a perfect Atate, but difguifes under which animals lurk. They have no bulinefs with the propagating of their fpecies, but are to be transformed into animals of another kind, by the putting off their feveral coverings, and then only they are in their perfect flate, and therefore then only Show the differences of fex, which are always in the dillinct animals, each being only male or female. Thefe copulate, and their eggs produce thefe creatures, which how no fex till they arrive at that perfect Itate again.

Hermaphrodite Flowers, in botany. Thefe are fo called by the fexoalifts on account of their containing both the antherex and fligma, the fuppofed organs of generation, within the fame calyx and petals. Of this kind are the flowers of ail the claffes in Liuncus's fexual method, except the claffics monactia and ciaccia; in the former of which, male and female flowers are produced on the fame root; in the latter, in diftinct plants from the fame feed. - In the clafs folysamia, there are always hermnphrodite flowers mixed with male or female, or both, either on the fame or diflinct roots. In the plantain tree the flowers are all hermaplirodite ; in fome, however, the anthera or male organ, in others the figma or female organ, proves abortive. The flowers in the former clafs are ftyled female bermaphrodites; in the latter, male bermaphrodites. -Hermaphrodites are thus as frequent in the vegetable kingdom as they are rare and fcarce in the animal one.

HERMAS, an ecclefistical author of the firft century ; and, according to Origen. Eufebius, and Jerome, the fame whom St Paul falutea in the end of his epifle to the Romans. He wrote a book in Greek fome time before Dumitian's perfecution, which happened in the year 95. This work is intitled The Paffor, from his reprefenting an angel fpeaking to him in it under the form of a hepherd. The Greek text is lolt, but a very ancient Latin verfion of it is ftill extant. Some of the fathers have confidered this book as canonical. The beft edition of it is that of agos, where it is to be found among the other apoftolical fathers, illuiltrated with the notes and corretions of Cutclerius and Le Clerc. With them it was tranfated into Englifh by Achbifhop Wake, the beft edition of which is that of 1710 .

Herosas, in butany: A genus of the monoecia order, belonging to the polygamia clafs of plants. The umbel in the hermaphrodite is terminal; there is an univerfal involucrum and partial ones. The rays of the fmall umbels ate lobed; the central one flower-bearing; there are five petals, and as many barren flamina; the feeds are two fold and fuborbicular. In the male the lateral umbels have univerfal and partial involucra; the fmall umbe!s are many-flowered ; there are five petals, and five fertile ftamina.

HERMES, or Herma, among antiquaries, a fort of fquare or cubical figure of the god Mercury, ufually made of marble, thuygh fometimes of brafs or other materials, without arms or legs, and planted by the Greeks and Romans in their crofs-ways.

Servius gives us the nrigin thereof, in his comment on the eighth book of the Nencid. Some finepherds, fays be, having one day caught Mercury, called by the Greeks /hcrmes, antep on a mountain, cut off his hands; from which he, as well as the mountain where the action was done, became denominated Cylleniss, from x.var.os maimed: and thence, adds Servius, it is that certain Itatues without arms are denominated Hirmefes or Herma. But this etymology of the epithet of Cyllenius contradias mofl of the other ancient authors; who derive it hence, that Mercury was torn at Cyllene, a city of Elis, or even on the mountain Cyllene itfelf, which had been thus called before him.

Suidas gives a moral explication of this cuftom of making llatues of Merctry without arms. The Hermefcs, fays he, were flatues of llone placed at the veltibules or porches of the doors atd temples at Athens; for this reafon, that as Mercury was held the god of fpeech and of truth, fquare and culical Aatues sere peculiarly proper; laving this in common with truth, that en what fide focver they are viewed, they always appear the fame.

It mult be oberved, that Athens abounded more than any other place in Hermefes: there were abundance of very fignal ones in divers parts of the city, and they were inceed one of the principal ornaments of the place. They were alfo placed in the high-roads and crofs-ways, hecaufe Mercury, who was the courier of the gods, preficed over the lhighways; whence he had his furname of T'rivius, from trivium; and that of Viacus, from wia.

From Suidas"s account, above cited, it appears, that the terms ternini, ufed among us in the door cafes, balconies, \&c. of our buildings, take their origin frcm

Vol.VIII. Part II.
thefe Athenian Hermefes; and that it was more proper to call them bermetes than termini, becaufe, though the Roman termini were fquare foncs, wheren a head was
frequently placed, yet they were rather ufed a landmarks and mere flones than as ornaments of building. See the articles Mercury and Thoth.

HERMETIC, or HERMEficas-Ait, a name given to chemillry, on a fuppofition that Hermes ग'rifinegi\{tus was the inventor thersof, or that he excelled therein. See Thoth.

Hermsitical. Philofothy is that which undertakes to folve and explain all the phenomena of nature, from the three chemical principles, fat, fulphur, and mer. cury.

Hiskratical Pbyju, or Medicine, is that fyfem o: hypothefis in the art of liealing, which explains the caufes of difeafes, and the operations of medicine, on the principles of the hermetical philofophy, and particularly on the fyltem of alkali and acid.
hermaticia Scal, a manner of thopping or cloling glafs vefiels, for chemical operations, fo very accurately;, that nothing can exhate or efcape, not even the motr fubtile fpirits. It is performed by heatian the acck of the veffel in the flame of a lamp till it be ready to mele, and then wills a pair of piscers twilling it clofe together. 'This they call putting on Hermes's feal. There are alfo other ways of fealing veffels hernetically: wiz. by ftopping them with a plug or itopple of glafs, well tuted into the reck of the vefict; or, by turning anotier ovam philofophicum upon that wherein the mater is contained.
herinharpocrates, or Hermarpocra. TEs, in antiquity, a deity, or figure of a deity, compofed of Mercury, and Harpocrates the god of Silence.
M. Spong gives us a hermharpocrates in his Rech. Cur. de l'Aniquit', p. 98. 6ig. 15 . having wings on hig feet like Mercury, and laying his finger on his mouth like Harpocrates. It is probahle they might mean, by this combination, that filence is fometimes doquent.

HERMIANI, or Hermiatite, a fect of heretice in the fecond century, thus called from their leader Hermias. They were alfo denominated Silcuciani.

One of their dillinguilhing tenets was, that God is corporeal. Another, that Jefus Chrift did not afcend into heaven with his body, but left it in the fun.

HERMIIONE (anc. geog.), a confiderable city of Argolis. It was in ruins (except a few temples) in the time of Paufanias; who fays that the new city was at the diftance of four fladia from the promontory on which the temple of Neptune flood. It gave name to the Sinus Hermionicus, a part of the Sinus Argolicus.
hermit, or Eremit, Eremita, a devout perfon retired into folitude, to te more at leifure for prayer and contemplation, and to difencumber himfelf of the affairs of this world. - The word is formed from the Greek ${ }^{6} p \mu(5)$, defert or wildernefs; and, according to the etymology, fhould rather be wrote Eremit.

Paul furnamed the Ifermit, is ufually reckoned the firf hermit ; though St Jcrome at the beginning of the life of that faint fays, it is not known who was the firlt.-Some go back to John the Baptift, others to Elias: others make St Anthony the founder of the exmitical life; but others think that he only rekind-

## H E R

Hombit led and lacightened the fervour thereof, and hold that for the firlt that practifed it. Tlue perfecutions of 1)cecius and Vakerian are fuppofed to have been the
oteation.-Several of the ancient hermits, as St An. thony, Sce. though they fived in deferts, had yet numbers of religious accompanying them.

There are alco various orders and congregations of religious dillinguifhed lyy the title of berinits; as, hermito of St Auguftine, of St John Baptifl, of St Jerom, of St Paul, sc.

Hermit (Gaytier Pcter the), a French officer of Amiens in Picardy, who quitted the military profeffion, and commenced hermit and pilgrim. Unfortunately, he travelled to the Holy Land about the year 1093 ; and making a melancholy recital of the deptorable fomation of a few Cbritlians in that country to Pope Ditan 1. and at the fome time cuthulidically lament-
 city whe the Author of Chortanity fort promid ase hin fandictrite, (h)ang gave him a fat commif. fion to earite all Chritian puincen to a general war againtt the urks and Saracens the pulleffors of the Holv has. Sue Cresabs.

HERMITAGE paperly fignifies a little but or babitation, in fone defert place, where a hermit dwelts.

Humitrose is alfo popularly attributed to any relimious cell, huile and endowed in a private and reclufe place, and thus amexed to fome large abbey, of which the fuperior was called bermita.

HEKMOFACIYL, in the materia medira, a root brought fr m 'lurkey. It is of the fhape of a heart flatted, of a white col ur, compact, yet eafy to cut or powder: of a vifcous fiweetith tate, with a light degree of acrimony. Hermodactyls were of great repute among the ancients as a cathartic; but thole we now meet with in the flops have very little purgathe virtue; Neumann declans he never found them to have any effect at all. - The hermodactil is the root of the Colchicum variegatum, according to fome; others fuppofe it to be the ront of the Iris tuberofa.

HERMOGENES, the firit and mof celebrated architcet of antiquity, was, accordines to lituvins, born at Alanbada, a city in Caria. He built a temple of Diana at Magnetia; another of Bacchus at Tros; and was the inventor of feveral parts of arelitecture. He cornpofed a book on the fubjeet, which is lot.
Hekmogengs-Tarfenfes, a rhetorician and orator, and who was in every refuct a prodigy. At 17 years of age lee publiflied liis fyilem of rhetoric, and at 20 lis philofophic ideas: but at 25 he forgot every thing lie had known. It is faid, that his budy being opened after his death, his heart wis fomud of an extracodinaly fize, and all over hairy. He died about 368 B. C.

HERMOGENIANS, a fuet of ancient hereties, denominated frum their hader Hermoge nes, who hised Lowards the clofe of the fecond century. Hermoenes; citabliffed matter as his frit principle; and regancing matter as the foubtain of ail evil, he mainsaned that the world, and every thing contaned in it, as alfo the fouls of men and other finits, were formed by the Deity from an uncricited and ctewal mafs of corragt
matter. The opinions of Hermogenes, with regard to the origin of the world and the nature of the focl, were warmly oppofed by Terallim.

The Ifermogenians were divided into fevera! branehes under their refpective chieftains, iz. Hermiani, Belcucians, Materiari, \&ce.

HERMON, or Aermos (anc. reoz.); a momtain of the Amorites, called Sanior by the Phomicians, and Samir or Swir by the Amorites, on the calt of Jerdan. It is alfo called Sion, (Mofes) : bue mult not be confounded with the Sion of Jerutalem. By the Sidonians it was calle! Scirion ; in the walzate, it is called Sarion. Jolua inf,rins us, that it was the dominion of $\mathrm{O}_{5}$ king of Bah n ; which mult be un. derfood of its futh fide. It is never particulatly mentioned by profanc whiters; being comprifed under the appellation $L$ ithan:s, or Antilitunts. with which momana is is joined to the eall. It is alfo called hermonim plurally, Pfdin slii. 6. becaufe it was extenfive, and comtained leval momazins.

HERAE'S (anc. geog.), a river of Ionia; which riting near D , rytem, a town of Phrygis, in a mountain facred to Dindyme or Cytale ronehed Myfa, and ran through the Regis Combula, then through the plains of buyma down to the fea, carrying ahng with it the Pactolus, Hivilus. and other lefs noble rivers. Its waters were faid to roll domn gold, by Virgil and nither poets.

HERAANORIA, Jack-in-a bot-tree: A genus of the triandria order, belongimg to the moncecia elufs of plants; and in the natural method ranking under the 3 Yth order, Tricocce. The male caly x is tripartite; the corolla triperatous: the female calix is truncated, quite entire ; the corrolla hexapetalous; the phom hollow, and open at the mouth or upper part, with a loofe kernel.

Species. 1. The fonora, or common jack-in-a-ber:, is a native of both the ladies lt grows 20 or 30 feet high ; and is garnifhed with broad peltated leaves, and monercimes flowers, fucceded by a large forollen hollow frut tormed of the calys; laving a hole or open at the end, aod a lard nut within. The wind blowing into the canty of this fuit makes a very whithng and ratting mole, whence comes the name. 2. The ovigera grous many feet high, garnithed with large oval leaves not peftated; and moriecions flowers, fucceeded by a fwollen fruit open at the cod, and a nut within.

Ufis. The fonora, in Jva, afiords a fure antidute agandt poifon, if you either put its fmall roots on the wounds or eat them; as was difeovered to Rumphius by a captive woman in the war between the perple of Macaiar and the Dutch in the year 1067 . The foldiers of the former always carry this root about them, as a remedy againt wounde with poifonous arrows.

Culure. Both thele plants being tender exotics, mut be planted in pots of rich earth, and always kept in a hot houfe; in which, ontwithatanding all the care that ean be taken, they feldom flower, and never grow beyond the height of common thrubs, tho' in the places where they are naives they arrive at the height of trecs. They are propagated by feeds procured from the Weft ludies.

HERNE, a town of Kent, 6 miles from Canterbu. ry, 12 fiom Margate, and $1+$ from Eeverham. It formerly

## H E R

merly had a market, and has now a fair on EaiterTuefday. The church is a large ancient frutiure, with a tower of flint, and has fix ftalls of the cathedral kind, with divilions of the choir from the nave by a carved fcreen of oak. The church is 113 feet long. The ftone font is very ancient. Here the great Dr Ridlcy, the Englifh martyr, was vicar. Here is a commodious bay, frequented by colliers, \&c.

HERNIA, in medicine and furgery, a defcent of the intelines or omentum out of their natural place; or rather, the tumour formed by that defcent, popularly called a rupture. The word is Latin, hernia, and originally fignifies the fame with tumor fcroti, called alfo ramex. Prifcian obferves, that the ancient Marfy gave the appellation bernia to rocks; whence fome will have hernias thus called propter duritiom, on account of their hardnefs. Scaliger choofes rather to derive the word from the Greek igvos, ramus, branch. See (Index to) Surgery.

HERNIARIA, ruptire-wort: A genus of the digynia order, telonging to the pentzndria clafs of plants; and in the natural method ranking under the 1uth order, Surmentaces. The caly x is quinque partite; there is no corolla ; there are five barren Itamina, and a mo nofpermous capfule.

Species. There are four fpecies, of which the only remarkable one is the glabia, or fmooth tupture-wort, a native of many pats of England. It is a low trailing plant, with leaws like the fmaller checkweed; the flowers conse out in clutters from the fide of the ftalks at the joints, and are of a yellowifh green col ur.

Ufes, \&c. This plant is a little fattith and aftringent. The juice takes away fpecks in the eye. Cows, theep, and horfes, eat the plant; goats and fwine refufe it.

HERO, in Pagan mythology, a great and illur. trious perfon, of a mortal nature, though fuppofed by the populace to partake of immoreality, and after his death to be placed among the number of the gods. The word is formed of the Latia beros, and that of the Greek "A"s fomiderts, "demi-god" -This Greeks erecter columns and other monumients over the tumbs of their heroes, and e!lablifhed a kind of worhp in honour of the manes bith of their heroes and heromes. The Romans alfo raifed thatues in homour of their heroes; but there were lix of their heroes of a fuperior order, and who were fuppofed to be admitied into the community of the twelve great gods: the fe were Hercules, Bacchus, Efculapius, Romulus, Caftor, and Pollux. Writers have dittinguifhed between the wormip which the ancients paid to their heroes and that offered to their geds. The latter, it is faid, confitted of facrilices and libations; the former was only a kind of funcral honour, in which they celebrated their ex. ploits, concluding the rehearfal with fatts.

Hero is alfo ufed in a more extenfive fenfe, for a great, illuftrious, and extracedinary perfonage; particulatly in ufpect of valour, courage, intrepidity, and other militany virtues.
F. Bouhours makes this diflinction between a great man and a hero, that the latter is more daring, fierce, and enterprifing; and the former inore prudent, thoughtful, and referwid. In this fenfe we properly fay, Alcxander was a hero, Julius Cxfar a great man.

HERO of a poem or romance, is the principal perfonage, or he who has the chief part in it. Thus the hero of the Lliad is Achilles ; of the Odyfiey, Uly fees ; of the Reneid, Aineas ; of Taifo's Jerufalem, Gudfrey of Bulloign ; of Milton's Paradife Loll, Adam; though Mr Dryden will have the devil to be Milton's hero, becaule he gets the better of Adam, and drives him out of Paradife.

Hero, in fabulnus hiltory, a famons prietefo of Venus, lived at Abydos, in a tover fituated on the banks of the Hellefpont. She being beloved by Leander, who lived at Seftos on the other fide of the ifrait, he every night fwam over to vilit her, being directed by a light fixed on the tower. But the light being put out in a formy night, the youth mifled his way, and was drownet; on which Hero threw herfelf into the fra, and perilhed.

Hero, the name of two celebrated Greek mathematicians; the one called the old, and the other the young, Hero. 'Tlie younger was a difciple of Ctefibius. They are known by two works tranflated iuto Latia by Barochius: Spiraliam liber, by Hero femor; and Tratat. arlis at macbin. militar. by Hero junior. They flourifhed about : 30 and 100 B . C.

HEROD, falfly flyled the Great, king and execrable tyrant of Judiea; who, on the ftrength of a milinterpreted prophecy, caufed all the male children of Bethlehem and its neighbourhood to be maflacred by his foldiers at the time of the birth of Chrilt, in the vain hope of dettroying the Saviour of mankind. He died, caten with wurms, two or three years after the birth of our Saviour, at the age of 71 , after a reign of to years. He had ordered that all the perfons of quality, whom he kept in prifon, ihould be maflacred the moment the breath was out of his body, in order that every confiderable family in the kingdom might fhed tears at his death; but that inhuman order was not executed.

HERODLAN, an eminent Greek hiftorian, who fpent the greatelt part of his life at Rome, flourifhed in the third eentury, in the reigns of Severus, Caracalta, Heliogabahus, Alexander, and Maximin. Hishitlory begins from the death of Marcus Aurelius the philofopher ; and ends with the death of Balbinus and Maximin, and the begitaning of the reign of Gordian. It is sritten in very elegant Greek; and there is an excellent tranllation of it into Latin, by Angelus Politianus. Herodian has been publithed by Henry Stephens in 4to, in 1581 ; by Boecher, at Strafburg, in 1662, $8 v 0$; and by Hudfon, at Oxfurd, in 1699, svo.
HERODIANS, a fect among the Jews at the time of our Suviour ; mentioned Math. xxii. 16. Mark iii. 6.

The crities and commentators are very much divided with regard to the Herodians. St Jerom, in his Dialogue againft the Luciferians, takes the name to have been given to fuch as owned Herod for the Meflab; and Tertullian and Epiphanius are of the fame opinion. But the fance Jerom, in his Comment on St Mathew, trcats this opinion as ridiculous; and maintains, that the Pharifees gave this appellation by way of ridicule to Herod's foldiers who paid tribute to the Romans; agreeable to which the Syrian interpreters render the word by the doneflics of Herod, i. e. "his

Heradotus. courtiers." M. Simon, in his notes on the 22 d chapter of Nathew, advances a more probable opinion. The name Herodian he imagines to have been given to fach as adhered to Herod's party and intereft; and were for preferving the government in his family, about which wete great divifions among the Jens.-F. Harduuin will have the Herodians and Sadducees to have been the fame.-Dr Prideaux is of opinion that they derived their name from Herod the Great, and that they were diflingumed from the other Jexs by their concurrence with Htrod's fcleme of fulyset. ing himielf and his dominions to the Romans, and likewife by complying with many of their heathen ufages and culloms. This fymbolizing with idolatry upon riews of interett and worldly policy, was probably that leaven of Herod, againtt which our Saviour cautioned his difeiples. It is farther probable that they were chiefly of the feet of Saddacees; becaufe the leaven of Herod is alfo denominated the laven of the Sadducees.

HERODOTUS, an ancient Greek hiftorian of Halicarnatfus in Caria, fon of Lyxus and Dryo, was born in the firlt ycar of the $7+$ th Olympiad, that is, about $4^{8}+\mathrm{B} . \mathrm{C}$. The city of Halicarnalfos being at that time under the tyranny of Lygdamis grandfon of Artemifia queen of Caria, Herodotus quitted his country and retired to Samos; from whence he travelled over Egypt, Grecce, Italy, Sic. and in his travels acquired the knowledge of the hittory and origin of many nati ns. He then began to digeft the maecrials he lad collected into order, and compofed that liflory which has preferved his name among men ever fince. He wrote it in the inle of Samos, according to the general opinion.-- Lucian informs us, that when Herodotus left Caria to go into Gieece, he began to conlider with himfelf,

> What he thould do to be for ever known
> And make the age to come his nwn,
in the molt expeditions way, and with as little trouble as pofible. His hiltory, he prefumed, would eafily frocure him fame, and raife his name among the Grecians in whole favour it was written: but then he forefaw that it would be very tedious to go through the feveral cities of Greece, and recite it to each refpective city; to the Athenians, Corinthians, Argives, Lacedemonians, \& E. He thought it moft proper therefore to take the opportunity of their affembling all together: and accordingly recited his work at the olympie games, which rendered him more famous than even thofe who had obtained the prizes. None were ingorant of his name, nor was thene a fingle perfun in Greece who had not feen himathe Olympic games, of heard thofe fpeak of him whu had feen him there.

His work is divided into nine books; which, aceording to the computation of Dionyfins Halicamaffenfiz, contain the moft remarkable occurrnces within a period of 240 years; from the reign of Cyrus the firt hing of Perlia, to that of Xerses when the hiftorian was living. Thefe nine books are called after the names of the nine mules, each book being ditinguifhed by the name of a mule; and this has given birth to two difquifitions among the learned: 1. Whether they were fo called by Herodotus himfelf; and, 2. For what realon they were fo called. As to the furt, it is generally agreed that Herodotus did not impofe thele names bimfelf; but it is not agreed why they were
impofed by others. Lucian tells us, that thele names Herodotu were given them by the Grecians at the Olympic games, when they were firll recited, as the bell compliment that could be paid the man $\boldsymbol{w}$ ho had taken pains to do them fo much bonour. Others have thought that the names of the mufes have been fixed upor them by way of reproach; and were defigned to intimate, that Herodotus, initead of true hiftory, had written a great deal of fable. Bot, be this as it will, it is certain, that with regard to the truth of his hittory, he is aceufed by feveral authors; and, on the other hand, the has not wated perfons to defend him. Aldos Manutios, Juachim Camerarius, and Henry Stephens, lave written apologies for him; and, among other things, have very joftly obferved, that he foldom relates any thang of doubtful credit without producing the authority on which his narration is founded; and, if he luas no certain authority to fix it upon, ufes always the terms ut firunt, ut erg audivi. \&c.

There is alcribed alfo to Herodotus, but fallely, a Life of Homer, which is ufnally printed at the end of his work - He wrote in the Ionic dialect, and his flyle and manner have ever been admired by all people of talte. There have been feveral editions of the works of this hillorian; two by Henry Stephens, one in 1570, and the other in 1592; one by Gale at London in 1679; and one by Gronovins at Leyden in 1715 , which is the lall and beit, though not the beft printed.

HEROIC, fomething belonging to a hero, or heroine. Thus we fay, heroi: actions, beroic virtue, beroic llyle, heroic vcrle, beroic poct, beroic age, \&e.

Heкole Afs, is that age or period of the world wherein the beroes, or thofe called by the pocts the children of the gods, are fuppoled to have lived.-The heroic age coincides with the fabubous age.

Heknic Puem is that which undertakes to deferibe fome extraordinary ation, or enterprize. Homer, Virgil, Statius, Lucan, 「alfo, Camoens, Miteon, and Voltaire, have compofed heroic poems. In this fenfe, beroic poen coincides with epic poem.

Herorc $V_{\text {evje }}$ is that wherein heroic poems are ufiully compofed; or, it is that proper for fuch poems. In the Greek and Latin, hexameter verfes are peculiarly denominated horaic verfes, as being alone ufed by Homer, Virgil, \&c. Alexandrine verles, of iz fyllables, were formerly called beraic verfes, as being fuppofed the only verfe proper for hevoic poetry; but later writers ufe verfes of ten fyllables.

HEROINe, Heroina, or Herois, a woman that has the qualities and virtues of a hero, or that has done fome heroic action.

HERON, in oathology. See Ardea.
This bird is a very great devourer of fith, and will do more mifchief to a pond than even an otter. Some fay that an heron will deftroy more fill in a week than an otter will in three months; but that feems carrying the matter too far. People who have kept herons, have had the curiofity to number out the filh they fed them with into a tub of water; and counting them. again afterwards, it has been found that a heron will eat 50 moderate-fized dace and roaches in a day. It has been found, that in carp ponds vifited by this bird, one heron will eat up 1000 Hore carp in a year, and will hunt them fo clote that very few can efcape. The readief method of deftroying this mifchievons bird is by fihing for him in the manner of pike, with a

## H E R

Herper baited hook; the bait confiling of fmall roach or ! ferring.
dace, and the hook falkened to one end of a flrons line, inade of filk and wire twilled together. 'To the
other end of the line is fatened a ftone of a pound weight; and feveral of thefe baited liues being funk by means of the done in different parts of the pond, in a night or two the heron will not fail of being taken by one or other of them.

HERPES, in medicine, a bilious puftule, which breaking out in different manners upon the flein, accordingly receives different denominations. See (the Index fubjoined to) Medicine.

HERRERA tordesillas (Anthony), a Spanith hiforian, was fecretary to Vefpafian Gonzaga viecroy of Naples, and afterwards liftoriograplecr of the Indies, under king Philip II. who allowed him a confiderable penfion. He wrote a general hiltory of the Indies, in Spanith, from ${ }^{1}+92$ to $155+$; and of the world (not io much ateemed), from $155+$ to 1598. He died in 2625 , aged about 66 .

Hekrer.s (Ferdinand de), an eminent Spanifh poet, of the 16 th century, wa born at Seville, and principally fuceceded in the lyric kind. Befides his poems, lee wrote notes on Garcilaffo de la Vega, and an account of the war of Cyprus, and the battle of Le-* panto, \&c.

HERRING, in ichthyology, a fpecies of Clepea.
The name kerring is derived from the German beer, an arney, which expreffes their number, when they migrate into our feas. Herrings are found in great plenty from the highent northern latitudes as low as the northern coafts of France They are alfo met with in valt hoals on the coatt of America, as low as Carolina: they are found alfo in in the fea of Kamtfehatka, and poffitly reach Japan: but their winter rendezwous is within the aretic circle, whitber they retire after fpawning, and where they are provided with plenty of infect food. For an account of the remarkable migration of herrings, and the hiftory of the fifhery, sic. fee Clupea and Herring-Fisherr.

They are in foll roe it the end of June, and continue in perfection till the beginning of winter, when they begin to depolite their pawn.

There ate different names given to preferved herrings, according to the different manners wherein they are ordered: $\mathrm{a} 9,1$. Seafficks; which are fuch as are caught all the fifhing feafon, and are but once packed. A barrel of thefe holds fix or eight hundred; eight barrels go to the tun by law; a hundred of herrings is to be a hundred and twenty; a latt is ten thoufand, and they commonly reckon fourteen barrels to the latt. 2. There are others, repacked on thore, called repackad berrings ; feventeen barrels of fca-fticks commonly make from twelve to fourteen of repacked hernings. The manner of repaeking them is, to take out the herrings, wath them out in their own pickle, and lay then orderly in a frefh barrel: thefe have no falt put to them, but are clofe packed, and headed up by a fworn cooper, with pickle, when the barrel is half full. The pickle is brine; fo flrong as that the herring will fxim in it 3. Summers, are fuch as the Dutch chafers or divers catch from June to the 15 th of July. Thefe are fold away in fea-lticks, to be fpent prefently, in regard of their fatnefs; becaufe they will not endure repacking. They go one with another, full and foot

Vol. VIII. Part II.

As for the manner of falting kerrings. The nets beings haled on board, the fiffes are t?ken out, and put into the warbacks, which fand on one fide of the veffels. When all the nets are thus unloaded, one filis the gippers balkets. The gippers cut their throats. take out their guts, and fing out the full harrings into one barket, and the thotten into another. One ma:r takes the full batket when they are gipped, and carries them to the rower-back, wherein there is falt. One boy rows and firs them about in the falt, and another takes them, thus rowed, and carries them in bafkets to the packers. Four men pack the herring; into one barrel, and lay them, one by one, Araight and even; and another man, when the barrel is full, takes it from the packers. It is left to fland a day, or more, open to fettle, that the falt may melt and difolve to pickle; after which it is filled up, and the barrel headed. The pickle is to be ftrong enough to futtain a herring; otherwife the fifh decay in it.

Herring (Thomas), archbihop of Cantcrbury, was the fon of the rev. Mr John Herring, rector of Walfoken in Norfolk, where he was born in 1693. He was ecuucated at Jefus-college, Cambridge; was afterwards chofen fellow of Corpus Chritit College, and continued a tutor there upwards of feven years. Having entered into priff's orders in 1719, he was fueceflively minifter of Great Shelford, Stow cum Qui, and Trinity in Cambridge; chaplain to I)r Fleetwood, bithop of Ely; rector of Rettingdon in Effex, and of Darly in Hertfordihire; pracher to the Society of Lincoln's 1 nn , chaplain in ordinary to his late majefty, retor of Blechingly in Surry, and dean of Rucbefter. In 1737 he was confecrated bihop of Bangor, and in 1743 tranflated to the archiepifcopal fee of York. On the death of Dr Potter in 1747, he was tranflated to the fee of Canterbury; but in 1753 was feized with a violent fever, which brought him to the brink of the grave; and after languithing about funr ycars, he died on the 13th of March 1557. He expended upwards of fix thoufand pounds in repairing aud adorning the palaces of Croydon and Lambeth. This worthy prelate, in a molt eminent degree, poffefed the virtues of public life; his mind was inlled with unaffected piety and benevolence, he was an excellent preacher, and a true friend to religig ous and civil liberty. After his death was publifled a volume of his fermons on public occafions.
herrnhut, or Herrinuth, the fift and moft
$3 \mathrm{O}_{3}$.
confiderable

## H E R

Ifresinat ronfoderable fettlement of the Uaited Prethren, commonly called Moravians, fituated in Crper lufatia, ufon an eftate betonging to the family of Nicolas I.en is Comnt Zintendurf, abont 50 miles eatt of Derf. den. See theaticle Unated lirethen.

The huilding of this place was begua in $1-=-$ ly fore cunigrants from Moravia, who furfook the ir pof-- Hhoms on account of the perfecution they faffecel as Protellants from the Roman Catiolies; and heing well received 1 y Couet Zinvendorf, cleated a Tpot of ground alluted to them bey him apori the rife of an bill called the Haterg, or Wisth-hill, from which they took ocalinn to call the new fettement /hermbat, or the Watch of the Lourd. More emigrants taking refuge with them, and many other perfons joining their congregation, the buildings increafed conliderably; and at prefent. Ierrahut is a regular and well buile village, containing about 1300 iuhabitants, all inembers of the Charell of the Whited Brethern. Befides the minither and lis affitants, a warden is appointed, who prefies in the vetry, and fuperintends the temporal concerns of the fettement. The Brethren difo tinguifl themfelves ly a plain and unifurm deds, the women having retained the drefs of the connties from which the firit emigrants proceeded, not from any fuperfitious attachment to old forms, but fiom a delire to prectude vanity and ufelefs experice. As mott of the fettlements of this community refemble each other, both in the difpofition of their buildines and in their internal regulations, we will give a fhort Actech of Herrmhut, as the pattern from which the reft were copied, though there are others in which the buildings are more regularly planned. The chapel, which is fituated in a large fyuare, is a fpacious and neat building, furnifhed with a good organ and moveable forms, but no pexs. The men fit on one fide, and the women on the other, entering at fiparate doers. Belides the whal Smaday's fervice, the cungregation meets here every evening and the chiddren every morming. The dwellings of the minifter and warden of the congregation fum one, and a fehool-houfe the other, wing to the chapd. From the chapel an avenue of trees leads to the burying-gromen, which is a large fquare field on the declivity of the Hutberg, and at fome dilance from the village. Several walls bordered by trees, and furnilhed with feats, furround and interfect it. The grave-ftones and graves are all of equal fize, and placed in regular rows; only the valt of Comit Zinsendorf, as lond of the manor, is larger than the relt. Berinls are performed with freat folemity, but no moneming deffes ufed.-On oue tide of the fquare, it which the chapel thand, is a large building, inhabited by the lingle men, with workhops, out-honles, and gardens, exclufive of the dwelling rooms. The main buidding contains a neat chapel, in which a thort norning and evening fervice is performed for the inhabitunts; a dining.fill ; and a dornitory, in which each has a feparate bed. The latter is a lufty room, furnithed with large windows and ventilators, ${ }^{\circ} \mathrm{Fo}$ as to admit and preferce a pure air. For the fick, apartments are allotted, and fick waiters appointed. The number of inhabitants in one room is proportioned to its fire, but theee are many who have rooms to themfehes. No one lise here by compulfon. Each in-
luabitant pays for rent and boand a moderate fum, fix. Hewhat ed by a committee of overfeers, in which the warden of the houfe prefides; whofe budinefo it is to maintain grood order, attend to the exreraal wilfare of the houfe and its inhabitants, and by his adviceand ativity to perent arery evil arifing from external forres. Befide; the warden, an umarried dergymon refides in the home, appeinted to attend to the mord conduct and firitual concoms of all the lingie men belonging to the congregation. He hears their com. plaint, aftits them with gomd advice, and wess adi his infactuce fur thair benefir, and for the prevention of any wit that would undermine their fipitual happi-nefs.- On the other fide of the fquare is another large buiding, mabited by fugle women; with a chapel, dining lall, dormitury, and a large garden. 'The internal regulations are exactly the fatne with thote of the homfe of the haghe men. 'There are likewife houles for widowers and widows, who lind in them an agree. able retreat, with baard and lodging. The poor are cared for and maintained; for which purpole deveral charitable buttitutionsexill in the cougregation.- The manor-houte, the houfe of Count Reafs, the hap and linen warchoule, are the mon contiderable buildings in Herrnhut; the family houles are buite in regular Arcets, opening iato the fquare. Both the Areeto and houfes are kept clean; and befides a watchman at night, an offece is appointed to attend to good order in the day. Alilltangers are treated with civility ; but neither drunken nor diforlerly vilitors nor beggars are fuffered to infell the ftreets. The latter receive an alms, and are then defired to proceed. The principal trade cartied on at Herrmbut is in linen; befides which the work done there by taylors, glovers, !loemakers, cabinet-makers, hilveifniths, and other artificers, is well known for its frood quality. They have their firit prices, and never make any abatement. Every workman receives his wages ; no commanity of goods exithing among the brethren, as is falifly fuppofed; and the contributions towards the fupport of the ellablifhment at large, the millime, and other charitable inditutions, are voluntary. The building and increafe of thi. Settement uccationed no fmall furprife in the adjacent country; and both in 1732, 1736, and 173 ${ }^{\circ}$, commiffioners were appointed to examine into the docarines and procectings of the hethern at Herrahnt. The cominithoners made a favouratle report; and ever fince both Hermhut and other fethements of the United Brethrea in Saxay have been protected, and even feveral immunitics offered them by the court, but not accepted. Herrnhat was silited in 1 - 6 or by the late Emperor Jofeph 11. after his veturn from breflen, by the prefent king of Prullia, and by keneal other royal perfonages, who exprefled their fatisfaction in examining ats pectiar tegulation: The Unired Brethen have fettements in saxomy, Silefia, and other parts of Gemany ; in Fulland, Dennark, England, Ireland, and America. In En. lamb, their pincipat fettlements are at Fuhee near Lecels, and Foiffich near Manchetler. In Grcealand, North and Suath America, the Wed Indie, and Ruflia, they have mitfons for the propagation of Chrikianity among the beathen ; and in many parts have had comblerable fuecefs. cernhut, of the Church of the Bretbren, Halle 1781; and Cranzz's Hifory of the Brettron, London 1780.

Hfrrnaut (Neal), the firl mifion fettement of the United Brethren in the inand of St 'Thomas in the Wefl Indies, under Danifh government, begun in 1739; their minitionaries laving endeavoured to propagate Cluitlianity among the negro flaves ever fince $1 ; 3^{1}$, and foffered many hardthips and perfecutions, from which their converts were not exempted. Many of the planters finding in proeff of time that the Chrittian dlase; were more trattable, moral, and induftrious than the heathen, not only countenanced but encouraged their cudeavonirs. Thefe were alfo greatly facilitated by the protection of the king of Denmark, Chrifian VI. The fectlement confifts of a fpacious negro church. a dwllling-hoonfe for the miffionaries, negro huts, out-houfes, and gardens. From this place the inands of St Croix and St Jan were at lirtt fup. plied with miffionaries; and the Brethren have now two fettenemts in eacl. The negro converts betonging to their church amount in thofe three iflands to near 8000 forls.
$H_{\text {ккекнит }}(\mathrm{Nezu})$, is alfo the name of the oldeft miffion fettlement of the United Betliren in $G$ reenland. It is fitluated on Banls River, a few miles from the fea, near Davi,'s Streight, on the wetiera coalt of Grecmland, thot far from the Danih colony Godhaab. The two firt miftionaric, were fent from Hecrulut in the gear 1733, nnd their landable intentions favourd by Chrititian 11 . king of Denmark. They had to druggle is this uncultivated, frozen, and favage connitry, with inconceivable liardhip, and found at firt great difficulty in acquiring the language of the natives. However, after fix yeart habsur and perfecerance, they had the fatiffaction to baptixe four perfous, all of one fanily; and from that time the million began to prolper, fo that in the finceceding ycars two other fettements were begun, called Lichunels and Lichtunan: All of them continue in prufperity. About 130 , of the natives have been chrillianized fince the begriming of this mifiton. See Crantz's Hyjiory of Girctaluad, London, $157 \%$.
HERSE, in fortification, a latice, or poreullis, in form of an harrow, befet with iron fpike. The word herfe is Frencli, and literally fignifies "harrow;" being formed of the Latin berpex or irpex, which denotes the fance. It is ufually hung by a rope fattenced to a moulinct; to be cut, in cale of furprife, or when the firt gate is broken with a petard, that the herfe may fall, and fop up the paiflage of the gate or other entrance of a fortrefs.
The herfe is otherwife called a farrafin, or cataraft; and when it confifts of ftraight flakes, without any crofs-pieces, it is called orgues.
Herse, is alfo a harrow, which the beficged, fur want of checaux de frife, lay in the way, or ia breaches, with the points up, to ineommude the march as well of the horfe as of the infantry.

HERSILLON, in the military art, a fort of plank or beam, ten or twelle feet long, whofe two fildes are drove full of fipikes or nails, to incommode the march of the infantry or cavalry. The word is a diminutive of berfe; the herillon duing the office of a little berfe. Sce Herse.

HERTford. Sec Habtford.
hertha, or Herthus, in mythology, a deity
workipped by the ancient Gurmans. This is mentioned by Tacitus, in his book De Moribus Germanorunn, cap. 40. Voffus comjectures, that this godderis was Cybele: hur fle was more probably 'Terra or the Earth; becaufe the Germans gill ofe the word bere for the earth, whence alfo the Engliih carth.

HERTZBERG, a confidrable town of Gernany, in the electurate of Saxony, and on the confines of Lufatia. E. Long. 13.37. N. Lat. 51. 42 .

HERVEY (Iames), a late divine of exemplary piety, was born in 1714, and fuccecded his father in the livings of Wefton Fawll and Collingtree in Northhamptonfhire. Thefe being within five miles of eads other, he attended alternately with his curate; till being confined ly his ill health, he relided confantly at Wefton; whete he diligently purfued the habours of the miniftry and his fludy, under the difadvantage of a weak conflitution. He was remakably charitable; and defired to die jult even with the world, and to be, ats he termed it, his own executor. 'I his execllent divine died on Chrifmas-day 1758 , leaving the litite he poffented to buy wam cleathing for the poor in that fevere feafon.-Nowork is more generalls, or deferved. 1y kuown than his Meclitations and? Contemplations: contaming, Meditations among the Tombs, Reflections ons a Ikwergarden, a Defcant on Creation, Contempha. tions on the Night and Stary E-avens, and a With ter-picee. The fullime fentiments in thefe pieces have the pectiar advantage of being conveyed in a flowing clegant language, and they have accoldingly gone thro" many editions. IIe publithedbelides, Remarks on Lored Buanguroke's leatas un hifhory; Theron and Afrofor, or a Sorics of Didugues and hethers on the miff imporiant fuljects; fome fumons, and uther traets.
HExtaz Illam', one of the South. Sea iflands dificoveted by Captain Cow, Septomber 23. 17-3, who gave it that name in hem our of the cafl of britul. It is a low iflamb, lituated in IV. Long. 158. if. S. Lat. 19.8.
IHESBON, ESEm, or Mcfolun (anc grog.), the rozal city of the Amwites, in the tribe of Renden, ace cording to Mufes: Thuagh in Johua xxi. 39. where it is reckoned among the lecvitical cities, it is put in the tribe of Gad; which algucs its fituation to be on the confines of buth.

HESIOD, a very ancient Greck poet; but whether cotemporary with Honer, or a little older or younger than him, is not yot agreed among the learned ; vor is there light enough in antiquity to fettle the matter exactly. His father, as he tello us in his Ofer. it Dies, was an iuhabitant of Cuma, one of the Eolian ines, now called Taio Siora; and removed from thenee to Afera, a hittle village of Bootia, at the foot of mount Helicon, where Hefiod was probably born, and called, as he often is. Alurat, fromit. Of what quality his father was, is iwwhere faid; but that he was drwen by his misfortumes from Cuma to Afera, Hefiod bimfelf informs us. His father feeras to have prof. pered better at Afcra than he did in his own country; yet Hefiod could arrive at no higber forture than keeping theep on the top of monet Helicon. Here the mufes met with him, and entered him into then fervice:

Frewhite an ther the thenterd fwain behold,
feeding beneath the fased moune his foll,
With iove of charesing fore him trealt they fiod,
'Here ne the teav'nly mufes fift infpir'd;
't here, when the macis of Jovet e likence ibreke.

Hefsan'.
infol To this account, which is to be found in the beginning Il of his Ceneratio Deerum, Ovid alliudes in thefe two lines:

Firraarti ge: indes villitibus Ajur, tuis.

Nor Clio nor her fifter have ! feen,
As Hoctiod faw them in the iffetzan yreen.
On the death of the father, an eltate was left, which ought to have been equally divided between the two bruthers Hefiod and Perfes; but Perfes defrauded him in the divifion, by corrupting the judges Hefiod was fo far from refenting this imjuttice, that he expreffes a concern for thofe mittaken mortads who place their happinefs in riches only, even at the expence of their vistue. He lata us know, that he was not only above want, but capable of affining his brother in time of need; which he often did though he had been fo ill ufed by him. The laft eircumftance he mentions relating to himfelf is his conquerl in a poctical contention. Archidamus, king of Eubcea, had inttituted funeral games in honour of his own memory, which his fons attenwards took care to have performed. Here He fied was a competion for the prize in postry; and won a tripod, which he confecrated to the mufes. Hefiod having entered himflelf in the fervice of the mufes, leit off the paforal life, and applied himalf to the ftudy of arts and learning. When he was grown old, fur it is agreed by all that he lived to a very great are, he removed to Locris, a town about the fame ditance from mount Parnaflus as Afra was from Heliron. His death was tragical. The man with whom he lived at Lecris, a Miletan born, ravihed a maid ist the fame honic; and though Heliod was entirely ig. morant of the fact, yet being maliciouly accufed to her trothers as an accomplice, he was injurioully مain with the ravifher, and thrown into the fea. the Theogory, and Works and Days, are the only undoubted pieces of this poet now extant : though it is fuppofed that thefe poems lave not defeended perfect and finished to the prefent time. A good edition of Hefiod's works was publifhed by Mr Le Clere at A.miterdam in 1701.

HESPER, Hesperus, in aitronomy, the evening itar; an appellation given to Venus when fhe follows ur fets after the fun. 'The word is formed of the Greek Eserfer; and is fuppofed to have been originally the proper name of a man, brother of Atlas, and father of the Hefperides.

Diodorus, lib. iii. relates, that Hefperus having afiended to the top of mount Atlas, the better to obierve and contemplate the flars, never returned more; and that hence he was fabled to have been changed mito this ftar.

HESPERIA, an ancient name of Italy; fo called by the Greeks from its wellern fituation. Hefferia was alfo an appellation of Spain; but with the epithet alima (Hor.), to dilinguifh it from Italy, which is called Hefperia magna (Virg.), from its extent of empire

HESPERI cornu, called the Great Bay by th. author of Hanno's Periplus ; but mot interpreters, following Mela, underfland a promontory; fome Cape Verd, others Palmas Cape : Volfins takes it to be the former, fince Hanno did not proceed fo far as the latter eape.

HESPERIDEE, in botany (from the Hefperides) ; golden or precious fruit: the name of the sth order in Linnxus's Fragments of a Natural Method. Sec Botany, p. 46 .

## H E S

HESPERIDES, in the ancient mythology, were Hefieride the daughters of Hefper or Hefperus, the brether of Atlas. Accurding to Diodorus, Hefperus and Athas, two brothers who poffeffed great riches in the weltern parts of Africa. KIefperus had a daughter called Hefperia, who married her unele Atlas, and from this marriage procected feven daughters, called Hsferidfes from the name of their mother, and stlantides from that of their father. According to the poets, the Heflerides were three in number, Fgle, Arcthufa, and Hefperthufa. Hefied, in his Theogony, makes them the daughters of Nox, Night, and Seats them in the fane place with the Gorgons; viz. at the extremities of the weft, near mount Atlas: it is on that aecount he makes them the daughters of Night, becaufe the fun fets there. The Hefperides are reprefented by the ancients as having the keeping of certain golden apples, on the other fide the octan. And the pocts give them a dragon to watch the garden where the fruit grows: this dragon they tell us Hercules new, and carried off the apples.-Pliny and Solinus will have the dragon to be no other than an arm of the fea, wherewith the garden was encumpanied, and which defended the entrance thereof. And Varro fuppofes, that the golien apples were uothing bat thecp. Others, with more probability, fay they were uranges.

The Gardens of the Hespesides are placed hy fome anthors at Larach, a city of Fez ; by others, at Bernieh a eity of Barea, which tallies better with the fable. Others take the province of Sufa in Morocio for the illand wherein the garden was leated. And, laftiy, Rudbeeks places the Fortunate Iflands, and the gardens of the Hefperides, in his own country Sweden.

HESPERIDUM insule (anc. geog.), ilands near the Hefperi Cornut but the aceounts of them are fo much involved in fable, that nothing certain can be affirmed of them.

HESPERIS, rocket, Dame's Violet, or queen's gillifloceer: A genus of the filiquofa order, belenging to the tetradynamia clafs of plants; and in the natural methed ranking under the $39^{\text {th }}$ order, Siliquefa. The petals are turned obliquely; there is a glandule within the fhurter flamina; the filiqua almolt upright ; the Atigma forked at the bafe, connivent, or elofing at the top ; the calyx clofe.

Species 1. The matronalis, or common fweet feented garden rocket, hath fibrous roots, crowned with a tuft of long, fpear-hhaped, rough leaves; uprigit, fingle, hairy falke, two feet high; garnifhed with oval lanceolate, flightly indented, elofe-litting leaves: and the falk and branches terminated by large and long fipikes of fweet-feented flowers of different colours and properties in the varieties, of which there are a great number. All the varieties of this fpeeies are fo remarkable for imparting a fragrant odour, that the ladies were fond of having them in their apartments. Hence they derived the name of dame's violtt ; and, bearing fome refemblauce to a tlock-gilliflower, were fonetines alfo ealled queen's gilliflozer; but are now molt commonly called racket. 2. The inodora, or feentefs rocket, hath a fibrous root; upright, ronnd, firm ftalks, two feet high, garninhed with fpear-flaped, acute-pointed, fharply indented, elofe-fitting, leaves; and all the branches terminated by large fpikes of fcentlefs flowers, with obtufe petals, of different colours and properties in the varieties. This fpecies
makes a fine appearance, but hath no fcent. 3. The triltis, or dull-flowered night-fnelling rocket, hath fibrous roots; upright, branching, fpreading, brifly ftalks, two feet high; fpear-fhaped pointed leaves; and fpikes of pale purple flowers, of great fragrance in the evening.

Culture. All the fpecies are hardy, efpecially the firft and fecond, which profper in any of the open borders, and any common garden-foil; but the third, being rather impatient of a fevere frof, and of much moifture in winter, fhould have a dry warm fituation, and a fow may be placed in pots to be fheltered in cafe of inclement weather. They may be propagated either by feeds, by offsets, or by cuttings off the talks.

HESPERUS, in fabulous hiftory, fon of Cephalus by Aurora, as fair as Venus, was changed into a flar, called Lucifer in the morning, and Hefperus in the ceving. See Hesper.
HESSE, a country of Germany, in the circle of the Upper Rhine; bounded on the fouth by the bithoprick of Fulda; on the eaft by the principality of Hersfeld, Thuringia, and Eichsfeld, as alfo by that of Calenburg; on the north by the hilloprick of Paderborn and Waldek, the duchy of Weltplatia, and the county of Witgenflein; and on the wett, by NaflatsDillenburg, the county of Solins, and Upper-Ifenburg. In the above limits, the county of Katzenellabogen and fome other territories are not included. The whole country, in its utmot lergth, is near 100 miles, and in fome places near as much in breadth. The air is cold, but wholefome; and the foil fruitful in corn, wine, wood, and pafture. The country abounds alfo in cattle, fifh, and game; falt fprings, baths, and mineral waters. The hills, which are many, gield filver, copper, lead, iron, alum, vitriol, pit-coal, fulphur, boles, a porcelain earth, marble, and alabafter. In the Eder, gold is fometimes found; and at Frankenberg a gold mine was formerly wrought. Befides many leffer freams, Heffe is watered by the following rivers, viz. the Lhan, the Fulda, the Eder or Schwalm, the Werra or Wefer, and Diemel. The Rline alfo and the Mayne pafs through the country of Katzenellnbogen. This country, like molt others in Germany, has its ftates, confiting of the prelates, as they are called, the nobility, and the towns. The diets are divided into general and particular, and the latter into the greater and fmaller committees. The houfe of Heffe is divided into two principal branches, viz. Caffel and Darmitadt, of which Pliilipfdale, Rhinfeldts, and Homburg, are collateral branches; the two firl of Heffe-Caffel, and the laft of Heffe-Darmiladt. Their rights and privileges are very confiderable. In par. ticular, they have feveral votes at the diets of the empire; and caules, not exceeding 1000 florins, are deternined by the courts of the country, without appeal. The princes of Heffe Caltel are not of age till they are 25 , but thofe of Heffe-Darmfladt are fo at 18 . The right of primogeniture hath been eftablihed in both houfes. The reventes of Darmiladt are faid to amount to near $102,000 \mathrm{l}$. a-year, and thofe of Hette Caffel to near 200,0001 The fmall county of Schaum berg alone yields a revenue of 10,0001 . and that of Katzenellubogen, with the forefts of Richardfwalde, it is faid, was farmed near 200 y fars ago at 12,0001 . The prince of Heffe. Caffel has 40 or 50,000 men in - Vol. VIII. Part II.

## $489]$ <br> H E S

his dominions fit to bcar arms; and the troops that be hires out have often brought him in large fums, efpecially from Great Britain. He keeps a ftanding army of 15,000 men. This family is allied to moft if not all of the Pioteftant princes in Europe. The branches of Caffel, Homburg, and Philip fdale, arc Calvinifts; that of Darmftadt, Lutherans; and that of Rhinfeldts, Roman Catholics. The prefent prince of Heffe-Caffel, indeed, in the year $15+9$, cmbraced the Roman Catholic religion; but in $175+$ drew up, and contirmed by oath, an inftrument, of which all the Proteftant princes are guarantees, declaring that the eftablithed religion of his dominions foould continue in every refpect as before, and that his children thould be brought up and infructed therein. Here, as in the other Proteftant Lutheran countries of Germany, are confitories, fuperintendants, and infpectors of the church. In the whole langraviate are three univerfitics, belides I atain fehools and gymuafia, for the education of youth. The manufactures of Hefe are linen cloth, hats, Itockings. gloves, paper, goldfmiths wares ; and at Caffel a beautiful porcelain is made. They havc alfo the finett wool in Germans; but are repreached with want of induftry, in exporting inflead of manufacturing it themfelves. -This is fuppofed to have been the country of the ancient Catti, mentioned by Tacitus, \&c. who, in after-ages, were called Cbatit, Cha/f, Half, and $H_{i} / \sqrt{2}$. The two chicf branches of Caftel and Darmiftadr have many rights and privileges in common, which we have not room to fpecily. Both of them have a feat and vote in the college of princes at the diet of the empire, and thofe of this circle. Each of thefe princer, befides their guards and militia, maintains a confiderable body both of horfe and foot.
HESSIAN fly, a very mifchievous infet which lately made its appearance in North America; and whofe depredations threaten in time to dettoy the crops of wheat in that country entirely. It is, in its perfect itate, a fmall winged infect ; but the milchief it does is while in the form of a caterpillar; and the difficulty of deftroying it is increafed by its being as yet unknown where it depofits its $6 g 5 \mathrm{~s}$, to he hatched before the firft appearance of the caterpillars. Thefe mifchievous infcets begin their depredations in autumr, as foon as the wheat begins to fhoot up throuch the ground. They devour the tender leaf and ftem wit 1 great voracity, and continue to do fo till llopped bj the frolt; but no fooner is this obitacle removed by the warmith of the fpring, but the fly appears again, layinr its eggs now, as has been fuppofed, apon the llems of the wheat jutt beginning to ipire. The catupillars, hatched from the fe eggi, perforate the thems of the remaining plants at the joints, and lodge thenfetves in the hollow within the corn, which flows no fign of difeafe till the cars begin to turn heavy. The ilen. then break; and being no longer able to perforn their ofice in fupporting and fupplying the ears with nourihment, the corn periflues about the time that it goes into a milky flatc. Thefe infects attack alfo rye, barky, and timothy-grals, though they feem to prifer wheat. The dellruction occalioned by then is defcribed in the American Mufum (a magazine fublifhed at Philadelphia) for February $1: 87$, in the following words: "It is well known that all the crops of wheat in all the land over which it has exterded, 3 P have

Hefise have fallen beiure it, and that the famers beyond it dreat ins appruabio the propuct in, that undefs means are diewered to prevent its progeref, the whale comtinent will ie onerorn ;-a cilamity nose to be dradce thata the ranace of war."

This torribio infect apocared sirt in Loug Ihant
 beem buathe fom Ge:mary bythe Holloms, whase it had the name of the $h$, whe Fiom thence it has

 raitw fuon the fince whote it was tirlt whered. At that time it consinucel to proesed with unabating in. ceeaic; being apparenty hopped micher by rivers nur mumat ins. In the fly tate it is likenice cecedinsy
 ins inter wictuls and hriak; filling the wirdows, and Al ing perpetually into the can lej. It dill continued to infeit lone liand as mach as ever ; and in many Flacts the culture of wheat was ensirshy abandoned.

The American Siates are likewife infetied with ano.
 This, however, has not yet palfed the river Delware; thuagh there is canger of its being god ally imured to cuder climates fo as to exterd ite depredations to the morthern colonics alio. But it is by means the fame with the Hefinanty. The wheat fly is the fame with that whore tavages in the Atagumois in Fiance are recorded by M. cu Haml; it cats the grain, and is a moth in its perfect trate. On the other hand, the Hellan ly has hitherto been unknown to nacuralits; it eats only the leaf and analk; and, in its perfet itate, is probably a tenthredo, like the black negro fly of the turnip.

As of late years great quantities of wheat were imported from America into Britain, it became an object worthy of the attention of government to confider how fat it was proper to allow of fuch impotation, If A this deftructive infect might be brought alung with the graill. The matter, therefore, was fully canvaffed befure the privy council; and the following is the fabfance of the intiomation relative to it ; and in confequence of this, the importation of American wheat was fortid by proclamation.

1. By a letter, dated 2 2d Apriliz -88 , Mr Bond, conful at Philadelphia, informed the marquis of Caermarthen, that there was a defign to export wheat from thence to England ; that the fy had made great depredations; and that there might be danger of its thus being conveged acrofs the Atlantic. He added, that it was not known where the eggs of the infect were depolited, thongh it wasfuppulato be in the grain. Steeping the feed in elder jaice he reconmented as an ef fectual emedy and prefervative of the crop.
2. In confequeace of this information his Lordhip wrote to Sir Jofeph Banks, prcitident of the royal fociety, defiring him to inq'ire as much as poffihle concorring the infect, both with regad to its natural hif. tory, and the method of preventing its ravages. In this refearch, however, that learned geinteman miftonk the infect call. d the fling ruervil for the $H_{c}$ fizen $f$ ly, Of this infect he gives a defeription*: but 14 a lutle

## $\because 5 \mathrm{ce}$

 time, beint fentible of his milake, he oblerved toHiovir. the council, that his repuri to the int quis of Citr. mar:hen applied not to the Heffan fly, but to a ciffer-
ent infea, viz, the fying werevil; that the danger of importing this mife was much greater than that of the Heftian lly. The corn alteady broughe from America, he was of opinion, miget eafly be exammed, and a diltown made wheticer the Ry had been there. A. meng uther methens which might be wifed for this purpote, that of patiug the comamong watur was one, whon the insectul grains would rite to the top, and might tha is be wened and examinel. Some dight that of that kine he had alrendy mase: and found manifeft fighs of the fly in fome foramo whice be had opened.
3. A farther account of the infeet was given by Dr Mixhel, in confequane of the above mentioned letter from the marquis of Caemarthen. Accordine to him it was fint difovered in the year 1776 , on Btaten $1 /$ and, and the well-end of Long lland; ince that tine it proceded rembilly though the fouthern dintrict of the Itate of New York, pait of Connecticut; and ar the time or giving the aceotur, July 1788 , had got itto New Jerfey. As it appeared about the time that the Herian trong arried, an opiniun had gone abroad that they brought it along with then: but the Ductor waz of opinion that it is a native animal, nourilhed by ione intigenons plant, bat which then, for the firt time, came among tite wheat, and found it proper food. He had feen the caterpillar, chryfalis, and ty, but never coald nud the ege, or difcover where it is depolited. The caterpillar appears, as has already been laid, in antumn, and, after having devoured the tender thlk, foon becomes a chryfalis, coluared hike a fiax feed; which, bsing lixed between the leaf and the talk, injures the plant by its mechanical prifure: from this proceeds the lly, which is either able of itfelf to fultain the intente winter frolls, or lays ceggs capoble of doing it. Early in the fpring the caterpillar appears again, even when the heat is fearce fuffisient to make the wheat grow; its ravages, thercfure, are at this period particularly dellactive; and it paffes through its metamorphofes with fuch fpeed, as to produce a third generation while the wheat is yet tender and juicy: however, as the conn has by this time grown conliderably, the third generation is not fo deftructive as the fecond. It hurts chichy by rendering the Hraw weak, and liable to break down when loaded afterwards by the weight of a full ear: "and fometimes (fays the DoEser) it will be infetted by the fourth fwarm before harveft."
4. In another communication of Sir Jofeph Banks, dated July $2+178$, he makes fome general obfervations on the nature of tiofe caterpillars from which flying infects proceed; and to which clafs both the Alying weevil and Hefian fly belong. Nature, he obferves, has provided againth the kinds of danger thefe tender infects are moll hkely to meet with. Thus, in climates whore the winters are fevere, the eggs of the moll tender iniects refilt the force of the ufual frolt; in feafons of remarkable feverity, indeed, fome are deithoyed; but a fufficient number always efeape for propagating the fpecics. The young caterpinlar, if hatchad before its proper fooll be ready, will furvive even wecks before it perifhes for want of nourifument; and in fome fow inflance, where it is hatched in the auumu, it is divected by inflinet to fpia a web, in which it remains torpid and without food during the whole
winter. The chryfalis, thongh deprived of loco-motion, is capable of acfilting various dangers, arifing from cold, heas, wet, \&e and the lengh of time which the animal remains in that itate $i$ capalle of very confiderable extulion. The complece animal, tender as it ap. pears, and intended to cwitt no longer than is neceffary to fultil the bufinefs of propagation, which, in fome fpecies, is gone through in a few days, neverthelefs is capable, in fome inllancess, of enduring the utmoft variation of climate ; and if, by accidental circumftances, the fexes are prevented from meeting, its thort life is extended to many times the amount of its ufual duration.

The obfervations on the fly made by Sir Jofeph in this paper, are not different from thofe already related; only he diffents from the opinion of Mr Eond, that the eggs are laid on the grain; thinking it more probable from analogy, that they are depolited on the ftraw ; and being fhaken offfrom thence by the flrokes of the flail in threfhing, are mixed with the corn; from whence it mult be very diflicule to feparate them. Hence he concluded, that thete was an apparent and very great rifk of importing the eggs along with the eorn; and there was no doubt, that when once they had got a footing, they would eftablifh themfelves in Ihritain as well as in America. It mult be whferved, however, that none of the grain which was examined mowd any figns of this fly, its eggs, or catelpillars; freh infects as were found in forne difrafed fpecimens being only the weevils common in England as well as in other countries; though fome which were infpecred in the month of Anguft this year contained the chryfalis of fome infects, which Sir Jofeph Banks was of opinion miglit be the flying weevil ; and as he did not know whether thefe would revive or not, he gave it as his opinion, that the cargo in which they were found ought not to be fuffered to come into the kingdon.
5. In order to procure all the intelligence that could be had concerning thefe infecte, the duke of Dorfet addrefled a letter to the royal fociety of agriculture in France, to know whether any of them exitt in that country. The report of the fuciety was accompranied with a drawing of two infects; one of which was fuppoled to be the caterfillar of the Ifefian fly, from its attacking the wheat only when in the herb; beginning its ravages in cutumn, reappearing it the foring, and undergoing the metamorphofes alrady mentioned. "That infect (fay the lociety) whofe havoc has been well known in America only fince 1776, does not appear to diiffer from it, as well as we can judge from a very thort defcription of thofe which have been obferved in the north, and of which the hintory is contained in the different volumes of the acadeny of fciences of Stockholm. Wc know that there exith in France catcrpillars whofe manner of living-refembles Phat of thofe infects ; but the mifchief which they do to corn having, never been confiderable enough to attract the attention of government, and not having been ourfelves engaged in following in detail the hillory of that fpecies of caterpillar, we regret not being able to fay any thing patticular upon that fuhject" The reft of the report concains an account of the flying weevil.
6. Further recomufe was now had to America for information. The marginis of Caermarthen wrote to Sir John Temple at New York, the Britith conful ge-
neral ; and this gentleman applied to colonel Morgan, who bad been more curious with refpect to this infeet than any other perton with whom he was acquanted. His account was, that the Heffan fly was firtt introduced into America by means of fome fraw made ufe of in package, or otherwife landed on Long Iftand as an early period of the late war; and its firt appearance was in the neighbourhood of Sir Willam Howe's debarcation, and at Flat Bufh. From thence it fpread in every direction, but at firt very flowly ; and it was not till the year 1786 that they reached Mr Morgan's farm, fituated not quite 50 miles from New York. No damage was done the firlt feafon, and very little the fecond; but in 1788 they were materially damaged, and in fome places totally deltroyed all round. "The name of $\mathrm{He}_{\mathrm{f} \text { fian fy (fays } \mathrm{Mr} \text { r }}$ Murgan) was given to this infect br myfelf and a fricnd early after its firft appearance on Long Ifland." In a letter to General Wafhington, dated July 31 it 1788, Mr Morgan treats particularly of the infect itfelf, and inentions feveral experiments made by himfelf to oppofe its depredations. The refult of thefe was, that good culture of fltrong foil, or well manured lands, may conctimes produce a crop of wheat or barley, when that fowed on poor or midulling foil, without the other advantages, will be totally defroyed. "But (fays let) as the infect lives in its aurclia ltate in Atraw and liter through the winter, I find that unmixed barnyard manure fpread on the land in the fpring multiplies the fly to an afonihing degree; hence the farmer will fee the neceffity of mixing his yard with earth and marle in heaps; adding, where he can do it, a quantity of lime, and changing the heaps, after they have undergone the necefiary fermentation, that their parta may be well incorporated, and a new digeltion brought on, which will effectually deftroy the infect. Rolling of wheat juft before the firf frofts in autumn, and foon after the latt in fpring, or before the wheat begins to pipe or fpindle, has alfo a good cffer. In the firlt place, it is a part of good culture ; and, fecondly, the rolier cruthes and deftroys a great proportion of the infect. 'Cop-drefings of lime, or of live afhes, are veful as manures, and may (when applied about the times I have mentioned as proper for rolling) be offontive to the infect, but if ufid in fuffecient quantity to deftroy them, would, I believe, deftroy the wheat alfo. In the year 1782 , a particular fpecies of wheat was introduced on Long IIland, which is found to reffit the Ay, and to yield a crop when all other wheats in the fame neighbourhood are deftroyed hy it. But as this wheat has been incautiouily fowed in fields with other kinds, it has generally become fo mixed by the farmocrs, as to fuffer in its character in proportion to this mixture ; infomuch, that fome farmers, from inattentiou to this circumltance, have condemned it altogether. Fortunately, however, fome crops have been preferved from this degeneration; and I was fo lueky as to procure the whole of my laft year's feed of the purell kind; the conlequence of which ha, been a good crop, whilit my nughbours lields, Sowed with other kinds of wheat, have been either cotally deftroyed or materially injured. I have fatistied myfelf that this fpecies of wheat was brought to Now York in 1782; that a cargo of it was then lient to Meffrs Uuderhill's mill to be manulactured into flour; and that, from feed faved out

H/y.

Hefian of this parcel, the yellow-bearded wheat was propaga-
in the webs, "any of them dead, but fome alive, and ftruggling to difengage themfelves; from hence I concluded that there was a propensity in the fly to get into the mow: but whether witha purpofe of mere fhelter and nurture, or with a view to depotit its egrgs, I ain at a lols to decidc."
9. Mr Bond now refers to fume obfervations by a Mr Potes and Mr Cleaver, which, with feveral other papers on the fubject, he had inclofed in his letter to the marquis. The former was a farmer in the county of Chefler, who tlacked his wheat in autumn 1789 , at a time when the fly had not heen feen in or near that connty. About fix or feven weeks after the harvelt he had occation to threth fome of his wheat; and with a vicw to present its feattoring ated wathing, he threw the thearts from the rick upon a large theet. On taking "p the heaves to cary them to the chremingfloor, he perceived a great number of Hies, anfwering precifely the defeription of the Heffian fy, ly ing apen the flseet, fone dead, and others in a torpid llate; from whence he concluded that the fly had got a footing in his rick; but frons any exmination cither of the flraw or giain, no trate of the eqge being depolited was difcovered. Mr Citaver, a farmer in the fame county, apprehending that the fly might approach his neigbbourhood, fowed fonse wheat in his garden, which grew fo as to appear above gromen in lefs than a fortnight, uhen a violent noth-tall wind came on ; and, immediately after be pesceived finall clouds of flies over and about the wheat he had fown. He examined the grain in a few days; and found that numbers of the flies lad depolited their eges in the leart of the main thalk, and many of them lay dead on the ground where the wheat vas fown, and near it. Many of the eggs were found in the ftalk; and fome fmall white worms produced from other eggs were lately difcovered in the italk vely near the toot of the wheat. Wherever thefe worms were found, the whole of the individual thalk was perceptiblf changed in point of colour, tending to a yellowifla call ; the top hanging down quate thruak and withered. In fone of the wheat which was carcfully examited, the egres were foum within the ftalk of a vely minnte lise and whitill cohour, with fomething of a yellow tinge. In thofe where the worn was formed, it was carefully wrapped up, furrounded by different coats of the thoot in which it lay, as if it had been kilfully and tenderly rolled up for its prefervation; around it the flalk was plainly eaten away, fome nearly throngh. The worm Atrongly refembles the niipper in cheefe, fomewhat thinner, and rather longer, of a whitifh calt. The ground on which this wheat was fown was rich garden ground, high and dry; the natural foil a Atrong red clay; few of the thoots, of which there were many in one clufter in proportion to their nmber, were hurt by the fly. This was imputed to the itrength of the foil, which producing a robult pisu rful growth, refited, in a great degree, the attack of the fly, though the weak fheots futlered generally.
10. A fimilar account of the Hellan fly is given by Mr Jacobs, : i experienced farmer in the county of Montgomery. Fiom his obfen vations the egge is ufually depotited in the funnel or theath a little above the lirtt joint. Whean the eggs are laid in the antumn or
leflan fpring, they are utterly deflructive of the growth of the wheat; but when they are depofited thortly before the harveft, the grain or even the ftalk is fearcely affected, efpecially in rich ground. The egg, he fays, is at firlt very minute ; it grows rapidly, becomes full and large, and turns to a brown hue, in fize and colour very like a tlax feed. A material difference was alfo perceived between rich and poor gruand with refpect to the ravages of the fly; but none between moilt and dry foils. He is alfo of upinion that the yellow. bearded wheat will refift the att..ckr of the fly; and that rolling and feeding the wheat will be of great fervice.
15. A fanmer in Jerfey, who dates his leteer from Hunterdon, Jan. 30.1787 , obferves, that though the fly is fuppofed to advanee about 15 miles annmally, and neither watess nor monntains obltruct its pal. fage; yet when dillurbed, he never faw them take a flight of above five or fix feet; neverthelefs they are fo active, that it is very difiente to cateh them. They firft appear towards the end of Suptember; and foon after their eggs appear hatehed, in colour and fize like a flax feed: they are erey low at the joints; fome even in the ground; and here they harbour all winter. On their firlt appearance in any dillriet, their numbers being fmall they feldom cut off the crop in this tate, which is often the cafe the fecond or thind year. In the fpring, after warm weather, they again appear as a finall worm, and dettroy the erop. The remedies propoted by this farmer are, fowing upon rich ground elder, and rolling. A gentleman whole account was dated on the firll of Nusember 1786 , Gays, that their egges refemble what is commonly called the fly blow on meat, being very fmall, and only one in a place. Soon after, the other blades of wheat proceeding trom the fame kernel inelofe the firt, the egg is covered, and agreable to the ufual progrefs of infects arrives at the fate of a worm, and defeconds towards the root, where it confumes the tender blade, fometimes dethroving the whole crop in the fall: but if, by reafon of the fertility of the foil, and other concurrent circumitanees, the vegetation is forapid as to bafle their eflorts, fome of the latter-laid cgers, when at the worm tate, coltrench thenfelics in the ground to the depth of an inch or mocre, where he had found them after fevere frotts changed from a white to a greenifl colour, and almot tranfparent; from this they proceed to the antrelia thate, and thus continue probably in the gruund till the !pring, when the $n_{y}$ is again produced, which again lays its eggs, and linifles the work begun in the fall, to the total deftruction of the cerop. Another piece of intelligence he gives, but not from his own obfysation, that by feeding the wheat very clofe in the winter and fpring, if the land is rich, it will arain fpring up, and the worms do not much injure the fecond growth. Dy another correfpondent we are informed, that maritime places are lefs liable to be infelted with the fly than the interior parts of the conntry; and therefore recommends as an experiment, that fine falt fould be fprinkled on the wheat jutt before, or very foon after, the appearance of the fly. Iyy whers, elder has been much recommended, as well as rolling. ${ }_{1} c$. though the bearded wheat alieady mentic ued eems to be the only effectual remedy.
1.2. By another communication from M: Morgan
to the Philadelphia Suciety for promoting agriculture, he informs us, that lie had made himfelf acquainted with the fly by breeding a number of them from the a white body with long black legs and whifkers, fo fmall and motionlefs as not to be eafily perceived by the naked eye, though very difermble with a micro. fcope; but they foon become black and very nimble, both on the wing and feet, being about the fize of a fmall ant. During the beight of the brood in Jure", where 50 or 100 of the nits lave been depolited on une falk of wheat, he has fometimes difcusered, even with the naked eye, fome of them to twitt and move on being diturbed: this is whle they are white; but they do not then travel from one ilalk to another, nor to different parts of the fame flalk. The ufual time of their fpring-latching from the chrydalis is in May. "Thofe (fays he) who are doubtful whether the tly is in their neighbourhood, or cannot lind their egegs or nits in the wheat, may fatisfy themfelves by opening their windows at night and burning a candle in the room. The fly will enter in proportion to their nambers abroad. 'The firit night after the commencement of wheat harveft, this featun, they filled my diningroom in fuch numbers as to be exceedingly troublefome in the eating and drinking veffels. Withon: ixaggeration I may fay, that a grals tumbler from which beer bad been juil diank at dimer, had 500 flees in it in a few minutes. The windows are filled with them when they defire to make their efeape. They are very ditinguithable from every other By by their homi or whinkers." With regard to the cure, it tecme to be contirned that the fowing of that called the vellozebarded ablata can only be depended upon. The thy in. deed will retick in fields of this wheat, and lay uts eggi upon the flalks ; but ne iajury was ever known to lapppen except in one fingle inflace, where it was foma 10 a held along with the common fort. and that in a very fmall proportion to it. By. anothor account, hewever, we are cold that the yellow-beaded wheat is ç:tal. Iy liable to be detlroyed in the autumn with the conamoun kind; fo that the onlymethed of kemrins the erop is by furing it late in the fedfon, when the dy is mortly over.
13. The utmont pains were taken by the Britith goverument to find out whether this dellructive infect exifts in Germany or any of the northern countries of Europe; but from the accounts reccived, it appears that it has not hitherto been wherved, or at leatt if it exilts, the damage dune by it is tou inconliderable to altract no.ice.
1.4. Wrom the whole correfpondence on this fubject, wiacia from the abricgement jutt now given of it is evidently fomewhat difcordant, Sir Jofeph Banks diew "lp d export for the privy conmeil, dated March 2. 1789, in which he fates the tollowing particulars: 1. The appearance of the fly in long lland was nett obferved in 1.79 . We mutl fuppofe this to be meant that its defrnctive edects liceame then lirt pereeptible; for it liems undoubtedly to lave been knowa in the year 1-5 S. 2. 'Mlue ofinion of colonel Morgan, that it was imported by the Ifelians, feems to be erroneous, as no tuch iufect can be found to exilt in Germany or any otber pat of Lurupe. 3, Since ins
thensa hrit upparance in Long thand it has advaused at the wate of 15 or 20 miles a $y$ gar, and neiher waters nor mountains have impeded its progrels. It was feen
troling the Detawate like a cloud, from the Fall's 'Sownthip to Matectich; had reached saratoga, 200 mides from its firt appearance. infening the conaties of Middefex, Somelfet. Huntington, Mowis, Sulfex, the neighbourbood of lhiladelphia, all the wheat connties of Conncticut, sec. committing the mot dread. ful ravages; attacking wheat, rye, barley, and timuthy. grati. + The dmericans who have fulfered by this infoct, fpeak of it in terms of the greatelt horm. In culunel Morgan's kiter to, Sir lohn Temple, he ures the following expreflions. ". W'ere it to reach Great l3r:tain, it would be the greateft fourge that ifland ever experienced; as it multiplies from heat and moiflure, and the molt intenfe frotts have no eflect on the exg or aurclia. Were a lingle fraw, containing the whect, ege, or aurelia, to be carried and fately depofited in the centre of Norfolk in England, it would multiply in a few years, fo as to defroy all the wheat and harley crops of the whole kingdom. There cannot exit fuch an atrocious villain as to commit fuch an act intentionally. 5. No latisfactory account of the mode in which this iufect is propagated has hitherto been obtained. 'Ihofe which fyy that the egga are depolited on the falk from fix or eight to 50 , and by their growth compitis and hinder the ftalic from grow. irg, are evidently erroneous, and the authors of them have plainly miltaken the animal itfelf for its eggs. It is fufficieni to remember, that eggs do not grow or increafe in bulk, to prove that what they oblerved was not egess. 6. The landho'der's opinion, that the eggs are depofited on the ripe grains of wheat, though contradicted by colonel Morgan, is not difproved, as the colonel advances no argument againit it. 7. A letter dated New York, September 1. 1786, fays that the eggs are depofited on the young blade, refembling what we call a fiy blow in meat; very fmall, and but one in a place : but this, though the only natural mode of accounting for the appearance of the infect, had it been true, muft undoubtedly have been contirmed by rumbers of ubfervations. R. Even though this thould te found hereafter to be the cale, there will fill remain a danger of the aurelias being beaten off by the fail from the flrav in threfling the wheat, and imported into britain along with it; the prefence of thefe flies in barus laving been fully proved by the obfervations of Meffrs Potts and Bond. 9. None of the remedits propofed againft this deftructive infect have been in any degree tfectual, exceping that of lowing the yellow bearded whent ; the Araw of which is fufficienty flrang to relit the imprefion of the infect, and even if its egrs are depofited upon it receives little injury in point of producc in grain: this provides, however, no remedy for the lofs of the barley crop, nor for that which mutt be incurred by fowing the yellow-bearded wheat on lands better fuited by nature for the produce of other kinds : it appears alfo that this very kind is liable to degenerate, and probably from a different canfe than that propufed by colonel Morgan, viz. the mixture with common wheat. g. Though the Agricultual Society at Philadelphia, as well as colonel Morgan, have declared their opinions decitively that no danger can aride from wheat import-
ed into Britain, as the infect has no inmediate connection with the grain : yet with nealy if not exactly the fame materals before him which thefe gentlemen were fumithed with, Sir Jofeph Banks could not avoid drawing a comstution directly contrary; and he conchudes his report with the words of Mr Bond in a letter to the maryuis of Caemarthen. "Satisfactory as it would be to my feelings to be able to fay with precifon, that I apprehend no danger of extending the milchief by feed, my doty urges me to declare, that 1 have not heard or feen any conclutive fact be whelu I could decide on a matter of fuch importance; and thll that telt nccurs, the wifdum of gtarding againt fo gricuous a calamity is obvious.'"

On the 27 th of April the fame year, another paper, by way of appendix to the foregoin, was given in by Sir Jofeph Baks In this he arain obferves, that none of the deferiptions of any Enropean infect hitherto publithed anfwer exactly to the Hetfian ily. In a letter from Mr Bond io the marquis of Catermarthen, he mentions a ather kind of iafeet in the ftate of Maryland, called by way of eminence the fly; and which in fome things relembles the Hethan lly, though it cannot be accounted the fame. It makes its way into the mow, and bites the ends of the grain percep. tibly, and no dount depofits its egss in the grain itlelf; fince it has been obferved, that wheat recently thethed, and laid in a dry warm plice, will foon be covered with an extreme clamny crult, which binds the wheat on the furface together in fuch a way as to admit its being lifted in lumps; but the wheat beneath will not he hurt to any conliderable depth. Such is the quality of this fly, that if the hand be inferted into the heap affected by it, watery blillers are inmediately raifed; and the farmers and flaves, riding upon bags of this infected wheat, never fail to be feverely bliltered thereby. . This infect (fays he) is called in Maryland the Revolution fy, by the friends of the Britifh government; but from all I can learn it is not the fame infeet which originated on Long Iland, and is called the Heffan fly (by way of opprobrium) by thofe who favourtd the revolution. All the papers I have read on the Heffian fly are very inaccurate, not to fay contradictory ; and 1 am convinced it is by no means a fettied point at this moment in what manner and place the eggs of thefe infects are depofited. The policy which indaced governnsent to upen the ports being founded on an appearance of a fearcity of corn, that evil may be remedied by the admifion of flour intead of grain ; and tho' the countries from whence the fiour is carried will have the advantage of the manufacture, Itill that cannot be reckuned as an object, when oppofed in the feale to an evil of fuch im ${ }^{4}$ menfe magnitude as the introduction of fo deltractive an infect may occalion. 'The ravages here are beyond conception ruinous. Many farmers have had their crops fo completely cut off as to be left without brearlcorn or even feed-corn. If the meafure of confining the importation to flour alone thould be adopted, great atteation thould be paid to the quality of the flour admitted into the britifh ports. An intinite deal of the wheat of the laft harvelt is of a very wretched quality; and thratagems will be practifed to give an ex. tenfive vent to fo chential a laple of the midde flates of America."

## H E T <br> 495 ］H E T

In another leter to the farme nobleman，Mr Dond exprefles himfelf to the following purpofe．＂I have not been able to collect any decided information which fixes the effertial point，how far the infeet may be communicated by feed．It is a matter at chis time quite undecided here：nor have I heard or obferved any very conclufive reaton to fuppofe that the fly makes its way generally into barns and ricks．A very intel－ ligent farmer in the county of 13ucks，informed one that it was the prevailing upinion there，and fo I found it，that the fly did not either in the field or in the mow affect the grain of the wheat：a neighbour of his，in threfhing the little wheat he had faved lat har－ veft，obferved the fly rife from the fraw in great num－ bers wherever it was Atruck by the Alail；but though it was at fall prefumed that the dy lacd invinuated it－ felf into the mow for the purpofe of depofiting its egigs in the grain or in the ftraw，no trace of the egrg could be difeovered from the appearance of any mucus or duf，either in the grain or in the fraw；hence it was inferred that all the mifchief was done in the field．＂

HESYCHIUS，the mont eelebrated of all the an－ cient Greek gramnatians whofe works are now extant， wa：a Chrillian；and，according to fome，the tame with Hefychius patriarch of Jerufalem．who lied in 609．He wrote a Greet lexicon；which，in the opi－ nion of Cafaubon，is the molt learned and ufeful work of that kind produced by the ancients．Schrevclius publifhed a good $\epsilon$ dition of it in 1668 ，in 4 to，with notes；but the ben is that of John Alberti，printed at Leyden in $17+6$ ，in two vols folio．
heterlarch，Heteriarcha，in antiquity， an officer in the Greek empire，whereof there were two fpecies；the one called fimply beteriarch，and the other great beteriarch，who had the direction of the former．
＇The word is Greek，（ratis） $\boldsymbol{\rho}^{2} \chi^{x}$ ，formed of the Greek ＂rapos focius，＂companion，ally，＂and apxn imperium， ＂command．＂Their principal funetion was to com－ mand the troops of the allies；befides which，they had fome other duties in the emperor＇s coure，defuribed by Crdin，De Offitiis，cap．5．n．30，31，32， 37.
heteroclite，Heterocliton，in grammar， an irregular or anomalous word，which either in de－ elenfion，corjugation，or regimen，deviates from the ordinary rules of grammar．The word is Greek，ityo． xairoo；formed of irigos alter，＂another，different，＂and narow，＂I dectine．＂

Heteroclite is more peculiarly applied to nouns which vary or are irregular in poine of dectenfiou；ha－ ving fewer cales，numbere，\＆c．than ordivary ；or that are of one dectenfion irs one number，and another in another：as，Hoc tas，vafis；bac vafa，waforum．

HETERODOX，in polemical the logy，fomething that is contran to the faith or doctrive etlablithed in the thue church．The word is formed of the Greek ＂reporiozoc ；a compound of irifos＂alter．＂and \＆$z_{z}$＂opi－ nion．＂Thus，we fay a betcrodox opinion，a betcrodox divine，\＆c．The word thands in oppolition to or－ thorix．

HE CERCGENEITY，in plyfics，the quality or dilfofit $n$ which denominates a thing benterogeneous． The word is alfo uted for the heterogencus pants
themfelves；in which fenfe，the heterorenenties of a body are the fame thing with the impuritics chereaf．
heterogeneous，or Heterogeneal，litr－ rally imports fomething of a diller ut nature，or that con－ filts of parts of difierent or diffluilar kinds；in oppofition to bon：ggeizous．＇The word is Greek；formed of erfers ater，＂different，＂and rwos genus，＂kind；＂q．$d$ ．com－ pofed of different kinds of parts．
Haferograstous Light，is by Sir Iface Newton faid to be that which confits of rays of different degrecs of re－ fraugibility．Thus the common light of the fun or clonds is heterogeneous，being a mixture of all forts of rays．
Hetknogrneous Acuns，one of the threc variations in irregular nouns；or fuch as are of one gender in the fingular number，and of another in the plural．－Hetero－ geneus，under which are comprehented mixed nouns， are lix－fold．I．Thofe which are of the mafculine gender in the fingular number，and neuter in the plu－ ral；as，bic tarkaras，base fartara．2．Thofe whichare mafculine in the fingular number，but indfeuline and neuter in the plural；as，bic locus，biloci E゙ bre loci． 3．Such as are feminine in the fingular sumber，but neuter in the plural；as，bace carbafus，\＆o bec carbaja． 4．Such nouns as are neuter in the lingular number， but malculine in the plural；as，bos calum，hi cali． 5．Such as are neuter in the fingular，but neater and mafculine in the plural ；as，boc raflam，bi radf： 3 bec refra．And，6．Such as are neuter in the fingu－ lar，but feminine in the plural number；as，hoc esubun， be epule．

Heterogengous Quatilies，atc thofe which ate of fuch different kind and confideration，as that one of them，taken any number of times，never cyuals or ex－ ceeds the other．

Hatenogensous Surds，are fuch as have different ta－ dical ligns；as，$\sqrt{ }$ aa，and ${ }^{3} \sqrt{ } 86 ;{ }^{5} \sqrt{ } 9$ ，and ${ }^{7} \sqrt{ } 19$ ．

HETEROSCHI，in geograply，a term of relation， denoting fuch inhabitants of the earth，as have their fhadows falling but one way，as thofe who live between the tropics and polar circles；whofe fladows at nown in north latitude are always to the northward，and in fouth lationde to the fontherard．

HE＇I＇H，the father of the Hittites，was the chdaf fon of Canaan（Gen．x．15．），and dwelt fouthward of the promifed lat d，at Hebron or thereabouss．Ephroa， an iuhabitant of Hebroa，was of the race of He：＂， and this whole city in Abraham＇s time was peopled by the children of Heth．There are fome who riain－ tain that there was a city called Huth，but we find no footlieps of it in the feripture．

HETTRURIA，and ETRURIA，a celcbated country of Italy，at the weth of the＇Yber．It originally con． tained 12 different nations，which had each flacir re－ fpective monarch．Their mancs were Veientes，Clu－ fini，Peruffini，Cortonenfes，Arretini，Vetuloni，Vola－ terrani，Rufellani，Volícinii，Tarquini，Falifei，and Certani．The inhabitants were particulaly fanous for their fuperlition and trist confidence in omeas， dreams，auguries，\＆c．They all proved powerful and efulute enemies to the riling empire of the Romans， and were conquered only ates much effution of blood．

IIEV压l（arce geog．），one of the feven people who occupicel Can an；a principal and nunaerous people，and the lame with the Kadmonsi，dwelling at the fort of Hamon

Hev：zi．

Heucrera Hermon and partly of Libanus, or between Libanus and Hermon (Judges iii. 3) 'Co this Bacharr refers the fables concerming Cadmus and his wife Ilarmonia, or Hermonia, ehanged to ferpents; the name Heri de-
notine a wild beatl, fuch as is a ferpent. Cadmus, who is faid to have carried the ufe of letters to Greece, feems to have been a Kadmonean; of whom the Greeks fay that he came to their country from Phoenicia.

HEUCHERA, in botany; a genus of the digynia order, belonging to the pentandria clafs of plants. There are five petals; the capfule is biroftrated and bilocular.

Hevelius, or Hevelke, (John), an eminent aftronomer, was born at Dantzie in 1611. He fludied in Germany, England, and France, and cvery where obtained the efteem of the learned. He was the firft that difcovered a kind of libration in the moon, and made feveral important obfervations on the other planets. He alfo difovered feveral fixed flars, which he named the firmament of Sobigk;, in honour of John III. king of Poland. His wife was alfo well killed in aftronomy, and made a part of the obfervations publified by her hufband. In 167 , he publifhed a defeription of the inftruments with which he made his obfervations, under the title of Macbina Calefis: and in 16.9 he publifhed the fecond part of this work; but in Scptember the fame year, while he was at a feat in the country, he had the misfortune to have his houfe at Dantzic burnt down. By this calamity he is faid to have fultained a tofs of feveral thoufand pounds; thaving not only his obfervatory and all his valuable infiruments and apparatus deftroyed, but alfo a great number of copies of his Machina Caleflis; which accident has made this fecond part very fearce, and confeguently very dear. In the yeat 1690 were publifhed Firmanantum Soticicianum, and Protromus afronomica nove tudule folares, una cum catulogo fixarum, in which he lays down the neceffary preliminaries for taking an exact catalogue of the flars. But both thefe works are pofthumous: for Hevelius died in 1687 , on his birth.day, aged 76 . He was a man greatly efteemed by his countrymen, not only on account of his great reputation and ikill in aftronomy, but as a very excellent and worthy magilltate. He was made a burgomafter of Dantzic; which office he is faid to have executed with the utmoft integrity and applaufe. He was alfo very highly efteemed by fortigners; and not only by thofe fitiled in aflronomy and the fciences, but by foreign princes and potentates: as appears abundantly Fiom a collection of their letters which wete printed at Dantaic in the year 1683 .
heurniUs, or Van Heurn, (John), a learned Fhyfician, was born at Uticcht in $5+3$; and fludied at Lonvain, Paris, Padua, and Pavia. At his return to his native country he became magitrate of Amfterdam; after which he was profeffor of phylic at Leyden, and rector of the univerfity of that city, where he died in 1501. He wrote, among other works, feveral treatifes on the difeafes of diflicrent parts of the body, and feveral commentaries on the works of Hippoerates. Otho Heurnius his fon was atfo profeffor of phytic at leyden, and wrote fome books.

HEUSDEN, a flrong town of the United Irovinces, in Holland, feated on the river Macfe, among N 153.
marfhes, with a handfome caftle, in E. Long. 5. 3. N. Lat. 51.47.

HEWSON (William), a very ingenious anatomit, way born in 1739. He became affikant to Dr Hunter, and was afterwards in partnerfhip with him ; but, on their difagreement, read anatomical lectures at his own houfe (in which he was feconded by Mr Falconer). He wrote Inquiries into the Properties of the Blood, and the Lymphatic Sy:fem, 2 vols; and difputed with Dr Monro the difcovery of the lymphatic fyltem of veffels in oviparous animals. He died in 1774.

HEXACHORD, in ancient mufic, a concord call. ed by the moderns a fixth.

HEXAGON, in geometry, a figure of fix fides and angles; and if thefe fides and angles are equal, it is called a regular bexagon.
HEXAHEDRON, in geometry, one of the five platonic bodies, or regular folids, being the fame with a cube.

HEXAMETER, in ancient poetry, a kind of verfe confilling of fix feet; the firft four of which may be indifferently either fpondees or dactyles; the fifth is generally a dactyl and the fixth aiways a fpondee. Such is the following verfe of Horace:

$$
\begin{aligned}
& \stackrel{1}{\mathbf{I}^{2}} \stackrel{3}{3} \quad \stackrel{4}{5} \quad{ }^{6} \\
& \text { Aut prol defe vollunt, aut deld cares poletre. }
\end{aligned}
$$

hexamillion, Hexamile, or Hexamilium, a celebrated wall, built by the emperor Emanuel in $1+13$ over the ifthmus of Corinth. It took its name from $f_{1} x$, and $\mu_{1} x_{12}$, which in the vulgar Greek fignifies a mile, as being fix miles long.

The defign of the hexamilion was to defend Peloponnefus from the incurfions of the balbarians. Amurathlif. having raifed the fiege of Conftantinople in the year $14^{2} 4$, demolifhed the hexamilium, though he had before concluded a peace with the Greek emperor. The Venetians reftored it in the ycar ${ }^{1} 463$, by 30,000 workmen, employed for 15 days, and covered by an army commanded by Bertoldo d'Eite general of the land forces, and Louis Loredano commander of the fea.- The infidels made feveral attempts upon it; but were repulfed, and obliged to retire from the ncighbourhood thereof: but Bertoldo being killed at the fiege of Corinth, which was attempted foon after, Bertino Calcinato, who took on him the command of the army, abandened, upon the approach of the beglerbeg, both the liege and the defence of the wall which had coft them fo dear; upon which it was finally demolifhed.

HEX $\rightarrow$ NDRIA, in hotany, (from $5 \frac{5}{5}$ ix, and avmp a man); the name of the fixth clafs in Linnxus's fexual method, confitting of plants with hermaphrodite Ilowers, which are furnifhed with fix famina or male organs, that are of an equal length. See Botany, p. 430.

HEXAPLA (formed of $: f_{1 x}$, and $x=\pi \lambda \omega^{\circ} I$ open, $I$ unfold), in chureh-hittory, a Bible difpofed in fix cohumas; containing the text, and divers verfions thereof, compled and publibed by Origen, with a view of fecuring the lacief toxt from future corruptions, and to correct thofe that had been already introduced.

Eufthius, IFil. Ecel tib vi. cap. 16. relates, that Origen, after his return from Rome under Caracalla, applied himklf to learn Hebrew, and began to collect the feveral velions that had becn made of the facred writings,

cularly St Chisyferom on the Palms, Philopontis in
his Hexameront, \&e. Some modern his Hexameroll, \&e. Some modern writers !ave earnelly endeavoured to colle ct fragments of the Hexapla, particularly Flaminius Nohilius, Drutur, and $11^{\circ}$. Montfaucon, in two folio volumes, printed at Paris in. $1: 13$.

HEXASTYLE, in architecture, a Euilding wich fix columns in front.

HEXHAM, a town of Northermberland, fituated near the confinx of the north and fouth Tyne. It is cormenly seckoned to be the Alexcduntm of the Romans, where the firll cohort of the spaniards were in garrifon. It was made a bifoop's fee ty Etheldreda, wife of king Egfred, in the year 675. Its furt hiflop St Wiffred buile bere a mort magnificent cathedral and monaftery, and it was poffefled by feven biflops fuceefively; but being very much iufefiel by the Danes, the fee was removed to York. The town and priony were deffroyed by the Scots in 1296, and pillaged again in 1345. There was a remarkable and bloody hattle fought near this town between the houles of Iancafter and York, wherein the former were defeated. chithy by the extraordinary bravery and conduct of John Nevil, bord ilontacute, who was for that rcafon created earl of Ninsthumberlaud. The prefent town is not populous, and the fleeets are narrow, with ill-built looufes. The market-place, near the centre of the town, is a fpacious fquare, it is fupplied by a fountain with water. A nong the remains of ancient Atractures is a gateway of Saxon architerture, leading to the priory, but of a much older date. There are two ancient towers in the town, one of which is ufed as a feffens-houfe, and was formely an exploratory tower; the other is on the top of a hill towards the Tyne, of remarkable architectinc, which has been much higher than at prefent, and has two dungens within it, befides feveral chambers with very little narrow windows. The town has a charity or grammar fehcol. It was in 1571 annexed to the county of Cumberland: but only in civil matters; fo: its eeclefiatical jurifdiction is not the fame with the relt of the councy, it being till a peculiar belonging to the archbifhop of York; and the vulgar fill call the neighbouning country Hexhamfhire. It is a corporation goverued by a bailiff chofen jearly. Neweatle is about 15 miles diflance. The markets here are Tuefday and Saturday: fairs on Augult 5. and November 8. A rivulet, called Hexloold, runs by the town, which fometimes overflows fuddenly.

HISIDON, a litle, pleafant, well built town of Yorkfire, in that part called Holderreff, feated on a river that falls into the Humber. It lias now but one church, tho' there are the it mains of two more; and had formerly a confiderable trade, which is now Inft, on account of its being fo near Hull. The houfes being rebuilt, adds to the beauty of the place. It is a corporation; and is governed by a mayor, a recorder, nine aldermen, and two bailifts, who have the power of choofing theriffs, and are jultices of the peace. It fends two menibers to parliament. W. Long. $0.55^{\circ}$ N. Lat. 53.46.

Heydon (Jolin), who fonetimes affumed the name of Eugenius Theoridadus, was a gicat pretender to Nkill in the Rolierucian philofophy and the ceictlial figns, in the reign of king Chatles 1. ; and wiote a conliderable number of chemical and aftrological works, with $3<$
very
very biagular tikcs. This idiculues atthor wos much tefoted to by the duke of Buckingham, who was infatuated with jucicial aftrologs. He employed dim to calentate the king's and his own nativity, and was affied that his ders had promited himgreat things. The cuke afo employed Heydon in fome trafonathle and feditions pratices, for which he was fent to the Tower. He letl much of lis former reputation by telling Kichard Cromoell and Thurloe, who went to him difguiled like cavaliers, that Oliver would infalibly be harged by a certain time; which he out-lived feveral years.

HEYLIN (Dr Ptter), an eminent Englif writer, veas bon at Burford, in Oxfordhire, in $560=$. He tudied at Hart Hall, Oxford; where he took lis degrecs in arts and divinity, and became an able geografher and hitorian. He was appointed one of the chaplains in ordinary to King Charles 1. was prefeated to the rectory of Hemingford in Huntingtonthire, made a prebendary of Weftminfter, and obtained fereral other livings : but of thefe he was deprived by the parlament, who allo fequeltered his ellate ; by which means he and his family were reduced to great necaflity. However, upon the reloration, he was refored to his fpiritualities; but never rofe higher than to be fubdean of Wellminfter. He died in 1662 ; and was interted in St Pcter's church in Wettminiter, where he had a neat monument erefed to his memory. Ihis writings ate very ntmerous: the principal of which are, 1. Aitrocofmus, or a Deforiptica of the Great World. 2. Comogriphia. 3. The Hitory of St Geozge. 1. Ecclefus Iinditas, or the Church of England Julli. fied. 5. Hillorical and Mifcellaneous Tracts, \&e.

HEYWOOD (John), one of our molt ancient draratic poets, was born at North-Mims, near Si Alhan's in Hertfordhire, and educated at Osford. From thence he retired to the place of his nativity; where Be had the gnod fortune to become acquainted with sir Thomas More, who, it feems, had a feat in that seighbourhood. This patron of genius introduced our comic poet to the princefs Mary, and afterwards to h.er father IVenry, who. we are told, was much de. bighted with his wit and tkill in mufic, and by whom i.e was irequently rewarded. When his former pa:ronefs, guten Mary, came to the crown, Heywood became a favourite at court, and continued often to s wentain her majotty, exereifing bis foncy before bir, even to the sire thot he lay languthing on ber detwod. On the accettion of Elizabcth, keing a zealous Papit, he thonedut it to decamp, with other favomites of her e'ecoated majeliy. He fettled at Mechlin in Flanders, whore he died in the year 1565.-John Heywood was 2 man of mogeat leaming, nor were his poetical taWhtir by any means extraerdinary; buthe poffefied taBrats of more importance in the times in which he lived, mamely, the talents if a jefler. He wrote feve3A plays; 500 epignams; 1 Dialoga in Irege comern-
 lie, a thick fio. Before the title of this laft work is a whole-kesth werden pint of the anthor; who is alforepefonted at the head of every chapter in the book, of which here are 77.-. He left iwo fons. who both became fothits and eminent men: viz. Ellis HeyWoon, who consinued fome time at Florence under the patrouge of cardinal Pole, and became fo good a
malter of the Italian tongue, as to write a tratife in that language, intitled Il Aloro; he died at Louvain about the year 1572 . Iis other fon was Jafper Heywood, who was obliged to relign a followthip at Oxford on account of his immoralities: he tranflated thrce tragedies of Seneca, and wrote various poems and devifes; fome of which were printed in a volune intitled The Paradife of Dainty Devifes, 4 to, 1573. He died at Naplestin 1597.

Heywoon (Eliza), one of the moft voluminous nowel witers this ifland ever produced; of whom we know no more than that her father was a tradefman, and that fhe was born about the year 1695 . In the early part of her life, her pen, whether to gratify her own difpofition or the prevailing tafte, dealt chiedy in licentious tal:s, and memoirs of perfonal fcandal: the celebrated Atalantis of Mrs Mlanley ferved her for a model ; and The Court of Carimania, Tise neau Ulopia, with fome other pieces of a like naturc, were the copies her genius produced. She allo attempted dramatic wriring and performance, but did not fuccecd in either. Whaterer it was tha: provoked the refentment of Pope, he gave full fcope to it by dittinguifhing her as one of the pizes to be gained in the games introduced in honour of Dullnefs, in his Dunciad. Neverthelefs, it feems undeniable, that there is much fpirit, and much ingenuity, in her-manner of trating fubjects, which the filends of virtue may perhaps wih the had never meddled with at all But, whatever offence fhe may have given to delicacy or morality in her early works, the appears to lave bien foon convinced of, and endeaveured to atone for, in the latter part of her life; as no anthor then appeared a greater adrocate for virtue. Among her riper productions may be fpecified, The $F c$ male Spacator, 4 vils; The biftery of NIf/s Butfy Thoughthefs, 4 vols; Fonmy and Gonny Foflumy, 3 vols; The invighle fip, 4 vols; with a pamphlet, intuted $A$ prefent for a fervant-maid. She died in 1759 .

HIAMEN, or Emour. See Emous.
HIATUS, properly fignifies an opening, chafn, or gap; but it is particularly applied to thofe verfes where one word ends with a vowel, and the following word begins with one, and thereby occafions the mouth to be more open, and the found to be very harfh.

The term biatus is alfo ufed in fpeaking of mant. feripts, to denote their defeets, or the parts that have been loft or effaced.

HIBISCUS, Syrian mallow: A genus of the polyandria order, belonging to the monodelphia clais of plants; and in the natural method ranking under the 37 th order, Columniferc. The cally is double, the exterior one polyphyllous, the capfine quinquelocular and polyfermous.

Spries. Of this genus there are 36 ppecies; the mott remarkable are, I. The Syiacus, commonly calltd althrad frutex, is a native of Syria. It rifes with fhrubby thalks to the height of eight or ten feet, fending out many woody branches covered with a fmooth grey bark, garnifhed with oval fpear-fhaped leaves, whofe upper parts are frequently divided into three lobes. The flowers come out from the wings of the ftalk at every joint of the fame year's fhoot. 'They are large, and thaped like thofe of the mallow, having five large roundith petals which join at their bafe, fpreading open at the tog, in the shape of an oper.

## H I B

iftus. bell. Thefe appear in Augult; and if the feafon is not too warm, there will be a fucceffion of flowers till September. The flowers are fucceeded by fhort capfules, with five cells, filled with kidney-fiaped feeds; but unlefs the fafon proves warm, they will not ripen in this country. Of this fpecies there are four or five varieties, differing in the colour of their flowers: the molt common hath pale purple flowers with dark bottoms; another hath bright purple flowers wich black bottoms; a third hath white flowers with purple bottoms; and a fourth variegated flowers with dark bottoms. There are alfo two with varicgated leaves, which are by fome much effeemed. All thefe varieties are very ornamental in a garden. 2. The Rofa Sinenfis, with an arborefeent ftem, and eggr pointed faved leaves. It is a native of the Eaft Indies, whence it has got the name of China rofe; but the feeds laving been carricd by the French to their Wert India fectements, it hath thence obsained the name of Mutrinico rofe. Of this there are the double and fingle flowering kinds; the feeds of the firft frequently produce plants that have only fingle flowers, but the latter feldom vary to the doublekind. 3. The mutalilis, or changcable rofe, has a foft fpungy fem, which by age becomes ligneous and pithy. It rifes to the height of 12 or 14 feet, fending out branches towards the top, which are hairy, garuifted with heart-flaped leares, cut into five acute angles on their borders, and fightly fawed on their edges; of a lucid green on their upper fide, but pale below. The flowers are produced from the wings of the leaves; the fingle are compofed of five petals which Spread open, and are at firft white, but afterwards change to a blufh rofe colour, and as they decay turn purple. In the Well Indies, all thefe altcrations hap. pen on the fame day, and the flowers themfclues are of no longer duration ; but in Britain the clanges are not fo fudden. The flowers are furrounded by fhort, thick, blunt, capfules, which are very hairy; having five cells, which contain many fmall kidney fhaped feeds, having a fine plume of fibrous down adhering to them. t. The albemofchus, or mufk-feeded hibifcus, is a native of the Wefl Indies, where the French cultivate great quantities of it. The plant rifes with an harbaceous thalk three or four feet high, fending out two or three fide branches, garmifhed with large - Ieaves cut into fix or feven acute angles, fawed on their edges, having long foottalks, and placed alternately. The flacks and Itaves of this fort are very hairy. The flowers come out from the wings of the leaves upon pretty long footfialks which thand ercet. They are large, of a fulphur colour, with purple bottoms; and are fucceeded by pyramidical five-cornered capfules, which open in five cells, filled with large kidney-haped feeds of a very mulky odour. 5. The tiliaceus, or malio-tree, is a native of both the Indies. It rifes with a wrody, pithy llem, to the height of ten feet, dividing into feveral branches towards the top, which are cosered with a woolly down, garnifhed with heartShaped leaves cuding in acute points. They are of a lucid green on their upper fide, and hoary on the under fide, full of large veins, and are placed alternately. The flowers are produced in loofe fpikes at the end of the branches, and are of a whitifh-yellow colour. They sure fucceeded by thort acuminated capfules, opening
in five cells, filled with kidney-fhaped feeds. 6. 'The trionus, Venice mallow, or tlower of an hour, is a native of fome parts of Italy, and has lung been cultivated in the gardens of this country. It ries with a branching flalk a foot and an half high, having many thort fpines, which are foft and do uot appear unlef. clofely viewed: the leaves are divided into thriec lobes, which are deeply jugged alnofl to the midrib. 'I'le flowers come out at the joints of the flalks, upon pres. ty long foot- Atalks. They thave a double empalement : the outer being compofed of ten long narrow leaves, which join at the ir bafe: the imer is of one thin lea! fwollen like a bladder, cut into five acete 「egments at the top, having many longitudinal purple ribs, and is hairy: Both thefe arc permanent, and inclofe the captile after the flower is pal. The tiower is compofed of tive obtufe petals, which fpread cpen at the top; the lower part forming an open beli-flaped llow. er. Thefe have dark purple buttoms, but are of a pale fulpher colour above. In hot weather the flowers continue but a few hours open; however, there is a fucceftion of flowers that open daily for a contider. able time. 7. The efculentus, or eatable hibifcus, tifes to five or fix feet ; has broad five parted leaves, and yellow large flowers. The pod or okra is from two to fix inches long, and one inch diameter. Whan ripe, it opens longitudinatly in five different placce, and difcharges a number of heart-flaped feeds.

Culture. The firl fort may be propagated cither by feeds or cuttings. The feeds may be fown in pots filled with light earth about the latter ond of March, and the young plants tranfplanted about the fame time next year. They will fucceed in the full ground; but mult be covered in winter whillt youg, otherwife they are apt to be deftroyed. The fecond, third, fifth, and feventh forts are propagated by feeds, which muft be fown in a hot bcd. The young plants are to be tranfplanted into fmall feparate pots, and treated like other tender vecetables, only allowing them a good hare of air. The fourth fort is annuat in this comtry, though biennial in thofe places where it is nativc. It is propagated by feeds, and mult be treated in the manner dirceted for Amaranth. The fixih fort is propagated by feeds, which hould be fown where the plants are defigned to remain, for they do not bear iranfplanting well. They require no other culture than to be kept frec from weeds, and thinned where they are too clofe; and if the feeds are permited to featter, the plants will come up fully as well as if they had been fown.

U/es. 'The fourth fort is cultivated in the Wich Indies by the French for the fake of its feeds. Thefe are anmually fent to France in great quantities, and form a confiderable branch of trade, but the furpofes which they anfwer are not certainly known. The inner rind of the fifth fort is very Atrong, and of great efteem, which the following recital from Dampier may ferve to illuftrate: They (the Muketo Indians) make their lines, both for fithing and Ariking, with the hark of Maho, which is a fort of tree or fhrub that grows plentifully all over the Well Indies, and whofe bark is made up of llrings or threads very Arong; you may draw it off either in flakes or fmall threads, as you have oscafion.-I: is fit for any manner of cordage, and prim $3 Q^{2}$

Hicelas vateers often make their rigging of it. See farther the ticle Bark.

The feventh fort is a native of the Weft Indies,
where it is chlinated in gardens and inclofures as an article of food. - The whole of it is macilaginons, tfecially the pods. "Thefe (Dr Wright informs Lis) are gathered gretn, cut into picees, dricd, and fent home as prefents, or are boiled in broths or foups for food. It is the chief ingredient in the celehrated pep. per-pot of the Weal Incies, which is no other than a rich olla: the other articles are either feth meat, or dried then and capficum. This difh is very palatable and nowriming.-As a medicine okra is employed in all cafes where emollients and lubricants are indicated."

HICETAS of Syracufe, an ancient philofophar and allronomer, who taught that the fun and ftars were motionlefs, and that the carth moved round them. 'This is mentioned by Cicero, and probably gave the firth hint of the true fylem to Copernicus. Ile flourifhed $3+4 \mathrm{~B}$. C.

HICKES (George), an Englif divine of extraordinaly parss and learning, born in $16 \psi^{2}$. In 1691 he was made kine's cliaplain, and two years after dean of Worcetter. The death of Chates II. Alopped his farther preferment; for though his church principles were very high, he manifelted too much zeal againt Popery to be any favourite with James Il. On the revolution, he with many others was deprived for refuling to take the oaths to king William and queen Mary; and foon after, archbifhop Sancroft and his collcagues confdering how to maintain epifcopal fucceffon among thofe who achered to them, Dr Hickes carried over a lift of the deprived ciergy to king James; and with his fenction a private confecration was performed, at which it is fail lord Clarendon was prefent. Ainong others. Dr Hickes was confecrated fuffragan bifhop of I'letford, and died in $1715 .-$ He wrote, 1. Infitutiones Grammetica Anglo Saxonice, et Mafo. Gothica. 2. Antiqua literatara feptentrionalis. 3. Two treatifes, one of the Chritian pricfthood, the other of the dignity of the epifcopal order. 4. Jovian, or an anfwer to Julian the apolate. 5. Sermons; with many temporary controverfal pieces on politics and stligion.

HICKCUP, or Hiccovgh, a fparmodic affection of the ftomach, ofophagus, and mufles fubfervient to deglutition, arifing fometimes from fome particular injury done to the domach, cefophagus, diapliragm, Sic. and fometimes from a general affection of the norvous fyllem. See (the Index fubjuined to) Menachene.

HIDAGE (Hidagium), was an extraordinay y tax fiyable to the kings of England for every hide of land. This taxation was levied not only in money, but in provifion, armour, \&c.; and when the Danes landed in Sandwich in 994, king Ethelred taxed all his lands by hides; fo that every 3 ro hides found one thip furnithed, and every eight hides furnifhed one jack and one faddle, 10 arm for the defence of the kingdom, Sc.- Sometimes the word bidage was ufed for the being quit of that cax: which was allo called bidegilh; and interpreted, from the Saxon, "a price or ranfom paid to fave one's orin or hide from beating."

HIDALGO, in modern hiltory, a title given in Spain to all who are of noble family.

The Hidalgos claim a defcent from thofe valiant fol.
diers who retired into Caltile, and the mountains of Atturias, and other remote parts of Spain, on the in. vafion of the Moors, where having fortifed themfelves, they fucceflively defeended into the plains, in proportion to the fuccefs of their arma: from the notoriety of their perfons, or the lands the $y$ became poffifed of, they acquired the appellation of Hiddigas notorios, Fiidalyos de folar somocido, or de cafo foliriciga. Of thefe, according to Hernando Mixia, there are thece forts; the firll being lords of placts, villdges, towns, or caltes, from whence they took their firnames, as the Guzmans, Mendozas, Laras, Guivaras, and others ; the fecond. who recovered any fortrels from the Aloors, as the lonces of Leon, and others; and the third fort, from the places where they tefided, or held juridiction, as Rodrigo de Narvacz was called of . Ritequera, from being Alcayde there. But this definition is not confuered as tsact or conclufive by Otalora, another civilian, who fays that the true meaning of Hidalgos $d_{2}$ folur conocido is explamed by the laws of Catile to be a well known manfion or poftetion, the nature of which is particularly explained in the laws of Parditar, lib. 5. tit. 35. which deferibe three forts of tenures called Devifa, Solariega, and Mobtris. By the dirt, lands are devifed by the anceftor; flar is a tenure upon another perfon's manor, and ubliges the owne. to recrive the lord of the fee when necedtity obliges him to travel ; and Betittriu is in the mature of an allo. dium. In proportion as thefe Aborigines gained ground on the Moors, and incseafed in their numbers, many private perfons ditiaguibed themfelves by their valour, and obtained tellimonics of their fervices, called cartas de mercal. which ferved them as a foundation of the: birth and good defcent, without which documenia their pollerity could not make it appear ; and if from a lapfe of time, or other unavoidable accidents, fuch proof Should lappen to be loft or deflroyed, the law affords them a remedy under thefe circumtances, Ey a declaration, importing, that fuch perfons as are fup. pofed to have had fuch certificates, may be relieved by making it appear that their ancetors, time imme, morial, have always been held and reputed as Hidal. gos, and enjoyed the privileges of freh, from a trorg prefumption in their favour; the poffeffion of land having equal force to any other document; which is fully fet forth in the Pragmatia of Cordova. 'L'o thefe executory letters are granted cartas executorias, cxpreflive of their privileges; and for the better regulation of thefe matters, proper offeers are appointed in the chancery courts, called alcaldes de lor bidhalgoso who ought to be bidalgos themelves, aud hold jurifdiction in thefe cafes, and no others: but even here innovations have taken place; for as thefe grants flow from the fovercign, who is the fountain of honour fome are declared Hidalgos de fargre, by right of defeent, and others de privilegio, or by office, in which the will of the fovereign has made amends for any deficiency of blood.

There is a fet of people near Segovia, at a place called Zamarramala, who are cxempt from tribute on account of the care they take in fending proper perfons every night to the catile of Segovia to kee? contirel-one cries out Vcla, scla, bao, and the other blows a horn, from whence they have been titled fir dalgo. ty the form. Le Catalonathore gentienten who

## H I D

are Atyled Hombre de Parega, are confidered the Came as Sidalyos in Callite, and were fo called from the word parejur, to equip, this name being given as a diflinction by $130 r e l o$ the th $^{\text {th }}$ count of Barcelona, at the ficge of that city, in 965 , who fummoniug all his vaffals to come to lis affitance againt the M ors, nine hundred horferacu well mounted and equipped joined him, and with their aid he took the city; and this appellation has been given in honourable remembrance of this loyal action.

Thefe noble hidalgos enjoy many privilgges and diftinctions; of which the following are the principal.

1. Thi firth and greateft privilege which they hold by law is to enjoy all polts of dignity and hotour in the church and thate, with liberty, when churchmen, of having a plurality of benctices. They are qualified for receiving all orders of knighthood, and are to be preferred in all embaffies, governnents, and public commiffions.
2. When they are examined as witneffes in civil and criminal cafes, their depotitions are to be taken in their own honkes, without being obliged to quit them to go to thofe of others.
3. In all cturches, proceftions, and other public aets or affemblies, they are to have the next place of honour and precedency after the officers of juftice, conforming themfelves to particular cutloms.
4. They are not obliged to accept of any challenge for combat, fuppofing fuch were allowed of, but from thofe who are their equals.
5. Though it is fortidden to guardians to purchafe the eflates of minors, this does not extend to Hidalgos, in whom the law does not fuppofe any fraud, and they may purchafe them publicly.
6. They are permitted to be feated in courts of juftice in prefence of the judges, from the refpect and honour due to them. They have alfo feats in the courts of chancery, in confaderation of their birth, which gives them a right to be near the perfons of princes.
7. Their perfons are free from arrelt for dett, nor can any attachment be laid on their dwelling. houfes, furniture, apparl!, arms, horfes, or mules in immediate ufe: nor can they make a ceffion of their eftates, nor be diftreffed in fuits of law, farther than their circumflances will admit of, but are to be allowed a realonable and decent maintenance for their fupport.
8. In cafes of imprifonment for criminal matters, they are to be treated differently from others. They are generally confined to their own horfes with a fafe guard, or under arreft upon the ir honour, or allowed the city or town they lived in, and in particular cafes are fent into cafles.
9. When punifhments are inflicted for criminal cafes, they are to be lefs fevere to them than to others, as they are not to fuffer ignominious punithments, fuch as public thame, whipping, gallies, nor are they to be banged, but beheaded, excepting in cales of treafon or herefy. In cafes that do not imply a corporal punifhment but a pecuniary one, they are treated with more rigour, and pay a larger fine than others.
10. They are not to be put to the rack or torture, excepting for fuch beinous crimes as are partisularly fpecified by the laws.
11. When there are title-deeds or other writings Hidalgo, or papers in which two or more perfons have an equal right or property, and require a particular charge. they are to be given up by preference to the cullody of an Uidaloo, if any of the parties are fucl?
12. The daugher of an lidalgo enioys every privilege of her bith, though married to a commoner: and a woman who is not an Ilidabo enjuys all the fe privileges when the is a widow, following the fortune of her hufband.-But if the widow is an Hudalgo, and the late hutband was a commoner, fhe falls into the Atate of her huifand after his death, though the had the privileges of her birth during his life.
13. 'They are free from all duties, called $P_{\text {echos }}, P_{c}$ dilos, Monelus, Alartenirgns, Contribuciones, as well royal as civil, and all other leviss of whatever kind they nay be, with a referve for fuch as are for the public benefit, in which they are equally concerned, fuch as the repairing the highvays, bridges, fountains, walls, dethaction of locifte, and other vermin.
1.4. They are free from perfonal fervice, and from gning to the wars, excepting whet the king attends in perfon; even then they are not to be Coreed, but invitcd, and acquainted that the royal Itandard is difplayed.
14. No perfons whatever can be qquarteled upon, or lodged in their houles, except when the king, queen, prince or infantesare on the road, as in fuch cales even the houles of the clergy are not exempt.
15. They cannot be compelled to accept of the office of rectiver of the king's rents, or any other en:ployment which is confidered as mean and derogatory
to their dignity and rank.
16. Dy a particular cultom confirmed by royal authority in that part of Caltile beyond the Ebro, baflards fucceed to their parenes, and crijuy their honouss contrary to the royal and common law.
17. If a lady, who marries a commoner, Mould be a queen, duchefs, marchionefs, or countefs (for they have no barons in Caftile), the not only does not lofe her rank, but conveys her titles to her hufluand, who holds them in right of his wife.
Thefe arc the general privileges which the Hidalgos enjoy: there are fome others of lefs confequence, as well as particular grants to cortain perfons and families. Aa ancient and ridiculous cultom is faid to be obferved by noble ladies who are widows of pleckeians, in order th recover their birthright, for which purpofe thry cariy a pack-faddle on their fhoulders to their hufband's grave, thea throwing it down and flrkong it thrce times, fay, ‘Villein, take thy villsiny, for I will abide by my nobility:' and then they recover their privileges again.

HIDE, the Rin of bealts; but the word is particularly applied to thofe of large catcle, as bullocks, cows, horfes, \&c.

Hides are either raw or green, jult as taken off the carcafe; falted, or feafoned with falt, alum, and faltpetre, to prevent their fooling; or curried and tanned. See 'Tannina.

Hide of Land, was fuch a quatrity of land as might be ploughed with one plough within the compafs of a year, or as much as would maintain a fanily; fome call it 60 , fome 80 , and others 100 acres.

LIERACIUM;

## H I E

fmall channel on the top. A woman was wafhing linen Hiera in it, with a child at her back; and beyond were cabins of the Turcomans, Itanding ditinet, much neater than any we had feen, each with poultry feeding, and a fence of reeds in front.
" It is an old obfervation, that the country about the Mxander, the foil being light and friable, and full of fales generating inflammable matter, was undermined by fire and water. Hence it abounded in hot fprings, which, after paffing under-ground from the refervoirs, appeared on the mountain, or were found bubbling up in the plain or in the mud of the river: and hence it was fubject to frequent earthquakes; the nitrous vapour comprefled in the cavities, and fublimed by beat or fermentation, burfting its prifon with toud explofions, agitating the atmofphere, and fhaking the earth and waters with a violence as extentive as deftructive; and hence, moreuver, the pettilential grotos, which had fubterraneous communications with each other, derived their noifome eflluvia; and ferving as fimaller vents to thefe furnaces or hollows, were regarded as apertures of hell, as paflages for deadly fumes riling up from the realms of Pluto One or more of the mountains perhaps has burued. It may be fufpected, that the furface of the country has in fome places been formed from its own bowels; and in particular, it feems probable, that the bill of Laodicea was originally an eruption.
"The hot waters of Hierapolis have produced that molt extraordinary phenomenon, the cliff, which is one entire incruftation. They were anciently renowned for this fpecies of transformation. It is related, they changed fo eafily, that being conducted about the vineyarde and gardetis, the channels became long Fences, each a fingle fone. 'They produced the ridges by our tent. The road up to the ruin=, which appears as a wide and high caufeway, is a petrilication; and overlooks many green fpots, once vineyards and gardens, feparated by partitions of the fame material. The furface of the flat, above the clift, is rough with flone and with channels, branching out in various diections, a large pool overGowing and feeding the numerous rills, fome of which fpread over the llope as they defcend, and give to the white flony bed a humid look, relembling falt or driven fnow when melting. This cruft, which has no talle or fmelh, being an alkaline, will ferment with acids; and Picenini relates, that trial of it had been made with fpirit of vitriol. The waters, though hot, were uftd in agriculture.
"Tamerlane, when he invaded this country, encamped for the fummer at Tanrûzlik, where many of his men were deltroyed by drinking of a fpring which Haznated and petrified. The Turkih name Pambouk fignifies cotton; and, it has been Caid, refers to the whitenefs of the incrutation.
"The thepherd-poet of Smyrna, after mentioning a cave in Phrygia facred to the Nymphs, relates, that there Luna had once defcended from the flky to Endymion, while he was fleeping by his herds; that marks of their bed wese then extant under the oaks; and that in the thickets around it the milk of cows had been fpilt, which men linl beheld with admiration (for fuch was the appearance if you faw it very far off); but that from thence flowed clear or warm water, which in a little whi'e conereted round about the channels, and formed a flone pavement. The writer defcribes the cliff of Hierapolis,
s. Hierapolis, if I miftake not, as in his time; and has added a local itory, current when he lived. It was the genius of the people to unite fiction with truth; and, as in this and other initances, tu dignify the tales of their mythology with fabulous evidence taken from the natural wonders in which their country abounded.
"We afeended in the morning to the ruins, which are on a flat, paffing by fepulchres with infcriptions, and entering the city from the eall. We had foon the theatre on our right hand, and the pool between us and the cliff. Oppofite to it, near the margin of the cliff, is the remains of an amazing flructure, once perhaps baths, or, as we conjectured, a gymnafium ; the huge vaults of the roof ltriking horror as we rode underneath. Beyond it is the mean ruin of a modern fortrefs; and farther on are maffice walls of edifices, feveral of then leaning from their perpendicular, the fones diftorted, and feeming every moment ready to fall; the effects and evidences of violent and repeated earthquakes. In a recefs of the mountain on the tight hand is the area of a lladium. Then arain fepulchers fucceed, fome nearly buried in the memantain-fide, and one a fquare building, with an infcription in large letters. All thefe remains are plain, and of the thone created by the waters. The fite has been computed about two hundred paces wide and a mile in length.
"After taking a general furvey, we returned to the threatre, intending to copy incriptions, and examine more particularly as we changed our fation. We found this a very large and fumptuons fructure, and the leaft tuined of any we had feen. Part of the front is flanding. In the heap which lies in confufion, are many fculptures well executed in baffo relicvo; with pieces of architrave infcribed, but disjointed; or fo encumbered with maflive marbles, tha: we couht colleat from them no information. The charager is large and bold, with ligatures. The marble feats are thill unrempved. The numerous ranges are divided by a low fenicircular wall, near mid-way, with inferiptions on the face of it, but molly illegible. I copied a hont but inaperfict one, in which Apollo Archegetes of The Ieabicr is requetted to be propitious. In another comparment, mention is made of the city by its name hierafolis; and on a third is an encomium in verfe, which may be thus tranflated, "Hail, golden city Hierapolis, the tpot to be peterred bcfore any in wide Alis: revered for the rillis of the Nymphs; adorned with fplendor." The $\mathrm{N}_{\mathrm{j}} \mathrm{mph}$ prefided over fprings and fountains.

After attentively viewing them, a:d ecafictring their height, width, and manner of arrangement, 1 am inclined to believe, that the ancient Aliatics fat at their plays and public fpectacles like the modern, with their legs crufled or gathered under them; and it is probabie upon carpets.
"The waters of Hicrapolis were furprifingly attem. pered for tinging wool, with a colvur from roots riyalling the more cottly purples; and were a principal fource of the riches of the place. The company of dyers is mentioned in the infcription on the fquare building among the fepulchres. That heroum or monument was to be crowned by them with garlauds or feftouns of flowers. The fprings flowed fo copiounly, that the city was full of fpontaneous baths; and A pollo, the tutclar deity of the Hicrapolitans, with Efculapius and Hygicia, on their medals, bear witoefs to the medicinal vir-
tues which they poffefs. The people, in fume of their Hierapolis inferiptions, are thyled the mof jplemilid, and the fenate the man pozverful.
"The pool before the theatre has been a bath, and marble fragments are vifible at the bottom of the water, which is perfectly tranfparent, and of a briny talle.
" Hierapolis was noted, befides its hot waters, for a plutonium. This was an opening in a finall brow of the adjacent mountain, capable of admitting a man, and very decp, with a fquare fence before it, inclofing about half an acre; which fpace was tilled with black thick mit, fo that the buttom could be fearcely difcerned. The air, to thofe who approached it, was innocent on the outlide of the fence, being clear of the mit in ferene weather, it remaining then within the boundary; but there death abode. Bulls, as at Nyfa, dropi down, and were dragged forth without life; nod fome farrows whieh Strabo let fly inflantly fell fenfelefs. But cunuchs, the priefts of Magna Mater, or Cybele, esuld go in quite to the apcrture, lean forward, or enter it mharmed; but they held their breath, as their vifares teftified, and fonctimes until in danger of fuffucation. Serabo, the relater, was in doubt whether all cunuchs conld do this, or only they of the temple; and whether they were preferved by Divine Providence, as in cafes of enthufialm, or were poffefled of fome powerful antidotes. But it is likely this mift was the condenfert fteam of the bot waters, made noxious by the qualities of the foil; and that the whote fecret of the priefts confifted in carrying their faces high in the air, as another fpeetator has obferved they always did; and in avoiding refpiration when they thoped. I had loped the defcription of this spot would have enalled me to find it, but I fearched abont for it unfuccelfively.
"We defcended to sur tent at the approach of evening, by a lleep track down the cliff, beginning beyond the pool, in which we alfo bathed with pleafurc, on the file next the gymnafium. Oor way was often rnugh and flippery, refembling ice, and our horfes wift difficulty preferved their footing. When arrived at our tent, I renewed my inquiries for the plutoriam; and $2 a$ old Turk, with a beard as white as funw, told me he know the place, that it was often fatal to their goats; and accounting for the effee, faid, it was believed to be the habitation of a demon or evil fpirit. We afcended agein early in the marning to the theatre, where he had promifed to join us; and a live forl was intendea to be the martyr of experiment." But our author was intereupted by fome banditti, and obliged to leave Hicrapolis in hafte.

HIERARCHY, among divines, denotes the fubordination of angels.

Some of the rabbins reckon four, others ten, orders or ranks of angels; and give them different rannes according to their different degrees of power and knowledge.

Hierarchy, likewife dentes the fubordination of the clergy, eceleliaflical polity, or the conftitution and government of the Chriflian church confidered as a fociety.

HIERES, the name of fome fmall iflands lying near the coall of Provence in France, oppofise to the towns of Hieres and Toulon, where the Englinh Hect lay many months in 1544, and blocked up the French and Spariin fleets in the harbour of Toulon.

## H I E

Fitirfs, a town of Provence in France, feated on the Mediterrancan foa. It is a pretty little town, and was fornierty a culuny of the Marfilians; and pilgrims ufed to embark here for the holy land. But its harbour being now choaked up, it is confidcrable only for its lalt-work. L. Long. 6. $1_{3}$ N. Lat. $43 \cdot 7 \cdot$

HIERO l. and 1l. kings of Syracufe. See Syracise.

Filiroclecs, a crucl perfecutor of the Clirinians, and a siolent promoter of the perfecution under Diocklian, flominhed in 302 . Ile wrote fome books argainlt the Chriltian religion: in which he pretends finne inconfilencies in the Holy sicriptures, and compares the miracles of Apollonius 'lyanzeus to thofe of cur Saviour. He was refuted by Lactantius and Eufobins. 'The remains of his works were collected into nue volume octavo, by bifhop Pearfon; and publifhed in 1654 , with a learned diflertation prefixed to the work.

Hifrocles, a Matonic philofopher of the fifth rentury, taught at Alexandria, and was admired for I.is cloquence. He wrote feven books upon Providence and 「ate; and dedicated them to the philofoplier Olympiodorus, who by lis embalites did the Romans great fervices under the emperors Honorius and "Ineodofus the yonager. But thefe books are loft, and we only know them by the extracts in Photius. He wrote allio a Commentary npon the golden verfes of Py -- hagoras; which is ftill extant, and has been feveral times publifhed with thofe verfes.

IfEROGLXPHICS, in antiquity, mytical characters, or $\mathrm{f}_{\mathrm{y}}$ mbols, in ufe among the Egyptians, and that as wedl in their writings as inferiptions; being the ligures of catious animats, the parts of human bodies, and mechanical inftruments. 'The word is compofed of the Greek efer facer, "holy," and ravarav foulpere, "to engrave ;" it being the cullom to have the walls, doors, $\mathfrak{k c}$. of their temples, obelifts, \&e. engraven with fuch figures.

Hieroglyphies are properly cmblems or figns of oivine, facted, or fupermatural things; by which they are diflinguthed from common fymbols, which are figns of futible and natural thinge.

Hermes Trifmegitus is commonly efteemed the inventor of hieroglyphics: he fitt introduced them into the heathen theology, from whence they have been eranfplanted into the Jewilh and Chitian.

Sacred things, fays Hippnerates, fhould only be communicated to facred perfons. Hence it was that the ancient Egyptians communicated to none but their kings and prietts, and thofe who were to fucceed to the priellhuod and the crown, the fecrets of nature, and the feerets of their morality and hiftory; and this they did by a kind of cabbala, which, at the fame time that it influcted them, onty amufed the eft of the people. Hence the we of hieronlyphics, or myftic figures, to veil thicir morality, politics, \&e. from profane eges. This anthor, it may be obferved, and many otheis, do not kerp to the precife character of a hieroglyphic, bat apply it to profane as well as divine thing 3.

Hitroghyhics are a kind of real characters, which so not ondy denote, but in fome meafure exprefs, the things. Thus, accurding to Clemens Alexandrinus, Strom. v. a lion is the hieroglyphic of frength

No 153.
and fortitude ; a bullock, of agricultare ; a horfe, of liberty; a fphinx, of fubtilty, \&e.

Such is the opinion that has generally been embraced, both by ancient and modern writers, of the origin and ufe of hieroglyphics. It has been almont uniformly maintained, that they were invented by the Egyptian priefts in order to conceal their wildom from the knowledge of the vulgar; but the late bihop Warburton hath, with much ingenuity and learning, enjeavoured to fhow that this aecount is erroneous.

According to this writer, the firlt kind of hieroglyphics were mere pictures, becaufe the moft natural way of communicating our conceptions by marks or figures was by tracing out the images of things; and this is akvally verified in the cafe of the Mexicans, whofe only method of writing their laws and hifory was by this piđture-writing. But the hieroglyphics invented by the Egyptians were an improvement on this rude and inconvenient eflay towards writing, for they contrived to make them both pictures and characters. In order to effect this improvement, they were obliged to proceed gradually, by lirtt making the principal circumitance of the fubject fand for the whole; as in the bieroglyphics of Horapollo, whith reprefent a battle of two armies in array by two hands, one holding a fhield and the other a bow : then putting the inltrument of the thing, whether real or metaphorical, for the thing iffelf, as an eye and fceptre to reprefent a monarch, a fhip and pilot the governor of the univerfe, Exe.: and tinally, by making one thing ftand for or reprefent another, where their obfervations of nature or traditional fuperftitions led them to difcover or imagine any refemblance: thus, the univerfe was defigned by a ferpent in a circle, whofe variegated fpots denoted the ftars; and a man who had nobly furmounted his misfortune was reprefented by the hin of the liyæna, beeaufe this was fuppofed to furnih an invulnerable defence in batile.

The Chinefe writing, he obferves, was the nexr kind of improvement in the ufe of hieroglyphics. The Egyptians joined characteritic marks to images; the Chinefe threw out the images and retained only the contracted marks, and from thefe marks proceeded letters. The general coneurrence of diffirent people in this method of recording their thoughts can never be fuppofed to be the effect of imitation, finifter views, or chance; but muil be confidered as the unifom vaice of nature fpeaking to the rade conceptions of mankind: for not only the Chinefe of the Eatl, the Mexicans of the Wefl, and the Egyptians of the South, but the Scythians likewife of the North, and the intermediate inhahitants of the earth, wiz. the Indians, Phownieians, Ethiopians, \&c. ufed the fame way of writing by picture and hieroglyplic.

The binhop farther thows, that the feveral fpecies of hieroglyphic writing took their rife from mature and necelfity, and not from choice and artifice, by tracing at large the origin and progrefs of the art of fpecelh. He proceeds to thow how in procefs of time the Egyptian hieroglyphics came to be employed for the vehicle of myftery. They uled their hieroglyphics two ways; the one more fimple, by putting the part for the whole, which was the curiologic hieroglyphic; and the other mote artificial, by putting one thing of refembling qualitits for another, called the tropical hicroolypbic:
thus

Fires thus the moon was fometimes reprefented by a half circle and fometimes by a cynocephalus. They employed their proper hieroglyphics to reeord openly and plainly their laws, policies, public morals, and hiftory, and all kinds of civil matters: this is crident from their obelifs, which were full of hieroglyphic characters, defigned to record fingular events, memorable attions, and new inventions; and alfo from the celebrated infcription on the temple of Minerva at $S$ ais, where an infant, an old man, a hawk, a lifh, and a river-horfe, expreffed this moral fentence: "All you who come into the world and go out of it, know this, that the gods hate impudence." Howestr, the tropical hieroglyphies, which were employed to divulge, gradually produced fymbols which were defigned to feerete or conccal: thus Egypt was fometinies sxpeeffed by the crocodile, fonetimes by a burning cenfer with a heart upon it ; where the fimplicity of the firll reprefentation and the ahfrufencifs of the latter fhow, that the one was a tropical hieroglyphic for communica. tion, and the other a tropical fymbol invented for fecreey.

Enigmatic fymbols were afterwards formed by the affemblage of different thirgs, or of their properties that were lefs known; and though they might have been intelligible at dirt, yet when the art of writing was invented, hieroglyphics were more generally dif. ufed, the people forgot the fignification of them, and the priefts, rctaining and cultivating the knowledge of them becalfe they were the reponituries of their learning and hiftory, at lengeth applitd them to the purpofe of preferving the feerets of their religion.

Symbols were the true, original of animal wormip in Egypt, as Sir Jolun Marıham eonjc čtured, Can. Cliron. p. 58. beeaufe in thefe hieroglyphics was recorded the hiftory of the ir greater deitics, their kings, and lawgivers, reprefented by animals and wher creatures. The fymhol of each god was well known and familiar to his worfhippers, by metans of the popular paintings and engraviugs on thicir temples and vether facted mo. numents: fo that the fyrmol prefentirg the idea of the gexd, and that ideacxciting fentiments of religion, it was naturd for them, in their addrefies to any particular god, to turn tw lis arerefentative matk or fymbol; efpecially when wic conkice farther, that the Egyptian pricas feigned a divinererginal for hicroglyphic eharaters, in order to iticesaic the veneration of the peoplefor them. 'ilace would of courfe bring on a relative devotion tothefe fymbolic figures, which, when it came to be paid to the liviny animal, would foon terminate in an ultinate worfhip.

Another confequence of the facrednefs of the hieroglyphic charakers was, that it difpofed the more fulperllitious to engrave them on gen:s, and wear them as amulets or cliarms. This magical abule feems not to have been wehearlier than the eflatlifhed won haip of the god Serapis, which happened under the Ptolemies. and was firft brought to the general knowledge of the world by certain Cloriftian heretics and natives of Egypt, who had nixed a number of Pagan fuperflitions with their Chrillianity. Thefe gems, called alraxas, are frcquently to be mot with in the cabinets of the curious, and are engraven with all kinds of hieroglyphic characters. Tu thefe abraxas fucceed the talifmans.

Vol. ViII, Part II.

HIEROGRAMMATISTS, (Hierogrammatci), i. e. bely reajfers, were an order of priells among the ancient Egyptians, who prefided over learning and religion. They had the care of the hieroglyphies, and werc the expofitors of religious doctrines and opinions. They were looked upon as a kind of prophets ; and it is pretended, that one of them predicted to an Egyptian king, that an lfraelite (meaning Nioles), cminent for his qualifications and atchievements, would leflen and deprefs the Egyptian monarehy. - The hierogrammatci were always near the king, to affit him with their informations and counfels. The better to bit them for this, they made ufe of the lkill and knowledge they had aequired in the fars and the motion of the heavenly lights, and even of the writings of their predteeffors, whercin their functions and juties were delivered. 'They were exempted from all civil employments, were reputed the lift perfons in dignity next the king, and bore a kind of feeptre in form of a ploughfare. - After Egypt became a province of the Ruman empire, the herogrammatei funk into neglect.

HIEROMANCY, in antiquity, that part of divination which predicred future cvents from obferving the various things offered in 「acrifice. See Divisus. tion and Sacrifice.

HIEROMNEMON, among the ancient Grecks, fignified a delegate chofen by lot, and fent to the great council of the Amphictyons, where he was to take care of what concerned religion. The hieromnemonies were reckoned more honourable than the other members of that affembly, the general mectings of which were ahways fummored by them, and their names were prefixed to the decrees made by that council.

Hieromsemov (eompofed of "epos "facred," and kunus. " one who advertifes or puts in mind of," an officer in the atucient Greek church, whofe principal function was to ftand behind the patriareh at the faeraments, cercmonies, \&cc. and fhow him the prayens, pfalms, \&ec. which he was to rehearfe. He difo clothed the patriarel in his pontifical robes, and alfigned the places of all thofe who had a right to be around him when feated on his throne, as the mafter of the ceremonies now does to the pope.
HIERONYMUS. See Jerome.
hierophantes, or Hierophanta, (from "fpos holy, and sxw: I appear), in antiquity, a prieft among the Athenians.
'The hierophantes was properly the chief perfon that officiated in the cleufinia, that great folemaity faered to Ceres.

This office was firte executed by Eumolpus, and continued in his family for 1200 years, though when any perfon was appointed to this dignity he was required alway to live in celibacy.

St Jerome fays, that the hieropbantes extinguihed the fire of lut by drinking cicuta or the juiee of hemlock, or even by making themfelves tuauchs. Apollodorus obferves, that it was the hieroplantes who inAlructed ferfons initiated irto their religion in the mytteries and duties thereof, and that it was hence he derived his name: for the fame reafon he was ealled prophetes, " the prophet." He had officers under him to do the fame thing, or to affith him therein, who 3 R were

HIGHAAl frrrers，an ancient borourth of Nor－ thamponthire in England，which has its nans：from the family of the Ferrers，to whom it formerly bee konged，and who had a calte in its neighbourhond． It fends one member to parlianent．E．Long．1．so． N．Lat．52． 20.

HLGEIGATE，a village five miles north of Lon－
don．It has its name from its high fituation，and from Highla a gate fet up there abont $+=0$ ycars ago，to receive toll for the b：hop of London，when the ohd mire road from Gray＇s－inn Lame to Barnet was tuned throuph the bifhop＇s park．＇There was a hermitage where the chapel now lands；and one of the hermies cauled a cateway to be made between Highgate and 111 ng on， with gravel dur out of the top of the hill，where there is now a pond．Nar the chapel，in $15^{\prime} 22$ ，lisist chicf baron Cholmondely built and en．3owed a brece foboul， which was enlarged ia 15 ；o by Edwin Sismy bihup of Lomdon．－＇his villape is a noted and aify retirement for the gentry and weathy citizens；and is a phece of good accommudation，befides its atiordins a delipheful and phatant profpect over the city ad adjacent coumery．

HIGHEANDERS，a general apptlition for the inhbitants of the monntanous pats of any country， In britain，the ame is appopristed to the people who inhabit the mountainous parts of Sontan l，to the nomth and north wath，including thofe of the H brides or Wellem ！lles．－l＇hey are a branch of the ancient Cdtae；and undoubtedly the defendauts of the firt inbabitants of Britain，as appears fion the many mo－ numents of their languse till retained in the mol an－ cient names of phaces in all parts of the inand．The Highluders，or，as they ate often terned by ancient authors，the Calodonims，were always a brawe，warbike， and hardy race of people；and，in the remotell times， feem tu have poffated a dagree of retinement in fenti－ ment and mamers then unishown to the other nations that furroundel them．This appears not only from their own traditions and poems，but alfo from the ieftimony of many ancient authors．This civilization was probably owing in a great meafure to the order of the bards，or Druids，and fome other iallitutions peculiar to this people．

The ancient Highlanders lived in the limaning fate till fome time after the era of Fingal，who was one of their kings towards the clole of the third eentury．For fome arges after that，they curned their chef attention to the paltoral life，which affurded a lefs precarions fublitence．Till of late，agriculthe in mot parts of the Highlands made but litte progrefs．

The Hightanders always enjoyed a king and go－ vermment of their own，till Kemath M．Alpine（anto $甘_{4}$ ），after having fublued the Pictim kimgum， transferned thither the feat of royalty．＇Phis evelle proved very unfavourable to the virtuts of the High－ landers，which from this period begran to dedme． The country，no longer awd by the preience of the fovereign，fell into anarchy and confufion．The chici－ tains began to extend deeir authonity，to form factions， and to foment divilious and fends between contending clans．The laws were cither too fecble to bind them， or too remute to take notice of them．Hence fprung all thofe evils which long difgraced the country，and dilturbed the peace of its inhabitants．Robbery or plander，providing it was committed on any one of an adverfe clan or tribe，was countenaneed and anthonfed； and their repifals on one another wete perpetwal． ＇Thus quarel，were haded down from one prenerations Io awother，and the whole clan were bound in honour to efpoule the carfe of every individual that belonged to it．By this means the genius of the people was

## H I G

land greatly altered; and the Eiglilanders of a few ages back were almoft as remarkable for their irregular and diforderly way of life as their predeceffors were for their civilization and virtue. It is from not attending to this diftinction between the ancient Highlanders and their pofterity in later times, that many have doubted the exillence of thofe exalted virtues aferibed by their poets to the more ancient inhabitants of the country. But now that the power of the chieftains is again abolifhed, law eftablifhed, and property fecured, the genius of the people (where it is not hindered by fome other extraneous caufe) begins again to thow itfelf in its genuine colours; and many of their ancient virtues begin to mine with confpicuous luftre. Juftice, generofity, honefty, firendfhip, peace, and love, are perhaps nowhere more cultivated than among this people. But one of the Arongeft features which marked the character of the Highlanders in every age, was their hofpitality and benevolence to ftrangers. At night the sraveller was always fure to find a hearty welcome in whatever houte he thould go to; and the hof thought himfelf happier in giving the entertainment than the gueft in receiving it. Even with regard to their enemies, the laws of hofpitality were obferved with the moft facred regard. They who fought againlt each other in the day, could in the night feaft, and even neep together, in the fame houfe. From the fame principle, they were, in molt other cafes, fo fathful to their trull, that they rately betrayed any confidence repofed in them. A prumife they thought as binding as an oath, and held it equally inviolable and facred.

The Caledonians in all ages hare been much addicted to poetry and mufic. 'The poems of Offan, fo univerlally repeated, and fo highly etteemed by every Highlander, are attong proof of the eally proticiency of this people in the poctical art. Even to this day, notwithilanding the many difadvantages they labour under, the mof illiterate of either fex difeovet frequently a genius for poetry, which ofton breaks forth in the molt natural and finple Arains, when love, grief, joy, or any other fuhject ot fong, demands it. Whereever their circumblanees ase fo eafy as to allow them any refpite from toil, or any checrfulnefs of fpirits, a good portion of their tine, efpecially of the winternights, is thill devoted to the fong and tale. This lath fpecies of compolition is chitily of the novel kind, and is handed down by tradition like their poems. It was the work of the bards; and proved, while they exilted, no contemptible entertainuent. But tince the extinction of that order, both the Gaclic poems and tales are in a great meafure either lolk or adulterated. -The genius and character of the Gaclic poetry is well known. It is tender, fimple, beautidul, and fublime.

Among the ancient Highlanders, the harp was the chief intlrument of mufic. It fuited the mildnefs of their maners, and was well adapted to the peace and quiet which they enjoyed under their own kings. In a later period, however. when the conllant quarrels of their chiefs. and the endlefs feuds of contending clans, turned all their thonghts to war, it was forced to give place to the bag-pipe, an inllrument altogether of the martial kind, and therefore well furted to the ftate of the country at that time. But ever fince the caufe
which had brought this intrument in vogue has ceafed to operate, the attention to it has been on the decline ; fo that the harp, with very little encouragement, might

Highland- again refume the leat from which it was once expelled. -The molt, and cfpecially the oldett of the High. land mufie, laving been compofed to the harp, is of a foft, tender, and elegiac calt, as belt fuited to the genius of that inflrument. Thefe pieces are generally expreffive of the paffions of love and grief. Other pieces, which were compofed in their flate of war, and adapted to a different inllomemt, are altogether bold and martial. And many are of a fprightly and cheerful catt, the offspring of mirth, and the fport of fancy in the feafon of feltivity. Many of thefe latt are of the chorus kind; and ate fung in almoft all the exercifes in which a number of people are engaged, fuch as rowing, reaping, fulling, \&c. The time of thefe pieces is adapted to the exercifes to which they are refpectively fung. 'I'hey greatly forward the work, and alleviate the labour. The particular mulic which is generally ufed by the Highlanders in their dances is well known by the name of Sirath/pey reels.

The language of the Highlanders is thill the Gaelic ; which, with many of their cultoms and manners, las been fecured to them by their mountains and faltneffes, amidtt the many revolutions which the ret of the illand has undergone in fo long a courle of ages. The Gaelic feems to be the oldelt and purelt dialect which remains of the Celtic, as appears from its approaching the nearell to the names of places, sce. which that language left in molt countries where it prevailed, and from its molt obvious adfinity to thofe tongues, ancient or modern, which have been in any meafure derived from the old Celtic. The Gdelic lias all the marks of an original and primitive language. Mo!t of the words are exprefive of lome property or quality of the objeets which they denote. I'his, together with the variety of its founds (nany of which, efpecially of thofe that exprefs the foft and mournful paflions, are peculiar to itielf ), renders it highly adajeted for poetry. It is generally allowed to have been the language of court, in Scotland, till the reign of Malcom Canmore. The Gaclic epithet of Canomore, or " large head," by winch this king is diltinghished, feems to intimate fo much. In fome particular parliaments at leatt, it was fooken much later, as in that held by Robest the Bruce at Ardehattan. That it has been formerly a good deal cultivated, appears from the tyle and complexion of its poems and tales, and from feveral ancient MSS. that have come down to the prefent times. 'To ilrangers the Gaelic has a forbidding afpect, on account of the number of its quiefcent confonants (which are retained to mark the derivation of words and their variation in cafe and tenfe), but its found is abundantly mulical and harmonious; and its genius Atrong and mafculine. Its alpliabet conlitts of is letters, of which one is an afpirate, 12 are confonants, and five are vowels.
'the Highlanders are beginning of late to apply to learning, agriculture, and efpecially to commerce, for which their country, every where indented with arms of the fea, is peculiarly favourable. Cattle is the chief tlaple of the country; but it produces more grain than would fupply its iuhabitants, if fo much of it were not confunsed in whiliy. The natives

S3inhore. are begirning to avail themfelves of their mines, woods, wool, and fitheries; and by a vigorous application, with the duc encouragement of goverument, may become a profperons and ufeful people.

The Highlanders are of a quick and penetrating gesius, fromgly tinctured with a curiofity or thirit of k.nowldge, which difpofes them to learn any thing very readily. They are active and indugtions, where oppretlion does not difoourage the: by fecleding even the bope of thriving. They are temakably bold and adventuruis, which qualizes them for being excellent feanen and foldiers. They are geatrally of a midelle fize, rather abowe it than otherwife; their eyes are brifk and lively, their features dittinctly narked. and their perfons tight and well made. Their countenance is open and ingenasus, and their temper frank and commuricaive.

HIGHIORE (Jofeph. Efq;) an eminent painter, was bern in the paribit of St Jume's, Garlickhithe, London, June 13. 16gz, being the thind fon of Mr Edward Hiphmore, a coal inerchant in Thames freet. Hawng foch an early and flrong inclination to painting, that he could think of nothing elie with pleafure, his father endeavoured to gratify him in a prosofal to his uncle, who was ferjeant painter to king William, and with whom Mr (atterwards Sir James) Thornhill had frved his apprenticeflip. But this was afterwards forgood reafons declined, and he was artiched as elerb to an attorney, July 10 th 1 -07; ; but fo much againit his cwn declared inclination, that in about three years he began to form refolutions of indulging his natural difpoftion to his farourite art, having continually em ployed his leifure hours in defiguing, and in the thady of geometry, perfective, architectare, and anatomy, brit without any inftructors exeept books. He had afierwards an opportunity of improving himfelf in anatomy, by attending the lectures of Mr Chefelden, befides entering himfelf at the painters academy in Great Queen threet, where he drew 10 years, and bad the honour to be particularly nuticed by Sir God. frey Kneller, who dillinguifhed him by the name of "the Y'oung Lawyer." On June '3th 17'4, his elenxthip expired; and on March 26th 715 , he began painting as a profeffion, and fetted in the city. In the fame ycar Dr Brook Taytor publihed his "Li. near Perfpective: or, a new method of reprefeating juftly all manner of objects as they appear to the cye in all fithations," On this complete and univerfal theory our artif grounded his fubfequent practice; and it has been generally allowed, that $f=w$, if any of the profeifion at that time, were fo thorough mafters of that excollent but intricate fyttem. In 1716 , he maried Mifs Sufanna Hiller, daughter and heirefs of Mr Anthony Hiller of Effingham in Surrey; a young lady in every reipedt worthy of his chaice. For Mr Chefel. den's "A Anatomy of the Human Budy," publifhed in 17:2, he made drawings from the real fubjects at the time of difiction, two of which were engraved for that work, and appear, but without his name, in tables xii. and xiii. In the fame year, on the exhibition of "The Confcious Lover," written by Sir Richard Steele, Mr Highmore addreffed a letter to the author po the limits of filial obedience, pointing out a material defect in the character of Bevil, with that clearnef6 and precifion for which, in converfation and wri-
ting, he was always remarkable, as the pencil by no means cngtolied his whole attention. Wis reputation and bufinfs increating, be took a more confpicuous Aation, by removing to a houfe in Lincolu's.Inn Fiches, in March 1723-4; and an opportunity foon offered of introducing him advantageonly to the nobility, Sc. by his being defired, by Mr line the engraver, to make the drawings for his prints of the knights of the bath, on the revival of that order in 1725 . In confequence, feveral of the knights had the ir portraits allo by the tame hand, fome of them whole lengths; and the duke of Richmonel, i:a particular, was attended by his three efquires, wi h a perlpective view of king Henry VIlth's chapel. This capital picture is now at Godwood. And our artill was fenz for 10 St Janes's by George It to draw the late duke of Cumberland, from which Senith feraped a merzotiato.

In 17cis, Mr Hawkins Browne, then of Lancoln's-
 ties, addrefted to him a peetical epitle "On Whin and Beanty ;" and, fome years aftor, an elegat Latin Ode, both now collectad ia his puens. In the fum. mer of $173^{2}$, Mr Highmere vilited the continent, in company with Dr Panberton, Mr Denjamin Robias, and two other friends, chicfly with a vicw of fecing the gallery of pistures betonging to the clector palane at Buffedorp, colketed by Rubens, and fuppolich the betl in Europe. At Antwerp alfo he had pectliar pleafure in contemplating the works of his favourite mather. In their return they vifited the principal towns in Holland. In 1734, he made a like excurfion, but alone, to Paris, where he received great civilities from hiscountrymen then there, particularly the duke of Ningiton, Dr Hikman (his tutor), Rolert Kinight, Efq; (the late cahnicr), sc. Here the had the fatisfaction of being fhown, by cardinal de Poligna:, his famous group of antique tlatues, the court of L.jcomedes, then jutt brought frum Rome, and tince purchafed by the king of Polfia, and deftroyed at Charlottenbourg in 1760 by the Ruffians. In 1742, he had the honour to paiat the late prince and princefs of Wales for the duke of Saxe Gotha; as he did fome years after the late queen of 1jenmark for that court. The publication of "Pamela," in 1744 , gave rife to a fet of paintings by Mr Highmute, which were engrdved by two French eagravers, and publifhed by fubicription in 1745. In the fame year he painted the only original of the late general Wolfe, then about 13. His Pamela introduced him to the acquaintance and friendhip of the excellent author whofe picture he drew, and for whom he painted the only original of Dr Young. In 1750 he had the misfortune to lofe his wift. On the firft iuftitution of the academy of painting, fculpture, \&ic. in 1753, he was elected one of the profefiors; an honour which, on account of his many arocations, he defined to decline. In 1754 he publifhed "A critical examination of thofe two Pantings [by Rubens] on the Cieling of the Ban-queting-houfe at Whitelall, in which Architecture is intruduced, fo far as relates to Perfpective; together with the Difcuffion of a Qucllion which has been the Subject of Debate among Painters:" printed in 4 to. In the folution of this queltion, he proved that Rubens and feveral other great painters were miltaken in the practice, and Mr Kirby and fe-

## H I G <br>  <br> H I G

e. veral other authors in the theory. And in the 17 thr into the Beauties of Painting, \&ec." In the fame Efighmore. volume of the "Monthly Revicw," he amimadverted (an:nymounly) on Mr Kirby's muwarsantable treatment of Mr Ware, and detected and expofed his errors, even when he exults in his own fuperior fcience. Of the many portraits which Mr Highmore painted, in a large practice of 46 years (of which feveral hav. been engraved), it is impolfible and ufelefs en difeufs particulars. Sume of the molt capital in the hitonical branch, which was then much lefs cultivated than it is at prifen', fall only be mentioned, viz. " Hagar and IMmael," a prefent to the Fundling hofpital: "The good Samaritan," painted for Mr Shepherd of Camp. fey Afh: "The finding of Mofes," purchafed at his fale by colonel (now general) Lifter: "The Harl we family, as defcribed in Clarifa," now in the polfe flim of Thomas Watkinfon Payler, Efq; at Heden in Kent: "Clarifta," the portrait mentioned in that work: " 'Ilne Graces unveiling Nature," drawn by memory from Rubens: "The Clementina of Grandifon, and the queen mother of Edward IV. with her younger fon, \&c. in Wellminfler abbey;" the three lat in the poff fion of his fon.

In 17 Gt , on the marriage of his daugher to the Rev. Mr Duncombe, fion to one of his oldell fritads, he took a refoution of retiring from bulinefs, and thifpoling of his collection of pictures, which he did by auctiun, in March 17 $\mathbf{C l}_{2}$, and fom after removed to his fon-inlaw's at Canterbury, where be palfed the remainder of his life without ever reviiting the metropolis. But though he had laid down the pencil, he never wanted employment : fo active and vigorous was his mint, that, with a conilitutional fow of fitits, ancl a relinh fur inlluctive fociety, he was never lefs "alone than when alons;" and, betides his prufefional pusfuits above mentioned, to phalufophy, builh aatural and moral, and alco divinity, he badabiy decticated his time and attention. No man had more clear. nefs and precifion of ideas, or a more ardent delire to know the truth: and, when known, confeientioufly to purfue it. With ilrong pafhons, ever guided by the flrictent virtue, he had a tender, fufceptible heart, always open to the diltreffes of his fellow-creatures, and always ready to relieve them. His capital work of the literary kind was his "Practice and perfpective, on the principles of Dr Brook Taylor, \&c." writen many years before, but not publificd till 1 - 63 , when it was printed for Nourfe, in one vol. qto. 'This not only evinced his fecentific knowledge of the furject, but remuved, by its perfpicuity, the only objection that can be made to the fiftum of Dr Taylor. It accordingly received, from his friends and the intelligent publie, the applanfes it deferved. In 1765 lie publifhed (without his name) "Olffervations on a Jamplet intituled, 'Chriflianity not founded on Argument:" in which, after fhowing that it is a continucd irony, and lamenting that to ample a field thould be offered the author of it for the difplay of his fophiftry; he gives up creeds, articles, and catechifms, as out-works raifed by fallible men, and, confining himfelf to the defence of the gofpel, or citadcl, fhows, that purc primitive Chrifianity, though aflaulted by infidels, will ever remain impregnable. His opinion of Rubens may be feen in the Geutleman's Magazine for $1766, \mathrm{p} .353$, under tbe title of " Remarks on fome paflages in Mr Webb's inquiry
year he publifhed, with only his initiali, " J. H." two finall voluncs of "Effys, inoral, relizions. and mifcellaneons; with a Tranfation is prove of Mr Browne's Latin Poem on the Immortality of the Soul," flected from a larg= number written at his leifure, at different periods of life. "Asiuch (fays Dr Hawkefwosth) they do the aultor great credit. "1hey are note excurtions of fancy, but effores of thought, and indubitanle indications of a vigorous andataive mind." In the Genteman's Magazine for 1,69 , p. 283 , he communicated "A natural and obvivas Manter of conltructing Sun-dials, deduced from the Situation and Mution of the Earth with refpect to the Sum," explamed by a febeme. And in that for 1778, P. 526 , hus remarks on coluuring, fuggelled by way of a nu:e on the "Epithe to aar eminem Painter," will Row that his takents were by no means impaired at the age of 86. Insered he retained them of the latt, and had even Atreugth and fpirit futheicut to enable him to ride out daily on horibback the funamer befure he died. A itrong comtitution, habitual temperatace, and cone flant atcontion to his bealth in youth as well as in age, prolonged his life, and prefervad his faculties to lris $88 t h$ year, when he gradually ccaled to breathe, and, as it were, tell afleep on March 3.1780 . He was interred in the fout aill: of Canterbury cathedrat, hatving une fon, Anthuny, educated in his owa pruedliven: and a daughter, Sufana, inemtioned abovic.

His abohtics as a paiuter appear in his works, whinh will nut ouly be admiral by his contempataries, but by their polterity; as his tines, like thole of Rubens and Vondyck, inticad of being impaired, are improved by tune, which lome of them have now withlood ahowe co years. His idea of beatir, when he indulged his fancy, was of the higholt kind; and hi, knowledje of perfacetuve gave hat gleat advantuges in fu-mily-pices, of which he panted more than any one of his time. He could take a likenefs by memory as well ats by a litting, as appears by his picture of the duke ot Louran (the late emperor), which Faber engraved; and thute of king George IL . (in liorkal. lanbly-rouas) ; quech Caroline, the 2 wo Mits Guanings, \&ce. Like many uther gitat paineers, the had " a paet for has triend," in the late Mir Brown ; to which may be added a pocin adúreffed to him in 1726 , by the Rev. Mr Bunce, at that tume of Trinity-ull, Cambrudge, who fucceeded Mr Highnure, and ia 1780 was vicar of St Sieplacn's near Camertury.
HIGHNEOS, a quathey or tithe of honour given to princes. - l'lue kings of England and Spain had forneely no other title but that of bighoues; the lint till the cime of James I. and the fecond till that of Charles V. The petey princes of Italy began lirte to be complimented with the titie of biginefs in the year 1630-- The duke of Otleansafumed the title of rogat bighnefs in the ycar t 631 , to dillaguith bimiclf from the uther princes of Fiasce.

The duke of Savoy, late king of Sardinia, bore the title of royal bighefs, on account of his pretenfiuns to the kingdom of Cyprus.- It is faid that duke ouly twok the title of royal Lighnefs, to put himfelf above the duke of Flurence, who was calied great duke; bue the great duke afterwards affumed the tithe of reynd bighrefs, to put himfelf on a lewil with :he duke of Suvay.
11.as. This prince of Conde firf took the tithe of mof forene

HIIARTA, in antiquity, feafts celebrated every year by the Rumans on the 8 th of the calends of April, or the 2 sth of March, in honour of Cybele the mother of the gods.

The hilaria were folemnized with great pomp and rejocing. Every perton drefed himelt as he pleafed, and took the marks or hadiges of whacever dignity or quality he had a faney for. The llatue of the groddefs was carried in proceflion through the flreets of the city, accompanied by mahtitudes in the moll fplendid attire. 'The day before the feftival was fpent in tears and mourning. Cobele reprefented the earth, which at this tinse of the year begins of fed the kindly warmeth of the fpring ; fo that this fudden trantition from forrow to joy was an emblem of the vicillitude of the feafons, which fucceeded one another.

The Romans took this feall originally from the Greckas, who called it araixaras, q. d. afcenfus; the eve of that day they fpent in tears and lamentations, and thence denominated it warateas, difcerfus.

Afterwards, whe Greeks took the name axpaz from the Romans; as appears from Photius, in his extract of the life of the philofopher Ifidne.

Cafanbon maintains, that befide this particular fignification, the wond tilaria was alfo a general name for any joyful or fettival day, whether public or pivate and domeftic. But Salmafius does not allow of this.

Trillan, tom. i p. $4^{82}$, ditinguilhes betwecn hitaria and hilarix. The former, according to han, were public rejoicings; and the latter, prayers make in coniequance thereof; or even of any private feat or rejoieing, as a mariage, \&e. The publec lafted feveral days; during which, all mourning and fuacral ceremonies were fuppended.

HILARIUS, an ancient father of the Chriltian choreh, who flourithed in the 4 th century. He was born, as Sit Jerome informs us, at loocticrs, of a groud family; who gave him a liberal education in the Pagan religion, and which he did not forfake till he was arrived at maturity. He was advanced to the bifhopric of Poicticrs in the year 255, aceording to liaronius; and became a molt zealous champion for the orthodox faith, particulally againit the Arians, who were at that time gaining ground in France. He affembled feveral councils there, in which the determinations of the fynods of Rimini and Scleucia were condemad. He wrote a treatife concerning fyouds; and a famous work in 12 books on the Trinity, which is much admired by the orthodox believers. He died in the latter end of the year 367 . His works have been many times publifhed ; but the latt and beft cdition of them was iven by the Benedictines at Paris in 1093.

HII,ARODI, in the ancient mulic and poetry, a fort of poets among the Grecks, who went about linging little gay poems or fongs, fomewhat griver than the lunic pitces, accompanied with fome inflrument. From the ftreets they were at laft introduced into tragedy, as the magodi were into comedy. 'lhey appeared dretted in white, and were crowned with gold. At firlt they wore thoes; but afterwards they affuned the crepida, being only a fole tied over with a flrap.

## Hillaky-terit. See T'frm.

HHLDESIHEMM, a mall ditrict of Germany, in the cincle of Lower Saxony. It hes between the duchies of L unenburg and Brunfwich; and may be about 25 miles from ealt to well, and 36 from north to fouth. It is watcred by the rivers lecine and Innerty. The foil is forite ; and its principal places are Pcine, Sarflad, Braggen, and Alvald. Hildatheim, from whence it takes its name, is governed as an imperial city. Its bilhop is now elector of Cologne.

Hindeshegm, a llrong city of Germany, in Lower Sixony, with a Roman-catholic bilhop's fee, whofe hifhup is fovercign. It is a free imperial city, tho' in fome things dependent on the bifhop. It is a large town, well built and fortificd. It is divided into the Ol. Town and the New, which hare each their feparate council. It is feated on the river Irncit, in E. Long. 10.0. N. Lat. 52. 17.

HHLI, a term denoting any confiderable eminence on the earth's furface. It is fometimes fynonymoua with the word mountuin; though generally it denotes ouly the leffer eminences, the word mountain being particularly applied to the very largetl. See Moun. T:IN.

Hill (Aaron), a poet of confiderable eminence, the fon of a gentleman of Malinefoury abbey in WiltThit, was born in $\mathbf{1 6 8 5}$. His father's imprudence having cut off his paterual inheritance, he left Wcllminfter fehool at 14 years of age ; and embarked for Conllantinople, to vilit lord Paget the Englifh ambaffador there, who was his diltant relation. Lord Paget received him with furprize and pleafure, provided him a tutor, and fent him to travel: by which opportunity he daw E.gypt, Paleftine, and a great part of the eaft; and returning home with his noble patron, vifited moft of the courts of Europe. A About the year J 709 , he pubhthed his firt poem intitted Camillus, in honour of the carl of Peterborough who had been general in Spain; and being the fame year made maller of 1) ury-lane theatre, he wrote his Firt tragedy, Elfred, or the fair laconitant. In 17 to, he became mafter of the opera-houfe in the Hay-market; when he wrote an opera called Rinaldo, which met with great fuccefs, being the firt that Mr Handel fet to mutic after he came to lingland. Unfortunately for Mr Hill, he was a projector as well as poet, and in 1715 obtained a patent for extradting oil from beceh-nuts; which undertaking, whether good or bad, mifcarried after engaging three years of his attention. He was alfo concerned in the firth attempt to fettle the colony of Georgia; from which he never reaped any advantage: and in 1728 he made a jouney inte the I lightands of Seotland, on a feleme of applying the woods there to mip-building; in which alfo he lolt his labour. Mr Hill feems to have lived in perfect harmony with all the writers of his time, except Mr Pope, with whom he had a fhort paper-war, oecationed by that gentleman's introducing him in the Dunciad, as one of the competitors for the prize offered by the goddefs of Dullnefs, in the following lines:
"Then Nill ctay": ; farce vanin'd out of fighe,
"He busy-up inftant, and returns to light;
"He bearm notoken nt the fubler ftreams.
" Aud mouuts far off among the Swans of Thames"
This, though far the gentlelt picce of fatire in the whole poem;

## H I L

poem, and conveying at the fame time an oblique complimene, roufed Mr Hill to take forae notice of it ; which the did by a poem writen during lis peregrination in the north, intited, "the proseres of wit, a caveat for the ufe of an eminen: writer:" which he begins with the followne eizht linea, in which Mr Pope's too will-known difpofition is elganty, yet wery feverely characterized:

" Ilfe Laticupliar hared and he II fer pride:
"Wi'h meris sopular with wis piohec,

"Inorl) ased be Fame he ne'er repays:
"Unthorn tucherihh, Ircaknuth approves:
"Anl watt the tor 1 of $\mathrm{r}=\mathrm{A}$ the worth he 1 ves."
The freakingly aptroves, in the latt couplet, Mr Pope was much affected by; and indeed through their whale controverfy afterwards, in which it was generally thought that Mr Hill had much the advantage, Mr Pape feems rather to exprefs his repentunce by denying the offence, than to vindicate himelf fupp ifing it to have beengiven. Befides the above poems, Mr Hill, among many others, wrote one, called The northern fiar, upon the actions of Czar Peter the Great ; fur which he was feveral years afterwards complimented with a gold medal from the empref $\mathcal{F}_{3}$ Callarine, according to $^{\text {a }}$ the Czar's delire before his deail. He likewife altered fome of Sbakefpeare's plays, and tranlated fome of Voltaire's. His talt production was Merope; which was brnught upon the ftage in 1)rury-lane by Mr Garrick. He died on the $\mathbf{c}$ th of Fehruary $17+9$, as it is faid, in the very minute of the earchquake: and af. ter his deceafe four volumes of his wows in profe and verfe were publifhed in oetavo, and his dramatic works in two volumes.

How (Sir John), a voluminnus writer, was originally bred an apothecary; but his marrying early, and without a fortune, made him very foon look round for other refources than his profemon. Havin, therefore, in his apprenticefhip, attended the botanical lectures of the company, and heing puffefed of quick na. tural parts, he foon macle himielf acquainsed with the theoretical as well as practical parts of botany: from whence being recommended to the lave duke of Richmond and lord Petre, ine was by them employed in the infpection and arrangement "f their hozanic gardens. Affired by the liberality of thefe noblemen, lhe executed a foheme of travelling over the kingdom, to colledt the molt rate and unicommon plants; which be afterward publifhed by fulfeription: but after 品eat refearches and uncommon indultry, this underaking turned out by no means adequate to his expectation. 'lhe ftage next prefented itfelf, as a foil io which genius might fland a chance of flowrihing: but after two or three unfuccersful atterupts, it was found be hat no pretenfians either to the fock or bufkin; which unce more reduced him to his botanical parfines, and his bufinefs as an ap wheiary. At tength, whout th year 1746, he tranflited from the Greek. a fmall tract. written by 'Theciphrafus, on Geme, which the putbifnes' ty fubfeription; and which, being weti exccoted. procured him friends, reputation, and money. Encourgget hy this, he engaged in works of greater extent and importance. The firft he undertook was A senera! nocural hiltory, in 3 vols folio. He next tagages, in cou jumthon with George Lewis Scott, Eff; in furniniong a Suppuatat
to Chambers's Diexionary. He at the fancerme Rarted the Irizith Marazine: and while he was engaged in a great number of thefe and wher works, fome of which fecmed to claim the continued attention of a whole life, he carried on a daily effay, under the tithe of $/$ a Ppetor Amidet this hurry of bminefs, Mr Hill was folaborious and ready in a! his undereakings, and was withal fo exag an ceconomill of lus time, that he fearcely ever mifled a public amulement for many years: where, while he relaxed from the feverer purfuits if illody, he gleaned up aricles of infurmation for his perin. dical works It would noe be ealy to trace Mr Hill, now Dr f-ill (for the pricured a diploma from the college of $S$ Andrew's) thenughat his various purfuits in life. A quarrel he had with the $R$ yal socicty, for being refuch as a member, which prowiked him to rillicule that leaned body, in $A$ review of the works of the R wa. S ciety of Lindon, 4to, 1-51; together with his uver-witing hivifelf upon all fubjects without referve; mate him fink in the cttimation of the public nearly ia the fame pace as he had afcended He fomad as ufual, however, retources in his own inventon. He applied himfelf to the preparation of certain fimple medicines: fuch as the effence of waterdock, tincture of valerian, balfan of honey, \&c. The well known fimplicity of thefe medicines made the public judge faymurably of the ir effeets, infomuch that they had a rapill fale, and unce more enabled the doctor to ngure it that fyle of life ever fo congenial to his inclination. Soon after the publication of the firft of thefe medicines, he obtained the patronage of the earl of Bate, through whofe interelt he acquired the management of the royal gardens at Kew, with an landfome falary: and to wind up the whole of an extraordiuary life, having, a little before his death, feized an oppartunity to introduce himfelf to the knowledge of the king of sweden, that monarch invelted him with one of the orders uf his court, which title he had not the happinefs of enjoying above two years. He died toward the clofe of the ycar 1759 .

HILLPif. fenior, of Babylon, prefident of the fanhedrim of Jerufalem. He formed a celebrated fehool there, in which he maintained the oral traditions of the Jews againt Shamai, his collearole, whofe difciples adhered only to the written law; and this controverly gave pife to the fects of Pharifees and Scribes He was likewife one of the compitirs of the Talnud. He alfo laboured mach at giving a conrect edition of the fa cred text; and there is attribured to him an ancient manufeript bible, which bears his name. He flonrithed about 30 years B. C. and died in a very adianced age.

Hillel, the nafi, or prince, another learred Jew, the grandfon of Judas Hakkadoth, we the saint, the author of the Mimma, lived in the fourth century. He compofed a crele; and $w$ as one of the principal doc. tors of the Gamara. The greatelt number of the Jewinh writers attribute to him the correst cdition of the Hebrew tex: which bears the name of Hillel, which we have atready mentioned in the precelong article. There have becu feveral other Jowih switers of the fance name.
HILLIA, in botany: A gemus of the monocynia order, belonging to the hexandria chats of planss: and in the nainral method ranking with th. fo of which the order is cunbiful. 'Ihe cely $x$ !s hexayhatious; the com

Ili.fon roida left in fis parts, and very long; the berry inferior, lifincular, and polyfpermous.

IHILSBOROUGH, a borough, fair, and polt-
H: : :ckles. $\underbrace{1+\ldots k}$ cown in the county of Duwn, and province of Uhter, (6u) r."? ferm Dublin. Here is a line feat of the cart of II"Courngh. 'the town is pleafantly fietated and athon new bealt, in siew of Lifourn, Beltan, and Carrickitgus bay; the clureh is magnificent, having an ciagant jpite, as lufty as that of St Jatrick's in Dub. lis, and ieven painted windows. Here is an excellont im, and a floriving manufacture of mulans. It has three fairs, and fends two members to parliament. '1'his pace gives tithe of eart to the family of Hill. bormenth. N. Lat. 5+. 30. W. Long. 6. 20.

H11.UM, among botanilts, denotos the eye of a bean.

IlimERA (anc. geog.), the name of two rivers in Sicily; one ruming northwards into the 'Iufcan lea, m, called Fiame di Termini; and the other fouthwads into the Lybian; dividing Sicily into two parts, being the boundary between the Syracufans to the eatt and Carthonians to the well; not nifing from the Lame, but from different fprings.

Haprat (anc.geog.), a town of Sicily, at the mouth of the Llimera, which ran northwards, on its left or weft bade: A colony of Zancle: afterwards deflroged be the Carthaginians (Diodorus Siculus).
ifIMERENSES Thermae (anc. geog.), a town of Sicily, on che calt fide of that Himera which rans to the north. After the deftuction of the town of Hinera by the Canhaginians, fuch of the inhabitants as remained, fetted in the fame teritory, not far from the ancicut tuwn. Now Termini. Made a Roman colong by Augufus.

HIN, a Hebrew meafure of capacity for things liquid, containing the fixth part of an ephah, or one gallon two pints Enghill meafure.

HINCKLEEX, a marketown of Leicefermire, buit on a riling ground, nearly on the borders of Leiretterfire, from which it is feparated by the Roman Wathing-fteet road. It is diltant from Coventry and Leicetter 15 miles each, and 102 from London. It has been much larger than it is at prefent, the back lanes between the orchards having evidently been ftrects originally, and the traces of the town-wall and ditch are in many places yet rifible. There are velliges of two Koman worls, viz. the mount near the river, and the ruins of a bath near St Nicholas church, where tulflated paremonis have been dug up. The Jewery wall is faid to have been the temple of Janus. The colte was inhabited by John of Gaunt ; but is now no mome, the fate being concerted into frarden gromed, the cafte-hill confiderably lowered, and a gentleman's donfe erected on the fpot in 1,70 . The fteeple of the prient church was burle with fome of the flones of the calle. The town is now divided into the borough, and the bond without the liherties. It lias a good market on Nondays, and a fair in Augutl. The chief manufacture is llockings and fine ale. The town is faid to contain about 750 houfs. There are two churches, one chapel, and a place of worthip for the Roman Catholics, behies four meeting-houtes. The church is a neat large old flucture with a modern tower and a fyire, the body of it was built in the $13^{\text {th }}$ century, and near it are three mineral fprings. This town is faid to be the middle and highelt ground in $\mathrm{N}^{\circ} 153$.

England; and from it 50 churches may he feen, befide's gentlemens feats. It received great damage by a fire S'ept 5.1728.

H(ND, a femalc flag in the third year of its age. Sce Cervus.

HINDON, a fmall town of Wiltheire in England, which fends two members to parliament. It is fituated in E. Lons. 2. 14. N. Lat. 51. 12.

HINDOOS, or Gentoos, the inhabitants of that part of ladia known by the name of Mindalan or the Alogul's enfire, who proffs the religion of the Bramins, luppoled to be the fame with that of the ancicat Gymasophins of Ethopia.

From the earlicet periud of hittory thefe people feem to have maintained the fame religion, laws, and cuftums, which they do at this day: and indeed they and the Clincfe are examples of perfeverance in thefe refpects altogether unknown in the wettern world. In rhe the time of Diodorus Siculus they are faid to havefion been divided into feven calls or trabes; but the inter- trib courfe betwixt Europe and India was in his time fo ${ }^{\text {c }}$ fimall, that we may well fuppofe the billorian to have been milaken, and that the fame tenacity for which they are fo remarkable in other refpects has manifelted itfelf alfo in this. At prefent they are divided only into four tribes; 1. The Bramin; 2. The Khatry ; 3. The Bhyfe; and, 4. The Soodera. All thefe have diftinet and lepararc offices, and cannot, according to their laws, intesmingle with each other; but for certain offences they are fubject to the lofs of their calt, which is reckoned the lighelt punifoment they can fuffer; and hence is formed a kind wf fifth cafl named Pariars on the coalt of Coromandel, but in the Shan. forit or facred language Clowdalus. 'I hefe are efteemed the diegs of the people, and are never cmployed but in the meaneit oflices. There is befides a geveral divifon which pervades the four cafts indifcriminately; and which is taken from the wulkip of their gods Filnou and Sherab; the worlhippers of the former being named Fifhow-iwhot of the latter, Sheevals. bubla.

Of thefe four calts the bramins are accounted the foremoll in every refpet; and all the Jaws have fuch an evident partiality towards them, as cannot but indace us to fuppofe that they have had the principal hand in framing them. They are not, however, allow'd to affume the fovereignty; the religious ceremonies and the intruction of the people being their peculiar province. They alone are allowed to read the $F$ call or facted books; the $A$ batries, or caft next in dignity, being only allowed to hear them read; while the other two can only read the Seglras or commentaries upon thom. As for the poor Clandalas, they dare not enter a temple, or be prefent as any religious ceremony.

In point of precedency the bramins claim a fuperiority even to the princes; the latter being chofen out of the Khatry or fecond calt. A rajah will receive with refpect the food that is prepared by a bratman, but the latier will eat nothing that has been prepared by any member of an inferior calt. 'Ihe punimment of a bramin for any crime is much mituer than if he had belonged to another tribe; and the greatell crime that can be committed is the murder of a bramin. No magiflrate mult defire the death of one of thefe facred perfons, or cut off one of his limbs. They muft

## H I N

be readily admitted into the prefence even of princes whenever they pleale: when paffengers in a boat, they mult be the firl to enter and to go out; and the waterman mult befides carry them for nothing; every one who meets them on the road being likewife obliged to give place to them.

All the priefts are chofen from among this order, fuch as are not admitted to the facerdotal function being employed as fecretaries and accountants. Thefe can never afterwards become priefts, but continue to be greatly revereneed by the other calls,

The Khatry or fecond caft are thofe from anoong whom the fovereigns are chofen. - The Bhyfe or Banians, who coultitute the third calt, have the charge of commercial affairs ; and the Soodera, or fourth calt, the moft numerous of all, comprehend the labourers and artifans. Thefe laft are divided into as many claffes as there are followers of different arts; ail the children being invariably brought up to the profeffion of their fathers, and it being abfolutely unlawful for them ever to alter it afterwards.

No Hindoo is allowed to quit the caft in which he was born upon any account. All of them are very fcrupulous with regard to their diet; but the bramins much more fo than any of the relt. They eat no flefh, nor fhed blood; which we are informed by Porphyry and Clemens Alexandrinus was the cafe in their time. Their ordinary food is rice and other vegetables, dreffed with shee (a kind of butter melted and refined fo as to be capable of being kept for a long time), and feafoned with ginger and other fpices. The food which they molt citcem, however, is mitk as coming from the cow; an animal for which they have the moft extravagant vencration, informuch that it is enacted in the code of Gentoo laws, that any one who exacts labour from a bullock that is hungry or thirtty, or that thall oblige him to labour when fatigued or out of feafon, is liable to be fined by the magitrates. The other cafts, though lefs rigid, abtain very religiouly from what is forbidden them; nor will they eat any thing provided by a perfon of an inferior caft, or by one of a different religion. Though they may eat fome kinds of flefh and filh, yet it is counted a virtue to abtain from them all. None of them are allowed to talle intoxicating liquor of any kind. Quintus Curtius indeed mentions a fort of wine made ule of by the Indians in his time; but this is fuppofed to have been no other than toidy, or the unfermented juice of the cocoa nut. This when fermented affords a firit of a very unnholefome quality; but it is drunk ouly by the Chandalas and the lower clafs of Europeans in the country. So exceedingly bigotted and fupertlitious are they in their abfurd maxims with regard to meat and drink, that fome Seapoys in a Britin frip having expended all the water appropriated to their ufe, would have fuffered themfelves to perifh for thillt rather than talle a drop of that which was ufed by the Mip's company.

The religion of the Hindoos, by which thefe maxims the are inculcated, and by which they are made to differ fo much from other nations, is contained in certain books named $V_{c d a}$, Vedams, or Beds, written in a language called Skanforit, which is now known only to the learned among them. The books are fuppofed to have been the work not of the fuprone God himfelf, but of

Vol. VIII. Part II,

## $5: 31$ H I N

an inferior deity named Brimha. They inform us, that Hindoos. Brama, or Brahna, the fupreme God, having created the world by the word of his mouth, formed a female deity named Bawaney, who in an enthuliafm of joy and praife brought forth three eggs. From thefe were produced three mate deities, named Brimba, Vijbnou, and Shecouth. Brimha was endowed with the power of creating the things of thiz world, Vifhnou with that of cherifhing them, and Sheevah with that of reftraining and correcting them. Thus Bimha became the creator of man; and in this character he formed the four calts from different parts of his own body, the Bramins from his mouth, the Khatry from his arms, the Banians from his belly and thighs, and the Soodera from his feet. Hence, fay they, thefe four different calts derive the different offices affigned them; the Bramins to teach; the Khatry to defend and govern ; the Banians to enrich by commerce and agriculture; and the Soodera to labour, ferve, and obey. Brama himfelf endowed mankind with paffioni, and underflanding to regulate them; while Bimha, having created the inferior beings, procseded to write the Vedams, and delivered them to be read and explained by the bramins.

The religion of the Hindoos, though involved in fupertition and idolatry, feems to be originally pure; inculcating the belief of an eternal and omnipotent Being; their fubordinate deities Brimha, Vithnou, and Sheevah, being only reprefentatives of the wifdom, goodnefs, and power, of the fupteme God Brama. All created things they fuppofe to be types of the attributes of Brama, whom they call the principle of truth, the Spirit of wijflom, and the fupreme being; fo that it is probable that all their idols were at lirit only detigned to reprefent thefe attributes.

There are a variety of feets among the Hindoos: Difeceris two great claffes we have mentioned already, viz. the fects. wormippers of Vifhnou and thofe of Sheevah; and thefe diflinguih themfelves, the former by painting their faces with an horizontal line, the latter hy a perpendicular one. There is, however, very little difference in point of religion between thefe or any other Hindoo fects. All of them believe in the immortality of the foul, a flate of future rewards and punifhments, and tranfmigration. Charity and hofpitality are inculcated in the Arongeft manner, and exift amoni; them not only in theory but in practice. "Holpitality (fay they) is commanded to be exercifed even towards an enemy, when the cometh into thine houfe; the tree doth not withdraw its fade even from the woud- cutter. Good men extend then charity even to the vilett animals. The moon doth not with-hold ber light even from the Chandala." Thefe pure ductrines, however, are intermixed with fome of the vileft and nast abfurd fupertitions; and along with the true God they worthip a number of inferior onts, of whom the principal are:

1. Bawaney, the mother of the gods, already men- teenn ef tioned, and fuperior to all but Brama limfelf; but all heer prosthe other goddeffes are reckoned inferior to their gods "p I detor lords.
2. Brinkat, in the Shanferit language faid to mean "the wifdom of God;" and who is fupofird to fly the wings of the Lanfe or hamingo; an inage of which is conftantly kept near that of the geod in the ternple

11i: urat. Where he is wompped. He has a crown on his heat, and is reprefented with four hands. ln one of thefe he holle a fecent $e$, in ansther the fotered bouke or "res cam, in the that a ring or cirele as the comblem of etennty, fuppriel tu be enpluyed in athiling and irus tectimg his wonks.
3. A) rafocut, lise godeds or wife of Brinha, prefides wer mbine, la many, elogrence, and insertion. She is alfo hat to be the inventocis of the tetere cated Dos peforg ly whin the divine will wat lirt promatpated anmornathom. In the argme it of an homa adhlallad to thes exoldef: the is fopp fed to have a namber of inferiar ditirs actiar in fubmdination 10 her. Thefe are callad Ress, aut prefle over exts mote, and likewie owet cach of the featons. Thefe fealions in Hindutatare fix in nunger; vis. t. 'The
 fon. 3. T"alint, the mild leafon or fprines. of Cretas. onz, we the bot feafon. 5. Parfit, the rainy featon. 6. Surat, the braking up or end of the rains.

The Rags, is their mulical capacity, are accompanicel cach wita tive Kazians, a kind of female deities or nymples of hamony. Each of thele has eight fons on genif ; and a dilinet fedum is appointed for the mufie of cach rag, cunine which only it can be funer or pheye.l: and thi, at dillinet and fated hours of the day or nisht. I teventh mode of mutic belonging to Diper, or hasid the infomer, is faid once to bove exitted, lut now to be lodt: and a musician, who attempted to refte re it, to have been condumed with fire from heaven.

4: Fibnou, the moll celebrated of all the Indian deitics, is fuppofed to fly or ride on the garoora, a kind of large brown kite, which is found in plenty in the neighburthood; and on which Vifhnon is fometimes reprefonted as litting; thongh at others he is reprefented on a ferpent with a great number of different heads. At fome of his temples the bramins accultom all the birds they can find, of the fpecies above mentioned, wonme and be fed; calling them l:g turkirg upon a trafs plate. This detty is faid to have had ten diferent incarnations to deftroy the giants with which the carth was infelled; and in thefe he is uprefented in as many diffecent ligures, all of which are to the lafl degree fantaftic and monttrous. His common form is that of a mon with four hands, and a number of hads fer round in a circle, fuppofed to be emblems of omnifience and omnipotence. In his firlt inearnation he is reprefented as coming out of the movith of a fifh, with feveral hands containing fivords, \&c. In another he has the head of a boar with monflrous tuks, beariug a city in the air. and llands upon a vanquifhed giant wilh horns on lis head. In others of his incarmations, he has the head of a horfe or other inmals, wich a great number of arms brandithing fivords, \&c.

In fome parts of his character this deity is repre. fented mot as a celtroyer, but a preferver of mankind; and lie is then ditlinguifhed by the name of Hary. Bithop Wilkins deferibes an image of him in this cha sacter at a phace manud feban query, a fmall rocky inand of the Canges in th pmonnce of lowhas. 'This image is of a signatic lize, recmoment on a ecolld ferpent, whofe mancerons heads a e twilled by the artill into a kiad of canopy over the flepuyg gid, and from each
of its mouths iflues a forked tongur, as threatening Hind deftrnction to thofe who thould dare to approach.
5. Shacoth is reprelented undor a haman form, thaugh frequently varied, as is alfo hi; name; but he
 his dentroying character he is reprefented as a man with a fierce look, with a foake twited round his rieck. He is thenght to prelide over pood and evil fortune, an token of which be is reprefented with a crefeent on his has?. Ile rideq upon an os.
o Torem., the and of vicory, in fuil to have had a particalar kind of lacrifice effered to him, fonewhate like the letperont of the Jews, viz. by letting a harle lose in the foreth, and not emphoying him again.
7. Piom Kajah, or Dirham $K i n h$, is repreiented as the judge of the dead, and ruler of the infernat region". in a manner limblar to the Minos and Pluto of the ancient Grecks. He is the fon of Sour, "the fun," by Bifiokam datugher of the great archited of the heavenly nanfons, and patron of artificers. He rides upon a buffalo, with a feeptre in hishand, having two adfiltants, $C^{\prime \prime}$ itor and Gope; the former of whom reports the fryod, and the latter the bad actions of men. Thefe are attended by two genii, who wath every individas of the buatn race; Chiter's fry beiny on the right, and Copt's a: the keft. The fouls of deceated perfons are carried by the 7 fon houts ar mef. fingers of death into the prefence of Darbam, where his actions are infantly proclained, and foatence patfed aecordingly. The infernal mantions are named by the Hodons Nordhs, and are divided into a great number of places, according to the degrees of punithment to be endured by the criminal ; but eternal pumhment for any offence is fuppofed to be insonfulent with the goodnefs of Gad. Intead of this, the Hindoos fuppofe, that after the fouls of the wicked have been punihed long enough in Narekha, they are fent back into the world to animate other bodies cither of men or bealts, according to circumitances. Thofe who have lived a life partly goond and pastly bad, are likewife fent back to this woild; and thefe trials and tranfmiprations are repeated till they be thorough!y purged of all inclination to lin. But as for thofe holy men who have fpent their lives in piety and devetion, they are intantly conveyed by the genii m the manfoons of etleftial blif, where they are abtorbed into the univerfal fpirit; a llate according to every idea we can form equivalent to annihilation!
8. Kribuen and the nine Copia, among the Hindoos, contefpond with Apullo and the nine mufes of the Grieks. 'This deity is reprefented as a yonng man fometimes playing on a hute. He has a variety of trames, and is fuppofed to be of a very amorous enmplexion, having once refided in a diftrict named birge, where he embraced almote all the women in the commtry. From his ehbence here, or from thefe anorous exploits, he is fometimes called Birge put.
0. Kimad dever the grod of love, is faid to be the fon of Maja, or the gencral attractive power; marrical to Rety, or Alfegion. He is reprefented as a beautiful youth, fometmes converhing with his mother or confort in his temples or gardens; at other times riding nn a purm by inomalight: And Mr forter informs th, that on the taking of 'Tanjore by the Englith, a cas-
dons. rious picture was found, reprefenting him riding on an elephant, the body of which was compofed of feven young women twifted together in fuch a manner as to reprefert that chormous animal. This is fuppofed to be a device of a limilar nature with that of the Crecks, who placed their Eros upon a lion; thus intimating, that love is capable of taming the ferced of animals. The bow of this denty is faid to be of fugar sane or of flecers, and the fling of bes: he has live arrows, each of them tippect with an Indian bloffom of an heating nature. His enfign is a fith on a red ground, carried by the foremoft of his attcudant nymphs or dancing gitls.
10. Iningar, correfponding to the Priapus or Pballus of the ancients, is worhipped by the Hindoo in order to obtain fecundity. This deity is adored the more fervently, as they depend on their childeren for perforning certain ceremonies to their manes, which they imagine will mitigate their punifment in the next world. The derotets of the ;ind go naked, but are fuppofed to be fuch fanctitied perfons, that women may approach them without any danger. They vow perpetual challity ; and death is the confequence of a breach of their row. Hufonds whofe wives are barren invite them to their heufs, where certain coremonies, generally thoughe to be cffectual, are performed.

Befides thefe, there are a number of other gods whofe charactur is lefs eminent, though we are by no means acquainted, nor are the Hindoos themfelves perhaps, with the particular rank which each deity carries with refpect to another. Some of theie deities are, it. Nared, the fon of Brimha, and inventor of a fretted inflrument named Vine. 12. Lecherny, the goddefs of plenty, and wife of Vifhnou. 13. Gowry, Kaly, from Kula "time;" the wife of Sheerah, rind godels of deflruction. i4. Varoona, the god of the teas and waters. nding on a crocodile. 15. Vayoo, the god of the winds, riding on an antelope with a fabre in his hand. 16. Agnee, the god of tire, riding on a ram. 17. Fojoodka, a goddefs reprefuting the earth. 18. Palrecty, or nature, reprefented by a beautiful yong woman. 19. Sour or Shin, the fun; called alio the king of the flars and planets, reprefinted as fitting in a chariot drawn by one horfe, fometimes with feven and fometimes with twelve heads. 20. Sungia, the mother of the river Jumna, and wife of the fun. 21. Cinardava, the mon, in a chatiot drawn by antelopes, and holding a rabbit in her right hand. 22. Vreck formet, the god of learning, attended by beautiful young nymphis named Wecdyadhares, or profeftors of Icience. 23. Gans, the god of prudence and policy, wothifped before the undertaking of any thing of confequence. 24. Fume, reprefented by a ferpent with a great number of tongues; and known by leveral names. 25. Darmadera, the god of virtue, fometimes reprefented; by a white bull. 26. Firfavana or Colluair, the god of riches, reprefented by a man riding on a white horfe. 27. Dhain avanary, the god of medicinc.

Budes thefe fuprere decities, the Hindoes have a number of demigods, who are fuppoled to inhabit the air, the earth, and the waters, and in thont the whote wold ; fo that every mountain, mict. woot, town, village, \&ic. hat one of thefe tutelar denties, as was the
cafe among the veltern licathens. Ry nature thefe Hindom aemigods are fubject to death, but are fuppofed to obtain immortality by the ufe of a certain drimk named Amruf. Their explsiss in many inflances refemble thore of Bacchus, Hercules, Thefeus, ac. and in a beautiful epic poem named Rancyan, we have an account of the wars of Rain, one of the demigudo, with Ravana tyant of Ceylon.

All thefe deities are wormipped, as in other coun- inaner of tries, by going to their temples, fafting, prayers, and worfoip, the performance of cerenonies to their honour. They pray thrice a day, at morning, noon, and evening, tuning their faces towards the ealt. They ule many ablutions, and, like the Pharifees of oll, they ahways wall before meals. Running water is always preferred for this purpofe to fuch as ftagnates. Iruls, flowers, incenfe, and money, are offired in facrifice to their idols; but for the dead they offer a kind uf cake na. med Peenda; and offerings of this hind ahways take place un the day of the full moon. Nuthing fanguinary is known in the worthip of the Hindoos at prefent, though there is a tradition that it was formerly of this kind; nay, thet even human facrifices were made ufe cf: but if fuch a cuftom ever did exilt, it muft have been at a very diltant periud. Their facred writings indeed make mention of bloody facrifices of various kinds, not cxcefting even thofe of the haman race: but fo many preuliarities are mentioned with regard to the proper victims, that it is almoft imporfible to find them. The only inflance of bloody facrifices we find on record among the Hindoos is that of the bnfialo to Bawaney, the mother of the gods.

Among the Hindoos there are two kinds of wormip, dithinguilned by the name of the worthip of the incolye God and of idols. The worhippers of the invilible God are, frictly fpeaking, deifts: the idolaters perform many abfurd and ummeaning ceremonits, too tedions to mention, all of which are conducted by a bramin; and during the performance of thefe rites, the dancing women occationally perform in the court, finging the praifes of the Deity in concert with various inflruments. All the Hindios feem to worfhip the fire; at leaf they certainly jry a great veneration to it. Bihop Wilkins informs us, that they are enjoined to light up a fire at certain times, which mult be procuced by the friction of two picecs of wood of a particular kind; and the fire thus prodnced is made ufe of for confaming their facrifices, burning the dead, and in the cercmunies of mariage.

Great numbers of devotees are to be met with ererr Their de. where through Hindoltan. Every call is allowed to volecs. affume this way of life excepting the Chamdalahs, who are exciuded. Thofe held molt in efteem are named Sinimites and Jogeys. The former are allowed no other cluthing but what luffices for covering their nakedncfs, nor have they any worldly goods belides a pitcher and faff; but though they are Arictly enjoined to meditate on the truths contained in the facred writings, they are exprefly forbiden to argue about them. They mulk cat but once a day, and that very fparingly, of rice or orher vagetables; they mult allo fhow the mon perfect indifference about hunger, thirt, heat, cold, or any thing whatever relative to this world; looking; forward with continazl delire to the feparation of the foul iron the body. Should any of them tait in this

Ihirdeos extravagant felf.denial, he is rendered fo much more criminal by the attempt, as he negleeted the duties of ordinary tife for thofe of another which he was not able to accomplith. The Yogeys are bound to much thee fame rales, and buth fubject themfelves to the molt extravagat penances. Some will keep their arms eonflantly ftretched over their heads till they become quite withered and incapable of motion; others keep them croffed over their breat during life; while othere, by keeping their hands contantly hut, hase them quite pierced through by the growth of their nats. Some chain themfeives to thees or particeilar fpots of ground, which they never quit ; chers refolve never to lie down, but fleep leaning ayainlt a the: but the moll cuivus penance perhaps on rocord is that of a Yocey, who meafured the ditarce between Bonares and Joggernaut with the length of his body, lving down and rifing alternately. Many of thefe enHhathe will throw themfelves in the way of the cha:iots of Vifhnou or sheevah, which are fometimes irocont furth in procefion to celtbrate the fealt of a temple. and dawn by feveral hundreds of men. Thus the wretched deroties are in an inftant cruthed to piects. Ott. rs devote themfelves to the Rames, in crder to thew their regard to fome of their idols, or to appeafe the wrath of one whora they fuppofe to be uffended.

A certain fet of devotees are named Pandarams; and another on the coaft of Coromandel are named CaryPatra Pandarams. The former rub themfelves all over with cow-dang, runaing about the conntry finging the frailes of the god Sheevah whom they worfhip. The latter go abuct alking charity at doors by ftriking their hands together, for they never fpeak. They acept of nothing bot rice ; and when they have got as much as will fatisfy their lunger, never give themfelves any trumble about more, but pafs the reft of the day in the flade, in a date of fuch fupine indolence as farce to look at any object whatever. The Tadinuns ate another fet of mendicants, who fing the incarbations of Vifhnou. They have bollow hrafs rings round their ancles, which they fill with pthbles; fo that they make a confiderable noife as they walk; they beat likewife a kind of tabor.

The greatet lingularity in the Hindoo religion, in Hedo however, is, that fo far from perfecuting thofe of a :og gon contrary petivafion, which is too often the cafe with other prot flors, they abfulutely refufe even to admit of a protelyte. They believe all religions to be equally acceptable to the supreme Being; affigning as a reafon, that if the Author of the univerfe preferred one to anotier, it would bave been impolfible for any other to have purvailed than that which he approved. Every religion. therefore, they contluce to be adapted to the comery where it is eftablined; and that all in their 9 crigisal purity are equally acceptable.
Thers mar- Among the Hindoos, marriage is confidered as a riapes. religives duty; and parents are frictly commanded to marry their chidren by the time they arrive at eleven years of age at farthett. Pulygamy is allowed; but this ticence is foldum made ufe of, matefs there fhould be no children by the imp wife. In cafe the fecond wife alfo proves barten, they commonly adopt a fon from among their relations.

The Himdous rectice do dower with their wives;
but, on the contrary, the intended hurband makes a prefent to the father of his bride. Neverthelefs, in many cafes, a rich man will choofe a poor relation for his daughter ; in which cafe the brije's father is at the expence of the wodding, receives his fon in law into his houfe, or gives lim a part of his fortune. The bridegroom then quits the dwelling of his parents with certain cefemonics, and lives with his father in-law. Many formalities take place between the parties even after the match is fully agreed upon; and the celcbration of the mantiage is attended with much expence; magnificent proceflions are male, the bride and bridegroon fitting in the tame palankeen, attended by their friends and relations; fome riding in palankeens, forme on horfes, and others on elephants. So great is their vanity indeed on this oecalion, that they will borrow or hire numbers of thefe expenfive animals to do honour to the cercmony. The rejoicings latt feveral days; during the evenings of which, fre-works and illuminations are difplayed, and dancing women perform their feats; the whule concluding with alms to the poor, and prefents to the bramins and principal guetts, generally confitting of fhawls, pieces of mufin, and other cloths. A number of other ceremonies are performed when the parties come of age, and are allowed to cohabit together. The fame are repeated when the young wife becomes pregnant; when the pafts the feventh month without any accident; and when the is delivered of her child. The relations affemble on the tenth day after the birth, to affitit at the ceremony of naming the child; but if the bramius be of opinion that the afpect of the planets is at that time unfavourable, the ceremony is delayed, and prayers offered up to avert the misfortune. When the lucky moment is difcovered, they fill as many pots with water as there are planets, and offer a facrifice to them; afterwards they fprinkle the head of the child with water, and the bramin gives it fuch a name as he thinks bett aclapted to the time and circumitances; and the ceremony concludes with prayers, prefents to the bramins, and alins to the poor. Mothers are obliged to fuckle their own children; nor can this duty be difpenfed with except in cafe of hicknefs. New cettmonies, with prefents to the bramins, take place, when a boy comes of age to receive the tring which the three firt calts wear round their wait.

Boys are tanght to read and write by the bramins, educat 10 who keep fchools for that purpofe throughout the coun- of chilc try. They ufe leaves inflead of books, and write with a pointed iron initrument. The leaves are generally thofe of the palm tree, which being fmooth and hard, and having a thick fubitance, may be kept for almolt any length of time, and the letters are not fubject to grow faint or be effaced. The leaves are cut into nlips about an inch broad, and their books confilt of a number of thefe tied tugether hy means of a hole in one end. Sometimes the letters are rubbed over with a black powder, to render them $m$ re legible. When they write upon paper, they make we of a fmall reed. Sometincs they are initiated in writing by making letters upon fand tirewed on the floor; and they are tanglt arithmetic by means of a number of frall pebbles. The education of the girls is much more limited; feldom extending farther than the atticies of their religion.

Among thefe people the cullum of burning the dead prevails
os. prevails univerfally; and the horrid pratice of wives burning themfelves alour with their deceafed hulbands was formerly very conames, though now much lefs fo. At prefent it is tois' : prohibitos in the Britifh dominions; and even the Wohaminedans endeavour terdifcountenance a prattice 4 b birbarous, thoush many of their governors are accufed of conniving at it throngh motives of avarice. At prefent it is moll common in the country of the Rajahs, and among women of high rank.

This picee of barbarity is not enjoined by any law exifting among the Hindoos; it is only faid to be proper, and rewards are promifed in the next wotld to thofe who do fo. But though a wife choofes to outlive her hufband, the is in no cafe whatever permitted to marry again, even though the marriage with the former had never been completed. It is unlawful for a woman to burn herfelf if fhe be with child at the time of her huf. band's deceafe, or if he died at a ditance from her. In the latter cafe, however, the may do fo if the can procure his girdle or turban to the put on the funeral pile along with her. Thefe miferable enthufiafts, who devote themfelves to this dreadful death, fuffer with the greatelt conflancy; and Mr Ifolvel gives an account of one who, being told of the pain the mutt fuffer (with a view to diffuade her), put her finger into the fire and kept it there for a contiderable time; after which the put fire on the palm of her hand, with incenfe upon it, and fumigated the bramins who were prefent. Sometimes a chaped is erected un the place where one of thofe facrifices lias been performed; fometimes it is inclofed, Howers panted opon it, and images fet up.In fome few places the Hindons bury their dead; and fome women have been known to fuffer themfelves to be buried alive with their deceafed lufbands: but the inflances of this are llill more rare than thofe of burning. - No woman is allowed any inleritance among the Hindoos; fo that if a man dies without male iffue, his eftate gues to his adopted fon or to his nearell relation.

The Hindous, though naturally mild and timid, will a of on many occafions meet death with the molt heroic in. he trepidity. An Hindoo who lies at the point of death, will talk of his deceafe with the utenot compofure; and if near the river Ganges, will defire to be carried out, that he may expire on its banks. Such is the exceffue veneration they have for their religion and $\mathrm{cu}-$ ftoms, that no perfon will infringe them even to preferve his own life. An Hindoo, we are told, being ill of a putrid fever, was prevailed upon to fend for an Buropean phyficisn, who preferibed hien the bark in wine: but this was refufed with the greatef obltinacy even to the very lall, thourh the governor himfulf joined in his folicitations, and in other matters had a confidurable infuence over him, In many intances thefe people, both in aucicnt and modern times, have beca known, when clofeiy beficged by an enemy whom they could nut refilt, to kill their wives and children, fet fire to their houfes, and then viclently ruth upon their aciverfaries till every one was delloyed. In the late war. fome Seapoys in the Britifl fervice, having heen concerned in a mutiny, were condenaned to be biown away from the mouths of cannon. Some grenadicrs cried out, that as they had all alung hat the poll of honour, they faw mo realion why they hould be denied it now;
and therefore defired that they might be blown away firt. This being granted, they walked forward to the guns with compofure, begged that they might be fpared the indignity of being tied, and, placing their breaits clofe to the muzzles, were fhot away. Tlue commanding olneer was fo much affected with this in. tlance of heroifm, that he pardoned all the rea.

In ordinary life the Hindoos are cheerful? and lively ; Their geree fond of converfation ard amufements, particularly dant rat charac. cing. 'They do not, however, learn or practife dancing lear. themfelves, but have women taught for the purpofe; and in beholding theie they will fpend whole nights. They difapprove of many parts of the education of European ladies, as fuppoling that they engage the attention too much, and draw away a woman's affection from her husband and children. Hence there are few women in Hindoflan who can either read or write. In general they are finely haped, gentle in their manners, and have foft and even mufical voices. The women of Kafhuncre, according to Mr Forfer, have a bright olive complexion, fine features, and delicate thape; a pleafing free-dom-in their manners, without any teadency to immodefty.

The drefs of the modett women in Hindoftan con. Drefo of the filts of a elofe jacket, which covers their breats, but women. perfectly fhows their form. The 胧琽s are tight, and reach half way to the elbows, with a narrow border painted or embroidered all round the edges. Intlead of a petticoat, they have a piece of white cotton cloth wrapped round the loins, and reaching near the ancle on the one fide, but not quite folow on the other. A wide piece of munin is thronn over the right houlder; which, paffing under the left arm, is crufled round the middle, and liangs doun to the feet. The hair is ufually rolled up into a knot or bunch towards the back part of the head; and fome have curls hanging before and behind the ears. They wear bracelets on their arms, rings in their cats, and on thei- fingers, toes and ancles; with fometines a fmall one in their no. Aril.

The drefs of the dancing women, who are likewife votaries of Venus, is very various. Sometimes they wear a jama, or long robe of wrought mullia, or goll and falver tiffuc; the hair plaited and hanging down behind, with fpiral curls on eac! fide of the face. They are tanght every accomplihment which can be fuppofed to captivate the other fex ; form a clafs entirely dif: ferent from the rett of the people, and live by their own ru!cs. Their clothes, jewels, and lodging, are condider(d) as implements of their trade, and nult be allowed them in cafes of confifation for debt : They may drink fpirituons liquors, and eat any kind of meat except beef: Their dances are faid to retemble pretty evartly thofe of the ancient Bacchanalians reprelented in fome of the ancient paintings and bas relicfs. In fome of their Jances they attach gold and filser bells to the rines of the fanie metals they wear on them ancles.

Ilfe men generally flave their heads and beards, D effof:i.. leaving only a nir of froall whikers and a lock on the srew. back fart of their head, which they take great care : prefere. In kalanere and fome other places, they let their teards grow to the leagh of two duches. 'lhey wear turbans on their heads; but the beamins who ofliciate in the temples commonly gro with their heals uncovered, and the upper part of the budy nakci:
fin: and round then oulder they hang the ficted Ariny calle :
 pold of a certain mamher of theads of a deermined length. The kivaries uear alfo a fling of this kind, bus comperat of fewer threats; the bhafe hase one with thill fower throwds, but the souderass are not al. buwd to war any fleing. The other defs of the bre mins conflit of a piece of white cotton cloth wrapped abent the loins, defernding below the knee, but lower on :he lete than on the righe firle. In coll wenther they fometimes put a red cap on their heads, and wrap a thasl ramo their bodics.- T'ie khatics, and moll other of the inhabitunts of this connery, wear alfo piecco of cotcon choth wrapped? round thi in, but which cober the upper as will as the lower frat of the boly. Jar-rings and bracelets she worn by the men as well as wonen: and they are fond of ornamentiox therifelves whith dianomis, mbies, and other procions tomes, when they can procure them. They wear Alppers on their feet of fine wormen cloch or whet, frecently embroideted with grold and fiver; thofe of prinees being fonetimes admed with precions ftomes. The lower claftes wear fandats or flippers of roarfe woollen cloth or leather. Thefe fippers are always put off on going into any apartment, being left at the door, or given to an attendant; neverthelefs the Himdons make no comphaints of the Europeans for not putting off their thoes when they come into thoir houfes, whicin noth certainly appear very uncouth to them.

Hindoo families are always governed by the elden make, to whom great refpect is thown. Filial veneration is carried to fuch on height among them, that a fon will not fit down in the prefence of his father untit ordered to do fo: and Mr Forlter ohferves, that inring the whole time of his refidence in India, he never faw a direct iuflance of undutifuncefs to parents; and the 16 fane is related by wher writes.
Theit hou- The houfes of the ITindous inake a worfe appearance es.
than could be fappofed from their ingenuity in other reffetis. In the fonthern parts of the comenty, the houfes are only of me lory. Oneach fide of the door, tow and the Areet, is a narrow gallery coverd by the flope of the roof which projects ouce it, and which, $:$ :s far as the gallery extends, is fupperted by pillars of lmick or wood. The floor of wis gallery is raifed about 30 inches above the level of the firect, and the porters, or bearers of palankeens, with the foot foldiers namal Peors, who commonly liire themfelves to noblemen, often lie down ia this place. This entrance leads into a court, which is alfo furrounded by a gallery like the former. On one fie of the court is a large room, on a level with the flow of the gallery; open in front, and fpread with mats and carpets covered with white cotton cleth, where the matler of the houfe receives vifits and trantacts bubuefs. Firom this court there are entrances by very fmall doors to the private apartments. In the northern parts, houfes of two or three flories are commonly met with. Over all the combiry alfo we meet with the ruins of palaces, which evidently fhow the mag.
17 nifichice of former times.
1.canning of The tramins of India were anciently much celethe Era- brated for the ir learning, though they now make a very mins. inconfadeable furue in comparion with the Earopans. According to Pbiduthatus, the Gymoofophills of Ethiopia were a colory of bramins, who, being obliged to
leave tidia on ace onnt of the morker of their king near Hir the banks of the Ganzes, migrated into that coentry. ithe ancient bramine, however, may jutly be fuppofed on lawe cuitivated fience with much greater fuccefs than havir defecmianta can boat of confidering the ruimons wars and rewolutions to which the comntry bas been fubjected. Metaplyyics, as if 11 as moral and natural mit, fophy, appear to have been well miderllond among them; hut at prefent all the llindooknowledge is continat to thon, whom they call Pundits, "doetors or leamed nen." Thefe oniy undernaind the languige called stimioit or Saferif, (bom two words fignifying perfection) ; in which the anciont books were writ101.

Tlue me:aply fies of the bramins is much the fame Met: wioh that of fone ancient Grock philufuphers. They fiss. believe the laman foul to be an emanaton from the Deity, as lighe ant heat from the $f$ in. Gowtama, an ancient metaphylician, difingulifus :wos kinds of fouls, the divine ant vital. The former velembles the cternal fpirit from which it came, is immaterial, indivinble, and with yat paffons; the vital foul is a fuhtile element which pervades all things, dilinct from oryanifed matter, and which is the ofizin of ali our dellices. The externat fenfeg, according to this anthor. are reprefentations of exterval things to the mind, by which it is furbithed with materiats for its varimas operations; but unkfis the mind act in conjunction with the fenfes, the operation is lont, as in that abfence of mind which takes place in deep contemplation. He treats hewife of reafin, memory, percepsion, and other abltact fubjects. He is of opinion, that the world conld not exilt without a firt caufe; clance being nothing but the effect of an unknown caute : he is of opimion, however, that it is folly to make any conjectures concerning the beginning or duration of the workd. In treating of providence, he denies any immediate interpolition of the Deity: mantaining that the Supreme Being lawing created the fyltem of nature, allowed it to proced according to the laws ariginally imprefled upon it, and man to follow the impulfe of his own defires, rellrained and conducted by his reafon. His doserine concerning a future thate is not difierent from what we have already nated as the betief of the Hindons in general. According to bithop Wrikins, many of them believe that ehis world is a flate of rexards and punilhments as well as of protation; and thas good or bad fortune are the effects of good or evil actions committed in a former llate.

The fecace for which the bramins, however, were rbis moll remarkalle, is that of aftrommy : and in this their nom progrefs was for great, as even yet to hurnih matter of admination to the molerns.--The Luropeans firt became acquanted with the Indian athronomy in 1687, from a slamele MS. containing rules for calculating the places of the fun and moon, brought home by M. L.onbere the French ambaflator at siam. The principles on which the tables in this MS. were founded, however, proved to be fo obfeure, that it required the genius of Caffini to invetirgate them. The miffomaties afterwards fent over two other fets of tallea from HindoAm; but no attention was paid to them sill M. Ic Centil returned from olderviag the trantit of Yenas in 1769 . During the time of his thay in Iliadoltan, the bramins hat been much mere familiar with him on accome of his allromomical knowledge, than they ufually were

## H I N

with Europeans; and he thus had an opportnnity of obtaining confiderable inlight into their methods of calculation. In confequence of this infltuction the publifited tables and rules, according to the Indian methed, in the academy of fciences for 1772 ; and in the explanation of thefe M. Bailly has employed a whole voluine. The objects of this alltronomy, according to Dr Playfair, are, 1. Tables aid rules for calculatiag the places of the fun and moon. 2. Of the planets. 3. For determin. ing the plafes of eeliyfes. 'they divide the zodiac into 27 conitellations. probilly from the mosion of the moon through it in 27 days; and to this lurar motion the Docor afcibes the general divifion of time into weeks, which has prevailed fo miniverfally throughout the world. The days of the week were dedicated to the plancts, 28 ty the ancient heathens of the wett, and in precilely the fame order. The ecliptic is dis? grees, and minutes, as with us: and indeed their ealculations are entirely fexayefimal, the day and night being divided into to hours; fo that each of their hours is only 24 of our minutes, and each of their minutes 24 of our feconds.
The requifites for celculatiag by the Indian tables are, 1. An obfecryation of the celelfial body in fome paft moment of time, which is commonly called the 1.poch of the tables. 2, The mean rate of the plaznet's motion. 3. The correction on account of the iiregular motion of the body, to be added or fubtracted from the mean place, according to circurnilances. They calculate the places of the fun and moon, not from the time of thecir entrance into Aries, but into the moveable Zodiac. 'Thus the beginning of the year is continually advancing with regard to the feafions; and in $z_{4}, 000$ years will bave made the complete round. The mean place of the fun for any time is deduced on the fuppolition that 800 years contain 292,207 days; from whence, by various calculations, the length of the year comes out only $\mathrm{t}^{\prime} 53^{\prime \prime}$ greater than that of De la Caille ; which is more accurate than any of our ancient aftronomical tables. In the equation of the fun's centre, however, they commit an error of no lefs than $16^{\prime}$ : but Dr Play lail is of opinion that this caunot be aferibed wholly to their inaceuracy, as there was a time when their calculation approached very near the truth; and even at prefent the error is lefs than it appears to be.

The motions of the moon are deduced from a cycele of 19 years; during which the makes nearly 235 revolutions; and which period conflitutes she famous cycle fuppofed to have been invented by Meton the Althenian aftronomer, and from hin called the Mrtonic Cycle. They are likew ife furprifingly exaer it calculating the moon's apugec and fome of the ine qualitics of ber motion ; they know the apparent motion of the fixed ftars eaftward, and the Slamefe tatiocs make it only four feconds too quick; which ftill fhows a great accuracy of cocolations, as Prolemy the celcerated aftrononier mate an error of no lefs than 14 feconds in calkulating the fame thing. M. Cafini, howeser, informs us, that thefe tables are not caleulated for the meridian of Siam, but for a place 1815 to the wettward of it, which brings us very near the nieridian of Benares, the ancient feat of Incian learning. This likewife agrees with what the aindross call their tirit meidian, which pafiss th.rough Celvi, and the banks
of the river Remananisr. It muft be ohferved, howe- Kin!oos. ver, tha: the gengraphy of the Hindoos is much more - inaccurate than their alltonoms.
'The dats of the Siamefe tables is not very ancient; and that of the tables above mentioned fent from Hindoltan by the miflionaries is thill more modern. Thefe, lowever, ate witten in fuch anenigmatical maner, that the miffonary who tent hem was table to tell their meaning; and Dr Playfai fufpofes that esen the Bras mins themfelves were igucrani of it. Neverthelets they were dec!phered by M. Ie Gentil; who thinks that they lave the appearance of being copied from inferiptiuns on llone. "I'he minutes and feconds are not ranged in retical columns, but in rows under one another, and without any title to poist out their meaning or connections.

The tabies of Tirvalore are among the mott remarkable of all we are yet aequaired $ห$ ith. Their date, according to Dr Plasfair, correfponds with the year 3102 B . C. thus running up to the year of the world 902, when Adam was llill in life. This era is famous in Hindotan under the name of Calyourbam: and as this extraordinary antiquity cannot but create fonse fufpicion, Dr Playfair has been ar fome painstodetermine whether it is real or fictitions, i. e. whether it has been cetermined by actual obfervation, or derived by calealation from tables of more modern date. The refult of his labours is, that we are to account the Calyougham as determined by obfervation; and that had it been otherwife, we muft have been furnithed with infallible methods of detecting the fallacy. His reafons for this opinion are,

1. The tafk would lave been too difficult, even for modern altronomers, to make the neceflary calculations, withont taking into account the difturbances ariling from the action of the heavenly bodies upon one another, and with which we cannot fuppofe the ancient aftronomers to have been equally well acquairted! with the moderns. By reaton of thefe variations, as well as from the fimall errors unavoidable in every ealculation, any fot of altronomical tables will be found procigiouly inaccurate when. :plied to any perios? very far ditant from the time of oblervacion. Iterice, fays onr author, " it may be eflablithed as a maxim, that if there te given a fy item of aftronomical tables, rounded on olfervations of an unknown date, that date may be foutad by taking the time whon the tables reprefent the celellial motions moll exactly." - I'his indeed might be conte, provided we were furnih:d wish any fet of perfectly accurate tables with whieh we conlt compare the fulpected ones; and Dr Playfuir thinks it "a very reafonable pollulatum', that our modern allronomical tables, though not perfectly acsurate, are yet capable of determining the places of the celclial bodis without any funble error for a longer period than that of the Calyougham.
2. By calulation from our medern tables, it appeara that the place of the flar Aldeharan, at the commencement of the Calyougham, diffirs only 53 from what the Indian tables make it. He thinks this coincidence the more remarkable, as the bramins, by reafon of the inaccuracy of their own diste, would have erred by four or five degrees, had they calculated from their nut modern tanles dated in 1421.
3. At the cummencement of this cpoch (which, according

## H I N <br> [ 520

Uindore cording to M. Bailly, happened at midnight between the 10 th and 18 th of February 3102 B. C.) the fun was in $10^{3} 3^{\circ} 35^{\prime} 13^{\prime \prime}$ by the Indian tables. But the mean longitude of the fun, according to the tables of M. de la Caille, for the fame time, comes gut to be only $1 c^{5} 1^{\circ} ; 57^{\prime \prime}$, fuppofing the preceffion of the equinoxes to have been the fame at that time as now. M. de la Grange, however, has demonftrated, that, in former ages, the preceffion of the equinoxes was lefs than at prefent; whence there alifes an equation of $1^{\circ} 45^{\prime} 22^{\prime \prime}$ to be added to the fun's place already mentioned ; and thus it will differ only $47^{\prime}$ from the sadical place in the tables of Tirvalore. Notwithflanding this reafoning, however. Dr Playfair thinks that no ftrefs is to be laid upon this argument, as it depends on the truth of a conjceture of M. Bailly that the place of the fun above inentioned was not the mean but the true one.
4. The mean place of the moon at Benares, calculated from Mr Mcyer's tables, for the 18ch of February 3102 B . C. will be $10^{5} 0^{\circ} 5^{\prime} 16^{\prime \prime}$, provided her motion had all that sime been equable: but the fame aftronomer iuforms us, that the motion of the moon is fubject to a finall hut uniform acceleration, about $g^{\prime}$ in 100 years; which in an interval of 480 : years, muft have amounted to $5^{\circ} 45 \mathrm{Ht}^{\prime \prime}$; which added to the preceding, gives $10^{5} 0^{\circ} 37^{\prime}$ for the true place of the moon at the commencement of the Calyougham. Now the place of this luminary, at that time, by the tables of Tirvalore, is $10^{5} 6^{2}$; the difference is lefs than two thirds of a degree, which, for fo remote a period, and confidering the acceleration of the moon's motion, for which no allowance could be made in an Indian calculation, is a degree of accuracy that nothing but actual obfervation could have produced. - This conclufion is confirmed by a computation of the moon's place from all the tables to which the Indians could have any accefs, and of which the enormous errors would inftantly fhow the deception. Thus, by the tables of Ptoicmy, the place of the fun would be to $21^{\prime} 15^{\prime \prime}$ greates; and that of the moon $11^{\circ} 5^{\prime} 7^{\prime \prime}$ greater than has juil bern found from the Indian tables. By thofe of Ulug Beg, the place of the fun would be $1^{\circ} 30^{\circ}$, and that of the moon $6^{\circ}$, different from what it is by the Indian tables: and in like mannier our author fhuws that the Indian calculations could not bederived from any other fer of tables extant. In like manner, he fhows that, with regard to the mean place of the moon, there is a coincidence for a period of nore than +000 ycars between the tables of Meyer and thofe of India named Cbrijuabouram; which, though they bear a more modern date than thofe of Tervalore, are thus probably more ancient. "From this remarkable cuincidence (fays Dr Playfair), we may conchude, with the highelt probability, that at leaft one fet of thefe obfervations on which the tables are founded, is not hefs ancient than the era of the Calyougham: and luough the poffitaility of their being fonc ages later than that epoch is unt abfolucely excluded, yet it may, by flrict mathematical reafoning, be inferred, that they camot have been later than 2000 years before the Chrittian era.
5. Since the time that Mr Bailly wrote, every argument refpecting the acceleration of the moon's moLiom has become more worthy of attention, and more conclufive. For that acceleration is no longet a mere
] II I N
empirical equation introduced to reconcile the ancient Hind obfervations with the modern, nor a fact that can only be accounted for by hypothetical caules, fuch as the reintance of the ether, or the time neceflary for the uranfinifion of gravity ; but a phenomenon which M. de ha Place has with great ability deduced from the principle of univerfal gravitation, and fhown to be neceffarily connected with the changes of eccentricity in the earth's orbit difcovered by M. de la Grange: fo that the action of the moon is indirectly produced by the action of the planets, which alternately increafing and diminihing this eccentricity, fubjects the moon to different degrees of that force by which the fun dilturbs the time of her revolution round the earth. It is therefore a periodical inequality, by which the moon's motion, in the courfe of ages, will be as much retarded as accelerated; but its changes are fo flow, that her motion has been conftaritly accelerated, even for a much longer period than that to which the obfervations of India extend.- To M. de la Grange alro we are indebted for one of the moft beautiful of the difcoveries in phylical altronomy, viz. That all the variations in our fytlem are periodical ; fo that, though every thing, almoft without exception, be fubject to change, it will, after a certain interval, return to the fame ftate in which it is at prefent, and leave no room for the introduction of diforder, or of any irregularity that might conflantly increafe. Many of thefe periods, however, are of valt duration. A great number of ages, for inflance, mult elapfe, before the year be exactly of the fame length, or the fun's equation be of the fame magnitude, as at prefent. An aftronomy, therefore, which profefes to be fo ancient as the Indian, ought to differ confiderably from ours in many of its elements. If, indeed, thefe difierences are irregular, they are the effects of chance, and mult be accounted errors; but if they obferve the laws which theory informs us they do, they mult be held as the moft undoubted marks of authenticity.
6. Neither thefe tables of Tirvalore, nor the more ancient ones of Chrifnabouram, are thofe of the greateft antiquity in India. The bramins conftantly refer to an aftronomy at Benares, which they emphatically fyle the ancient; and which, they fay, is not now underftond by them, though they believe it to be much more accurate than that by which they calculate.
From thefe and other fimilar arguments, Dr Play. Con fair diaws the following conclutions with refpect to In. hy D dian aftronomy. 1. The obfervations on which it is ${ }_{\text {cern }}$ founded, were made more than 3000 years before the Indi Chritian era; and in particular, the places of the frot fun and moon, at the beginning of the Calyougham, were determined by actual obfervation. 2. Though the attronony now in the hands of the bramins is fo ancient in its origin, yet it contains many rules and tables that are of later conltruction. 3. 'The batis of their four fyltems of aftronomical tables is evidently the fame. \&. The conftruction of thefe tables implics a great knowledse of geonietry, anithonetic, and even the theortical part of altronoiny. All this, however, en i we find controverted, or at leaft rendered fomewhat Ma doubtful, by William Marfden, Eiq. who has written a paper on the chrmology of the Hindoos in the Philofophical Tranfactions for 1790. "The Kalee Yoos (fays he), or principal chronological era, began in the year $3102 \mathrm{~B}, \mathrm{C}$. according to the common inethod of

## $\begin{array}{ll}\mathrm{H} & \mathrm{N}\end{array} \quad[5: 1 \mathrm{j}$

competation, or in 3101 according to the antronomical method, on the $t 8$ th of locbruary, at fun-rife; or at midnight, according to different accounts, ander their firft meridian of Y.cute. - At that period it is faid to be afferted by their afronomers, that the fun, moon, and all the planets, were in conjunction according to their mean places. The reality of this faci, hut with confiderable modification, has received a refpectalle fanction from the writings of an ingenious and celebrated member of the French academy of fciences, who concludes that the aftual obfersation of this rare phenomenon, by the Hindoos of that day, tras the occafion of its eftablifhment as an aftronomical epoch. Although N. Bailly has fupported this opinion with his ufual powers of reafoning, and although abindane circumflances tend to prove their early flill in this feience, and fome pats of the mathematics connected with it; yet we are conframed to queftion the verity or poffibility of the obfervation, and to conclude rather that the fuppofed conjunction was, at a later period, fought for as an epoch, and calculated retrofpectively. That it was widely mifcalculated too, is fufficiently evident from the computation which lif. Bailly himifclf has given of the longitudes of the planets at that time, when there was a differtnce of no lefs than $73^{\circ}$ between the places of Mercury and Venus. But fifeec dass after, when the fun and moon were in oppoftion, and the planets far enungh from the fun to be vifible, he computes that all, except Ve. nus, were comprehended within a fpace of $17^{\circ}$; and on this he grounds his fuppofition of an actual obfervation.
"In their current tranfactions the inhabitants of the peninfula employ a mote of computation of a dif. ferent nature, which, though not unknown in other parts of the woild, is confined to thefe people among the Hindoos. This is a eycle, or revolving period, of 60 folar years, which has no farther correfpondence with their ot her eras than that of their years refpectively commencing on the fame day. Thofe that conflitute the cycle, inttead of being numerically counted, are diftinguifhed from each other by appropriate names, which in their epitles, bills, and the like, are inferted as dates, with the months, and perbaps the age of the moon annexed; but in their writings of importance and record, the year of Salblan (often called the Sishor year) is fuperadded; and this is the more effential, as I do not find it cultomary $t 0$ number the cycles by any progreflive reckoning. In their all ronomical calculations we oblerve, that they fometimes complete the year of their cera by multiplying the number of cycles clapfed, and adcing the complement of the cycle in which it commenced, as well as the years of the current cycle; but from bence we are led to no fatisfactory corclufion concerning this popular mode of eftimating time. The prefumption is in favour of its being more ancient than their hittorieal spochs. The prefent cycle, of which forty three complete years were expired in April 1790, Eegan in 1747, with the year of Salaban 1669 , and of the grand era 4848 . M le Gentil, to whom Europe is chicfly indebted for what is known of Hindno aftronomy, has fallen into an unac. countable error with regard to the yearsof this cycle, and their correfpondence with thefe of the Kalee loog, as appears by the comparative table he has given of them,

Vol. VIII, PartII.
taken it for granted, without due cxamination, hatc the year 3 boce of the lateer nult have been produced by the madtiplication of the cycle of 60 into it?clf; and confequently that the firf year of this grand era mult likewifs have been the frrit of the cyele. But this is totally inconfitent with the fact ; the Kalee loog hegan the thirteenth year of the cjele of 62 ; and all the rsafoning founded on the felf-production and harmony of thefe periods muft fall to tle gronnd."

From what Mr Marfen here fetz forth, it is plain that we mut make very confiderable abatements in our contidence of the extreme antiguty of the Hindoos obfervations. Incerd we can farce conceive a poffibility of reconciling fuels extravagant antiguity with the authentic liftories of which we are poffefed, or with thofe of feripture. The want of an ancient hiftory of Elindultin leaves us indeed in the dark, and gives roorn for ingenious and fpeculative men to indulge themfelves in marellous reveries coneerning their antiquity. Iut the food, we know, which if it cxifad at all, could not be but general oper the whole earth*, ' See tize muth have delloyed every monument of art and fci- article De ence; and it is furely more reafonable to believe, that ${ }^{\text {fage }}$ M. le Gentil, or the noft learned man in the prefent ase, has been miftaken (even though we flould not be able to determine the particular manner), than at once to deny the authenticity of all hiltory both facred and profane, and attempt to evade cvidence which no power of redfoning can ever fet afide.

It is, however, undeniaule, that the progrefs of the Great fril! Hindoos in geometry as well as aftronomy has been "f the Hinvery great is ancient cimes. Of this a mott remath- duns ir. able inflance is riven by Dr Mayfair, in their finding Erometry. out the proportion of the circumference of a circle to its diameter to a great degree of accuracy. This is determined, in the Ayern Ahbary, to be as $3 y^{2} 7$ to 1250 ; and which, to do it arithmetically in the fimplet manner poilible, would reguire the infcription of a polygon $7<19$ filss; an operation which cannot be performed withont the knowledge of fome very curious properties of the circle, and at lait ninc extractions of the fquare root, each as far as ten places of decinals. "Ihis proportion of 1250 to 3927 is the fame with that of ito $3.1+16$; and differs very little from that of 113 to 155 difcorered by Metris. He and Vieta were the firl who furpaffed the accuracy of Archimedes in the folution of this problem; and it is remakable that thefe two matherraticians fourified at the very time that the Aycen Akbary was compofed among the Ifindoos.-In geography, howerer, they are such deficient; and it is very difficult to fund out the true lituation of the maidians mentioned by their atshors from what they have faid concerning them.

The art of painting among the Hindoos is in an im. Paintang, perfect ftate; nor are there any remains of antiquity foulpturs, which esince its ever being more perfect than it is jult $\$$.. now. Their principal defect is in drawing, and they feem to be almolt cotally igmorant of the rales of perfpective. They are much beiter filled in colouring; and fome of their pittures are fininhed whith great nicety. Their feulptures arc likewife rude, and greatly refermble thofe of the Egyptians. They feem to follow no regular rules in architecture: their tereples in-

Hindose．deed are filled with innumerable columne，but moft of them without any jut hape or proportion．They are principaily remarkable for their imnenfe fize，which gites them an air of majety and grandeur．

The mulic of the Hindous is but little known to Eurepeans；and the art feems to have made but little proget＇s among them in comparifon with what it has done in the wettern countries ；though fome of the hu－ dian airs are faid to be very melodious．Their mufical inftruments are very numerous：in war they ufe a kind of great kettle drum named nogar，carried by a camel， and fometimes by an elephant．The dole is a long narrow drum fang round the neck；and the tam tam is a flat kind of drum refenbling a tabor，but larger and louder．They ufe alfo the cymbal，which thisy name talan；and they have various forts of trumpets， particularly a great one named tary，which emits a mott doleful found，and is aiways wfed at funcrals，and Gometimes to announce the death of perfons of ditinc tion．
The jugglers among the Hindoos are fo expert，that many of the milhonaries have afcribed their tricks to fupernatural power；and even fo a late traveller as Mir Grofe feems to be not of a very different opinion $\dagger$ ． Like the Egyptians，they feem to have the power of difarming ferpents of their poifon；and there are many frollers＇who go about with numbers of thefe aninals in bags，having along with then a fmall bagpipe call－ ed mugoutp，which they pretend is ufeful to bring them from their luking piaces．They take the ferpents， though of the noolt poifonous kinds，out of the bags with their naked hands，and throw them on the grond， where they are taught to rear and move about to the fund of their mufie．They fay that this is accom－

26 Antiquity eff fire arme among the Hindoos． pifitedty means of cetain incantations．
The ufe of fire－arms appears to have been of great antiquity in India．They are prohibited by the code of Gentoo laws，which is centainly of a very ancient date．The plaraie by which they are denmmated is agneafir，or weapons of fire；and there is alfo men－ tion made of Aact agree，or the weapon that kills an hundred men at once．it is impoffible to guefs at the time when thofe weapons were invented among the Hindoor；but we are certain，that in many places of the call，which have neither been frequented by Mo－ lammedans nor Earcpeans，rockets are almoll niviver－ fally made ufe of as weapons of war．The Hinduo tooks themflves aforibe the invention of fire－arms to Baz Recoicrma，who formed all the weapons made ufe of io a war betwist the good and evil fririts．Fire－ balts，or butue lights，emploged in hefieged places in the night time，to obferse the mations of the befiegers， are met with cerery where through I Zindolan，and are contracted in fuil as great pulection as in Europe． Eireworks afoure met with in great perfection；and， from the earlictl ages，have conflituted a principal article of aryuifnent among the Himdoos．Gun pow－ dor，of a compolition fonsewhat re fembling it，has been． fouad in many other phaces of the eat，yarticularly China，Pegu，and Siam ；but there is reafon to be－ lieve that the iavention came originally from Hindo． Ran．Puitined weapons of all linds are forbiden in
tbis country．

The lindoos are remarkable fur their ingenuity in all kinds of handicraft；but their utenfits are fimple，
and in many refpeets inconvenient，fo that incredible labour and fatience are neceffary for the accomplifh． ment of any piece of work；and for this the Hindous are very remarkable．Lacquering and gidding are ufed all over the connery，and mall have been ufed in very early ages；thungh in fome places the lacquering is brought to much greater perfection than in others．

The principal anticle of food throughout all Hin－ 28 dofan is rice，and of confequence the cultivation of it rice． forms the principal object of agriculture．In this the molt important reguifite is plenty of water；and when there happens to be a fearcity in this refpect，a famine mutt be the confequence．To prevent this as far as pofible，a vall number of tanks and water－courfes are to be met with throughout the country，though in fome places thefe are two much neglected，and gra－ dually going to decay．After the rice is grown to a certain lengeh，it is pulled up，and tranflanted into fieds of about too gards fquare，feparated from each other by ridges of earth；which are daily fupplied with water lit in upon them from the neighbouring tanks．When the water happens to fall below the level of the channels made to receive it，it is raifed by a fimple machine nanied fiotit，the conflucation of which is as fullows．A piece of timber is fixed up－ right in the ground，and forked fo as to admit another picce to muse tranfuerfely in it by means of a throng pin．The tranferfe timber is flat on one fide，and has pieces of rood acrufs it in the manner of lieps． At une end of this timber there is a large bucket，at the other a weight．A man walking down the fleps throws the bucket into the well or tank；by going up， and by means of the weight，he raifes it；and another perfon fanding below emptics ic into a channel made to convery the water into the felds．The man who moves the machine may fuppor：himflit by long lam－ boos that are fixed in the way of a railing from the top of the piece of upright timber towards the wall．

A number of other kinds of grain are to be met with in Hindolan，but wheat is not cultivated farther fouth than $18^{\circ}$ latitude．It is imported，however，to every port of the country by the Banjaries．Thefe are Accous ${ }^{25}$ a fet of people Lelonging to no particular caf，who the $\mathrm{P}_{2}$ live in tents，and travel in feparate bodies，each of ries． which is governed by its own particular regulations． They frequently vifit tuwn on the fea coaft，with hul－ luck loaded with wheat and cther articles；carrying awey in exchange fpices，cluths，but efpecially falt， which they carry into the inland parts of the cuuntry． Some of their parties have feveral thoufands of oxen belonging to them．They are rarely moletted，even in tine of war，otherwite than by being fumetimes preffed into the fervice of an amy to carry bagtare or provifions；but for this they are paid，and difmif－ fel as foon as the fervice is over．The lindoos them－ folves are prohibited from going out of the country． under the fevereft of all penalties，that of lofine their． call．Notwithantling this，however，it is certain that they do fettle in forcigu parts in the character of mer－ chants and bankers．Perbaps thefe may have a tole－ ration from the principal bramin，or there may be an exemption for poople of their profeflion；but this is not known．At any rate，wherever they go，they， appear inviolably attache to their religions ceremon te：es，and refufe to eat what is prohibited to then in

## their：

## H 1 N

thefe ftories are falfthoods. He thinks it is impoffible Hindofan. that Alcxander could have been ignorant of the witings of Herodotus, who gave an account of the dif. coveries of Scylax ; and with regard to the other circumbance he exprefles himfelf as follows. "The fory of Alexander's furprife at fecing the tides in the Indus, appears to me equally improbable; leeing that the fame Herodotus, book iii. fpeaks very particularly of the tides in the Red Sea, and deferibes them as being not only !trung, bui ebbing and flowing every day. (That mot intelligent and ingenious traveller M. Valney informs us, that the tide ebhs and fows three fect and an half at Suez). Arrian takes no notice of the tides until Alexander's flect had arrived near the mouth of the river. It is true, the tide in the Indus does not go up fo high as in other rivers of equal bulk, and that run on fofmall a defcent ; but nevertheles. as the tide is perceptible at 50 or 60 miles above the river's mouth, we may conclude, that it could hardly efcape the notice of Alexander and his people in their voyage from Pattala to the fea, Cuppoling they had not been apprifed of the circumitance. Befides, Arrian's account of the tide which did formuch mifchief to the fleet, is deferiptive of the bore, or fudden influx of the tide, in a body of water elevated above the cummon furface of the fea; fuch as occurs in the Ganges, \&c. He fays, thole thips which lay upon the fand were fwept away by the fury of the tide; Whife thofe that thuck in the mud were fet afloat again without any damage. To the generality of readers no reaton will appear why the circumllances of the Thips thould be different in the mud and on the fand: the fact is, that the botoms of channels in great rivers are muddy, while their fhallows are formad of fand; and it is the nature of the bore to take the fhortelt cut up a river, intead of following the windings of the channel; confequently it muk crofs the fand-banks it meets in its uray, and will alfo prove more dettructive to whateser it meets with a.ground than what is a float." For an account of the exploits of Alexander in Hindottan, fee the article Macenon. Hinort

The Grecian expedition into India foon excited a fram the a general curiofity in the Europeans to become ac- time of quainted with a country fo wealthy and fo remote. Me. Alcxamer gatthenes, the ambalfador of Seleucus. relided long at the Margit Palibothra the capital of an Indian nation, and from Moham. him the ancient writers learned molt of what they nedans. knew concerning that part of the world. He lived about 300 years before the Chrillian era, and kept a journal during the time lie refided in India.

For fome fhort time the weftern provinces of India continued fubject to the Syrian empire founded by Seleucus; but he quickly ceded thefe diffant countries to one Sandrocottus, who gave him only 500 elephants in exchange. Soon after this the province of Bactria likewife became independent; and thus the connection betwixt India and the weftern parts of the world was entirely diflolved, and wee are almoft entirely ignorant of the tranfactions of that country till the time of the Mohammedan conquelt. That the extenfive country we now call Hiraloghan was divided among many different nations, we have no reafon to doubt; but major Rennel is of opinion, that however this might be the cale, there was gencrally a large empire or kiugdom, which

Hinsofan. occupied the princinal part of that immenfe valley through which the Ganges takes its courfe ; the capital of which has flutuated between Dehli and Patna, as the limits of the enpire have varied. This was named the kingdom of the Prafij or Ganzaride in the times of Alesander and Megathenes. Major Renasl is of opinion that it extended weftward to the l'an$j$ job country; and he alio thinks it probable that the capital named Palibothra flood on the fame fpot which is now occupied by the city of Patna. The kingdom, according to this fuppofition, would occupy part of Bengal; and he thinks that it could not be lefs than that of France. It was on the borders of this kingdon that Alexander's army mutinied and refufed to proceed any farther. Arrian infurins us, that the people were rich, cacellent fuldiers, and good hufbandmen; that they were governed by nobility, and that their rulers impofed nothing harfh upon them.

The Hindoos themfelves pretend to an extravagant No ancie, , Hindoo his thory to be sedited. antiquity; but we are informed by major Rennel, that " there is no known hillory of Hindoftan (that refts on the foundation of Hindoo materials or records) extant before the period of the Nohammedan conqueils; for either the Hindoos kept no regular hitorics, or they were all deftroyed, or fecluded from common eyes by the Pundits. We may judge of their traditions by that exifting coneerning Alexander's expedition; which is, that he fought a great battle with the emperor of Hindoftan near Delhi, and though victorious, retired to Perfia acrofs the northern mountains; fo that the remarkable circumitance of his failing down the Indus, in which he employed many monthe, is funk altogether. And yet, perhaps, few events of ancient times reft on better foundations than this part of the hillory of Alexander, as appears by its being fo highly celebrated, not only by cotemporaries, but by feveral of the mott eminent authors for fome centuries following. The only traces of Indian hiltory we meet with are in the Perfian hillorians. In the beginning of the $17^{\text {th }}$ century, Mohammed Ferilhta compofed an hillory of Hindoflan, mont of which was given in that of colonel Dow, publifhed upwards of 30 years ago; but with regard to the early part of it, majur Rennel is of opinion that it cannot at all be depended upon. of the Saracens, who mider the khaliff Al Walil had extended their conqueils immenfely both to the eat and wett. Mahmed was the third from Abillagi a governor of Khorafan, who had revolted from the king of Backharia. He poffeffed great part of that country formerly known by the name of Ballia. Gazni, Gazna, or Ghizni, was the capital; a city which flood near the fource of the Indus, though Balkh likewife. claimed this honour. Subuctagi, the father of Mahmud, had projected the conquefl of the wellem part of India; but dying before he could put his defigns in execution, Mahmud took upos himfelf the conduct of the expedition; but previons to his invation of India, he ftrengthened himfelf by the conquett of the whole of the ancicnt Bactria. His lirt invation took place in the year 1000; during which be made no farther progrefs than the province of Moultain. That part of the country was inhabited by the Eutrry and

Fajpoot tribe, the Malli and Catheri of Alexander, Hindo who till retained their ancient fpirit, aul made a vety flout refifance to the armies of that furious enthulialt. As he was prompted to this undertaking no lefs by a defire of externinating the Hindoo religion than by that of conquell, a ledeye was at lat formed againtt him among all the Indian princes from the banks of the Ganges to the Nerbudta. Their allied forces, however, were defeated, and the year $1 \cos$ was mark. ed by the dellruction of the fanous temple of Nagracut in the Panjab country. Having fatiated himfelf with plunder on this occalion, Mathmed returned to his own country; but in 1015 invaded Hindollan once more, detlruying Tanafar a city on the weit of Delth, and a more celcbated place of worlsip than Nagracut itfelf. Delbi was reduced on this occation; and in feven years after Canoge was taken: the temples of Matıa ur Methura, the Methora of Pliny, a city of great antiquity, and remarkable for a place of worfhip near Agra, were likemife demolihed; but he failed in his attempts on the Rajpoots of Agimere, cither through their own valour or the flrength of their country. His 12 th expedition took place in the year 1024, when he dettroyed the celcbrated temple of Sumamat in the peninfula of Guzerat, adjoining to the city of Puttan on the fea coall, and not far from the inand of Din, now in the hands of the Portuguefe. In this expedition he proved very fucceffful, reducing the whole peninfula of Guzerat, with many cities, the temples of which he conftantly deftroyed; and indeed feemed no kifs plealed with the overthrow of the Hin. doo religion than with the conqueil of the country. At his death, which happened in 1028, he was polfotied of the eattern and by far the largetit part of Perfia, and nominally of all the provinces from the weftern part of the Ganges to the peninfula of Guzerat; as well as thofe lying between the Indus and the mcuntains of Agimere; but the Rajpoots in that country ttill preferved their independency, which they have done all along, even to the prefent time.

In the year 1158 the empire of Gazna fell to pieces Divifif from the fame caules by which other large and un-the er wieldy tates have been deltroyed. The wellern and of $G$ and $v$ largell part, which fill retained the name of Gazna, and was fized, upon by the family of Gaurides, fo na- in Hi ned from Gaur or Ghor, a province beyond the In- that b dian Caucafus; while thofe contiguous to both thores frens ven of the Indus were allowtd to remain in the poffifion vent of Chufero or Cufroe, whofe capital was fixed at La. hose. In $118+$ the pofterity of this paince were driven out of their territories by the Gaurides; by which means the Mohammedans became neighbours to the Hindoos, and in a thort time began to extend their dominions to the eaftward. In $119+$ Mohamined Gori penetrated into Hindollan as far as Benares, and repeated the fame feenes of devaftation which had formerly taken place under Mahmud Gazni. At this period major Kenael is of opinion, that the purity of the language of Hindoftan began to decline, and continued to do fo till it became what it is at prefent ; the original dialect being what is called the Sanicrit, and which is now a dead language. Muhammed Gori ad. fo reduced the fouthern part of the province of Agemere, and the territory to the fouth of the river Jumna, taking poffefion of the frong fortefs of Gualiors
oftan After his death in $\mathbf{1 2 0 5}$ ，the empire of Cazna was again divided：and the Patan or Alghan empire was founded by Cuttub，who had the Indian part，the Per． Gan remaining ：o Eldoze．Cuctub tixed his imperial refidence at Dethi ；and in 2210 the greateit part of Hindoftan Proper was conquered by the emperor Al－ tumith，the fucceffor of Cutcub．After his time the government of kirngal was always bellowed upon one of the reigning emperor＇s fons；and during lis reign the bloody conqueror Jeughiz Khan put an end to the other branch of the Gaznian empire，known by the name of $\mathrm{K} \%$ oram ；of which revolution an accourt is given under the article Gazna ：but Hindotlan was at that time left modilurbed．In 1242 the Moguls besan to make irruptions ineo．Induftan，but did not at this time make any permanent conque⿰⿰三丨⿰丨三一⿻上丨又期．＇The country was now in much the fame ？ate in which it had been before the invation of the Mahommedans，viz．divided into a great number of dates tributary to the empe－ ror，but in a great meafure independent；and which did not fail to revolt whenever a favourable opportu－ nity offered．The kingdom of Malaz，which had bren reduced by Cutsub in 1205 ，Mook off the joke in the year 1265，and the Rappots were on every oc－ calion ready to revolt，notuithitanding that their coun－ try lay in the neighbourhood of the capital．The inolt dreadful maffacres，rebellions，and confufion，now took place，which from that period almont to the time that the Britilh government commenced，make up the hiftory of Hindollan．The empire being parcelled out among a fet of rapacious governors，the people were reduced to the lalt degree of mifery，and were at laft fo far mifled as to imagine that it was their intereft to take up arms，in order to render thefe governors in－ dependent．Had the emperors of Hindoftan confuled their true interell，they would have given up the pro． vinces which lay beyond the upper part of the Indus and the deferts of Agimere；as thele formed a bar－ nier which could not eafly be paffed by any invader． By neglecting this precaution，howerer，they at lalt gave an opportunity to the Moguls to penetrate into their country；and thefe，after feveral invafions，he－ －came at lalt fo formidable，that they were permitted by the emperors，in the year 1292 ，to fettle in the coun－ try．At this time the reigning emperor was Ferofe II． of the tribe of Cbilligi or Killigi，io named from Kil－ lige ncar the mountains of Gaur；and in 1293 this n．emperor projected the conqueft of the 1 eccan；by which －was moant at that time all the territor）lying to the fouthward of the Nerbudda and Mahanada and Cat． tack rivers；an extent of dominion alinot equal to all that he already poffeffed in Hindollan．Ferofe was incited to attempt this by the riches of one of the princes of Deccan；and the perfon who propoled it was one Alla，governor of Gurrah，a country neally bordering upon that which he was about to invade． Alla，having aecomplished his undertaking，during which he amaifed an incredible quantity of treafure， depoled and murdered the emperor，afluming to him－ felf the forereignty of Hindottan．He then began a new plan of conquell ；and the firtt inftance of his fuc－ cefs was the reduction of Guzerat，a ftrong fortref， which had bitherto remained independent，and，while it continued fo，was a frong obitacle to his defigns epon the Deccan．He acat reduced Rantanpour and

Cheitore，two of the Atrongeft forts in the Rajpoot Hindurtan： country．In 1303 the city of Warangale，capital of - － a kingdom of the Deccan，named I＇elhingrana，was re． duced；bat in the midt of thefe conqueits the Mo－ guls invaded the country from an oppoliee quarter，and plunctred the fuburbs of Delli．Notwithltanding this check the emperor refumed his plan of conquat；the remainder of Malwa was fubdued；and in 1306 the conquett of the Deccan was again undertaken．The conduct of the war was now conmited to Cafoor： who nut only carried his army into Dowlatabad，bu， in 13 ， 0 ．penctrated into the Carnatic alfo．The ex－ tut of his conquells in that country is not known；and indeed hiscopeditions feem to lave been made with a view lather to plunder than to atchieve any permanent conquett．＇Thequastity of riches he amafled was fo great， that the foldiers are laid to have carried away only the gold，leaving filver behind them as too cumberfome． As the treafure carried off on this occafon had been accumblating for a number of ages，it is probable that the country had long remained in a tate of tranquillity．

Cafoon thill proceeding in his conquefts，ravaged a fecont time the northern part of the Deccan，and obliged the inhabitants of l＇cllingana and the Carnatic to become tributary to him．Rebellions took place in $13: 22$ ；but the country was again rednced in 1325 ， and the whole Carnatic ravaged from one fea to the other．This year Alla died，and his fucceffora，not being polfefted of his abilities，were unable to rotain the duminions he had left．Under the emperor Mo－Revolesanse hanmed III．the people of the Decean again revolt．confufion ed，and drove the Mahommedans fo completely out of the whole thefe countrics，that nothing renained to them but empre． the fortrefs of Dowlatabad．In a 3tt the ciiy of Dif． nagar，properly Bijinagur，was founded by Belddeo the king of Deccan，who had lieaded the inhabitants in their late revolt．Molammed in the mean time at． tempted to extend his dominions towards the saft ；but while te employed hinfelf in this，mary provinces were lolt by rebellions in Beugal，Guzerat，and the Panjab． His fuccefor Ferofe III．who aleended the throne in 1351，feemed mure deliruus of improving the remaing of his empire than of extending it ；and，during his reign，which continucd for 37 years，agriculture and the arts were the favourite objects of his purfuit．At－ ter his death，in 1335 ，a icbellion and civil war took place，and continued for feveral years；and matrers were brought to a crilis in the time of Malimud III． who fueceeded to the thrunc in 1393；and，during this time，the empire of Hindoltan exhibited the lin－ gular circumitance of two emperors reliding in the fame capital，and in arms againtt each other．While corg matters remamed in this lituation，Tamerlane，after ba－and mars－ ving fubdued all the wettern part of Tartary and factes of Afia，turned his arms againtt Hindoltan in the year 1398．His conquett was eafy，and his behaviour fuch as rencered him worthy of the name by which lie is yet known in lindultan，＂the dellruyiag prince．＂ After having brought into captisity a valt number of the poor inhabitants，he caufed a general maflacre to be commenced lett they frould join the enenty in cale of any fudden ensergency；and in confequence of this cruel order，upwads of 100,000 were put to death in one bour．In the beginning of the year $13 y y$ he was met by the Indian ariny，whon be defated with great

[End tow. flaughter, and foon after made himfelf mafter of the imperial city of Delhi. At this time the capital confilled of three cities, named Old Delli, Seyri, and Jehnn litiab. Sevri was furrounded with a wall in the furm of a circle; and Old Dchlii was the fame, but much large, lying to the fouthwed of the other. Thefe two were joined on each lide by a wall ; and the third, which was larger than the other two, lay between them. As the city made no reflillance, there could not be a pretence for uting the inhabitants with any crucity; and thus matters palled on quictly till the J 2 th of January, when the Tartar foldiers infulted fome of the inhabitants at one of the gates. The Eimirs were ordered to pet a flop to thefe diforders, but found it impoffible. The Sultanas, having a curioffy to fee the rarities of Dehhi, and particulatly a famous palace adorned with 1000 pillars buile by an ancicut Indian king, went in with all the court ; and the gate being thus left open for every body, above 15,000 foldiers got in umperecived. But there was a far larger number of troops in a place between the cities above mentioned, who commited fuch diforders, that an infurreation commenced; fome of the inhahitants attacking them, while others, in defpair, fet fire to their houfes, and burnt themflelves with their wives and children. The foldiers, taking advantage of this confufion, pillaged the houfes; while the diforder was augmented by the adinifion of more troops, who feized the inhabitants of the neiglibouring cities that had fled to Delhi for fhelter. The Emirs caufed the gates to be thut; but they were quickly opened by the foldiers, who rofe in arms again't their officers; fo that, by the morning of the next day, the whole army was entered, and the city totally deltroyed. Gome foldiers carried off no fewer than 150 flives, men, women, and clildren; nay, fome of their b:ys had zo flaves a piece to their hare. The other fooils in jewels, plate, and manufactures, were immeufe: for the Indian women and girls were all adorned with precious flones, and had bracelets and rings on their hands, feet, and even toes, fo that the foldiers were loadd with them. On the 15 th the Indians attempted to defend themfiles in the great mofque of Old Delhi; but being attacked by the Tartars. they were all flanghtered, and towers erected. A dreadful carnage now enfued throughout the whole city, though feveral days elapfed before the inhabitauts could be forced to quit it entirely ; and as they went, the Emirs took many of them into their fervice. The artifans were alfo diftributed among the princes and commanders, all but the mafons, who were referved for the emperor, in order to build him a large flone mofque at Samarcand.

After this terribte devaltation, Tamerlane marched into the different provinces of Indottan, every where defeating the Indians who oppofed him, and naughter. ing the Glebrs or wormippers of fire. On the 2 ;th of March he retired, and thus fet the miferable inha bitants free from the mot bl ody conqueror that had cver invaded them. He did not, however, diflurb the fucceffion to the throne, but left Mahmud in quict poffeflion of it, referving to himfelf only that of the Panjab country. The death of Mahmud, which happened in $1+13$, put an end to what is called the Patan Cynally, founded by Cuttub in 1205 . He was fucceeded by Chizer, whoderived his pedigree from the im-
poftor Muhammed, and his polterity continued to en Hicde joy it till the year 1450 ; when Belloli, an Alghan of the tribe of Lodi, took poffeftion of it, the reigning prince Alla II. having abdicated the government. Under him all Hindoftan was divided into feparate ftates; and a prince, whofe title was the ling of the Eafl, who refided at Jionpour in the province of Allatiabad, becane fo formidable, that the king of Delhi had only a fladow of authority remaining to him. A confiderable part of the empire, however, was recovered by the fon of Belloli; who, in the year 1501 , fixed his royal refidence at Agra. During his reign che Purtugucfe firlt accomplifhed the paffage to India by the Cape of Good Hope, but they had no connection with any other part of Hindoftan than fome maritime places in the Deccan which thad always been independent of the court of Delli. In 1516, during the reign of Ibrahim 11. matters fell into fuch confution that Sultan Baber, a defeendant of Tamerlane, found means to conquer a very couliderable part of the empire. His firlt expedition took place in the year 1518 ; and the year 1525 made himfelf mafter of Dellii. In his lat invafion he is faid to have brought with him only 10,000 horfe; having been furnifhed with the reft by the difaffected fulijects of the emperor. During the five years that he reigned, his chicf emplyment was the reduction of fome of the eallern piovinces, but had not time to compofe the difturbances which took place throughout the whote of his dominions. On lis death the feeds of rebellion, which Baber had not been able to exterminate, produced fo many revolts and infurrections, that his fon Hunaioon, though a prince of great abilities and virtue, was driven from the throne, and ubliged to take fhelter among the Rajpoot princes of Agimese, where he lived in great diftrefs. During the time of his exile his fon Ackbar was born, whom Mr Rennel looks upon to be one of the grearell princes that ever fat on the throne of Hindollan. Tlise fovercignty was held in the mean time by an uturper, named Sheerkhan, who in $15+5$ was killed a: the ficge of Cheitore, and buried in a magaiticent mautuleun, of which Mr Hodges lately exlibitied a drawing in this country. His territories, at the time of his death, extended from the ladus to Bengal; but fo unfettled was the government, that after his deceafe no fewer than five foveleigns appeared in the fpace of nine years. This induced a ftrong party in Hindoftan to recal Humaioun; but he lived only one year after his seturn.

In 1555, Humaioon was fucceeded by his ron Ack-Reix bar, at that time only it years of age. During his Acki long reign of 51 years, he etlablifined the empire on a preat more fure foundation than it had probably ever been before; though even at chis time Mr Rennel is of opinion, that all the tranquillity enjoyed by the people was merely that there was no actual rehellion. The firit years of his reign were fpent in reducing the provinces which had revolted from Agimere to Bengal; and the obedience of thefe he took care to fecure as well as poffiisle by a careful choice of governors ; particularly by an unlmited toleration in religious matters, and an attention to the rights and privileges of the people. In 1585, he refolved to invade the Deecan, which had hitherio refiled the power of the Magul princes. The war continued for 20 years; during all which time no

## H I N

dotar. farther progrcts was made than the reduction of the weftern part of Berar, Candeifh, Tellingana (a divifion of Golconda), and the northern part of Amednagur ; the capital of which, named alfo Amednagur, was taken in 160 t , after a long and bloody liege, and an ufuccefsful attempt of the princes of the Deccan to relieve it. Under his fuccefor Jehan Cuire, the project was but faintly carnied on; the empire was difturbed by the rebeilion of siah Jchan the emperor's fon; and the infuence of Noor Jehan his niltrefs perplexed the conncils of the nation. In this prince's reign Sir 'Thomas Roe, the firft Englith anmallador, arrived at the court of Hindofan. The rortugute had now acquired confiderable - poffeftions in Guzarat and Bengal, but only thofe in the former province attracted the attention of the court ; fo that the Perfian hiflprian takes no notice of thofe in Bengal. In the reign of Shah Jchan, who fuccecded his father Jelan Guire in 1627 , the conquet of the Deccan was more vigoroully puthed than before; and the war was carried on in fuch a dellunkive manser, that moft of the princes in thofe parts were fain to make fubmifion to the emperor. During this reign a war took place with the Portuguefe, whichended in the ces pultion of the latter from Hoogly on the Ganges. In his private character Shah Jehin was a very debauched and wicked prince, which gave occalion to one of his fons named Aureng- $\approx i b$ or Aureng.zebe. to dethrone him. npire This prince attained his end by a train of deep hypocrify and diffmulation ; covering his ambition with a pretence of religion, and under that pistence committing the greatef crimes. He engaged in a war with two of his brothers, both of whom he defeated by un forefeen accidents, when he himfelf fremed to be on the briak of deflruction. Having at laft got them into his power, he put them both to death, and then lamented their misfortune. One of his brothers who affilled him, was rewarded firl with imprifonment, and then with death. By the year 1660 , he had attained full poffefion of the foveseignty, and from that time to the year 1678 there reigned a profound t:anquillity throughout the whole cmpire. In the lat:er part of his reign he undertook the conquet of the Deecan, to which he was fuppoled to be incited by the refulution and growing power of Sevagee. the founder of the Mahrattaftate; and who, in that character, appeared almolt as a rival to Aurengrabe himfilf. Having quelled a rebellion of the Patans, who lived beyond the Indus, he perfecuted the Hindoos to fuch a degree, that the Rajpoot tribes in Agimere commenced a war againlt him. On this occafion be headed his armies alfo in perfon; but having the misfortune to be hemmed in among the mountains, le would certainly have been taken prifoner, had not the enemy thought proper to allow him to efcape. They allowed alfo the emprefs to make her efcape after fhe had been actually saken. In 168 the renewed his incurfions into that country, took and deftroyed Checture, commiting other devaftations, and every where dellroying the Hindoo temples and objeets of wothip; but notwithtlanding all his efforts, he was at laft obliged to abandon his enterprile, and allow them to remain in peace. Irom the year 1678 to the tinue of his death in 1707 , he is faid to have been chiefly employed in the Deecan, the greatelt part of wbich ho reduced, and for the la!
five years of his life is faid to have been actually ein Hinot A:n. ployed in the lield. 'This long abfence from his capital could not but be productive of bad confequences Rebellions broke out in various parts of the empire; and during this period, the Jats or Jauts tirll madic their appearance in the province of $A$ gia. They were at firlt only a fet of banditti; but have fince grown to be a very conliderable ftate, and once were of fore confequance in Upier Hindultan. Afier the loits year of Aurengache's reign, however, we know very litthe of his trantactions, as he would not allow any hiftory of it to be written. At the cime of his death the empire extended from the 10 th to the 35 th elegree of lathtude, and almoft as many degrees in longitude. $\because$ His icvenue (fays Major Reanel) exceeded 35 mil. lions of pounds Sterlage, in a country whese the products of the earth are about four times as cheap as in Englatud. But fo wrighty a feeptre eould be wielded only by a hand like Aurengecte's: and we aceordingly find, that in a courfe of 50 years after his death, a fucceflion of weak princes and wicked minitters refuced this afonifling empire to nothing."

A urengzebe left four fons: Maufum, afterwards em- Ies quick peror, meder the tite of Bahader Shah: A\%em, Kaumdechine anBuh, and Acbar, who hat been obliged to fly th P(r. der ho fuo fia 30 years before on account of his having engaged c.lluro. in rebellion againlt his father. A civil war inflantly commeneed between Azemand Manzum; the crent of which was decided in a preat battle, where 300,000 combatants were browight into the field on cach fide. In this battle Aeen was defeated an! hilled; alter Which Mawama afcended the throne by the title of Bahader Shals. He was a prince of confiderable abilities; but the diforders of the empire were already rifen to fuch an height, that during his thort reign of five years, he found it impormble to compole them. He was firlt engaged in war with his brother Kaum Bufh, whom he alto defeated and killed ; after winich his aitention was engaged $t y$ the Sciks, a now fot of religionilts, who, during the reign of Eivah Jehan, had then:ly eftablifhed themfelves along the foot of the eatern mountains. They now appeared in arms in the province of Lahora, and ravaged the whole conatry from thenec to the banks of the jumma. The emperor marchid againtt thefe adrerfarics in ferfon, and with great difievolty brought them under fubjection. He then took up his refidence at Lahore, where be Guedafter a hort illnefs, without laving ever vinied the imperial citice of Agra or Delhi.

After the death of Bahader Shah the empire was again contelted among his four fons. Of thefe the fecond, named azem Oohaun, took puficfioun of the treafures ; but was oppofed by his three brothers, who agreed to divide the empire among them. Azem was doflated and killed in a battle, gained chictly by the valour and condunt of the younget naned Shab jotion: who feemed refolved to abide by the agreemerit, and as a proof of his fincerity, ordered the treafures to be di. vided. 'Ihis was prevented by the intrigues of Zoolfecarkhan, an omrah in high trutt. A new civil war commenced, in which Jehan Shah was killed. The two remaining bruthers tried their fortune in a third battle, which left Jehaunder, the eldeft, in poffeffion of the throne. In nine months be was dethroned by $F e$.
-fiadoftim, makere, or Furrokifre, fon to the decenfed Azem OoAlaun; having, during his flinrt reign, difplayed ahnof unparalleded meanuefs of firit.

This revelution was accomplified by the affilance of two brothers, Honfein Ali Kilan and Abdooila Khan, who had extenfive governments in the eaftern provinces. The calamities of the empire were not at all abated during this reign. In 1713 the Seiks appeared again in arms; and in 1716 were grown fo formidable, that the emperor himflelf was obliged to march againft them ; but we are totally ignorant of the

Y\%man :arta to - he Eait lis. dia com.
 particulars of this campaign. About this time the Engliha Eaf India company obtained the famous Fir. nan or grant, by which their goods of export and import wexe exempted from duties or cuftoms; which was regarded as the company's conmercial charter in India, while they flood in meed of protection from the princes of that country.
Ferokfere was depofed, and his cyes pot out by the two brothers who had raifed him to the throne; and in the courfe of the fame year two other emperors, whom ihey afterwards fet up, were depofed and murdered: and thus, in eleven years after the death of Aurengzube, is prinees of his line, who had either mounted the thone or been competitors for it, were csterminated, while the government declined with iush rapidity, that the enpire feemed ready to be difmembered ton a greater degree than it had even been before the invation of Tamerlane. In 1718 the two bothers 1aifed to the throne Mohammed Shah, the grandfon of 13 ahader thah; but this prince having got fufficient warning by the fate of his predeceffors, took care to rid himfelf of thefe powerful fubjects, though this could not be accompliface without a civil war. New enemies, however, tharted up. Nizam-al-Muluk, viceroy of the Decran, had been for fome time augmenting his power by every poffible method, and was evidently afpiring at independence. Having received fome af. fronts from the two brothers, who for fome time had ouled every thing with an abfolute fway, he thought proper to ietire to his government. In 1722 he was invited to court, end offered the place of vizier or prine miniter, but declined accepting it, white the growing and formidable power of the Mahrattas furnihed him with a protence for algmenting his army. At latt, having by the year 1738 attained a fufficient degree of trength to accomplith his purpofes, and contident of his havirg a large party at court, he came thither attended by a great boly of armed followers. Finding, however, that the intereft of the emperor was thill
s tor powerful for him, he invited the celebrated Perfian ufurper Nadir Shah, enmmonly known by the name of Klos'l Khen, to inwade Hincollan. 'The invitation wat accepted, and Nadir entered the country without oppofition. The imperial general Dowran being killed in a firmifh, no decifive engagement took place; and the Perfian chief, though far advanced into Hindoftan, yet looked upon matters to be fo uncertain, that he offered to evacuate the ceuntry and retire for 50 lacks of rupees, about half a million therling. The intrigues of the Nizam and his party hindered the emperor from complying with this moderate demand; inftead of which he abfurdly threw himfelf upon the ufurper's racrey, who then took foffifion of Delti, demanding
$\mathrm{N}^{2} 15 \div$.
a ranfom of 30 millions fterling. At an interview with Hind the emperor, he feverely reprimandad him for his mifconduet; however he told him, that as he was of the race of 'Tituur (Tamerlane), who had not offended the reigning fanily of Perfia, be would not take the cm pirc from him; only as he lad put him to the trouble of coming fo far to fetile his affirs, he infifed that his expences fhould be paid. The unfortunate emperor made no anfwer :o this fpecch; but Nallit took care to cnforce the latter part of it. Some time after the departure of the emperor, Nadir went to the camp to pay him a vifit; where he feizsd upon $2 c 0$ cannon, with fome treafure and valuable cfiects, fending then off immediately to Candahar. He then marched back to Delhi, where a mob arofe about the price of corn. As Nadir Shah was endeavou:ing to quell it, a mukket was defignedly fired at him, by which he naroowly ef. caped being killed. Exaโperated at this, he commanded an indiferiminate maflacre to be made, which his Iohat cruel foldiers inflantly put in execution with the greatelt of De alacrity, and 120,000 , or, according to others, 150,000 , 1 lau 6 of the miferable inhabitants were llaughtered without reercy. This was followed by a feizure of all the jewels, plate, and valuable artictes which could be found, befides the exaction of the 30 millions, which was done with the utmolt rigour ; infomuch that many of the inhabitants chofe rather to put an end to their own lives than to bear the torments to which they were fubjected in cafe of inability to pay the fum impofed upon then. During thefe horrid feenes, Nadir caufed the marriage of his fon to be celebrated with a grand daughter of Aurengzebe; and after having extorted every thing which he demauded, at laft took leave of the emperor with every mark of friendihip. He put the crown upon his head with his own hands; and after having given him fome falutary advice relative to the government of his empire, he fet out from Dethi on the Gth of May 1739.

Dy this invation the empire fultained prodigious lofs. Mirt Since the arrival of Nadir in Fiindoflan, about 200,000 ante people had been deftroyed, and goods and treafune car- $\begin{aligned} & \text { ater }\end{aligned}$ ried off to the amount of 125 millions thelling. No. depa lammed had ceded to the ufurper all the provinces of Hindotan fituated to the wett of the Indus. His departure left the Nizam in poffeffion of all the remaining power in the empire, which he iuftantly made ure of to ctablith himfelf in the fovereignty of the Deccan. The province of Dengal had already become independent under Aliverdy Cawn, in the year $1 / 38$; and not long after, it was invaded by a saft ariny of Mahrattas under fanction of the empetor's name; who being unable to fatisfy them in the arrears of tribute he had been obliged to confent to pay, fent them into Bengal to collect for themfelves. About the fame time, the Rohillas, a tribe from the mountains which lie between India and Perfia, encetad an independent flate on the calt of the Ganges, within So miles of Dethi.

The total diffolution of the empire feemed now to be fatt approaching. In the confufion which took place after the murder of Nadir Slah, Abdallah, one of his generals, feized upon the eaftern part of Pertia, and the adjoining prowinces of India, which had been ceded to Nadir by Mehammed Shah; which he formed into a kingduen !tia known by the name of Conda. hat

## H I N <br> 529 H I N

onaa. lar or Abdalli; of which a more particular account is given in the fubfequent part of this article.
This year Mohammed Shah died, after a reign of 29 years; which, confidering the fate of his immediate predeceflors, and the anarchy univerfally prevalent throughout Hindoflan, mult be accounted very won. derful. He was fucceeded by his fon Alimed Shah; during whofe reign, which lafted about fix years, the total divifion of the remaindet of the empirc took place. Nothing now remained to the family of Tamerlane but a fmall tract of territory round the city of Delhi, now no longer a capital, and expofed to the repeated depredations of invaders, with confequent maffacres and famines. The laft army which could with propriety be termed imperial, was defeated by the Rohillas in 1749 ; by which their independence was fully eflablifhed in the eaftern parts of the province of Del. hi. The Jauts, of Jats, a Hindoo tribe, eftablifhed themfelves in the province of Agra; the Decean and Bengal were feized upon by their viceroys, Nizam and Aliverdy. Oude was feized on by Seifdar Jang (father to the late Sujah Dowlah); Allahabad by Mohammed Kooli. Maliva was divided between the Poonah Mahrattas and feveral native princes and Zennindars: Agimere reverted of courfe to its ancient lords, the Rajfoot princes; and the Mahrattas, in addition to their proper thare of Maliva, poffeffed the greatell part of Guzerat, Berar, and Oriffa; befides their ancient dominions in the Deccan. Thefe people were now become fo powerful, that they were alternately courted and employed by the contending parties, like the Swifs in Europe ; with this difference, that the Swifs are paid by thofe who employ them, whereas the Mahrattas always take carc to pay themfelves. Abdalla having eitablifted his empire in the manner above related, entered Laliore and Moultan, or the Panjab, with a view to conquef. "The whole country of Hindoftan was in cominotion (fays ihiajor Rennel) from one entrance to the other, each party fearing the machinations or attacks of the other; fo that all regular government was at an end, and villany was practifed in cevery form. Perhaps in the annals of the world it has feldom happened that the bonds of government were fo fuddenly diffolved, ovcr a fortion of country containing at leaft 60 millions of inhalitants."

In 1748 the Nixam died at the age of 104, and was fucceeded by his fon Nazirjung, to the prejudice of his eldeft brother Gazi, vivier to the nominal emperur. The contefs that followed on this occafion for the throne of the Deccan, and nabobmip of Arcot, firft n. engaged the French and Englih as auxiliaries on oppofite fides. This was followed by a long ferics of hofilitics, which terminated in the total expullion of the French frem Hindoflan, the entire hur.iliation of the Mogul, and his being reduced to the hate of a mere tool of the Englith Eaft India company; together with the fubjection of a sal tract of country to the latter. Thefe unafactions have occafioned very confiderable revolutions, not only in the country properly called Hindofan, but in other places of that extenfive tract called the Enf Indies: for fome account of which fee the article ladia.
The vall country of Hindoftan is at prefent divided among the following powers.

1. Timur Shah, fon of Ahmed Shah, or Abdallah, Vol. VIII. Part 11.
poffeffes an cxtent of territory to the nuth weftward triadeffen before we come to the river Indus. This country, extending all the way betwixt India and Perdia, is known by the name of Duran, or Turan; and was poffeffed by the Afghans, of whom Abdallah became the fovereign. He was defeended from an illuttrious farnily ; and having the misfortune of being taken pritoner by Huffin Khan, then chicef of Kandahar, along withe his brother Zulfecur Khan, they were releafed by the celebrated Nadir Shah in his paffage through that country to Hindoftan; but as that conqueror fill looked upon them with a jealous eye on account of their great influence with their conntrymen, both were fent to Mazandaran in Perlia. Here Zalfecur Khan, the brother of Ahmed, died; and, fome time after, we find the latter promoted to the command of a body of Afghan cavalry in the Perfian army. He continued attached to the intercits of Nadir while that conqueror lived; and even attempted, though ineffectually, to revenge his dearh. Proving unfucceffful in this attempt, he returned to his own country; and, arriving at Kandahar, was faluted chief of the Afghans. In the courfe of a fow montlis he became malter of all the countries which the Mogul had been obliged to cede to Nadir Shah; and, encouraged by the diflracted ftate of the affairs of Hindoftan at that time, he croffed the Indus, and plundered the country to the fouth. eaft. An indecifive battle fought with the Indian army under the command of the prince royal and sizier, in which the latter was killed, obliged Ahmed to return to his own territories; but he foon undertook another expedition, in which he conquered the province of Lahore. In 1755 he returned; and after Ataying fome time at Lahore, marched to Dethi the capital, having been invited thither, as was fuppofed, by the Mogul himfelf, in order to get ricl of the tyranny of his vizier. The latter was accordingly deferted in a battle by orders of the emperor, and obli. ged to furrender himelf prifoner: but inflead of being put to death, he liad the addref to ingratiate himfelf with the conqueror; and the unfortunate Allumghire, the Mogul, was obliged to fubmit to be ruled by him as before. Ahmed took care to indemnify himfelf for his trouble, by laying the city of Inchis under a heavy contribution; and having ftaid for about a month, during which time he concluded a marriage betwixt his fon Timur and the emperor's niece, he marched againft a tribe of Hindoos named the $\mathcal{F}$ outs. and conquered the greatelt part of the province of Agra. In this expedition he furprifed the city of Matra, famous for being the birth-place of Kiriken, the Apollo of the Hindoos; and facrificed to the Gopia, the mufes of the country. He failed in his attempt to furprife $A$ gra through the refolution of Fazil Cawn the governor; after which he led back his troops to Dethi, where he married the daughter of Mohammed Shal the late emperor, whom Allumghire had in vain folicited for himfelf.
Having fettled his fon Timur in the government of Lahore, Ahmed quitted Hindoftan, and returned to lis dominions, where he found cvery thing in confufion. Timur, who during his father's abrence had been frequently difurbed by the Seiks, a trihe of Hin. doos who protefa deifm, was in 1760 driven out by a valt army of Mubrattas commanded by Roganaut Row

Hiotofian : the Paiflua's brother, of whom fo much mention has already beea made. Next ycar, however, Almed eroffed the Indus, and cafly recovered his former tertotories; foom after which lie became head of a league formed atnong fome of the Indian princes, in order to oppofe the overgrown power of the Mahrattas. In this euterprife he proved fueceffoll; and overthere the Mahrattas in a decifive and wery bloody batte, in which more than 50,000 of them were killed on the fpot. The porfuit lafted feveral days, and their valt army was totally difperfed; Ahmod being every where received with acchamations as the detiverer of the faithful. In 1762 be again croffed the indus, with a view to conquer, or rather to exterminate, the Seiks, whofe incurfions had become very troublefone, and even dangerons, to his kingdom. Having deleated thetrarmy, and forced them to take refuge in the woods and Atrong holds, he fet a price on the heads of all thofe who profefled their tenets; and that with fuch fuccels, that heaps of them are faid to have been piled up in all the principal towns in the fe parts. At lait, hearing that they had affembled in great numbers to celebrate an annual feftival, he marched with an army to furprife them. The Sciks, however, were well provided for his reception, and an obRinate battle enfued. During the time of the engagement an eclipfe of the fun happened, which, though difregarded by the Seiks, greatly difmayed the fupertitions Mohammedans. Ahmed was therefore defeated; and though he frequently returned, was never able thoroughly to fubdue that people. At latt, having been long amicted with an ulcer in his face, he died on the 15 th of July :773, at a place named Kobtobit, anneng the mountains of Kandahar, to which he had retired for the fake of coolnefs, and was fucceeded by his fon Timur, who fill contimaes to enjoy the fovereignty. The dominions of this prince extend a very conliderable way to the northward of the Indus, but be porfetes nothing in Hindoftan belides the province of Kafhmire.
2. The Sciks inhabit a country on the other fide of the Indus, and making part of Hindoftan properly fo called. They derive their origin from a Hindoo named Nanuck of the cant of Khatry. His father, named Bal.a Caloo, poffefied a fmall difrict in the province of Lahore named Telandi, where Nanuck was boin in :he year $1+70$. Like other founders of new feets or nations, he is faid during his infancy to have given many indications of bis future fuperiority to the rett of mankind. Hefeems, however, to have received no farther education than what was common to young men of his calt; viz. reading, writing, and arithmetic, and hearing the fattras or commentaries on the facred books. In his early youth he was married to a woman of his own catt, by whom he had two four. Being a convert to the worfhip of the Jnvifible, or deifm, he accultomed himfelf to declaim againtt the folly of worshipping idols, and the impicty of paying adoration to any but the fupreme Being. At the age of 25 he left his family to vifit Bengal and the eaftern parts of Hindoftan; in a fecond journcy he vilited the fouth, and in a third he went as far as Perfia and Arabia. On his return from this latt journey, he expreffed a defire of remaining in his native eorntry; and was fumihed, according to his wih, with a piece of ground on the
banks of the river Bavy, atout So miles north-eaftward Hinds from the eity of Lahore. Here he took up his refidence for the eelt of his days; and cheoling to be free from the cares of this worl\}, he diwelt at a dianace from his wife and chidern, wha came occalionally to vilit lim. Having acquired great reputation for his piety, wiflom, and laming, he died at the age of 70 ; and lince his death the place of his abode has obtained the name of Dibra Daird, or "the place of worthip." His theft fon founded a lect of devotecs named Nanuit Shoiy; but his fecond employed himleif in the ufual occupations of mankind. On account of the opprethon of the Mchammecian gevernors, however, he removed from 'Pelvandi, the ettate of his anceltore, and fettled at Kartarpour, which his deteendants fitil polfels. They are refpected by the Siks on accourt of their being the poterity of Nunuck, but are not held in any veneration on a religioas account.

The doctrines of Nanuck were taught by a favnurite difciple of his named Lhina, but on whom he bellowed on his death bed the appellation of Angrot. By him the doetrinss of the fect were collected in a worl named Put'y, or "the book;" and an hitury of the life of Nanuck hinfelf was given in another named Fonum Salky. Both thefe were writeen in a particu. lar kind of character called Gour Mouely, and faid to have been invented by Nanuck himfelf. Angud named for his fuceeflor another difciple called Amorbofs; and this method of continuing the fuccerfor feems to hase been practifed as long as the difciples continued to own one fupreme chief.

Fur many years the Seiks lived in peace, and gaine 1 the good will of the Mohammedan governors by their quitt and inoflenfive behaviour. By degrees their numbers and their power greatly increaled, but is proportion to their good fortune, they leem to have lolt their virtue; fo that their gourons, or chiefs, who had hitherto borne the character of apollcs, at lait Itood forth as military kaders. The firit of thefe wess named Taigh, whofe fuceefor, named Gowand Sing, was the tenth and latt of the gomous. He engaged in a rebellion agannt the government; but was at lat obliged to fubmit, and even attonded the emperor Bahader shah in perfon. At lalt he was affalinated by a Petaa foldier, not without a fuftition of the emperor himflf being conctrned. At he did not name a fuccelfor, his followers chofe a chief for then:felves named Banla, who foon began to make depredations on his neighbours ; but being as lall taken prifoner, and fent to Duhi wih his fannily and many of his countrymen, they were all put to an ignominions death. By this execution the Seiks were fo much exafperated, that they fwore eternal vengeance againt the Mohammedans, and have ever fince manifelted a mot implacable hatred againit them. Taking adrantage of the dillraction of the Mogul empire by the invalion of Nadir Shah, they conqueted Sueral pronvinces. Wherever they came they threw down the mofques, and obliged every one to quit the country who refufed to embrace their tenets. Their war with Ahmed Shah has been already mentioned. Since his death they have recovered all the territories they lolt during their conteit with him; and now poffefs the greatcit part of Multan, as well as fevcral diftriats in the province of Delti ; iacluding in their territerics

San the whole of that rish country named the Panjub, on account of tive rixcrs which cefeend from the northern mountains, and inclofe or interfect it, running afterwards iuto the Indus.

The Sciks, as has a'ready been mentionec, worfhip one Crod; but without image, or believing in any mediater. They eat all kinds of meat except beef; fparing the black cattle, in all probability, on account of their utility. Pork is very generally caten, probably on acecunt of its being forbidden by the Mulammedans. They are comrio:ly dreffed in blue, a colour reckoned unlucky by the cther Hindoos. Their drefs contifts of bluc trowiers of cotton, a fort of plaid generally chequered with blue and thrown over the right thoulder, with a blue turban. Their government is lodged is an aftembly of different clieff; but who, as individuals, are independent of one another, and have feparate territoties. They meet annually, or oftener if occafion requites, at a place called Alutuorfer, which is held in a kind of religious veneration: where there is a large tank lined with granite, and fiurrounded with buildings, and beautifully ornamented. Their furce is very confiderable, amounting to no fewer than 200,000 cavalry. Howerer, they can feldom be brought to act in concert, unlefs the whole nation be threatened with fonce imninent danger. They are a ftrong hardy race of men, and capable of bearing much fatigue; and fo expert in war, that of late almof all the neighbouring countries have been laid under contribution ty then, feveral petty cliiffs having confented th pay them a fmall annual tribute in order to avoil their in. curfions. When in the feld, rone but the principal cfficers have tents, and thofe extremely fmall, fo that they may be fruck and tranfported with the greater quick refs and facility. In cold weat ther the foldiers wrap themfelves during the night in a coarfe blanket, which in the time of marelling is fleded and carried on their horfe. Their country is well eutevated, por fulous, and abounding in cattle, particulatly horfes, which are reckoned the baft in all Hindoldan. This may probably be owing to the tuds whech were for. pierly eflablified in different places of the province of Lahore on account of the Mogul Limicif. Stallions were fent thither from Putfia and Arabia, and there was a fixed order to fend to the fluds in L.ahore all fuch Arabian and Perfian horfes as by any aceident Diould be rendered unfit for micuming. Notwithtanding their deifn, the Seiks are faid to have a fuperftitious veneration for thes ferord; infomucl, that before one of them will eat wish a perfon of another religion, he draws his fword, and paffing is over the victuals, repeats fume words of prayer, after which the will frecly partake of them. Contrary to the praćtice of all the other Hindoos, they dnike the fmoking of tobacco ; but many of them fmoke and dhew bang, which fumetirces protures a degree of intoxication.
3. The provinces of Dithi have, in the courfe of a fuw years, frequectly changed their naftere, but have fearce at any period during that time been under the authority of the foveretgn. Their laft governor was vamod Audfiff Kbun, under the title of generalilino of the emperor. He was involvid in the ruin of MoLammed Kculy Khan, coltin to Soujah al 1)owlab ; after which he went to Coffim Aly Kban dabob of

Bengal; afier ulafe expulion he retired with a patey Hind.fare of horfe tu Lundelcund into the fervice of Rajah Coman Sing. He next joined the Englim; and at latl beenne the generai of Shah Allum. With a body of linerlitas feapoys who had been put under his comanand, and fome ohler troups whom tie had taken intu his ferviee, he fubdued the cuuntries near Delli, conquered aimalt all the territuries of the Jants, reducing the cicies of Agra, Dieg, and other principal towns. 'Thefe curnquefts were indeed effected in the name of the Mogul, but he derived little benefit from them; Nadjaf being the real malter, and keeping poffeflion of them till his death, which happened in 178: : and fince that time the countrics we 1peak of have been involved ia a foenc of continual anarehy and bluodihed.
4. Next to the prorinces of D thi are the dominion: of the independent rajahs, whofe dominions lie contrguous to one another. 'The principal are thofe of Joinagar or Japour, Joadpour or Mirwar, Oudiapour or Chiture, amd Jefalmire. Thefe countrics are under a bind of foudal conftitution, and every village is obliged to furnith a certain number of horfemen at the fhortell warnins. "The people are brave, hardy, and very much attached to ther refpective chicfs; and their army is very formidable, amounting when culletted to about $1 ; 0,000$ horfemen.
5. The Jauts were a tribe who followed the oceupation of agriculure in the narthern parts of Hindoftant. About 40 years ago they were formed into a nation by Tackolt Sourazemul, proprictor of an in. confisterable diftrict. Afer making himfelf mailer of all the countrics dependent on Agra, of the cown it IAI, and many other important places, he was killed in bat:le with Nadjib ul Dowlah, the Rohilld chief, in 1763. Since that time the pows of this people has been fo much reduced by dumeflic contentions and foreign wars, that the prefent rajal puffefies only a Atrong town named Bartpor, with a fimall dillice around it. "Ihe Jauts, however, it is faid, are now manifelting a martial difpulition, and thus may polibiy be foon in a condition to recover their furmer extent of territury.
6. The molt confoderable of all the Hindon powers are the Mahrattas, with whon! the Eurupeans firlt became acquainted in their original territories of Malabar. The firlt of their chiefs was named Sceva, or Sceud jee; who is faid to have been defended from the ancicut Hinduo emperurs, and whole father was lond of a fmall dittrict, for whith he paid tribute to the Muliammedan king of Viaiapour. Fur fome reafon, nuknown to us. He was at lalt arrefted by order of that king, and died in confmement; but his fon Seve-jec took up arins in defence of his counsry, and made himfelf matter of feveral important places, with a condiderable tract of territury, which were afterwards ceded to hins by the queen-regent, the king of Viziapour having ditd foon after the commencement of the war.

Secva- jee having thus eftablithed himfelf, foon became furmidable to his neighbours. Many of the Hindoo princes put themfelves under his protection, and he at length ventured to make war upon the emperor Aurengzebe. In this be proved un\{ucceffful, wastaken prifoner, and carried to Delhi. Having found means, however, to make his cfape, he guickly recommenced hoftitities;

## II I N

Hindonz. and the cmperor, who was now far advanced in life, $\xrightarrow{\sim}$ thought proper to come to an accommodation with fo troublefone an enemy. On this oceafion the Mahrat. tas pretend that their prince obtained a grant of to per cent. On all the revenues of the Deecan; which has often ferved as a pretence to invade that country, and levy contributions on the fouthern nabobs. Since that time the Mahrattas have become fo powerful, that all the princes of Hindoltan are alarmed when they pat themfflves in motion. Their territories extend about 3000 miles in length and 700 in breadth; and they ate governed by a number of feparate chiefs, all of whom acknosledre the Ram Rajah as their fovercign, and all except Moodajce Booflah acknowledge the Paifhxa as his vicegerent. The capital of the fovereign was Sattarah; but the Paifhwa generally refides at Poonah, one degree to the fouthward, and about 100 miles diftant from Bombay. The country extends along the coaf nearly from Croa to Cambay. On the fouth it borders on the territories of Tippoo Saib; on the ealt it has thofe of the Nizam and the rajah of Berar; and on the nouth thofe of the Mahratta chiefs Sindia and Holkar.
7. The rajah of Berar, befides that country, has the greateft part of Orixa. His dominions extend about 600 miles in length from eaft to weft, and 250 from north to fouth. The eaftern part of the Orixa extends along the fea-eoalt for about 150 Englifh miles, and divides the Bitifh poffeffions in Bengal from thofe commonly called the Nortbern Circars. On the weft his territories border upon thofe of the Paihwa; on the fouth, upon thofe of the Nizam, Mahomet Hyat a Patan chief, Nizam Shah, and Ajid Sing. The rajal himfelf refides at Nagarpcur, about midway betwixt Calcutta and Bombay.
9. Madajee Sindia has the greatell part of the government of Maka, together with the province of Cardeifh. The remainder is under the government of Holkar; who, as well as Sindia, pretends to be defcended from the aneient kings of Malva. The principal refidence of Sindia is at Ugein near the city of Mundu, which was once the eapital of thefe kings. Holkar refides at Indoor, a town little more than 30 miles to the waftward of the former. The dominions of thefe, and fome other princes of fmaller note, extend as far as the river Jumma.

The two laft mentioned princes, though properly Mahrattas, own no allegiance to the Ram Rajah or great chief to whom the main body are nominally fubject. Some time ago the Mahrattas aimed at the conquef of all Hindoltan, and even avowed a defign of expelling all the Mohammedan princes; but their power was effectually checked by the Britim, and their diffenfons among themfelves put an end to all fchemes of that kind. Still, however, they were ready to watch every opportunity of invading the territories of their neighbours; and their refources being foconfiderable, they wore defervedly accounted a very formidable enemy. The ftrength of their army confifts chiefly in cavalry; and both men and hot fe are capable of enduring a great deal of fatigue. Dodies of 50 or 60,000 cavalry have been known to travel 50 miles a day for many days together; which, conbidering the exceffive heat of the country, mult certainly appear very furprifing. The country ibounds very much in horfes, and there is one
kind named the Bheemerteddy liorfe, which is greatly Hindort efteemed, and fold at a very high price. The common horle of thefe parts is lean and looks ill, but is abundantly fit for the purpofes of war. 'The only weapon ufed by the horfemen is a labre; in the ufe of which they are fodexterous, that it is fuppofed the beft European huifar would not be more than a match for a Maliratta horfeman. There are confiderable fuda in every province belonging to the Paifhwa and different chiefs; and there are likewife many jundis or great herds of horfes belonging to particular perfons, who turn thofe they liave no occafion for loofe in the open plains.

The Mahratta horfemen are drefled in a quilted jacket of cotton, which is fuppofed to be one of the beft defences againit a fword that can eafly be contrived of equal lightnefs; but the heat of the climate frequently renders it neeeffary to be taken off. The reft of their drefs conflls of a pair of trowfers, and a kind of broad turban which defcends low enough to cover the neck and thoulders. In cafes of emergency the horfemen carry provifion both for themfelves and their horfes in a fmall bag tied upon the faddles: the food of the rider contitts only of a few fmall cakes with a little four or rice, and fome falt and fpices; the horle is fed with a kind of peas named gram, or with balls made of the flour of thefe peas mixed with butter, prepared after a certain manner, and named ghee, together with fome garlie and hot fpices. Thefe balls are given by way of cordial, and have the property of invigorating the animal after extraordinary fatigue. Sometimes it is faid that they add a fmall quantity of bang; a kind of drur which poffeffes an exhilarating virtue, and produces fome degree of intoxication. The Maliratta cavalry feldom make any ufe of tents: even the officers frequently have no other accommodation than a fmall carpet to lit and lie on ; and a lingle camel is able to cary the whole bargage of the general. The officers, however, are generally well mounted, and have fparc horfes in the field.

All the fubjects and vaflals of the Mihratta prinees are generally ready to follow them into the field; and in any cafe in which the honour or intereft of the nation appears to be conecrned, they generally unite in the common caufe. Before they invade any country, the general is at great pains to inform himfelf of the nature and fituation of it ; and they have now made incurfions into fo many different parts of Hindoftan, that there are but few eountries there with which they are not very well aequainted. Their great fobriety, and the fatigue they are capable of undergoing, render them very dangerous enemies. In all their exp:ditions the foldier firlt provides for his horfe, and then gocs to his own meal; after which he lies down contented by the fide of the animal, and is ready to mount lim at the firft found of the nagar or great drum. They have their horfes under the molt ex. cellent management; and by perpetually carefling and converfing with them, the animals acquire a degree of docility and fagaci:y unknown in otber countries. When on an expedition, the horfes are aecuftomed to eat grafs pulled up by the roots, which is faid to be very nutritive, and to be deflitute of that purgative quality which belongs to the blade alone. When they make an invafion, the devaftation is terrible; the cattle

## H I N

an. are driven off, the harveft deftroyed, the villages burned, and every human creature deftroyed who comes in their way. Notwithfanding this barbarity in time of war, however, they are very humane in time of peace, living in great harmony among themfelves, and being always ready to entertain and affit ilrangers. Many of the cruelties they commit may be juflly reekoned the effects of retaliation for other crueltics exercifed upon them by their adverfaries. Thus in 1771 , after having given Hyder Ally a great defeat, they cut off the ears and nofes of a whole regiment of prifoners, and in that condition fent them back to their commander in return for his having done the fame to a few prifoners he had taken fome time before.

The revenue of the Paifhwa is very confiderable; being not lefs than ten millions fterling; but after deducting the expence of collection, and the expence of troops kept in readinefs for the fervice of the ftate, it is fuppofed that he cannot receive more than four millions. From this again we muft deduct the expences of the troops immediately belonging to the Paithwa himfelf, and which may amount to about three millions ferling; fo that there remains a furplus only of one million after paying all the necelfary expences of government. 'This neverthelefs has been managed with fuch economy, that though long and expenfive wars were carried on after the death of Narrain Row, the flate was not only clear of debt, but there was a furplus of two millions in the treafury, which Rogobah diffipated.
9. The Deccan, as left in 1748 hy Nizam al Mulek, was by far the moft important and extenfive foubadary or viceroy thip in the empire. It then furpaffed in fize the largett kingdom in Europe ; but fince that time many provinets have been conquered by the Maluattas, and the northern Circars by the Britih. The pofferfions of the Nizam are alfo diminifhed by the ceffion of the Carnatic to the nabob of Arcot; great part of the territories of Tippoo Saib; and many other provinces of lefs note. Still, however, the Nizam poffeffes very confiderable territories; but his finances are in fuch a wretched condition, and his provinces fo ill governed, that he is accounted a prinee of no confequence, though otherwife he might be reckoned one of the moft confiderable powers of Hindoftan.
10. The dominions of 'Tippoo Saib, the fon and fucceflor of Hyder Ally, are bounded on the north by the territories of the Paifhwa; on the fouth by Travancore, the territory of an independens Hindoo prince; on the welt by the fea; and on the eall by a great ridgre of mountains, which feparate them from the territories of the nabob of Arcot. The country lying to the caftward of thefe mountains is called the Carnatic Payin Gbat, and to the weftward the Carnatic Bballa Ghat. The latter belongs to Tippoo Saib; and the two together make up the country formerly named the Carnasic, though the name is now rellrieted to the Payen Ghat. The fituation of the Bhalla Ghat is confiderably more elevated than the other; by which means the temperature of the air is much conler. On the coalt of Coromandel there is a pile of ruins called by the natives Malavipatam, and by the Britith the feven fagodas. Concerning this there is a tradition, that it once flood at a conficerable diftance from the fea; though molt of the ruins are now covercd with water:
and there is likewife a tradition, that the mountains Hindonan. we fpeak of once formed the boundary of the ocean. The revenue and frength of Hyder $\mathrm{Al}_{\mathrm{y}}$ are faid to have been greatly exaggerated; the former amounting to no more than four millions annually, though by his economy and good management he made it anfwer every purpofe both in time of war and peace. He was at great pains to introduce the European difcipline among his troops; but notwithfanding all his endeavours, he was far frombeing able to make them cope with the Britih. The advantages he gained were owing to his valt fuperiority in cavalry, and the celerity of his marches; which would have been countera ted had his adverfaries been poffefled of a gaod body of cavalry; and it is probable that the event of the war would have been decided in a fingle campaign. His fon Tippon Saih is faid to be a man of lefs abilities. than his father, though more violen: in his difpofition. Againf chis prince hoflilities have lately been commenced by the Britith in conjunction with the Mahrattas, between whom an alliance had been formed. But this event has not as yet been attended with any confequences that merit a detail.

With regard to the prefent government of Hin-Govern dollan, our limits will not allow us to enter particu-nese tof larly upon it, nor indeed is it perhaps of any impor. Hindonam. tance, as the country is divided into fo many difierent kingdoms; the fovereigns of which, however they may differ in other refpeets, feem all to agree in defpotifin and oppreffion of their fuijeects. As a very confiderable part is now under the dominion of ibritain, it may be neceflary to take fome notice of the behaviour of our countrymen in that part of the world, efpecially as an idea of their exceffive defpotifm and oppreffion of the natives has of late prevailed fo much, that the national character has fufficed confiderahly by it. This has arifen partly from the great pains taken to propagate it, and partly from the ignorance of thofe among whom the report was circulated; and the exaggerated accounts and contentions of the menbers of the government themfelves, have contributed no lefs to confirm and heighten the prejudices of the publie.

The Britifh territorics in the Eaft Indies were ori-Defence of ginally under the juridiction of a governor and 13 the Bricina members; but this number has fluetuated oceafionally wusenfrom 14 to 4, at which it was fixed by act of parlia- nent in des ment. In this council all matters, whether relating to peace or war, government or commerce, were debated, the governor having no other fuperiority than that of giving the cafting vote. In other refpects the whole executive power was lodged in his hands, and all the correfpondence with the native princes of India was carried on hy his means, the difpatches to them being figned by him fingly ; and all the princes and great men who vilited the prefidency were firtt received by hims, and then intioduced to the counfellors. He was military governor of Fort William, and commander in chief of the prefidency; whence, as by his office he was invefted with a confiderable degiee of power, he becanie an ohject of fome anyy and jealonfy to the members of the council and other confiderable people in that part of the world. In conlequence of this, the government was divided into two parties, one fiding with the governor, and the other oppofing him; in confequence of which, the debates were frequently car-

## $\mathrm{H} \quad \mathrm{N}$

Maduan ane 1 on whb fuch heat and violenee, that the records of the company are frequently fluffed with nothing but aceonts of the contentions of thefe jarrint patics. This indeed may be looked upon as one of the pris. apol caufes by which the reputation of the Britill g ). coment in the coston parts of the world has fuflerded; fur as there wert very frequently opinions diancerically eppofite to one anoth $e r$ recorded upon the fame funget, the contending partics in the Britim parliameint had aimays fufficient authonity for what the $y$ frid, let them take which fide they would; and thus the charaters of all concerned in the Latt India govermanent were, by one perfon or other, fet forth in the noull oppobrious light.

A nother fource of reproach to the Britifl goverament in India was, that the conit of directors in Eng. l.and becane infucted with the fame finit of party and contention which pervaded all other departments of the Rate. Lord Clive and Mir Sullivan were the two great leaders in thefe party-difputes; and as the interelt of the one or the other prevailed, different perfons were appointed to the adminiltration, and different meafurcs adopted. The event of all this was, that whenever a new adminiltration was formed, the firt ohject was to condemin the meafures of thofe who had gone before them. Thus, in the year $1_{7} C_{4}$, when L.ord Clive was made governor of Bengal, the new direftors reprefented the affairs of the company as in the worlf fituation imaginable, from which they could onIy be extricated by the abilities of Clive. On the arrival of the latter in the eat, he took care to write home reports to the fame purpofe, and to condemin in the molt violent manner cery thing that had been Cone; the whole body of the company's fervants were cenfured indifcriminately without being allowed any means of defence, as they were in truth ignorant of the charges brought againt them. When the alfairs of the company were brought under a paliamentary roview in the year 1774, the government was brought under a new regulation. It now confitted of a gover-nor-general and four counfellors; three of whom were fent from England; two being military gentlemen of high rank, and the third a genthman employed in the war-office. On their arrival they proceeded in the fame manner that Lord Clive had dune before them: they pronounced in the moll decifive manner, that the company's allairs were in a ruinous thate; and that crery fecies of corruption had been practifed by the former governmeat. This general accufation, unfupported by any kind of evidence, was the contlant theme of the difpatches fent by them to Eugland; and thus has the reputation of the Britih government fuficed cxceedingly through the unwarrantable liberties which its owa fervants have been allowed to take with one another. It muta alio be confidered, that from the remote fitnation of India, and the unavoidable ignerance of its allairs on that account, it was eafy for any porfon, whofe malicious purpofes it might fuit, to prejudice the public againd the fervants of the company to as great a degree as he pleafed. Hence fome pirfons, lotired by difappointment, or envious of the fuppuid anolumats of others, reprefented matters in fuch an what light to their correfpondents in England, that the mat manath and thameful charges were freguentiy brought ageinal inamenat perfons, which they
could wither prevent nor defend thenfelees agaruit. Hind The dreatiu! funt:a which took place in Bengal in the year 1-(o), oficed to thefe malevolent perfons a moll Iruitful tource of calumny; and many individuals were aceurd of having bourht on this dreadful calmity, Which aroic entirely from a nutural canfe, viz. the failure of the rains, and which no human power could have prevented ar removed.

Opinious of this kind have not only been circulated through the illand of Britain in the moft open manree, but have even appeared in fome very refpectable publications. Thus in Mr Smith's Treatife on the Wealsh of Nations, when fpeaking of the opprefion arifing from monopolies, and comparing their cffects in different fates: "The Englifh company (fays he) have not ret had time to eftablifh in Bengal fo perfeetly dettructive a fyltem. The plan of the government, however, has had exagly the fame tendency. It has not been uscommon, I am well aflured, for the chicf, that is, the firll cleck of a factory, to order a peafant to plow up a rich field of poppics, and fow it with rice or tome other grain. The pretence was to prevent a fearcity of provifions; but the real reafon, to give the chief an opportunity of felling at a better price a large quantity of opium he had on hand. Upon other occations the ouder has been reverfed, and a rich field of rice or other grain has been plowed up to make room for a plantation of poppies, when the chief faw. that extraordinary proht was to be made by opium." To this, however, the following anfwer has appeared in a late, publication, intitled $A$ fhort Review of the Britifl government in lndia. "The poppy is a plant which requires a peculiar foil, and particular care in the culture of it. 'The mediun price of the land on which it is cultivated is about if or 12 rupees a beab, or one third of an Englith acre. It is fowed at the beginning of October, when the feafon of the periodical rain expires. 'The plant begins to be fit for incifion, in order to extract its juice, of which opium is made, about the end of December, and contimues fo till Match. It requires a dry foil, and can be brourht to maturity only in the dry feafon, when the periodical rains have ceafed. Paddy or rice lands let on a mediun at three rupees a begah. Rice is fowed about the end of MLy, fut before the periodical rains commence. One crop is raifed about the end of Sepsember; and another, which is the latt, and by far the greatell, about the end of December. It requires a foil faturated with water, and lies foaked in it for a confaderable time. On this account it is fowed jutt before the paiodical rains commence; and nine-tenths of the quantity of wee produced in the company's provinces grow in the kingdom of Bengal, which is fo low and flat, that the grounds are either overflowed by the rivers Gurges and Burrampooter, with their tributary Areams, or foaked with the rain which falls and tlagnates upon them. It is therefore evident, that the foil and the feafon, which alone can fructify the paddy or rice, would rot and deftroy the poppy; and it is ther fore as evident, that it is utterly imporfible, from the nature of the two plants, that the one can be plowed up to fow the other."

With regard to the adninittration of the Brisifh affairs in the Eaft Ludies, it mult allo be remarked, that the company now ast in a very difitrent capacity frome what

Nar. what they origivally did. From a fociety of merchauts, they are now bccome fovereigns of the country to which they track. The latior character wios quite forcign to them; and thy bave accordingly locked upon that of merchants to be the principai one, while that of foveregns was to be orly a kind of ap. pendage to it. Thus, inftead of cting for the interent of the country they govern, and which as fovereigts they naturally oughe to $d$, they heve atted in many cafes directly oppulite to it, which, as merchants, is alfo their natural interell. Hence all, when the adminiftration in Irdia didany thing in ubediance to the orders of the directors, which orders being dictated by menchants, were pregadicial to the incerdits of the county, that injury has been fometimes urjuftly attributed to their lervants, who ased mexely in obedience to the orders they received. On the other band, when the India admitititration acted with the generous fpirit of fowereigne, they were fometimes blamed by the dinectors, who judged as merchants, and fometimes by the minittry, who ware alwass ready upon the fimallefl pretence to interfere in their affais.

At the time when the Britilh adminiftration firft cominenced in Hindellan, the Iindoo governors were univerfally named Rajabs; but though many of the Hindoo families yet bear that title, it does not appear to refemble, in any manner of way, our titles of nobility, or to be a dignity which ean be conferred by any of the prinees, or even by the Mogul himfelf. Heace, in that part of the world there are no ancient nobility, the titles being conferred mercly by ufurpers, who have neither ight nor title derived from any thing but vivenere.

In this country we find the tithe of Zeminalar very 'common; a word compounded of two others, lignifying, in the Perfic language, a landboller. It ap. pears to have been introduced by the Mohamonedans, and to have been a kind of temporary office, picferibing the performauce of certain Jutics, and requaring fecurity for the perfonal appearance of the Zemindar. He is obliged to attend the excliequer of the king's chief collector, at the commencenient of evcry new year, to fettle his revenucs; and he is not allowed to enter upon the duties of his office for the year without a fpecial order for that puipofe. On the death of a Zemindar, the candidate for fucceflion mult pettion the fovereign, engaging himfelf to perform all the ftipulated datics, and to pay the cultomary fees; nor can be enter upon his office without a ficcial inveftiture. As the Zemindars were by virtue of their office invefted with confiderable power, they foon hecame not only very defpotic in their own dominions, but by degrees began to encroach on the power of the fovereign himflf. After the irruption of Nadar Slah every thing was thrown into confution; the viceroys threw off ubedience to the emperor, the nabobs threw off all obedience to them, and ufurped their power ; at which time it is probable that the Zcmindars likewife aflumed powers to which they were by no means intitled from their office. Notwithfanding thic, howsever, they were fometimes treated by the Mohammedor governors as mere revenue-officers, and ufd very larih. 1y. At fome times there were a fet of poople bimud for the Zemindars under the title of $W$ codedars; and thefe lad either a joint power with the former, or
were fuperior to them in the collection of the reve. Imatan. nues: and fometimes they were fuperfatad $1 y$ olfiees appointed immediately by government itfelf, under the vaitious names of Alunils, Tsthillers, or $\delta$ 'zaveran's. - The Zemindaries are not limited in cxtent or value; there being fome in Bengal whish yichl a revenue as high as $350,000 \mathrm{l}$. Aterl ag, while others fearcely amount to 350 l . ; but all the great $Z$ emindars, and many of thofe in modeling circumitances, laving procured for themflves the tite of Rajab, wffect much pomp and flate in their difietent diftricts, and kecp their inferiors in as grat fubjection as the Muhammedan governors krep them. Some of them alfo have their puower augmented by being of the bramin call; and by the reverence fuppofed to be due to religion on that account, joined with the power conferred upon then by the fovercign, they are in gencral rendered exceedingly defpotic, with an almot unlinaited authority to plunder their tenauts; in which they were indulged by the Nabobs from the motive of plundering them again. From the confultations of the felect committice is 1 -69, we are informed that the Zcmiadars have a power of levying tines at pleafure; that they raile large fums from duties collected in the market ; and that they ficquently ublige the ryots or tufbandmen to work for nothing. In thort, the fame clains made by the European barons on their vafluls in the times of the fendal fytten, are now made by the Zemindars on the cominon people of Hindoftan. If one of them is to be married, if the has a child born, if honours are to be conferred upon him; nay, if he is even to be lined for his own mifconduck, the poor ryot mull always contribute his fhare. Mr Scrufon, in his history of Hisadofan, fets forth the fituation of the inhabitants in the following words:-"Unhappily for the Gentoos, eliemfelves are male the minithers of oppreffion over each other ; this Moor men, haughty, lazy, and voluptuous, make them, uf whom they have no jealoufy, the minillers of their oppreflion, which further anfwers the end of dividing them, and prevents their uniting to fing off the $y$ ke; and by the Arange intoxication of power, they are found ftill more rapisciuns and crucl than their furcign mafters: and what is more extrdordiuary, the bramins till execed the rell in wery abufe of power, and feem to think, if they bribe God by bellowing a part of their pluader on cows and faquirs, their iniquities will be pardoned."

From this account of the fituation of the people of Hindoulan under their native rulers, it is by no means probable that they could make a worle exchange by falling tander the juriffiction either of the Mohammedans or Europeans. A notion indeed bath been indultrio ount propagated, that the Britilh governenent has behavod with the greatell cruelty in collecting the revenues, and that they hase even invented tortures to make the rich people difeover their treafures; but on examining the matter impartially, the reverfe of this is found to be true. As the time that the Britifh government interfered in the affirs of Ifindollan, the provinces were found to be in a puinous Alate, in confequence of the wars which had taken place in the country. Even in the moll fexthed hate, and when the adminitration :"月5 moft regular. the government wa; altogether defpotic, ant the mode of condesing its revenues satemely ar-.
$\underbrace{\text { Birdenar. Bitrary ; the punifhments inflicted very cruel; and the }}$ $\xrightarrow{-}$ whole fyfem of government fuch as would be reckoncd quitc fhocking in Europe. It is only within thefe few ycars that the Britifh could effectually interpofe in behalf of the natives; and in that fhort time it has produced a very confiderable reformation. It is certain, that the Britifh government has difcouraged oppreflive meafures as much as poffible; abolithed the cruel modes of punithment ufed by the Mohammedans; and by inflituting a more regular plan of juftice, has procured eafe and fecurity to the natives, and preferved them in a thate of tranquillity altogether unknown to them before its commencement. Many inllances of the greatelt cruelty exercifed upon the Zemindars and other collectors are to be met with in the hiftory of Bengal, written by a native hiltorian, and tranflated by Gladwin: yet the perfon who exercifed thefe cruelties was dignilied with the titles of the faithful fervant of the Empire, and the Glory of the State; which fhows that the people were abfolutely familiarifed with cruelty, and did not know what it was to be under a lemient government. Siace the Britifh had the dominion, matters have been totally reverfed, and the Hindoos, inftead of being treated with cruelyy, perfecuted on account of their religion, and compelled to renounce it, have been ufed with at leall comparative lenity, and great indulgence has been fhown to them even in their nont abfurd practices and fupelitions. When the Britifh grovernment firlt accepted of the office of Dewanny, or collcation of the revenues, it was not in their power to interpole with any kind of efficacy for the relief of the inhabitants; becaufe it was at firft thought proper to allow the taxes to be collected by natives, who would undoubtedly follow their ancient modes of collection. Even at that time, however, the mildnefs of the Britih governors had fome effect upon the Afiatics; fo that the people in general were treated with more lenity than formelly: and in the year 1772, when the council of Bengal openly aftumed the office of Dewan themfelves, an immediate flop was put to all thofe arbitrary and oppreflive methods which had been formerly in ufe. Formerly fome Zemindars had been flogged even to death, by an inftrument called a Soral: but from the moment that the Britilh council took the collection into their own hands, not only this inftrument was laid afide, but all kind of corporal punifment ; by which means the feverity of the Mohammedan government has been entirely abolifhed, and no other punimments inflicted in cafes of infolvency than fuch as are in ufe in our own country. Still, however, in fuch extenfive dominions, where a gieat thare of power mult be one way or other committed to the natives, it is impoflible but fome arbitrary acts nuf be committed, as the natives are always prone to acts of defpotifm whenever they can conmit them with impunity; but examples of this kind cannot with any degree of candour be brought as a general charge againt the Britifh government in India.-Mr Scrofton gives the following account of the wretched fate of the provinces now under the Britin jarifdiction at the time they ware ceded to them by the Mogul. "When the governors of the provinces found the weaknefs of the Mogul, and each fot up as fovercign in his own province, aluhough they could not break through thefe immutable laws, they invented new taxes under new $\mathrm{N}^{\mathrm{C}} 15 \mathrm{t}^{\circ}$
names, which doubled or trebled the value of the ori- His ginal ones, and which the landholder was obliged to levy upon his tenants. The old flock of wealih for fome time fupported this; but when that failed, and the temants were thill preffed for more, they borrowed money of ufurers at an exorbitant inteselt; and the govermment Alill continuing thefe demands, the lords of the lands were obliged to do the fane: but as all this white the value of hads did not inereafe, the confequence was, that at laft, unable to pay the intereft of the mortgages, the rents were feized by rapacious ufurers. The government finding the revenues fall fhorter every year, at latt fent colle tors and farmers of the revenues into the provinces. Thas the lord of the land was divefted of power over his country, and the tenants expofed to mercilefs plunderers; till the farmer and manufacturer, finding that the more they laboured the more they paid, the manufacturer would work no more, and the larmer would cultivate no more than was juft fufficient for the fubfiftence of his family. Thus this once flourifing and plentiful country has, in the courfe of a few years, been reduced to fuch mifery, that many thoufands are continually perifhing through want. The crown lands are fill worfe off, let out to the highett bidder; and the Jagheer lands alone remain unplandered. Hence that equal diftribution of wealth that makes the happinefs of a people, and fpreads a face of cheerfuluefs and plenty through all ranks, has now ceafed; and the riches of the country are fetted partly in the hands of a few ufurers and greedy courtiers, and the reft is carried out of the country by the foreign troops taken into pay to maintain the governors in their ufurpations. This unhappy decay the India company has already experienced in the decay of their trade, and the rife and price of their manufactures; and will, I fear, experience more and more annually."

With regard to the depofitions of the Nabobs by the Britih, which has been ufed as a great argument againt the general fpirit of Britih government in thofe parts, it mult be remembered, in the firlt place, that thefe Nabobs were mere ufurpers, who had not the leaft title to their dominions, and confequentiy could not, in point of riglt, complain more reafonably of teing deprived of their dominions, than the perfons from whom they had taken them might do of their injullice in driving them out. Their behaviour in government alfo was fuch, that it was impofible it could have fubitited for any length of time without the abfolate ruin of the countries they pofeffed. Thus, in the cafe of Jafier Aly Cawn, Mr Vanfituart declared the country to be in fo confufed and impoverifhed a llate, that in all truman appearance another month could not have been run through before he would have been cut off by his own Seapoys for want of pay, and the city become a fcene of plander and diforder. On this account he was degraded, though without any of thofc circumflances of cruelty which generally characterife the revolutions in this part of the world. The adminiftration was transferred to his fon-in-law Meer Colfin; who being an enemy to the Britilh government altogether, a war followed, terminating in his expulfion. This was followed by the invafion of Sujah Dowlah, and by feenes of horrid barbarity and devaftation; when in 1765 Lord Clive took
shan. took upon him the office of Dewan, or minifter who fuperintends the lands and collections of the revenue. An account of his proceedings has already been given; but whatever applaufe he might gain, and in fome refpects defervedly at the time, it is now faid, with fome probability, that he raifed the expectations of the people of England by far too high. The feeds of the fucceeding evils were alrcady fown. Many fources of wealth were dried up. Raw filk, cloths, and other manufactures, had formerly been exported to Guzerat, Lahore, and even Ifpahan. This had ceafed on the invafion of Nadar Shah; and the influx of wealth from the Eurnpean nations had ceafed beforc the Britih government in Bengal had an exiltence. It was computed that Coffim Aly Cawn robbed the country of near five millions tlerling in jewels and fpecie. Chisa, Madras, and Bombay, were fopplied from Bengal to the amount of more than two millions; and feveral other circumflances befides thefe contributed to diminifh the riches and opulence of the country. In the mean time the interral adminittration of the country had been extremely defective. The Zemindars being under very litte reftraint, acted in a very arbitrary manner within their own diftricts; and the tenants had no redrefs againft the impofitions and exactions which werelaid upon them. Meir Coffim appointed Aumils to the collection of the revenues rather than Zemindars. The Aumils derive their autbority directly from the perfon who las the command of the country for the prefent time, and confequently are more eafily called to an account than the Zemindars. At lafl, however, thefe Aumils, having obtained too great an influence in the country, Lord Clive thought proper to change the plan of collection. Tbree natives were now appointed, in the nabob's name, to fuperintend this department ; and one Englifh gentleman, thoough whom the bufinefs was tranfacted, had his refidence at the nabob's court, and communicated the intelligence to Calcutta. The principal acting minifter in this plan, however, thought proper to change the mode of collection once more, and to re appoint the Aumils; in confequence of which the revenue became greatly diminifhed, aud they were befides complained of as greatly oppreffing the people. 'To remedy thefe evils, it was firft propofed hy Mr Verelt to fend fome of the company's fervants into the internal parts of the country with the title of fupervifers: but the defects of adminilltation were now beyond their power to remedy; the reverue was not only gteatly diminihed, but the expence of government exceedingly augmented; and in the year 1771 the company were alamed by accounts that bills had been drawn upon them to the amount of $1,200,000$. At this time Mr Haftings was appointed to be governor of Bengal; and the confufed late in which matters were at the commeneement of hisadminiltration will eafily appear from the following part of a letter from the governnent of Bengal, dared in the month of November t772.-" Every zeminda ry was left to its own particular cuftoms. The articles which compofed the revenue, the form of kecping the accounts, the computation of time, even the teclanical terms, which ever form the greatelt obfcurity in every feience, differed as much as the foil and productions of the province. The nabobs exacted what they could from the zcmindars and great farmers of the re-

Vol. VIII. Part II.

## H 1 N

venue, whom they left at liberty to plunder all below, Hisdonan. referving to themfelves the liberty of plundering them in their turn, when they were fuppofed to have enriched themfelves with the fpoils of the country. The mutfaddies, who flood between the nabob and zemin. dars, and between them and the people, had each their thares of the public wealth. Thefe profits were confidered as illegal embezzlements, and therefore were taken with every precaution which could enfure fecrecy; and being, confequentiy, fixed by no rule, depended on the temper, abilities, or power, of each individual for the amount. It therefore became a duty to every man to take the moll effectual meafures to conceal the value of his property, and evade every inquiry into his conduct; while the Zemindars and other landholders, who had the advantage of long poffeffion, availed themfelees of it by complex divifions of the lands, and intricate modes of collection, to per. plex the officers of government, and confine the knowledge of the rents in themfelves. The internal maragement of each ciftrift varied no lefs than that of the whole province. The lands fubject to the fame collection, and intermixed with each other, were fome held by farm, fome fuperintended by fhickdors or agents on the past of the collector, and were left to the Zemindars themelves, under various degrees of control." For fome political seafous the company, though they had acquired the Dewanny, had not yet chofen to affume the exceutive part of the office them. felves, but committed it to the management of natives, a's has already been mentioned, and their plans had been found extremely defective. By the time that Mr Haftings had been invelted with the government, the court of directors had refolved to change their plan, and openly aflume the office of the Dewanny; and the rules eftablifhed by that genteman for the collection of the revenues, his mode of adminiftering juftice, and his police for the government of the country, are still obferved with very little variation.

The plan for collecting the revenues confifted, in the firft place, in rendering the aceounts as limple and intelligible as poffible ; in the next, in eflablithing fixed rules for the collection; and in the third, making the mode of them uniform in all parts of the provinces; and in the fourth, providing for the equal acd. minittration of jullice. The power of the Zemindas: was now circumferibed, and their extortions thuroughly put altop to; many vexations taxes and tolls were abolified, and a new mode of cellecting the cuntoms was eltablihed, to the great relief of the merchants: and fo well were all the paits of this plan found to be adapted to the purpofes they were deligned to anfwer, that it has hitherto been made the modet of all fubie. quent tegulations.

One great objection to the India government is, that the Englidh law, which undoubtedy is buter caleulated than any other for fecuring the liherties of the people, has not yet been adopted in India; whence it is thought that the company's fervants have fill fhowed a difpofition to opprefs, rather than to relieve, the opprefled inbabitant 6 of Hincollan. But in anfwer to this it is faid, that the difierence betwixt the two countries is fo great, that there can be no comparion betwixt the oue and the other, ror can the conatitution of England be in any degree adapied to that of the 3 - other.

## H I N

Hirelofan rther. The religion, laws, manners, and cuftoms, of buth, Ihindoos and Moliammetians, are fo effentially dif. ferent from thofe of this country, that it is impoffible to ahimilate them, fhould ever any thing of the kind tre attempted. The only true methot therefore of jusging whether the prefent flate of IIndoltan is preferable to what it fenmerly was, is to compare it with what it was moter the bett Mogul emperors: and in this comparifon it mult cersainly appear that the preference is waty in favour of the lobith adminithation. In Maj $r$ Remmel's work we are informad, that dusing the sefin of tokbar, whom he ty les "the afory of the houle of limur," the country hat never en joyed fo math tranquillity; " hut this trampillity. would hardly be beemed fich in any other quarter of the world, and mult therefore be underitood to mean a thate thort of aciun rebellion, or at leat commotio:a." 'The fane author, fpeaking of the tate of tha Brition enpire there, wes the folloning words: "the ben. gal provinces, which have been in nur actual polieflion near 2 years, have, during that whole perioch, enjoyed a greater thare of tranquility than any uther part of India, or indecd than thute provinces badere expe. rienced lince the day; of durengzebe." "To this we may add, that the provinces have not only experienced a perfect freedon from esternal mations. but likewife choge a degree of intermal tranguillity altogether un known before, by the forfection and civilization of a fet of banditti who inhabited the hills of Rajemahl, and jufetted the travellers who paffed that way a wandering tribe of rilifions m-n licants, who were wont to commit the great an arm ties.

Another advantage the mhabitants of this country reap from the $B$ itith gowermen, is the fecurity from violence and oppreffion either by their Mohammedan fuperiors or by one amothor. Under the article Hin. noo we have already mentioned the particular circumflance that thele people ate hable o the punifiment of lofing their call from a vartety of caufes, and that this is looked upun by them to be the mot grievous calarity they can fulfer. The Nohammedan governors frecuently took advantage of their fuperfition in this refpert to oppets them; and this circuntance alone freguently produced the motl horrid confution. In tlee inllactions given to the fupervifors, Mr Verelit informs them, that " it is difleult to determine whether the original coftoms, we the degenerate manners of the Mufialmen, have moll contributed to confound the principles of right and whong in thefe provinces. Certain it is (addo he), that almot every decifon of thens is a corrupt bargain with the highell bidder. Comperfation was fequently accepted of even for capilial r:imes, and tines became at latt an intelerable gresance; nay. fo wenal were the judges at that time, that it became at late a fected rule to allow each of them a fourth part of any property in difpute as a compenfation for his trouble.- It is impomble to fuppofe that fuch montrons abufes continue under the Brith gowernment : on the contrary, we moit readily beave, what the governors themflles affert, that immedrately ater the provinecs fell under Britith jurifdiction, butu Lindoos and Mohammedans have been deft to the free exercife of their religion, laws, and cuftoms. The hindons themfelves acknowledge this, and are as weli pleafed will the mildiefs of the Brition
governmert, as they are difpleafed with tlie fupertition Hind and cruelty of the Mohammedans. Under the Britifh government we eannot fuppofe but that commerce, to which the inhabitants of this country are fo much addicked, will be much more encourayed than by the avaricious and barbarous Mohammedans. The later had impoled to many reilraints upon uake of all kinds, by the multitude of taxes collected at the landing. plases, wateh honles, markets \&ic. that it was almot imposfible to carry is on with any advantare. Among other Shlutary iegulitions, however, enacted by the Britilh ghvernment in 1772, many of thefe taxes upen comnerce were abolithed, and a phan laid fur effectually li. berating the inhabitants from thofe thackles lay which their commeree nad been fo long fettered. - Negard las aldo been paid tos the influction of the people in neful knowledge; and the feminary eftablimed at Calcutta by Sir William Jones, certainly does much honour to the founder Some regard had indecd been paid whis by the Mohammedan emperors; but at the time that the Britith gowernment commenced, thefe had been entirely neglected, their endosments refumed by government, and seen the buildiags fallen into ruin.

From a comparifon of any government to which the Hindoos have hitherto been finject, with that of britain, indeed, it is evident that the preference mult be given greatly in favour of the latter. At the time when the Britich rit vilited that eountry, they were not under the juridiction of their native fovereigns, nor had they veen fofor a long time before. The Vloguls were not only foreigners, but a moll cruel and deteltable race of men; and it was by ufurpations or their' own rebellious fubjects thit the anarehy and confution was introduced, in which the conatry was involved for fo long a time. The Britith are foreigners as well as the Moguls; but the latter, who profefs the intolerant fuperthition of Mohammed, fuffer their conduct to be influenced by it in fuch a manner as to treat thenatives with the umolt cruelty. The greatelt evil perlaps which refults from the Britifh government is, the exportation of great fums of money to a forcign country; but this cvil, with retpect to the provinces poffef. .d by the Bitith, exilled alfo under the Molammedan government. The Magul emperors retided at Delhi, which, is far diftant from the provinces of Bengal, Bahur, and Oriffa, the cerritories now poffelled by Britain; fo that the greatell part of the treafure fent to that capital was totally lot to them. In the time of Aurengzetbe, the emperor's tribute amounted to three millions flerling; and of this a confiderable part was fpecie; but lince that time the tribute was fixed at unly 1,$2 ; 0,0001$. and even this was a vatt fum; to which if we add that carried ont of the country by commanders of mercenary troops who were all foreigners, it is not unreafonable to fuppofe that under the Mogul government matters were till work, even in this relped, than under that of Britain.

We thall conclude this apology for the Britim government, with the following extract from the treatife lately quoted, A hort Review of the Britifh Govern. ment in India. "A more deteltable or detelled race of prople never appeared than the Mohammedan conquerors of India: whether we condider the brutality of iheir pafions, the bigotry of their religion, the corrup. tion
doAsn tion of their manners, the barbarity of their eduation. or the tyranny of their government: ln all thefe refpects they were the terror and ahhorrence of the Hindons, whofe counery they invaded, and whofe dominion they ufurped.
"The fanaric ignorance of the favage caliph which diatated his barbarous reafon for dellroying the Alexandrian library, had neither been tutored nor refined hy the Tartar education of Timur and his predeceffors. The fame fupertlitious bigotry which incited the Arabian caliphs to deltroy the monuments of weftern learning; likewife impelled the Tartar khans to overthrow the religinus temples of the cattern worthip. At the commencement of the 1 thi century Mahmood entered Hindoftan, and in the courfe of 12 expeditions he deftroyed the famous temples of Nagracut, Tannafar, Matra, and Sumnaut. In the latter end of the next century, Mahmood Gori penetrated as far as the city of Benares, and committed outrage as Mahmood liad done before at Nagracut and Sumnaut Tamerlane poffeffed as much of this furious zeal as any of his fasage predeceffors: and if the enthufiafn of this deflentive religion had not eccafinnally abated arnong fome of his fueceffors, they would fearee have left a Hindoo temple or prietl in the country they fubdued.
"Enough, however, had been done to fix an indelible tlain on the memory of thofe intolerant tyrante, and to make a lafting impreffion on the minds of the Hindous, who. to the lateit period of the Mogul gom vernment, were kept in conftant derad of doetrines, which, to their appretienlions, feemed to infpire the Mohammedans with facrilegions crnelty. Idolatry is as great ar abomination twa Mufulman as it was to the Jews when they mof flrictly revered the divine command which prohilits it ; and mnft of the Hindoo ceremonies beiner confidered by the Mohammedans as acts of idolatry, and all their pagodas as temples of idols, a religious princip'e excited mutual fentiments of abhorrence and ancipathy between the conquerors and their fobiects. The reit of the charater of the M.. hammedans may he fummed up in the concife and emphatic words of Mr Sicrafton. Whn fays, ' their dillingrifting quatities are perfidy and fenfuality'
"But notwithtanding thefe fact:, and that the hifo tory of their guvernment is a difgulling reputition of oppreffion, maflacres, and robetlion, the fothion of the times las been en praife it, and to repuefent the ditua. tion of the Hiadons as eafy and happy under it, till they were dilturbed in this peaceful llate of repofe and fecurity hy the Eonglim: who have been deferibed (with unparalleled injullice) as a fet of rapacious tafk. mathers. It furely requires a very fmall degree of reflection to perceive, that fuch reprefentations of the two gorernments mut, from the very sature of things, be falle.
"The Mohammedan conquerors came into Inlia from a barbarous recion, with minds and manmers as uncultivated as the wilds from which they ifluct. 'The only notion the y had of government was abfilute power in the fovereign, and abfolute futbiffion in the fubject. The encts of their religion, fof far from foftening the ferncity of their nature. ferved only to whet the ellee of their perfecntion towards the fuffering Ilindoos, whom they haraffed without merey, and dafroyed with. ent remorfe. The Britifh conquerors cane from a
country famed for arts and fciences; the geneross prins. Houdutith. ciples of public liberty had been inflilled into their minds from their carlied infancy: the mild tenets of Chrittianity cherithed and commanded every charitable du:y; and they had been taught, by precept and ex. ample, to ruke uith cquity, and to obery whith beedom. Can it be fuppofed that, under thefe circum'lanees, the two nations thould have totally chansed characters on their consing into India? Ihat the barbarom and ferocious Tautar thould become mild andemizhtenel ; that the cultivated and generous Briton fanonld have depene. rated into a cruel tyrant ; and that the Britith govet. nors mould have rendered the fituation of theis flindoo fubjects work than it was under the Wogn! emperors? Reafon revolts at the idea; and nothing hut the rauket prejudice could either fuggent or adopt it."

With regard to the greography of this country, Mr Rennel obferves, that though by the modern Europeans, Hindullan has beco underllond to emean the :ract lituated between the rivers Indus and Ganges on the eall and weft, the mountains of 'lhibet and Tartary on the north, and the ocean on the fouth, the catcnt of Hindoltan, properly fo called, is much more cireum. feribed; and the name ought only to lee applied to that part which lies to the northward of $21^{\circ}$ or $22^{\circ}$ laticud: I'he reputed fouthern boundary of Iliudollan is the Nerbudda river as far as it goes, and the northern fronticrs of Bengal and Batar compofe the remainder. The countries to the fouth of this line sre called Decean hy the Indian geographers, and cumprehend about one half of the territory generally known by the name of the Nogul Empire. Our author therefore choofes to dillinguith the northern part by the name of Hindofore Proper; which has indeed the Indus and mountans of 'Thibet and Tariary for its weftern and northern boundaries: but the Burramponter river is rather to be conslidered as the callern boundary than the Canares; the latter interfecting fome of the tichet provinces in the empire. According to this fuppofition, Hindullan Proper will equal in lize the councrics of France, Ger-. many, Bohemia, Hungary, Switzerlaud, Jtaly, and the 1ow Conntrics; the Decean and peninfula being about equal to the Britim iffands, Spain, and l'urky in En: 10 pt .

Towards the north, Hindoian is very cold and har. ren; but towards the fouth, very loo, and fertile in corn, rice, fruits, and other usceables. The northern pruvinces are very mountainous and fandy: while the fonthern are for the molt part level, and well watered with feveral rivers.

The mof remarkable mountains are thore which furrund it on three lides Tliofe on the well, fepasating it from Perfia, callet, in general, Soleynan Ki.j, or the mountains of Saloman, are of a vall heipht as well as breadth, and are only paffable in certain places, through which roads lave been inade for the dake of commerce. The chiet are thofe which lenst 10 Kabul, Gazna, and Kandahar. This great chaiu of mountains is inhabited by diferent warions, the principal of which are the Afyhans, or I'atans, and the Buluches, who have extended themfelses on the fide of India, as well as l'erlia. The monntains on the no:th are called Nagrelut, Hima, or Mis Tig, which has an affinity with Imnzis, and by other names, which are given alfo in common to the monutains on each fude, $3{ }^{\prime} 2$
ifparating

## H I N

Hinconan. fepmating Hindonan from Tibet. The very profpet of thefe metuntains is frightful, being nothing but hi. deons precipices, perpetually covered with how, and nor :o be croffed withour the greatetl danger and dificculty.

The mof remarkable rivers of Hindottan are the Indus and Ganges. The former is called by the orime tals, Send, Sin:l, or Sinde. It rifes in the mountains to the north or northeall of Hindutlan; whence, after a long courfe, firlt to the fouth and then to the louth-with, it falls into the Perfian fa, below Lower Bander, by feveral mouths. In its courfe it reecives feveral other large rivers, as the intat, Jamal, Beht t, and Lakka.

The Gantei, called in the Indies Gonsa, rifes in archingdem of Tilet: entering Hindulta abunt the 3th degree of hatude, it runs lirit fouthe eatward ty Whe cities of Bekaner, Minapor, Halabas, Benâres, and Patna, to Rajih Mahl, where it divides into two branches. The eallern having paifed by Dikka, the captai of Bengal, enters the gulph of that name about Chatigan. The weftern, defeend:ng by Koflum Bazar and Hught, falls into the gulph bclow shandernagur, tosands Pipeli.

Many of the Jews and ancient Cluilians believed Whis river to be the Pifon, one of the four mentioned in feripture as the bomadaries of the terreltrial para. dife. The Iudians retain the greatelt reverence for its waters, going in crowds from the remoteit parts of the country to wath in them, from a perfuation that they deface from all the fpoes of lin . The reafon of this is, becaufe they imagine this river dues not take its fource from the bofon of the earth, but defeends from heaven into the paradife of Devendre, and from thence into Hindoftan. Nothing is more childifh than the fables of the Bramins on this fubject, yet the people fwallow then all. The Mogul and pince of Golconda drink no other water than that of the Ganges: foreigners, on the contrary, pretend that it is very unwholefome, and that it cannot be fafely drank till it is firt boiled. Thete are a great number of fuperb pagodas ou the banks of the Ganges, which are immenifly rich. At certain fellivals, there has been fometines a concourfe of 100,000 people who came to bathe in it. But what principally dittinguifhes this river, befides its greatneif and rapidity, is the gold it bings down in its fands and throws on its banks; and the precious thones and pearls it produces, not only in itfelf, but in the gulph of Bengal, into which it dif. charges its waters, and which alvund therewith. The Chun or Jemma, the Guderafu, the Pertilis, Lakia, and feveral other rivers, difcharge themfelves into it Juring its courle.

The weather and feafons are, for the general, very refrular in this fpacions conntry; the winds blowing contandy for lis months from the fouth, and his from the north, with very little bariation. The montles of April, May, and the beginning of June, sill the rains fall, are fo extremely bot, that the reRexion from the ground is apt to bliller one's face; and but for the breeze or fmall gate of wind which blows every day, there nould be mo living in that Eountry for poople bred in northern climates; for, exeepling in the rainy feafon, the coldelt day is hotter Bereas :ova tha the hotelt day in England. LIow-
ever, vory furpmining changes of heat and cold fome. Hind times happen within a few hours; fo that a filling hot day is licceeded by a night cold emongh to produce a thin ice on the water, and that night by a noon as foorching as the preceding. Sometimes, in the dry fealen, befure the rains, the winds blow with fuch extreme violence, that they carry vall quantitics of dult and fand imto the air, which appear black, like clouds charged with rain; bet fall down in dry howers, fil. ling the eyes, ears, and noltrils of thofe among whom they defcend, and penctrate every chen, cabinet, or cupboard, in the honkes or chits, by the bey-hole or crevices.

From Suat to Agra, ancibeyond, it fellom or never rains, excepting in oue fafon of the year: that is, from the midale of June to the middte of September. Thefe rains generally begin and end with molt furious florms of thunder and lightning. During thefe three months it rains ufually every day, and fometimes for a week together without internifion: by this means the land is enriched, like Egypt by the Nite. Athough the land looks before like the barren fands of the A rabian defarts; yet, in a few days after thofe flowers begin to fanl, the funface appears covored with verdure. When the rainy feaion is uncr, the foy becomes perfeetly ferene again, and fcarce one "cloud appears all the other rime months: howeser, at refrehing dew falls every nught during that dry interval, which cools the air, and cherithes the earth.

The produce of Hindoltan is very rich in every kind, whether it be folfil, veretalle, or animal. Befides other precions ftomes fomad in it, there is a dia-mond-mine at the tuwn of Summetpar in Bengal. Quarrics of Theban thone are foplentiful in the Mogul's empire, that there are both mofques and pagods buik entirely of it. Sume travellers tell us. there are mines of kad, iron, and copper, and even ifser; but thofe of the latt, if there be any, need not be opened, fince the bultion of all natoms is funk in this empire, which will take nothing elfe in exchange for her commodities, and prohbits the exporting it again. They till the ground with oxen and foot-ploughs, fowing in May and the beginaing of Junc, that all may be over before the rains, and reaping in November and December, which with them is the moll temperate months in the year. The land is no where inclofed, excepting a little near towns and villages. The grafs is never mowed to make hay, but cut off the ground, either green or withered, as they have occation to ufe it. Wheat, rice, barley, and other grain, grow here in plenty, and are very good. The country abounds no lefs in fruits, as pomegranates, citrons, dates, grapes, almonds, and cocoa-nuts; plums, thofe efpecially called miraluclans; plantanes, which in thape refemble a flender cucumber, and in tafte excel a. Norwich pear ; mangos, an exce!lent fruit, refembiing an apricot, but larger; ananas or pine-apples; lemons and oranges, but not lo good as in other counsties; variety of pears and apples in the northern parts; and the tamarindtree, the fruit of which is contaised in a pod refembling thore of beans. There are many other kinds of fruit-trees peculiar to the country. Bu: the valuable trees are the cotton and mulbery, on account of the wealdh they bring the natives from the manufactures of callicoes and filks. T'luty plant abundanee of fugar-

 rich and frong as that of Anserica, for want of knowing how to cure and order it.

Hindoftan affords allo plenty of ginger, together with carrots, potatoes, onicns, garlic, and other roots known to :us, befides finall roots aud berbs for fallads; but their flowers, though beautiful to look at, have no feent, excepting roles, and fome few other kinds.

There is a great varicty of animals in this country, both wild and tame; of the former are elephants, this nocerofes, lions, tygers, leopards, wolves, jackals, and the like. The jackais dig up and cat dead bodies, and make a hideous noife in the night. "The rainoceros is not common in the Mognl's empire: but elephants are very unmerous, Come 12,14 , or 15 feet high. There is plenty of venifon, and game of leveral kinds; as red-deer, fallow-deer, elks, antelopes, kids, hares, and fuch like. Nune of thefe are imparked, but all in cor.mon, and may be any body's who will be at the pains to take them. Amony the wild ani. mals alfo may be reckoned the mulk-animal, apes, and monkeys.
Hindotlan affords variety of beafts for carriage, as camels, dromedaiics, mules, affes, horfes, "xen, and buffaloes. Moit of the horfes are white, and many curiounly dappled, pied, and fpotted all over. The flefh of the oxen is wery fwect and tender. Being very tame, many ufe them as they do horfes to ride on. Inftead of a bit, they put one or two frimall trings through the grille of the noftrils, and fallening the ends to a rope, ufe it inftead of a bride, which is held up by a bunch of griilty tyeth which he has on the forepart of his back. Tlicy faddle hum as they do a horfe; and, if fpurred a lietle, he will go as fall. Thefc are generally made ofe of all over the Iodies; and with them only are drawn wafgons. coaches, and chariuts. Some of thefc oxen will travel 15 leagues in a day. They are of two forts; one fix feet high, which are rare; another called decarfs, which are only three. In furne places, where the roads are thony, they thoe their oxen when they are to travel far. The buffalo's nkin makes excellent buff, and the female vields very good milk; but their fechi is neither fo palatable nor wholefome as beef. The fheep of Hindolian have large heary tails, and their flech is very good, but their wool coarfe.
This country is much infetted with reptiles and infects ; fome of a noxiuws kind, as fectrpions, fnakes, and rats; but the lizards, which are of a gricen colour, are not hurtful. Snakes and ferpents, we are told, are Iometimes emplysed to difpatch crininals, efpecially fuch as have been guilty of tome atricious crime, that kind of dath being atecnded with the moth grievors torture. The rrolt troublefune infeets in this hot country are fies, mulietues, and chinches or bugs, the firlit by day, and the others in the wight ; wien they offend nu lefs ty their tench than their bite.

HINE, or Hism; a lublandman's fervant. Thus the perfon who orufees the reft, is called the maitici's hinc.

HINNOM, or the Tralty of Haveos, (acc. geog.), a place that lay to the fouth of Jerufalem. It was alfo called the valley of Tothet, and was temarhable for the cluel and baitarous worlhat of the god Moloch,
where parents made their children pais thentrgh the fire in honum of that idu!.

HIP, in the materia medica, the fruit o? the dog. rofe or wild brier. See Ros.1.-They contain a fourifh fweetigh pulp; woth a rough prickly matter inctofing the feeds, from which the pulp ought to be carefolly leparated before it be taken internally : the Wirtemberg college oblerves, that from a neglect of this caution, the pulp of bups fometimes occations a pruritus and uncatinefs about the anus; and the conforse of it has been known to excete violent vomiting. Ilhe conteree is the only officinal preparation of this fruit. Aud as it is not fuppofed to poffefs any larticular medical virtue, but is merely ufed to give form to other aticles, the Edinburgh college have, perhaps without any naterial difadvantage, entirely omitted it.

HIPPAlRCHUS, a great allronomer, burn at Nice in Bithynia, Homrifued between the 15 th $^{\text {th }}$ and 163 d Olympiads. His commentary upon Aratus's phenomena is fill extant. Rohault was very nuch nuftaken when he afferted, that this aftronomer was not ac. quanted with the particular motion of the fixed flars from weft to calt, by which their longitude changes. By foretelling eclipfes, he tanght mankind not to be frightened at them, and that even the gods were bound by laws. Pliny, who tells this, admires him for making a review of all the fars; by which his defeendants would be enabled to difoover whether they are born and dit, whether they change their place, and whether they inceafe and decreafe.

HIPldA, in botany ; a genus of the polygania necentaria order, betonging to the fyigenetia clato of plants. The receplacle is nahed; there is no papput; the feeds are naked, with very broad margins; the calys is hemifpheric, and fubimbricated ; the riding confils of ten corollula, obleare, and rather chele inte there.
hippobosca, or Horse-fly, in zonlogy; a genus of insects, belonging to the oider of diptera. The beak confits of two valves, is cyharrical, oberafe, pexiat. and hancing: and the feet have feverai claws. 'There are four lpecies, dithinguithed by their wing \& \&e. The moll remarkable is the equina, the peat of horfes and cows. 'I'his infect is broad, Adt, thining, and as it were fcaly. Its head, hrorax, ard abdomen, ate yellow, unclulated with brown; and the kegs are interiec. ted with yellow and brown. I he wings, croffed one over the other, exceed the length of the body by above one half; they are thanfarent, tinged with a litele yellow towards their outwatd edge, and hase a frot near shat edge of a brown colour. Thefe infects are very difficule to be killed on account of the hard crutaceons thell which covers them; and they fix fo clofe and fats to the poor anmals with their claws, that they cannet rub os bite iacm off without wounding theinfeles.

IIIPDOC.IMDUS, in ichtayology. Sue Sys. gsatiaus.

HIPI'OCASTANLTM, or common hwrle.chefnut. See Fisectus.-It may be lere adjed, that from teverat experiments in the 'French Mcmoires d' Alyricultur., it appears that the fruit of the horie-chefunt allords a wholelore nuurihment for cattle, and may even be comployed with fuccefs for fatconing them. It is fa:t to ronder the tallow of thofe tatened with it parsicu:

Hippo-
larly form. The milk gielled by corss fed upon $\mathrm{i}^{\circ}$, is alfo faid to be thicker and richor athan that produccd foom any other kind of food. - The frait of this tree has been likewife ufed as food for theep ard poultry, and as fuap for wamior. It was mach empluy. ed in powder as a lemutatory by an itincrant oculith, and has buen recommended by fome others in ceethin flates of ophthalmia, headach, \&e. in which errhines are indicated. Its effects as a Alermutatory may alfo be obtained by uling is under the fom of intulam or decoetion drasu up into the nollvils. And it is entirely with a riew to its errline power that it is mow introduced into the pharmacoper of the Edinburgh collegre. Bat betides this, the bark has ali, been reprefeuted by lome as a cure for intermittent fevers; and It is probably with this intention thas this part of the hippocallanim is intrenduced as an officinal article in the Plarmscoporia Ruffica.

HIPPOCENTAUR (formed of w+e " horfe," xert " fungo, "I fpur," and towesi "bull," in antiquity, a fablious monter, fuppofed to be half horle and half man.

What gave occafion to the fable was, that a people of Theffaly, inhabiting near mount Pelion, became thus denominated, becaufe they were the firlt that taught the art of mounting on horfeback; which occafioned fome of their neighbours to imagine, that the horfe and man made but one animal.

The hippocentaurs fhould feem to have difiered from the centaurs, in this, that the latter only rode on bullocks, and the former on horfes, as the names themfelves intimate.

HIPPOCRAS, a medicinal drink, compofed of wine, with fpices and other ingredients infufed therein; much ufed among the French by way of a curdial dram after meals.

There are varions kinds of hippocras, according to the kind of wine and the other additional ingredients made ufe of; as white hippocras, red hippocras, clatet hippocras, Arawberty hippocras, hippocras without wine, eyder hippocras, de.

That directed in the late London Difpenfary, is to be made of cloves, ginger, cinnamon, and nutmegs, beat and infufed in canary with lugar: to the infulion, milk, a lemon, and fome llips of rofomary, are to be put, and the whole 1 rained through a llannel. It is recommended as a cordial, and as good in paralytic and all nervous cafés.

HIPPOCKATIA, in botany: $A$ genus of the monogynia order, belonging to the trimadria clafs of plants : and in the matural method raking with thofe of which the order is doubtful. The caly is quinquepartite ; the petals five, the captules three in num. ber, and the latter of an ohcordate thape.

HIPPOCRATES, the greatelt phyfecian of antiquity was born in the inand of Cos in the soth Oiym. piad, and hourihed at the time of the Peloponnetian war. Ile was the lirt that we know of who laid down precepts cuncernine phyfic; and, if we may believe the author of his life, who gones under the name of Soranus, drew his oliginal from Fl rocules and Efeulapius. He was firl a pupil of his own father Iferaclides, then of Herodicus, then of Gorgias of Leontinum the orator, and, according to fome, of Democritus of Abdera. After being inllructed in phydic, and in the liberal arts,
and lofing his parents, he left his own country, and Hipy prablied phytic ali over Grecec; shere he was for much almired for his fill, that he was publicly fent for with Euryphon, a man fuperior to him in years, to Per. diccas king of Macedonia, who was then thought to be confurptive. But Hippocrates, as foon as he arrived, promoneced the difeafe to be entirely mental, as in truth it was. For upon the death of his father Akexander, Pudiceas fell in love with Philas, his father's mittrels: and this Hippocraces difeernmg by the great change her prefence always wrought upon him, a cure was foon effected.

Berng increated by the people of Ablecato come and cure Democritus of a fuppofed madnefs. he went; but, upon his arrival, intlead of finding Democritus mad, he found all his fellow citizens fo, and Democritus the only wife man among them. Ite heard inany lectures, and learned much phitofouhy from him; which has made Cornelius Celfus and fome others inagine, that Hippoerates was the difciple of Demoeritus, though it is probable they never faw each other till this irtervicov whech was occalioned by the Abderites. Hip. pocrates had allo public iavitations to other countrics. Thus, when a plague invaded the llyrians and Pwo. nians, the kings of thofe countrics begged him to come to their relief: he did not go; but learning from the meflengers the comfe of the winds there, he concluded that the dillemper would come to Athens; and, fore telling what wonld happen, applied himlelf to take care of the city and the itudents. He was indeed fuch a lover of Greece, that when his fame had reached as far as Perfia, and upon that acconnt Artaxerxes had intreated him by his governor of the Hellefont, with a promife of great rewards, to come to him, he refufed to go. He allo delivered his own commtry from a wat with the Athenians, that was jut reaij to break out, by prevailing with the Thelfalians to conse to their af. hitance, for whish he received very great honours from the Conss. The Athenians alio conferred great honour; upow him: they admitted him aext to Hercules in the Elutiaian ceremonies; gave him the freedom of the city : and voted a public mainsenance for him and his family in the pryanenn or council-houle at Athens, where none were mantained at the public charge but fuch ar hat done fignal fervice to the itate. Ife died among the Larilimans, fore fay in his goth year, fome in his sjth, whers in his ropth, and fome in hes togth. The bed edivion of his works is that of Fiuefus, in Grek and Latin. EXippocrates wruie in the Ionian dialect His aphoritins, prognottics, and all that he has written on the fymptoms of difeafes, jallly pa's formaller-pitces. Sse Hylory of Mmoicinf.

HIPIOCRENE (anc. gens.), a founisu of mount Helicon, on the borders of Dewtis, facred to the Mitfes. Some, as Ond, mate Hippocrenc and Asanippe quefame. Sec toanipre.

HIPPUPHAGi (ance geog.), a poople of Scythia, fo called trom their loving om home-Refh: the fare at this day of the Tartars their defect dants. Alfo a prople of Perfia (1'tolemy).

HIPPOCREPIS, CUMッON HORSE-SHOE VETCH, in botany: A genus of the decantria order belonging to the diadephia chafs of plants: and in the natue ral method ranking under the 323 erden, Papilionacea. 'Lhe legumen is compralled and crooked, with many
incifions on the interior future. There are three fpecies, two natives of the warm parts of Europe, and one of Britain. They are all low herbaceous trailing plants, with yellow flowers. They are propagated by feeds; but having no great beauty are feldoni kept in gardens.
hippoldrome, Hipporomes (compoled of ranos " horle," and do-kos " courfe," of the vetb Eptuw curro, "I run), in antiquity, a bilt or courfe wherein chariot and horfes races were performed, and horfes extrcifed.

The Olympian hippodrome or horfe-courfe was a fpace of ground of 0 o paces long, furrounded with a wall, near the city Elis, and on the banks of the river Alpheus. It was uneven, and in fome degree irregular, on account of the fituation; in one part was a hill of a moderate height, and the circui: was adorneal with temples, altars, and other embellifhnents. Sce Stadium. There is a very famous hippodrome at Conflaneinople, which was begun by Alexander Severus, and finimed by Contautine. This circus. called by the Turks american, is too paces long, and above 100 paces wide. At the entrance of the hippodiome there is a pyramidal obelifk of granite in one piece, about 50 fect high, terminating in a point, and clarged with lieruglyphics. The Greek and Latin infcrip. tions on its bafe fhow, that it was ereeted by Theodeflus; the machines that were employed to raife it are reprefented upon it in baflio-telicto. We have fome velliges in Eindand of the hippoltomus, in which the ancient inhabitants of this colntry performed their races; the moll remarkable is that near Stonehenge, which is a long tract of ground, about 350 fect, or 200 druid cubits wide, and more than a mile and three quarters, or 6000 druid cubits it length, inclofed quite round with o baik of earth, extending directily eall and weft. The goal and carcer are at the eath end. The goal is a high bank of earth, raifed with a flope inwards, on which the judges are fuppofed to have fat. The inctex are two tumuli, or finall barrows, at the welt end of the cout fe. Thet he hippodromes were called in the language of the country rhedagua, the racer rledagrer, and the carriage rbeds, from the Britifh word riadeg "to run." One of thefe hipprodromes, about half a mile to the foutinand of S.ecefler, retains evident tracta of the oll name rie. dagua, in the corrupted one if razw dikes. There is another of thefe, fays Dr Stukcley, near Durchether; another on the banks of the river Lowther, naar Penrith in Cumberland: and another in the valley, juit without the town of Ruyiton.

HIPPOCRLOSSUS, in ichthyolngy ; a fpecies of Pleuronectes.
HIPPOLITUS, a fon of Thefeus and Hippolite, famous in fabulous hillory for his virtue and hus misfortunes. His llepmother Phodia fell in love wihh him, and when the refifed to pollute his father's bed. the aceufed him to Thefens of offering violenve to her perfon. Her accufation was readily believed, and Thefeus intreated Neptune to punith the incontinence of his fon. Hippolytus fled from the refonment if his father; and an he purfued his way along the fea thores, big horfes were fo friyliteneds at the noife of fea calves which Neptune had purpufely fott thete, that hey ran among the recks till his chariot was broken and his
hody torn to pieces. Temples were raifed to his me. mory, particularly at Treezene, where lic reccived disine honours. According to fome accounte, Diana retlored him to life.
hidpondine, the manchineel.tree: A genus of the adelphia order, belonging to the monocecia clafs of plants; and in the natural method rauking under the 38 th order, Tricocce. The male has an amentum and bifid perianthium, without any curolla; the femate perianthium is trilitd ; there is no corolla; the thigma is tripartite; and the phom or capfule tricocous.

Species. 1. The mancinclla, with oval fawed leaves, is a nutive of all the Well India inauds. It hath is fmowth bruwnith bark ; the trunk diviles apwad Pase many branches, garmeded with oblung kaves about three inches long. The flowers come wat in thort fpikes at the enal of the branches, but make no great appearance, and are fucceeded by fruit of the fame flape and lize with a golden pippin. The tree grows to the fize of a large oak. 2. The biplindulofa, with oblong bay leaves, is a native of South Arncrica; and grows to as large a fize as the firth, from which it difers moltly in the flape of its leaves. 3. The fpinofa, with luolly leaves, is a native of Campeachy, and fuldom rifes above 20 feet high; the haves greatly refeable thofe of the common holly, and are fes with flatp prickles at the end of each indenture. They are of a lucid green, and continue all the year.

Culture. Thefe plants being natives of very warm climates, cannot be prefersed in this country without a llove; nor can they by any means be made to rife above five or fix feet high even with that aflillince. They are propapated by feeds; but mult lave very litele inoiture, or they will certainly be killed by it.

Properties. Thefe trees have a very poifonous quas. lity, avounding with an acrid milky juice of a highly cantlic nature. Strangers are often templed to eat the fruit of the firit fpecies; the confoguences of which are, an infammation of the mouth and throat, pains 1 the flowach, \&e. which are very dangerons undefa remedies are specdily applod. The wood is unuch tAteenced for making eabinets, book-cates, \&e. being very durable, taking a tine polif, and not being liable to become worm-eaten: but as the trees abound with a milky canllic juice already mentioned, fires are majs romd their trunks, to burn out this juice; otherwife thofe who fell the trees would be in danger of lofing their fight by the juice hying in their eyes Thes juice raifes blithers on the dikin wherever it lall, turns linen black, and makes it fall ont in holes. It is allo dangerous to work the wood after i: is fawn out ; for if any of the faw-dult happons to get into the eyes of the workmen, it caufes inflammations and the lofs of fighs for fome time; to prevent which. they generallycoser their faces with tine lawn during the time of working the wood. It is with the juice of this tree that the Indians ufed to poifon their arrows.

HII POMANES. a fort of poifon famous among. the anciunts as an ingredient in amorous philters or lowe charms The word is Greek uaspery, compufed of wews "a horfe," and $\mu$ awiz "fury or madnets."

Authors are not agreed about the nature of the hippomanes. Miny defcribes it as a blackith caruricio found on the head of a new-born ccl:; which ibe dam

Hipporax bites off and eats as foon as fhe is delivered. He adds, 14 that if fie be prevented herein by any one's cutting it

Hip: upo
tal.211s. off before, fhe will not take to nor bring up the young. Virgil. and after him Servius and Cohmella, deferibe it as a poifonous matter trickling from the pudendum of a mare when proud, or longing for the horfe. At the end of Mr Bayle's Dictionary is a very learned differtation on the hippomanes, and all its virtues both real and pretended.

HIPPONAX, a Greck poet, born at Epherus 540 years before the Chrilian era. He cultivated the fame fatirical potetry as Archilochus, and was not inferior to him in the beanty or vigour of his lines. His fatirical raillery obliged him to fly from Ephefns. As he was naturally deformed, two brothers, Buphalus and Anthermus, made a tatue of him; which, by the uglinefs of its features, expofed the poet to univerfal ridicule. Hipponax refolved to revenge the injury; and he wrote fuch bitter invectives and fatirical lampoons againt them, that they hanged themflves in difpair. (Ciz.ad Famil. vii. ep. 2t.).

HIPPOPHAE, sea-buckthorn: A genus of the tetrandraa order, belonging to the dioceia clafs of plants; and in the natural method ranking under the ith order, Calyciftora. The mate calyx is bipartite ; there is no corolla; the female caly $x$ is bifid; there is no corolla; there is one fiyle, and a monofpermous berry.

Specties. 1. The rhamnoides hath a frubby ftem, branching irregwlarly eight or ten feet high, having a dark brown bark. It is armed with a few thorns; hath fpear. fhaped, narrow, feffile leaves, of a dark green above, and hoary underneath. 2. The canadenfis hath a Thrubby brown fem, branching eight or ten feet thigh, with oval leaves, and nale and female flowers on different plants.

Culture, \&c. Both thefe fpecies are very hardy, and may be propagated in abundance by fuekers from the roots, by layers, and by cuttings of their young thoots. They are retaised in gardens on account of their twocolonred leaves in fummer ; and in winter, on account of the appearance of the young fhoots, which are covered with turgid, irreguldr, [ealy buds. Guats, fheep, and horfes, eat the firt fpecies; cows refule it.
hippopodes, Hippopedes, or Hippopodit, compofed of are: horfe, and wes foot, in the ancient geograply, an appellation given to a certain people fituated on the banks of the Scythian fea, as being fupposed to have had horfes fect. The hippopodes are mentioned by Dionytius, Geogr. v. 3 to. Mela, lib. iii cap. G. Pliny, lib. iv. cap. I 3. and St Augulline, De Civit. lib. xvi. cap. 8. But it is conjectured, that they had this appellation given them on account of their fwiftnefs or lightnefs of foot. Mr Pennant fuppofes them to have been the inhabitants of the Bothnian Gulfl, and that they were the fame fort of people as the Fimni Ligzipedtes of Olaus. They wore frow thoes; which he thinks might fairly give the idca of their being, like horfes, hoofed and thod.

HIMPOPOTAMUS, the river-horse; a genus of quadrupeds belonging to the order of bellu:e, the characters of which are thefe: It has four fore-teeth in the upper jaw, difpofed in pairs at a dittance from each other; and four prominent fore-teeth in the under jaw,

N: 154.
the intermediate ones being longeft: There are two tulks in each jaw, thofe of the under one very long and obliquely truncated; in both they fland folitary, and are recurvated: The fect are hoofed on the edges.
'There is but one known fpecies, vis. the amphibius, or river horfe, (Plate CCXXXVI.) The head of this animal is of an enormons fize, and the mouth vally wide. The ears are fmall and pointed, and lined within very thickly with thott fine hairs. The eyes and noftrits are fmall in proportion to the bulk of the animal. On the lips are fome flrong hairs fcattered in patches here and there. The hair on the body is very thin, of a whitifh colour, and fcarce difcernible at fis it fight. There is no mane on the neck, as fome writers feign, only the hairs on that part are rather thicker. The Nin is very thick and ftrong, and of a dußky colour. The tail is about a foot long, taper, comprefled, and naked. The hoofs are divided into four parts. The legs are fhort and thick. In bulk it is fecond only to the elephant. The length of a male has been found to he 17 feet, the circumference of the body 15 , the height near 7 , the legs near 3, the head above $3 \frac{3}{\frac{1}{2}}$, and the girth near 9. The mouth, when upen, is above 2 feet wide; and furnifhed with +4 tecth of different figures (incluting the cutting teeth and the canine). The cutting, and particularly the canine teeth of the lower jaw, are very long, and fo lard and flrong that they ftrike fire with tteel. This circumftance, it is probable, gave rife to the fable of the ancients, that the hippopotamus vomited fire from his monch. The fubfance of the canine teeth is fo white, fo fine, and fo hard, that it is preferable to ivory for making artificial teeth. The cutting teeth, cfpecially thofe of the under jaw, are very long, cylindrical, and chamfered. The canine tecth are alfo lony, crooked, prifmatic, and fharp, like the tufks of the wild boar. The grinders are §quare or oblong, like thofe of man, and fo large that a fingle tooth fometimes weighs three pounds. The tuffs, according to Dr Sparman, are 27 inches long. - With fuch powerful arms, and fuch a prodigious Arength of body, the hippopotamus might sender hinfelf formidable to every other animal. But he is naturally of a mild difpolition, and is only formidable when provoked. Hiv bulk is io great, that twelve oxen have been foond neceffary to draw one afhore which had been thot in a river above the Cape; and Haffelquitt fays, its hide is a load for a camel. Tho' he delights in the water, and lives in it as freely as upon land; yet he has nut, like the beaver or otter, membranes between his toes. The great fize of his belly renders his fpecific gravity nearly equal to that of water, and makes him fwin with eafe.

Thefe animalo inhabit the rivers of Africa, from the Niger to Berg River, many miles north of the Cape of Good Hope. They formerly abounded in the rivers nearer the Cape, but are now ahnott extirpated; and to preferse the few which are left in inerg River, the govern was abfolutely prohibited the hooting them withors percicular permiflion. - They are not found in any of the Afri an rivers wish rua into the Mediterranean except the Nile, and cven thetc only in Upper $\mathrm{E}_{5}$ spt, and in the fens and lakes of Ethiopia which that river paffes through. From the unwieldinefs of his body and the mortnefs of his legs, the hippopotamus
t2-tamus is not able to move falt upon land, and is then extremely timid. When purfued, he takes to the water, plunges in, finks to the bottom, and is feen walking these at foll eafe: he sannot, however, continue there long without oftew iling towards the furface; and in the daytime is fo fearful of being difcovered, that when he takes in freth air the place is hardly perceptible, for he does not venture even to put his nole out of the water. In rivers unfiequented by mankind, he is lefs cautious, and puts his whole head ont of the water. If wounded, he will rife and attack boats or canoes with great fury, and often fink them by biting large pieces out of the fides: and frequently people are drowned by thefe animals; for they are as bold in the water as they are timid on land. It is reported that they will at once bite a man in two.-In thallow rivers the hippopotamus makes deep holes in the bottom, in order to conceal his great bulk. When he quits the water, he ufually puts out half his body at once, and fmells and looks around; but fometimes rufhes ont with great impetuofity, and tramples down every thing in his way.-During the night he leaves the rivers in order to patoure; when he eats fugar-canes, rufhes, millet, rice, \$ce confuming great quantities, and doing much damage in the cultivated fields. But as he is fo timid on land, it is not difficult to drive him off.———The Egyptians (Mr Haffelquift informs us) "have a curious manner of frecing themfelves in fome meafure from this deftructive animal. They remark the places he frequents molt, and there lay a large quantity of peafe: when the beall comes on hore hungry and voracious, he falls to eating what is nearct him; and filling his belly with the peafe, they occafion an unfopportable thirll: he then returus immediately into the river, and drinks upon thefe dry peafe large draughts of water, which fuddendy caufes his death; for the peafe foon begin to fwell with the water, and not long after the Egyptians find him dead on the thore, blown up, as if killed with the Arongell poifon." The river-horfe alfo feeds on the roots of trees, which he loofens with his great teeth; but never eats lifh, as is afferted by Dampier. It was reperted to Mr Haffelquift, that the river-horfe is an inveterate eremy to the crocodile, and kills it whenever he meets it : and that this, with fome other reafons, contributes much to the extirpation of the crocodile; which otherwife. conlidering the many eggs they would lay, would meterly deltroy Egrpt. But Ms Pennant creats the alleged eninity of the hippopotamus and crocodile as a vulgar error: an eye-witnefs, he tells us, declaring lie had feen them fwimming together without any difagreement. - The hippopotami fleep in the reedy itlands in the middle of the flrearn, and on which they bring forth their young. A herd of females has but a fingle male: they bring one young at a time, and that on the land, but fuckie it in the water. - They are capable of being tamed. Helon fays, he has feen one fo gentle as to be let loofe out of a dable and fed by its keeper without attempting to injure any one. They are generally taken in pitfalls, and the poor people eat the feth. In fome parts the natives place boards full of flarp irons in the corn-grounds; which thefe bealts Itrike into their fect, and fo become an eafy prey. Sometiones they are Altrock in the water with harpoons fallereed to cords, and to or 12 canoes are emploged in the shace.

Voz. VIlI. Part ll.
'The hippopotamus was known to the Romans: Ilippopotso Scaurus treated the people with the light of five crocodiles and one hippopotame during his redilefhip, and exlibited thom in a temporary lake. Auguftus produced one at his triunsph over Cleopatra.
'Ihis animal is the behemoth of Job; who admirably defcribes its manners, food, and haunts. "1. Dehold now behemoth, which I made near thee: he eatctle grafs as an ox. 2. Lon! now his alrengtl is in his loins, and his force is in the navel of his helly. 3. His bones are as atrong pieces of brats; his boncs are like bars of iron. 4. He licth under the flady trees, in the covert of the reed and fens. 5. Behold! he drinketh up a river: he trutteth he can draw up Jordan into his mouth." The firt, the learned Bochart obferves, implies the locality of its fituation ; heing an inhabitant of the Nile, in the neighbourhood of $\mathrm{U} \%$, the land of Job. The lecond deferibes its great Arength ; and the third, the peculiar hardnefs of its bones. The fourth itudicates its refidence amidt the valt reeds of the river of Egypt, and other African rivers overfliadowed with thick forelts. 'The fifth, the characterillic widerefs of its mouth: which is hyperbolically defcribed as large enough to exhauft fuch a fleam as Jordan.

That this article may include every fort of information which could be collected concerning a creature fo highly noted aud of fuch ancient fame, we hall add the following particulars, extracted from Sparman's Voyage to the Cape of Good Hope, where thefe animals are called fodecous.
"Towards evening (Jan. 24. 1756), we came to a pit in the river, which our guides knew ufed to be frequented by fea-cows. For this reafon, all the different ways by which thefe animals might come up from the river, were befet by us feparately; our hunting. party confitting in the whole of feven perfons, wiz. five of us Chriftians, together with my Hottentot and another belonging to the farmers. Befides this, the refl of the Hotentots were ordered to go to the windward and to the more open places; and by fmacking their whips, and making other noifes, to frighten and drive the animal towards us as foon as it frould make its appearance : in confequence of which meafores, it appeared to 11 , that when at lergth obliged to go on fhore in quett of its food, it mutt neceffarily come to the hiding-place of fome one of the hunters. Every one of thefe places were jult at the edge of the river, between the reeds which grew on the dry parts of the riser, or on thofe fpo:s which the water had left, and at the fame time clofe to the very narrow paths which the animal had made for itfelf at each place: in confequence of which difpofition, it would inevitably pals not above fix inches, or a foot at moft, from the mouth of the fportfinan's piece. Confequently our whole dependence was opon two circumblances; ariz. that our guns hould not mifs fire, and that the fhot hould not fail to prove mortal. In the former cafe, the fportman mutl have inevitably paid for his temerity with his life; thongh in the latter he lad reafon to hope, from inflances of what had happened to others, that the fire, together with the report from the piece, as well as the ball itfolf, would confure the animal, fo as to prevent it from immediately making towards its eneury, The banks of the pit which we then befet

Hipnopeta were in mot places ftecp and perpendicular, and the nul:。 pit it fulf was almolt three quarters of a mile long: but my polt and that of my fellow-traveller (Mr Immelman) happened to be at the diflance of not above 30 or 70 paces from each other. To thefe very places too, after we had waited at them an hour and an hatt in the mont profound filence, the enormons animals did not fail to refort. They had already, white on the other fide of the river, got feent of the Eottentats; and now fhowed by their fwimming up and down and blowing themflues, as well as by a thot but acute and piercing grunt or neighing noife, that they had a grat fufpicion of thefe pafles. I betieve Mr Immelman was not lefs cager and anxious than myfelf, cach of us expecting every moment to have a bout with a huge enornous beaft which we knew had given certain proofs of its being able to bite a manafunder. let were we each of no. at tines no lefs fearful lett the other fhould have the honour of killing game of fuch confequence. The hippopotamus, however, left ns, and had made its appearance in the fame manner where the farmers were feationed; notwithtanding which, at that very intant we heard it thot at by one of the Hottentots. - The fable darknefs of the nifht, and the glittering of the Hottentol's piece, rogether with the loudnefs of the report from it, occafioned by the weight of the charge, and the vibrations of the ccho prolonging the found along the ntigtbourng chain of mountains, all confpired in compofe a molt awful and fuperb fpectacle, which was flill heightened by the expectation of feeing an animal fall fuperior in bulk to the elephant. This fublime fpectacle was imenediately followed by a ridiculous hind of farce performed by a troop of baboons; which, from their calling and anfwering each other along a traight line, we could difcover to be encamped on a fteep rocky mountain in the neighbourhood, with regular out-pults in the trees on each fide of it. After an interval of a comple of minutes, filence again took place, till two ocluck, when the other Hottenict fired his piece; and an:other alam, though of horter duration, went through the baboons out-potts and head quarters.
"The next monning, for the arrival of which we ardently longed, in order to fatisfy our curiofity, our fivitentot fportimen related to us the following particulars concerning the adventures of the night. Involved in darknefs, covered up to the cyes in rects, and overhado ved with beanches of tices, they could onvy get a glimple of the animal, and confepuently could not anfwer for their fhots having taken place: and orie of chem acknowled ged, that he was a litte confufed, as he could not well fee what he was ahout; and for the fame reaton fired his piece too foon, be fore the animal had well rifen out of the water. The other indecd had had an opporturity, both with the ball and fhot that mate up the charge, of woundiag the anmal, which went on its road, and paffed directly by him; but he corld one fee which part of the animal preferated itfelf before the muzzle of his piece. As foon as le had fired, l.e flank away, and directly afterwards heard the beatt take to the watur. 'the refl of the Hottentuts had obferwed one of thefe animals, probably a different one from thic, tun up on a thallow along the river fode, and thus suske its tifape, without their having been able to prerent it. After this we faid here till the alemon, in
hopes that the wounded animals would die and rife to Hipm the top of the water. But we thaid in vain; and to as little purpofe would it probably have been had we waited till longer, as there grew by the lide of the siver a great number of trees, to the roots of which thefe creatures, it is faid, in the agonies of death, make themfelves fatt by means of their long and crooked tulks. On the other hand, fuppofing thefe two fea-cows to be but nightly wounded, they would be cautious how they made their appearance; and inceed, in all probability, it would have been a dangerous fervice ts the fiportimen who hould have ventured to have followed them any farther. Befides, the water had now, in the face of a few hours, rifen conliderably, and had overflowed many fpots lit for lying in anbulh; for which reafon we departed to another hippopotamus pit lefs than this. Here too we laid, by way of frate, á large bhunderbufs. The Hottentots occupied ane poit ; two of our company guarded another: other two (an old farmer and his fon) ttationed themfelves at the third, and placed me in the middle of them. Jult in this part the banks of the river were of a contiderable height, and the river iffelf was dried up near an extenfive hallow, where it was ipread out intu a little plain covered with pebble-Itones and gravel. We three then fet ourfelves down clofe by the fide of each other, in a path made by the fea-cows, making ourfelves pretty certain, as the place was flat, and confequently it was light here, of being able, if any hippopotanus thould chance to come upon the fhallow and look about it, to fee it plain enough to kill it with a volley of three fhot. But, to the great endangering of our lives, we on a fudden found the animal much quicker in its motions, as well as bolder, than we had thought it: for while I was fitting half afleep, and moralizing on the fubject, fruck with the confideration that we with our guns had at that prefent moment the dominion over Job's leviathan or behemoth; while, on the other hand, the flies or fmall mufquitos lad the dominion over us (fo much, indeed, that I was obliged to wrap my face up in a handkerchief), a fea cow came ruhaing upon us out of the river, with a hideous cry, as fwift as an arrow out of a bow; at the fame time I heard the farmer call out, "Heer Jefus!" But fortunately at the very intant he difeharged his piece, which fathing full in the animal's face contributed perhaps more thin the ball to make it A tart back; whon fetting up another cry, it threw itfolf into the water again with as great precipitation as it came out.
"At this I was not a little alarned; yet, what is very lingular, not at the danger, which was real, of being trampled under foot, or being bitten afunder by the beaft, but in confequence of iny apprehenfions, which wete merely imaguary, of being drowned : for the ratting noife, arifing from the creature's running. out of the wattr and along the ftoney beech, immediately fugrefted to me the idea that the river had on. a fudden overlowed its banks; a fuppofition to which, I was the more inclined, as I knew that this accident happens very frequently here. And as the hippopotamus, when it is newly come up out of the water, and is wet and himy, is faid to gliften in the moon-fhine like a fifh, it is no wonder that as foon as I took my handkerchief from before my eyes, it hould appear to
popota me, at fo near a view as I had of it, like a high cuhum of water, which feemed to threaten to carry us off and drown us in a moment : for which reafon I rath, or rather flew, towards the ligher ground, leaving both my guns and my brother fentinels behned me. But as juft at this fpot I was prevented by the ftecpats of ehe river's banks from afcending the heights, and mevertheto perceived that neither my companions mer mufelf were drowned, it ran in my hoal, for the face of fevetd feconds, that we were all of us cither deaming or delirious. 'The farmer's fon had fallen :flep, and thill continued to tleep very foundiy. As wise farmer himifelf, who, panting and breathlef: cvery now and then locked up to beaven, and at the fume tume, with much aukwarduefs and buttle, wers endeavouring to make lis efeape, I made ail the halle I could to difengage him fron a large wapper, which, as well on account of his gout as by way of keeping off the dies, he had wrapped romed his legs. I then afked him what coutfe the water had taken when it overlowed? and he, after a long paufe, anfwered only by atking me in his tum if I was not mal? upon which I was almoft ready to put the fame queftion to myfelf. And even at lak, when all this was univided to me, I could no: help doubting of the truth of it, till I found the farmer's gun was really difcharged: for the rateling among the fones and the fquabing in the water, of cationed by the fea.cow, was what I firt lieard, and what made me take to my legs; fo that I did nut attend in the leafteither to the report of the gun or the cry of the animal, chongh thefelater appeared to the refl of our party the molt terrible: fo much, indeed, that they occafoned Mr Immelman, together with the farmer's fon-in-law, to fly from their pott; though they had feen nothing of all that had happened, and could not ealily have come to any harm.- We concluded the chace; and fpent the remainder of the uight in laughing at each other, in chattering, and forming various conjectures on the fubject of the precipitation and impetuous fury of the fea-cow; which, however, was probably as much alarmed and frightened as we ourfelves could polibly be: we even fmoked a couple of pipes while we liftened to the roaring of the lion, and waited for the approach of the moming. Scveral Hotentots then told us, that foon after the noife and tumult we have been deferibing had ceafed, they had feen a fea-cow making its way sut of the river towards that fide of it which was unguarded.
"On the 25 th, from fome traces of the fea-cows which we found in the dult near another fpot, we concluded that many of thefe huge amphibious aninuals had lately taken up their quarters in a certain pit thercabouts; which we accordingly prepared to lay fiege to in every poffible way. In the mean time, we Saw a young lion make its efcape inso a clofe theket on the fide of this fame pit, where it might be per. fectly fafe from us and our hounds. Not nuch ap. proving of this animal's being fo near a neighbour to us, we thought it bett for feveral of us markfmen to be together at each hiding-place; at the fame time ordering our Hottentots, partly by making a nuife and uproar, and partly by the means of making large fires, to frighten the feacows from attempting any of the other paftes. Thefe animals had probably been befet in the fame manncr feveral times before, as this
niglt we feareely heard any thing of thens. In the tipopopota. mean while, howeser, we flatered onfelves, that by mous contmang to bloek then up, we fronld at leaft by farving them force them to quit their alylum, and expufe themfelves on the land to the fire of bur guns.
"On the zoth likewife we were on the look out after thele animals, between the hours of ten and cleven in the formoun, and alio jun befure dulk, thonsh upon a quice different flan from what we had tef re, as we meant now to hit them on their flomes the i.de flant they flowh fick them up within the reach of our guns utit of the water in crder to cake becalh, or more properly (as it is rut umapty called by the cu. lenits) to blow themfelves. In urder that the foot might prove mortal, ws were cbliged, howewer, ou this occalion, to direct it in fuch a manner, that the ball thould pufs through the eavity of the nofeinta the brain. It was meredy upen this plan that we vent out after the fea-cows beforewearrived at Asures isparificsboogte, and wete ftrengthened by the farmer's party. But we coultantly found the fe animals too thy to allow us to put our defigns in exceution: for althon! $r_{1}$, in thofe places where they had nut been frightemed or wounded, they will often in the midelie of the day raife their heads and pat of their bodies above the furface of the water, they at this time fearcely ventured jutt to put one of their nottrils only out of it, in order to breathe almolt imperceptibly ; and this only for the mott part in thofe fpots in which they were fheltered from us by the langing branches of trees. Nowithflanding this difadrantageons fituation, they, in confequence of the acutenefs of their fincll, fremed ftill to difocrn us, efpecially when we were to the windward of them; as in that cafe they intantly withdrew to another part.
" The fame night we betook ourfelves again to our polts; and at half an hour after eight, it being already very dank, a fea-cow began at intervals to put its lucad up above the water, and utter a harp, piercing, and, as it wore, a very angry cry, which feencel to be between granting and neighing. Perhaps this cry may be beft expreffed by the words biarkh burkh, bub.bull: the two firtl being uttered flowly, in a hoarfe but tharp and tremulous found, refembling the grunting of other animals; while the third, or compound word, is founded extremely quick, and is not unlike the neighing of a horfe. It is tree, it is impollible to exprefs theie inarticulate founds in writing ; but pertaps one may make nearer approaches to it than one can to the gutturopalatial founds of the Hottentot language. At cleven u'clock came the fame or elfe lome other hippopotamus, and in like manner vifited the pults we occupied. He did not, however, dare to come up, thoush to our extreme mortification we heard him come and nibble the boughs which hung over the furface of the water, as well as a litte grafs and a few low thrubs which grew here and there on the infide of the river's banks. We were, however, in hopes that this way of living would not long fuffice animals, one of which only required almokt a larger purtion than a whole team of uxen. Thus far at leall is errtain, that if one thould calculate the confumption of provifions made by a fea-cow from the fize of its fauces, and from that of its body and of its belly, which hangs almott down to the ground, together with die quantity of

## H I P

Hfippopsto- grafs which I have at diferent times obferved to bave mus. betn confumed by one of thefe animals in fpots whither it has come over night to graze, the amount would appear almoft incredible.
" We paffed the following night at the fame pofts as we occupied on the night preceding, the fea-cows atting much in the fame manner as before. On the 28th, after fun-rife, jull as we were thinking of going from our poRs home to our waggons, there comes a female hippopotamus with her calf, from fome other pit or river, to take up her quarters in that which we were then blockading. White the was waiting at a rather theep part of the river's banks, and looking back after her calf, which was lame, and confequemty came on but flowly, the rectived a hot in her fide, upon which the directly plunged into the river: but was not mortally wounded; for Flip (the farmer's fon), the drowliclt of all fublunary beinge, who had thot her, and that inftant could hardly be awakened by two Huttututs, was till half ankep when he fircd his fiece. And happy was it for him that the enormous beaf did not make towards his hiding or rather fleeping place, and fend him into the other world to fleep for ever. In the mean while his thot was fo far of fervice, that one of my Hottentots ventured to feize the calf, and hold it fatt by its hind-legs till the relt of the hunting party came to his affitance. Upon which the calf was fat bound, and with the greatelt joy borne in triumph to our waggons; though while they were taking it over a fhallow near the river, the Hottentots were very much alarmed left the wounded mother and the other fea-cows fhould be induced by the cries of the calf to come to its refcue; the creature, as long as it was bound, making a nuife a good deal like a hog that is going to be killed, or has got faft between two polts. The found, however, proceeding from the hippopotamus calf was more flarill and harth. It fhowed likewife a conliderable thare of ftrength in the attempt it made to get loofe, and was found to be quite unmanageable and unwieldy: the length of it being already three feet and a half, and the height iwo feet; though the Hottentots fuppofed it to be no more than a fortnight, or at molt three weeks, oid. When at latt it was turned loofe, it ceafed crying; and when the Hottentots had paffed their hands feveral times over its nofe, in order to accuftom it to their efluvia, began directly to take to them.
"While the calf was yet alive, I made a drawing of it, a copy of which may be feen in the Swedifh Tranf. attions for 1778. After this it was killed, diffected, and eaten up in lefs than three hours time. The reafon of this quick dipatch was partly the warmth of the weather, and partly our being in abfolute want of any other frefh provificns. We found the flefh and fat of this calf as flabby as one might have expected from its prant of age, and confequently not near To good as that of the old fea-cows; of which I found the fleh. tender, and the fat of a talle like marrow, or at leaft not fo greafy and Atrong as other fat. It is for this reafon likewife that the colonits look upon the fleth and fat of the fea cow as the wholefomett meat that ean be eaten; the gelatinons part of the feet in particular, when properly dreffed, being accounted a great dalicacy. The dried tongues of thefe animals are alfo
confidered even at the Cape as a rare and favory difh. Hippoy On my return to Sweden, I had the honour to furnilh his majelty's table with a dried fea-cow's tongue, two feet and eight inches loug. With refpeet to form, the tongue of a full.grown hippoputanus is very blunt at the tip, and is in fact broadelt at that part; if at the fame time it is flanted off towards one fide, and marked with lobes, as 1 was informed it is, this circumfance may, perlaps, proceed from the friction it fuffers againit the teeth, towards the ide on which the animal chietly chews; at lealt forme traces of this oblique form were difcoverable on the dried tongue I am fpeaking of.
"The hide of the adult hippopotamus bears a great refemblance to that of the rhinoceros, but is rather thicker. Whips likewife made of this hide are frongcr, and after being ufed fome time, are more pliable than thofe made of the hide of the rhinoceros ufually are, though they are not fo tranfparent as thefe latter are when new.
"The food of the hippopotamus confilts entirely of. herbs and grafs, a circumfance of which we are informed by Father Lobo; and which may partly be inferied from what I have already faid on the fubject, as well as from the figure of the flomach belonging to. the foetus of a hippopotamus given in Meffrs de Buffor and Daubenton's elegant work. I therefore do not look upon it as very prohable, that thefe animals, agreeably to the aflertions of M. de Buflon, p. 93. or of Dampier in his voyage, fhould hunt after liih by way of preying upon them ; efpecially as in fome of the rivers of the fouthern part of Africa, where the fea-cows are feen daily and in great abundance, there is not a fifh to be feen; and in others only a few baflard fpringers, as they are called (cyprinus gonorynchus), which are fearcely as big as a common herring. It is faid, that a fmall fpecies of carp is ftill more rarely to be met with here. It is true, that the feacows fometimes frequent the mouths of the rivers here, which are full of fea-fin, and even fometimes the fea itfelf: we know, however, that thefe huge quadrupeds are notwithtanding this obliged to go from thence upon dry land in quelt of food. Neither is it probable that they can drink the fea-water; as an inftance was related to me of the contrary in a hippopotamus, which, having been diturbed in the rivers, had taken refuge in the fea, and yet was obliged to go afhore every night and drink frefh water from a well in the neighbourhood, till at lan it was Shot by fome people that lay in wait for it there. That the hippopotamufes actually lived in falt-water, I have feen evident proofs at the mouths both of Kromme and Camtour rivers, particularly in the latter, on my journey homewards; where many of thefe animals blowed themetres in broad-day-light, and thruft their heads up above the water; and one of them in particular, which had been wounded by an ill directed that on the nofe, neighed from anger and refentment. In Krakekamma I faw on the beach manifen traces of a hippopotamus whick had come out of the Sea, but had retired thither again directly. That very attentive navigator Captain Burtz informed me, that he had frequently feen on the eaftern coall of Africa fea-horfes (meaning probably the hippopotamus) raife their heads above the furface or the water, in urder to blow themelves and neigh. I

## H I P

- have been induced to be rather circunitantial on this fubject, as M. Adanfon had taken iuto lis head, in his V'oyage mu Senesal, to limit the abode of the hippopotanns to the frefh water rivers only in Africa; and M. de Buffon has taken upon him to fupport this opinion, and to renker Kolbe's teftimony to the conerary diable to fulpicion.
"An old experienced huntiman toid me, that he had once feen two hippopetamules copulate, which they did in the fame manner as common cattle. On .this occalion the beafts ftood in a flallow part of the siver, where the water reached up to their knees.
"The method of catching the hippopotanus confilts (befides flooting it) in making pies for it in thofe parts which the aniural paifies in his way to and from the river: but this method is peculiar to the Hottenrots; and is only practifed by them in the rainy feafon, as the gromed in fummer is too hard for that purpole. It is faid that they have never fucceeded in killing this luge aquatic animal with poifoned darts, though this way of killing gane is practifed with advantage . by the Hottentots for the deflyuction both of the elephant and rhinoceros. The colonifts likewife were not entirely unacquainted wi!! the mothod mentioned by M. Haftelquit, as being common in Egypt, riz. to Atrew on the ground as many peafe or bcans as the animal can poffibly eat, by which means it burlts its belly and dies. But as this method is very expenfive, and they can geterally lave this animal for a lingle chayge of powder and a tin ball, fiot in a proper direction, they chiely and almoft fulely have recourfe to this cheaper expedient.
"The bippopotamus is not fo quick in its pace on land as the generality of the larger quadrupeds, though perhaps it is not fo flow and heavy as M. de Buffon defcribes it to be; for both the Hottentots and colonifts look upon it as dangerous to meet a hippopotamus out of the water, efpecially as, according to report, they had had a recent inflance of onc of thefe .animals, which, from certain circumftances, was fuppofed to be-in rut, having for feveral hours purfued a Hottentot, who found it very dificult to make his efcape. The people of this country did not entertain that opinion of the medicinal wirtues of the hippopotamus, as they did of certain parts of the elephant and rhinoceros; 'excepting one colonill, who imagined be had found the of fitrofum of this animal reduced to powder, and taken in the quantity that would lie on the point of a knife, excellent in convulfions, and particularly in the convullions (Ruypen) of children. That the fefh is reckoned very wholefome fuod, I have already mentioned.
"Having already exceeded the limits I had preCcribed to myfelf, I do not intend to dwell here on the anatomy of the hippopotamus we caught, particularly as the intcrual conformation of the calves is fomewhat different from that of the atult animal. I fall therefore only briefly mention the following particulars: the fomaclis were four in number, and cunfequently one more thantin the foetus examined by M. D.abenton, which was kept in fpirits. Conpare Buifon, Tons. xii. Tab. iv. fig. 2. The two firt thonachs were each of them about feven inches long and three inches in diameter; the third was nue inches in length, aud a little wider than
the two former; the fourth was fexea inches long, Ihiplaposis. and at the upper part five inches broad, but decreafed by degrees on one fide till it terminated in the fylorus, which had an aperture an inch in width, being about half as wide again as the cardia. I did not oblerve any inch valves as M. Daubentors has delineated. The firff fomach we found molly enipey, it contsining only a few lumps of chece or curd; it lihewife difered from the refl by the fuperior linenefs of its internal coat. The internal membrane of the fecond tlomach was rather coarfer, and had many farall holes in it; it likewife contained feveral elods of cafeons mater, together with a great quanticy of fand and mud. The third flomach had very vilible folds, both longitudina! ald tranferfal, on the infide of it, and containcd cafenus lumps of a yellow colour and laader comfilence than the others, together with feveral keaves quite whole and freft, and at the fame time fome dirt. The interior membrane of the fuirth fomach was very finooth, though it was nut without folds; in the bomach itfelf chere was a good deal of dirt, with a fmall quantity of curds, which were whiter than they werc in any of the other flomachs. 'This fourth itomach in a great meafure covered the relt, being lituated un the right fide of the animal, and was found tollave the upper part of the melt adhering to its fuperior and interior edge. This latter vificus, which was one foot long and three inches broad, diverged from it downwards on the left fide. The inteftinal catal was 109 fect long; the liver meafured it inches from right to left, and 7 or 8 from the hind part to the fure part. On its auterior cdges it had a large notch, being in other refpects undivided and entire ; it was of an oblique form, being broadeft towards the left fide, where I difcovered a gall-bladder five inches in length. In the - uterus there was nothing particularly wortly of obfervation. I found two teats, and the heart furrounded with much fat ; the length of this mufcle was five inches, and the breadth about four inches and a half. The communication between the auricles, called the foramen ovale, was above an inch in diameter. Each lung was eleven inches long and undivided: but at the wetior and exterior part of the right lung there were two globules or proceffes clevated half an inch above the furface; and on the fide comerponding to it, in the left lung, and in the upper part of it, there was a little exciefconce, terminating in a point: fomewhat below this, yet more forwards, there was found likewife a procefs half an inch in height. Direetly over the lower part of the communication formed between the right and Ifft lung, there was a kind of crell or comb, meafuring an inch from the top to the bafis.
"One of my brother fportfmen faid, he had once obferved a peciuiar kind of vermin on the body of one of thefe amphibious animals; but on tbe calf we had caught we found nothing but a fpecies of leech, which kept only about the anns, and likewife agood way upin the flrait gut, where, by a timely abtraction of the blood, they may be of ufe to thefe large amphibious animals; and particularly inay aft as prefervatives againft the piles, repaying themfelwes for their trouble in kind. Moft of them were very fruall ; but on the other hand there was a coufiderable number of them. The only large one 1 faw of this fecies, bcing fome-

## H I R

 mate a dowing of: this is infetted hy the nance of

 grane Treatife on Wornis, which DI. Adohphes Nadeer, final Ecertary of the patriotic fociciy, is plepaning for the pretu. Intlead of the lighter coloured threak upon the back, there was difoorerable in fome of thefe lecches noe and fometines two Imgitudinal brownith lines, which grew fatiter and fanter towards the extremitics.
"The hupe animat of which we have been \{peak. ing, las dubulefs obtanel its prefent name of lippopotamus, which fienites river horfe, mercly in confegurnce of the neighing found it makes; as otherwife in its form it bears not the leaft refemblance to a horfe, but rather to a hog. Neither does it in the leatl refemble the ox; fo it coud be only the diferent fomachs of this animal which could occation it to be called far on at the Cape; and perhaps it is for the Game raton that the Hotentots call it the troto, which nearly approaclacs to $t^{\prime \prime}$ au, the name by which the buffalo is known amone the fe people.
"From the account given by Bellonits of a tame hippopotamus, which he deferibes as a beall of a very mill and gerte nature, as well as from the difpofition of the calf we had jutt caught, it Collows, that this animal might be eafily bronght over to liurope, where it has beer formenly exhibited at two different times in the public ipectacles at Rome. For this purpofe, the capture misht ealict be made at Kcnaps-river, where thefe animals, accorcing to the accounts given me by the Caffres, refide in great abundance; and milch cows might be kept ready at hand, in order to rear the calf in cafe it was a fuckling. lndeed 1 am apt to fuppofe, that one a little older than this wouk not be very nice in its food; as that which we caught was induced by hunger, as foon as it was let loofe near the waggon, to put up with fomething not extremely delicate, which had been juft dropped from one of our oxen. This perhaps may appear very exiraordinary in an antol with four fomachs; but there have been infancers of this kind known in common cattle, which in Herjedal are partly fed with horfednag. (Vid. - Hathras. A. A. Hulphers's Befkafning om Nomland *, 3:je Difertion Saml. om Herjedalen, $\mathrm{p} 27-87$ ) 1 have been likewife of Norzwiy afured, that this method of feeding cattle has been practifed with great advantage in Uplandia, when there has been a fearcity of fodder ; and that afterwards thefe fane cattle, twon when they have not been in want of proper fodder, have taken to this food of their own accord, and eaten it without any thing eife being mixed with it."

HIPPURIS, mare's rall: A genus of the monogynia order, belonging to the monandria clafs of plants; and in the natural method ranking onder the 15 th order, Inundata. There is no calyx, nor any petals: tite lligma is fmple; and there is one feed. Thace is only one fpecies, a native of Britain, and which grows in ditches and fagnant waters. 'The flower of this plant is found at the bafe of each leaf, and is as fimple as can be conecived ; there being neither empalemtnt nor bloffom; and only one chive, ene pointal, and one feed. It is a very weak aftrin-
gent. Goats cat it ; cows, fhecp, horfes, and fwine, cofure it.

HIR.S.A, in botany; a genus of the trigynia order, folonging to the decandria clafs of plants. The calyx is pentaphyllous; the petals roundith and ungnictilated: there are three bilabiated feeds.

HIRAM, a king of Tyre, cotemporary with Solomon, whom he fupplied with cedar, gold, liber, and other materials for building the tomple. He died 1000 years B. C.

Hiram of 'ryse, an artift who aflifted in the conAruetion of Solomon's temple, and other public buildinge at Jerufalem, flouribed 1015 D. C.

HIRCANlA (anc.geog.) Sce Hyrcania.
HIRCH-horn, a town of Germany, in the circle of the lower Rline, with a Atrong calle. It is feat. ed on the fide of a bill on the river Neckar, and belongs to the elector Palatine. E. Long. 9. o. N. Lat. 49. 23.

H1RE (Philip de la), an eminent French mathematician and aftronomer, born at I'aris in 1670 . His father, who was painter in ordinary to the king, defignat him for the fame profeflion: but he devoted himfolf to mathematical lludies, and was nominated together with M. Picard to make the neceflary obfervations for anew map of France by the directions of M. Colbert. In 1683, he was employed in continuing the famous meidian line begun by M. Picard; and was next the gaged in conftrueting thofe grand aqueducts which were projected by Louis XIV. He died in 1718 , after having written a great number of works, betides feveral occational papers difperfect in journals, and in memoirs of the Academy of Sciences.

HIRING, in law. See Borkorelng and Hiving.
HIRPINI (anc. geog.), a people of Italy, next to the Samites, to the fouth-eaft, and defeendants from them; fituated to the north of the Picentini, and to the wett of the Aprali, having on the north the $A$ pennin and a part of Samnium. The name is from lifrus, a term denoting a wolf in their language; either becaute under the conduct of this animal the colony was led and fettled, according to Strabo ; or beeante, like that prowling animal, they lived on plunder, according to Servius.

HIRSBERG, a town of Silefia, in the territory of Jauer, famous for its mineral baths. It is feated on the niver Bofar, in E. Long. 17.50. N. Lat. 5050.

HIRSCHIELD, a town of Germany, in the circle of the upper Rhine, and capital of a principality of the fame name, depending on a famous abhey which was ficularized in farour of the houle of Caffel. It is feated on the river Fulda, in E. Long.9.52. N. Lat. 5 t .46.

HIRTELLA, in botany: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. There are five petals; the filaments are very long, perfifing, and firal; the berry is monofpermous; the ftyle lateral.

HIRUDO, the leech: a genus of infects belonging to the order of vermes intellina. The hody moves cither forward or backward. There are feveral fpeeies, prineipally diltinguithed by their colour. The molt remarkable are the following.
\%. The

## H I R

1. The medicinalis, or medicinal leech, the form of which is well known, grows to the length of two or three inches. The body is of a blackifh brown colour, marked on the back with fix yellow fpots, and edged with a yellow line on each fide; but both the foots and the lines grow faint, and almoft difappear, at fome feafons. The head is fimaller than the tail, which fixes itfelf very firmly to any thing the creature pleales. It is viviparous, and produces but one young one a: a time, which is in the month of July. It is an inhabitant of clear running waters, and is well known for its ufe in bleeding. 2. The fanguifuga, or horfe-leceh, is larger than the former: Its ikin is finooth and glefly; the body is depreffed; the back is dulky; and the le:lly is of a yellowifh green, having a yellow lateral margin. It inhabits tlagnant waters. 3. The geometra, or geometrical leech, grows to an inch and a half in lengrl ; and l:as a fmouth and glolly livin of a dufisy brown colour, but in fome featons greenith fyotied with white. When in motion, its back is clerated into a kind of ridge; and it then appears as if meafuring the fpace it patted over like a compals, whence its name. Ies tail is remarkably broad: and it holds as firmly by it as by the head. It is common on thones in fhallow runnit.g waters; and is often found on tront and other thit after the foawning feafon. 4. The muricata, or muricated leech, has a taper bodr, rounded at the greater extremity, and furnifhed with two fmall tentacula or horns ftrongly anmulated and rugged upon the rings, the tail dilated. It inhabits the Atlanic Ocean, and is by the fifhermen called the far kects. It adteres to filli, and generally leaves a black mark on the fpot.

The organs of generation in leecles are formed like thofe of the fea and land frails. See H:rmx. - The leech's head is armed with a tharp indrument that makes three wounds at once. 'They are three marp tubercles, frong enough to cut through the kin of a man, or even of an ox or horfe. Their mouth is as Vor- it were the body of the pumb, and their tongue or 21. flefny nipple the fucker: by the working of this piece of mechanifm, the blood is made to rife up to the conduit which conveys it to the animal's Ponach, which is a membranaceous likin divided into $2+$ finall celle. 'Ille blood which is fucked out is there prefervel for feveral months ahnoll without coagulating. and proves a ftore of provifon to the animal. Tlie nutritions parts, pure and already digetted by animals, have no call to be difengaged from lieterogeneous fubtances; nor indeed is there an auns difecverable in the leech, mere tran piration feems to be all that it performs, the matter fixing on the furface of its body, and afterwards coming off in fmall threads. Of this an experiment may be tried by putting a leech into oil, where it keeps alive for feveral days; upon being taken out and put into water, there appears to loofen from its body a kind of nongh theped like the creature's hody. The organ of refpiration, though urafcertained, feems to be fituated in the mouth; for if, like an infect, it drew its breath through sent holes, it would not fubfift in oil, as by it they would be Atopped up.

It is only the firfe feceies that is afed in medicine; being applied to tender parts upon the veltels in order to draw off the infpiffated blood with which they are avercharged, or to phdbotomize joung children. If
the leceh does noi fatton, a drop of mulk is pui un the thum fpot it is wihed to fix on, or a little blond is drawn by means of a light puneture, after which it imme. diately fetties. Prudence requires it Chould be laeld falt with a piece of rafh, lett it thoulh find its way into the anus whea ufed for the hemorirloids, or penetrate into the efophasus if employed to dew the grums; othcrwife it would make the grate f havocls cither in the domadi or inteflines. In frach a cafe, the bett remedy is to drink fale water; which is the method pracifed to make it loole its hole when it fucks longer than was intended. Oil of tartar, volathe alkuli, perper, and acids, make it alio leave the part on which it was applied. If, on the cuntrary, is is intended it hould draw a larger quantity of blood, the ered of its tail is cut ofr. It then fucks continually to make up the lofs it fulains. The difcharge occafioned by the puncture of a leech is calily flopped with brandy or other Ityptics.
d: Cejlon, travellers who walk hare leaged are molated by the great numbers of leeclees concealed under the grafs. - All leeches vary in their colours at fome fealons, but they are generally of a dufty grecaith brown or yellow, and often variegated. "hey ats faid to te very reitlefs before a change of weather, if continerl in glafles.

HIRUNDO, in ornithologe, a genus of birds of the order of paitres. There are 37 fpecies, chiefty ditinguithed by their colour. The mot remarkabis are,

1. The rultica, common or chimney- fwallow, is Plate diftinguinced from all the other pecies by whe fuperion cexax is forkitices of its tail, and by the red fpot on the forehead and conder the chin. "The crown of the luesd, the whole upper part of the body, and the coverts of the wings, are black, glofed with a rich purplith blue, moft refplendent in the male: the breatt and belly white, and in the mals tinged woth red: the tail is black; the two middle feathers are plain, the others marked tranfueffely near their cnds with a white fpot: the extcrior feathers of the tail are much longer in the male than in the remale. The food of this fratlow is the fame with the others of its kind, viz. infocis. For the tahing of thefe, in their fwiftef lipht, nature ham admirably contrived their foreral parts: their moution are very wide to take in nies, se. in their quickat motion; their wings are longe and adapted for dillan and continual fight; and their tails are forked, to enalde them to turn the readier in purfuit of their pery. "I'his fpecies is the firll comer of all the Britith hirundines; and appears in general on or about the 13 th of Apml, though now and then a tlraggler is feen much earlier. 'Tlis hirundo, though called the chimnoj frechlore, by no means builds altogether in chimneys, but often within barns and out-loufes againtl the rafters; and fo the did in Virgil's time:

## 

In Sweden nie builds in barns, and is called ladu frwals, the barn fwallow. Befides, in the warmer parts of Europe, there are no chimneys to houfes except they are Eng. lih built: in thefe countries flie contruets her nelt in porches, and gate-ways, and gallerics, and open halls. Here and there a bird may allect fome odd piculiat place.

## H I R [ 552 ] H I R

plact : but in general with us this fpecies beecis in chimners; and loves to haunt thole Hacks where there is a contant fite, ro coubt for the fake of warmeth. Not that it can fubsilt in the immediate fhate where there is a fire; but prefers one adjoining to that of the kitchen, an! difregards the perpettal fnoke of that Emnel. Five or fix or more fect down the chamney does this fitcle bird begin to form her nefl abut the midale of May, which confils, like that of the honfe-martin, of a ciut or thell compsfed of dirt or mud, mised with thort piecs of flaw to render it tough and permanent; with this difference, that whereas the fhell of the martin is nea:ly hemifpheric, that of the fwallow is open at the top, and tike half a decp difa : this neft is lined with fine gralles, and feathers which are often collected as they toat in the air. Wonderful is the admers ( Mir White ubferves) which this adroit bird fows all day long in afcending ard defoending with fectirity though fo narrow a palj. When hovering over the mocth of the funntl, the vibrations of her wings act. ing on the contined a:r eccation a rumbling like thunder. It is not improbable that the dam fubmits to this inconvenient fituation folow in the fhaft, in order to fecure her broods frorn rapacions birds, and particularly frori owls, which frequently fall down chimneys, perhaps in attempsing to get at thefe nellings.

This bird lays from four to fix white egge, dotted with red fpecks; and brings out her lirl brood about the latt week in June, or the firt week in July. The progreflive method by which the young are introduced into life is very amuling: Firt, they emerge from the fhaft with difficulty enough, and often fall down into the rooms below: for a day or fo they are fed on the chimney-top, and then are conducted to the dead leaflefs bough of fome tree, where, fitting in a row, they are attended with great affiduity, and may then be called perchers. In a day or two more they become Alyers, but are fill unable to take their own food: thercfore they play about near the place where the dams are hawking for fies; and, when a mouthful is collected, at a certain fignal given, the dam and the notlling advance, rifing towards each other, and meeting at an angle; the young one all the while uttering fich a little quick note of gratitude and complacency, that a perfon mult have paid very little regard to the wonders of Nature that has not often remarked this feat. The dam betakes herfelf immediately to the bufinefs of a fecond brood as foon as the is difengaged from her firlt; which the at once aflociates with the firll broods of houfe-martins; and with them congrerates, cluftering on funny roofs, towers, and trees. This hirundo brings out her fecond brood towards the middle and end of Auguft. All the fummer long is the fwallow a molt inftrubtive pattern of unwearied indutry and affection ; for from morning to night, while there is a family to be fupported, the feends the whole day in flimming clofe to the ground, and exerting the molt fudden turns and quick evolutions. Avenues, and long walks under hedges, and patture-fields, and mown meadows where catcle graze, are her delight, N $1015+$
efpecially if there are trees interiperfed; becaufe in fuch fpots infects moft abound. When a fly is taken a fmart finap from her bill is heard, refembling the noife at the hating of a watch-cafe: but the motion of the mandibles are too quick for the eye.

The fwallow, probably the male bird, is the excubitor to houfe-martins and other lit le birds, anouncing the approack: of birds of prey. For as foon as an hawk appears, with a farill alarming note he calls all the fwallows and martins shout him; who purfue in a body, and bulft and trike their enemy thll they have driven hin from the village, carting down from abore on his back, and riing in a perpendictilar line in perfect fecurity. This bird alfo will found the alarm, and Itrike at cats when they climb on the roofs of houfes or otherwife approach the nelts. Each fpecies of hirundo drinks as it flies along, fipping the furface of the water; but the fwallow alone, in general, wafhes on the wing, by dropping into a pool for many times together: in very hot weather houfe-matins and bank-martins dip and wath a little.-The fwallow is a delicate fongtler, and in foft funny weather fings both perching and fying; on trees in a kind of concert, and on chimney tops: it is alfo a bold flyer, ranging to dittant towas and commons even in windy weather, which the other fpecies feem much to diflike; nay, even frequenting expofed fea-port towns, and making little excurfions over the falt-water. Horfemen on wide downs are often clofely attended by a little party of fwallows for miles together, which plays before and belind them, fweeping around, and collecting all the foulking infects that are roufed by the trampling of the horfes feet: when the wind blows hard, without this expedient, they are often foreed to fettle to pick up their lurking prey.

This fpecies feeds much on little coleoptera, as well as on gnats and flies; and often fettles on dug ground, or paths, for gravels to grind and digeft its food. Mr White inforns us, that before they depart, for fome weeks, to a bird, they forlake houfes and chinneys, and roolt in trees; and ufually withdraw about the beginning of Othober; though fome few itragglers may be feen at times till the firtl week in November. Mr Pennant fays, that for a few days previous to their depattare, they affemble in valt flock; on houfe-tops, churches, and trees, from whence they take their flight ( $\Delta$ ). They are fuppofed to take up their win-ter-quarters in Senegal and parts adjacent; and feem to poficfs in turn the whole of the old continent, being known from Norway to the Cape of Good Hope on the one hand, and from Kamtichatka to India and Japan on the other. They are alfo found in all parts of North America, migrating north and fouth, as with us. Kalm fays, that in America they build in houfeg and under the outides of the roofs; allo on the mountains, in fuch parts of them as project beyond the bottom, as well as under the corners of perpendicular 1ocks.
2. The tahitica, or Otaleite fwallow, is five inches in length; its body is of a brown-black colour with a frining.
(1) See Micratiov.- Concerning the annual difappearance of thefe birds, however, naturalifs have enter"amed different opinions; a detail of which, as the fubject is curious, and would form too long a digreffon in this place, is referved for a feparate article. See Swileow.

## H I R

unso. fhining bluif glofs, the breatt of a fulvous purple, the abdomer of a footy brown; the bill, tail, and legs are black. It inhabits the mountainous parts of Otaleite. Sec Fig. i.
3. The efculenta, or edible fwallow, according to Bulton, is lefs than the wren, and only two inches and a quarter in length. The bill is black; the upper parts of the body are brown, the under whitifh; the tail is forked, and cacl feather of it tipped with white: the legs are brown. See Fig. 2.

Mr'Latham thinke, that the fize as above defcribed is by much too finall, as Mr Marden fays that the bird "appears to be the common martin ;"-" and (fays Mr Latham) we are much inclined to think that it is at ieall of that fize, from the eggs which accompany the nett now in the Britih muleum, which are as big as thofe of the martin, and of the fame colour. Ifowever, we cannot difpute the point." 'The moit curious part of the natural hiftory of this bird confits in the $n \in R$, which is compofed of fuch materials as render it not only edible, but one of the greateft danties of the Afiatic epicures.

Thefenefts (of which a particular account is given under the article $M_{I R D S}-\lambda^{r} / / s$ ) are found in vall numbers in certain caverns, in various ifles in the Soulo Archipelago, fituated between longitude 117 and 120 , latitude 5 and 7 ; particulanly in three fmall ines, or rather rocks; in the caverns of which the nefls are found fixed to the fides in atonihing numbers. "I'hey are alfo found in amazing quantities on a fmall illand called Toc, in the Atraits of Sunda; the catverns of which are lined with the netls: but nowhere in greater abundance than about Croce, near the fouth end of Sumatra, four miles up a river of that name. Brat they are not peculiar to the above places': for they are liketvife common from Java to Cochinchina on the north, and from the point of Sumatra well, to New Guinea on the eall ; where the fea is faid to be covered with a vifcous fubltance like half-melted gluc, which the bird is fuppofed eithe: to take up from the farface with its bill during tlight, or to pick it from the ruck: when left there by the waves. - Of thefe tiells, it is faid the Dutch alone export from Batavia 1000 pickles (B) every year, which are brought from the ifkes of Cu= chinchina, and thofe lying to the calt of them. It is much to be wondered, that, among other luxuits imported by us from the eall, the whe of thefe nefls thould not have fousd a way to our tables ; as being yet fos fearce in Eingland as to be kept as raritics in the cabirets of collectors. The birditfelf at Sumatra is lanown by the nance of Layonglayong.
4. The borbonica, or wheat-fivallow, is about the fize of the fwift: the plamage above is blackith brown ; bexeath grey, marked with longitudinal brown fpots: the tail is even at the end : the bill and legs are black. "This fpecies inhabits the Ifen of France; frefuenting piaces fown with wheat, and glades of woods; affecting cherated lituations, and frequently foer pereh. ed on trets and pomes. It fullows herds of cattle for the fake of the flies shich furround them; and is frequently feen in the wate of thips in great numbers, in :Vul. Vlll. Pare Il.
the road near the ifle, no doubt fur the fame purpofe. Hirunce. It is often obferved of eveniniss about the clefts in the mountains, where it is faid to pafs the right: and where it makes its $n=t t$, which is compofed of draw and feathers. It lays two eggs, of a grey coluur dotted with brown.
5. The francica, or grey rumped furallow, is in length four inches and a quarter; having the upper parts of the body blackilh, the rump and under parts whitifh or grey: 'This [pecies allo inhabits the Ille of France, but not in great numbers; and is found chiefly in the neighbourhood of freth waters. It fies fivift; and is feldom obferved to perch. It is fuppofed to refl in the woods at night, being feen ahout the fkirts of them :0wards evening. It is generally very leau, and not good food.
6. The urbica, or matin, is inferior in fize to the chimncy-fwallow, and its tail mach lefs forked. The head and npper-part of the body, except the rump, is black glolled with blue: the breall, belly, and rump, are white: the feet are covered with a fhort white down. This is the fecond of the fwallow-kind that appears in our courtry; and of its mauncrs and economy we have the following curious accomt in the Rev. Mr White's Natural Hiltory of Selborne. "I'hcy begin to appear about the 16 th of April; and for fome time they in general pay no attenion to the butinefs of nidification: they play and $\mathrm{C}_{\mathrm{r}}$ ert abont, cither to recrnit from the fatigue of their jonnere, if they do migrate at all; or elfe that their blood may recover its tue tone and texture afier it has been folome lerambed by the feverities of winter. About the middle of May, if the weather be fine, the martin begins to think in earnct of providing a mantion for its famly. The crutt or thell of this neft leems to be formed of fuch dirt or loam as comes moft readily to hand, and is tempered and wrought together with little bits of broken flaws to render it tough and tenacious. As this bird ofen build againft a perpendicular wall without any projecting ledge ninder, it requires its utmolt efforts to get the firil foundation firmly hixed, fo that it may fafely carry the faperdructure. On this occation the bird not only chngs woth its claus, but partly fupports itfelf by frongly inclining iss ail againt the wall, making that a fulernm; and thus fleadied, it works and plafters the materials into the face of the brick or thone. But then, that this work may not, whle it is fuft and green, puil itfelf down by its own weight, the provident architect has prudence and furbearance enongh not to advance her work ton fall; but hy buiding only in the morning, and by deticating the relt of the day to food and amufement, gives it fuffieient time to dyy and harden. About half an inch leem: so be a futhecient layer for a day. Thus carefnl workmen, when they build mutwalls (informed at firt perliaps by this little bird) raife but a moderate layer at a tienc, and then defitt; lett the work Coould becume top-thear, and fo be ruined by it 3 own weight. By this method in about 10 or 12 days is formed an hemifpheric netl, with a imall aperture towards the top, trone, compact, and warm: and perfedily fitted for all the purperes for which is was intend-

 Engths weight.--Sce V'oy, vol. ii. i. 132.

Hirundo. ed. But then nothing is more common than for the houfe-fparrow, as foon as the fhell is finimed, to feize on it as its own, to eject the owner, and to line it after its own manner. Afeef fo much labour is betlowed in ereting a manfirn, as natare feldum works in vain, matins will breed on for fereral years tugether in the fame neth, where it happens to be well hethered and fecure from the injuries of the weather. The thell or crult of the net is a fort of rultic-work, full of knobs and prosuberances on the mutide: nor is the infide of thofe that I have examined fmoothed with any exactnefs at all ; but is rendered foft and warm, and tit fur ircutation, by a lising of fmall thraws graffes, and feathers; and fometines by a bed of mofs aterwoven with wool. In this net they tread or engender, frequently daring the time of building; and the hen lays from three to five white eggs. At firt, when the young are hatched, and are in a maked and helplefs condition, the parerst thids, with tender afiduity, carry out what comes away fom their young. Was it not for this allectionate cleanlinefs, the nellines wrold foen be burnt up and deternycd in fo deep and hohtow a nelt by the ir own caultic excrement. In the quadruped creation the fane nedt precaution is made ufe of, particularly amomg dong and cats, where the dams liek away what proceeds frum cheir young. But in birds there feems to be a particular provifion, that the dung of nellliness is enveloped in a tough kind of jerly, and therefure is the eatier cunveyed off without foiling or daubing. Yet, as na. ture is cleanly in all her ways, the young perform this olfice for themfelves in a little time, by thruling their tails out at the aperture of their neit. As the young of fmall bids prefently arrive at their n"uiz, or "full groweh," they foon become impatient of confinement, and fit all day with their leeads out at the orilice, where the dame, by clinging to the nefl, fupply them with food from morning to night. For a time the young are fed on the wing by their parents; but the feat is done by fo quick and almont impereeptible a night, that a perfon mutt have attended very exactly to their mutions, before he would be able to perccive it. As foon as the young are able to hift for themfelves, the dams inmediately turn their thoughts to the bufinefs of a fecond brood : while the firft tlight, thaken off and rejected by their nurfes, congregate in great flocks, and are the birdithat are feen cluttering and hovering on funny mornings and evenings round towers and Ateples, and on the roofs of churches and houfes. Thefe congregatings ufually begin to take place about the firft week in Angult; and therefore we may conclude that by that time the firl flight is pretty well over. The young of this fpecies do not quit their abodes all tigether ; but the more forward birds get abroad fome days befure the reft. Thefe approaching the eaves of buillings, and playing about before them, make people think that feveral old ones attend one neft. They are often capricious in fixing on a nefling.place, begiuning many edifices, and leaving them unfinifhed; but when once a nefl is completed in a meltered place. it ferves for feveral feafons. Thofe which breed in a ready finifhed houfe, get the flart in hatching of thofe that build new by so days or a fortaight. Thefe induftious artificers are at the ir labe,uss in the long days before four in the morning: when they fix their materials, they plafter them on with their chins, moving their heads with a quick vi.
bratory motion. - They dip and wafh as they fly fumetimes in very hot weather, but no: fo frecquently as fwallows. Martins love to frequent towas. efpecially if there are great lakes and rivers at hand. They are by far the leall agite of the Britifh hirundines. their wings and tails are flort, and therefore they are not capable of fumblarprifing turns, and quick and glancing cuolutions as the fwallow. Accordingly, they make nife of a placid eafy motion, in a midule region of the air, follom mounting to any great height, and never fweeping long together over the furface of the ground or water. They do not wander far fur food; but affeet theltered diftiats, over fome lake, or under fome hanging wood, or in fome hoiluw yale, elpecially iu windy weather. They breed the latelt of all the fwallow kind: in $17 / 2$ they had nething on to Oito. ber the 21 it, and are never without unfedyed young as late as Michaclmas.-As the funmer delines. the congregating flocks increafe in numbers daily, by the conHant accelfion of the fecond brouls; till at ladl they fwarm in myrids upon myriads round the villages on the Dhames, darkening the face of the fiy as they frequent the aits of that river, where they rooit. They retire, the bulk of them I mean, in wat a seks torether about the beginning of Oet seer: bui have apperared of late years in a conli Jerable flighe in this neighburthood, for one day or two as late as November the 3 d and 6th, after they were fuppofed to have been gone for more than a fortnight. They therefore withuraw with us the latell of any frecies. Undefs thefe birds are very hort lived indeed, or unlefs they do not return to the ditrict where they are bred, they muft andergo vall devaftations fome how, and fome where; for the birds that return yearly, bear no manncr of proportion to the birds that retire."
7. The rufa, or rufous-lyellied fwallow, is of the fame fize with the former; and has the upper patta of the body uf a glofly black; the under rufuns, growing paler towards the vent: the forectead is whitim; and the bill and legs are duky. Thefe are found at Cayenne, and not unfrequently as far north as New. Yo.k. They build in houfes, without any mixture of mud ; fabricating the neft with mofs, dried plants, and Mort bits of Aick3, all united with a fort of gum, fo as fearee to be broken, and lined with feathers; fufpending it from the beams and rafters, fiucs of walls, and caves of horofes. It is fometimes a foot and a liale in length; and is fixer) by one of its folcs, the opening being made near the hottom. The female lays four ur five eggs; and the young go out as foon as their wings will fapport them.
8. The riparia, fand martin, or thore-bird, is 4 th inches in length, with the whole upper parts of the body of a moufe colour, the throat and under parts white, the bill and legs blackif. It is common about the banks of rivers and fand pits, where it terebrates a round and regular hole in the fand or earth, which is ferpentine, horizontal, and about two feet deep. At the inner end of this burrow does the bird depofit, in a good degree of fafety, her rude neft, confilting of fine graffes and feathers, ufually goofefeathers, very inartiticially laid together. "Though at firl (fays Mr White) one would be difinclined to believe that this weak bird, with her foft and tender bill and claws, flould ever be able to bore the nub-

## H I R

 with thefe fechle inflruments lave I feen a pair of them make great difpatch; and could remark how much they had fcooped that day by the frefl fand which ran down the bank, and was of a different colour from that which lay loofe and bleached in the fun. In what fpace of time thefe little artits are able to mine and finifh thefe capitics 1 have never been able to difcover: but it would be a matter worthy of obfervation, where it falls in the way of any naturalift to make his remarks. This I have often taken notice of, that feve. ral holes of different depths are left unfimithed at the end of fummer. 'To imagine that thefe beginnings were intentionally macic in order to be in the greater forwardnefs for neret fpring, is allowing perlaps too much forefight and rerum prudentia to a fimple bird. May not the caufe of thefe latedra being left unfinifhed arife from their mesting in thote places with itrata too harh, hard, and folid, for their purpofe, which they relinquifh, and goto a frefll fpot that works more freely? Or may they not in other places fall in with a foil as mucts too loofe and moudering, liable to flounder, and threatening to overwhelm them and their labours? One thing is remarkable-that, after fome years, the old hokes are forfaken and new ones bored: perhaps becaule the old habitations grow foul and fetid from long ufe, or becanfe they may fo abound with heas as to become untenantable. 'This feceies of fwallow morenver is Arangely annoyed with heas: and we have feen theas, bed heas (fulex irriluns), fwarming at the mouths of thefe thotes, like bees on the flools of their hives.The fand-mautin arrives much about the fame time with the fuallow; and lays, as the dues, from four to fix whiteqzs. Lut as this fpecies is cryptogame, carrying on the bufinefs of niditication, incubation, and the fupport of its young in the dark, it would not be caly to afeertain the time of breeding, were it not for the coming furth of the broodg, which appear much about the cine, or rather fomenhat earlier than thofe of the fwallow. The nellings are fupponted in common, like thofe of their congeners, with gnais and other finall infels: amed fonctinem they are fed with herllale (dra. gon Hien) ainouft as loug as themefoes. 'Thes hirundo is faid to lay cully once in a year, ant to produce its young more carly than the relt of its trbe : thoush from this latt circumflance it would feem probable that they breed at leaft at beond time like the houfe-martin and fwallow. It does not always take pains to make an hule for a weft; frectuenly laying in cavities of quarties, and in hohows of itces, where it is convenichet. When they la appen to breed near hedges and enelofures, they are often difpoffiffed of their brecding holes hy the houfe-fparrow, which is on the fame account a fell edverfary to houfe-martins. Thefe birundiner are rin fongters, but rather mute, making only a litte harth noife when a perfon approaches their neits. They feen not to be of a fuciable mirn, never with us congrepating with their congeners in the antumn. They have a peculiar manner of deing; fleting about with odd jerks and vacillations, not unlike the motions of a butterfly. Doubdefs the flight of all / /irundines is in. fluenced ly and adapted to the peculiar fort of infects which furnifh their fond. Herice (fays Mr White) it would be worth inguiey to caametne what particular
genu: of infects affords the principa! food of eack Hiruoum refpective fpecies of frallow.
9. The montana, or crag-fwallow, is about the fize of the martin, and in its upper plumage like the fand-martin: the under part of the bady is rufous, the tail is fearcely forked; the legs are covered with grey down mixed with browa; the bill and the claws are black. Thefe birds inhabit the rocks and crags about Savoy; arriving there the middle of A pril, and departing the 15 th of Augutt, for the moll part; now and then fome flragglers retnain to the ecth of October. This fpecies is alfo found in the mountains of Auvergne and Dauphine; and Specimens have beea received from Gibraltar.
10. Thic purpurea, or purple fwaliow, is in lenech feven inches, and the whole body is of a deep violet, very gloffy: the quills and eail are of the fame colour, but fill deeper, and the laft forked: the legs and claw are blackin; and the bill is black. The colour of the female is dufky brown, with a tlight tinge of violet. This fpecies is found in fummer in Carolind and Virginia; coming in May, and retiring at the approach of winter. The common people are very fond of them; and make little conveniences of boatds on the outfides of their honfes for the birds to build in, like as is done for Sparrows in England; being defirous to keep them near, as they are of much ufe in alarming the poultry of the approach of the hawk and other birds of prey; not onty thriaking violently on the appearance of thefe enemies, but attacking them with all the eflurts of our martins in Europe. See fig. 4.
11. The apus, or fivift, is a large fpecies, being near eight inches long, with an extent of wing near eighteen inches, though the weight of the bird is only one ounce. Their feet are fo fmall, that the action of walking and rifing from the ground is extremely difficult; fo that nature has made it full amond, by furnifhing it with ample means for an eafy and continual tight. It is more no the wing than any other fwallow; its flight is more rapid, and that attended with a hrill fercam. It refts by clingine againt fome wall, or other apt body; from whence hlein Atyles this fpecies birundo muraria. It breeds under the eaves of houfes, in fleeples, and other lofty buildings; and makes its nefl of graftes and feathers. The feet of this fpecies are of a praptictular ftructure, all the toe's ftanding foreward. the leaft conifils of only one bone; the others of an equal number, viz. two each; in which they differ from thofe of all other birds: a conftruetinn, however, nicely adapted to the purpofes in which their feet are employed.
'Ihe frift is a fummer inhabitant of thefe kingdoms. It comes the lateft, and departs the foomeft, of any o: the tribe; not always flaying to the middle of Angut, and often not arriving before the beginning of MayA pair of the fe birds were found adhering by their claws, and in a torpid flate, in Fcb. 1766 , under the roof of Longnor chapel, Shropfhire; on being broughe to a fire, they revived, and moved about the room.
The fabulous hiftory of the manuiodiata, or hird of faradife (fays Mr l'ennant), is, in the hiflory of thits ipecies, in gerat meafure verified. It was believed to have no fect; to live upon the celeftial dew ; in flat perpetirally on the atmofphere; and to perform all its furctions in that element. The fuift aetually proved of the former, except the fnall time it takes in lecping, and what it devotes to incubation; every other action is done on wing. The materials of its noll it collects cither as they are carried about by the wiuds, or picks them up from the furface in its fweeping fight. Its food is mendeniably the infocts that fill the air. Its driuk io taken in tranfient fips from the water's furface. Even its amorous rites are performed on high. Few perfons who have attended to them in a fine fummer's moming, but muft have feen them make their aerial conffes at a great height, encircling a certain fpace with an caly fleady motion. On a fudlen they fall into each others embraces, then drop precipitate with a loud fhriek for numbers of yards. This is the critical conjuncture ; and to be no more wondered at, than that infects (a familiar inflance) mould difcharge the fame duty in the fame element.

The fwift is a moft alert bird, riling very early, and retiring to roofl very late; and is on the wing in the height of fummer at leat fixteen hours. In the longeft days it does not withdraw to reft till a quarter before mine in the evening, being the latelt of all day birds. Juft before they retire, whole groups of them aftemble high in the air, and fqueak, and fhoot about with wonderful iapidity. Dut this bird is never fo much alive as in fultry thundery weather, when it expreffes great alacrity, and calls forth all its powers. In hot noomings feveral, getting together in little parties, dafl round the Reeples and churehes, fqueaking as they go in a very clamorous mamer: thefe, by nice obfervers, are fuppofed to be males ferenading their fitting hens; and not without reafon, fince they feldom fqueak till they come clofe to the walls or eaves, and fince thofe within utter at the fame time a little inward note of complacency. When the hen has fat hard all day, he rufhes forth juft as it is almot dark, and ftretches and relieves her weary limbs, and fnatches a ccanty meal for a few minutes, and then returns to her duty of incubation. Siwifts, when wantonly and cruelly fhot whik they have young, difcover a little lump of infects in their mouths, which they pouch and hold under their tongue. Ingeneral, as already obferved, they feed in a much higher dittrict than the other.fpecies; they alfo range to valt diftances; fince locomotion is no labour to them, who are endowed wihh fuch wonderful powers of wing. At fome certain tinaes in the fummer, however, they have been obferved hawking very low for hours tugether over pools and fireams; and upon inquiring into the object of their purfuit that induced them to defeend fo much below their wiual range, it has been found that they were taking thrysanca, ephemerp, and libiltula (cadew-flies, may-fies, and dragon-flies), that were juft emerged out of their zurelia llate. It appeared then no longer a wonder that they fhould be fo willing to floop for a prey that afforded them fuch plentifal and fucculent nourihment. -Swifts fometimes purfue and Arike at hawk that come in their way; but not with that vehemence and frery that fwallow's exprefs on the fame occafion. They are out all day long in wet days, feeding about and difregarding thill rain: from whence two things may be gathered; firt, that many infects abide ligh in the air, even in rain ; and next, that the feathers of thefe tirds muit te well preened to refift fo mueh wet.
they difike; and on fuch days withdraw, and are fearce ever feen. - 'There is a circumitance refpecting the colour of fwifts (Mr White remarks), which feems not to be unworthy our attention. When they arrive in the fpring, they are all over of a glofly dark footcolvur, except their chins, which are white; but, by being all day long in the fun and air, they become quite weather-beaten and bleached before they depart, and yet they return gloTy again in the ipriner. Now, if they purfue the fun into lower latitudes, as fome fuppofe, in order to enjoy a perpetual fumner, why do they not return bleached ? Do they not rather perhaps retire to rell for a feafon, and at that juncture mocilt and change their feathers, Gace all other birds are known to moult foon after the feafon of breeding?
"Swifts (continues our author) are very aumalous in many particulars, diffenting from all their congeners not only in the number of their young, but in breeding once in a fummer; whereas all the other Britifh horundines breed invariably twice. It is palt all doubt that fwifts can brecd but once, fince they withdraw in a hore time after the fight of their young, and fome time before their congeners bring out their fecond broods. We may here remark, that, as fwifts breed but once in a fummer, atd only two at a time, and the other hirundines twice, the latter, who lay from four to fix.eggs, increafe at an average five cimes as fatt as the former. But in nothing are fwifts more fingular than in their early retreat. They retire, as to the man body of them, by the tenth of Augult, and fometimes a few days fooner: and every Atrabgler invariably withdraws by the twentieth, while their congeners, all of then, llay til the beginaing of Octuber; many through all that month, and fone ocentionally to the begianing of November. This early retreat is myferious and wonderful, lince that time is often the fwectelt feafon in the year. But, what is more extraordinary, they begin to retire till earlier in the not foutheriy parts of Andalufa, where they can be no ways influenced by any defect of̂ leat ; or, as one might fuppofe, defect of food. Are they regulated in their motions with us by a failure of forst, or by a propenfity to moultiarg, or by a difpolition to rell after fo rapid a life, or by what? This is one of thofe incidents in natural haftory that not only bathes our fearches, but alinott eludes our gueffes!"

Swifts never perch on trees or roofs, and fo never congregate with their congeners. They a:e fearlefs while haunting thcir melling places, and are not to be fcared with a gun; and are often beaten down with poles and cudgels as they floop to go under the eaves. Mr White informs us, that having untiled part of a roof over the neft of a fwift, the dam notwithitanding fat in the neft: fo ftrongly was the aftected by natural crogin for her brond, which the fuppofed to be in danger, that, regardlefs of her own farcty, the would not ilir, but lay fullenly by them, pernitting herfelf to be taken in latid. Swifts are much infunted with thofe pelte to the genus called hippobofare birundinis; and often wriggle and feratch themfolves, in their flight, to get rid of thai clinging annoyance. And young oncs, over-rum with thefe infects, are fometimes found under their netls, fallen to the ground; the number of vermin sendering their abode infupportable.

## H 1 R

Swifts are no fongters, and have only one harfin fcreaming note; yet there are ears to which it is not difpleafing, from an agreeable alfociation of ideas, finec that note never occurs but in the moft lovely fummer weather. 'I'hey never fettle on the ground but through accident ; neither can they walk, but only crawl; but thry have a ftrong grafp with their fect, by which they cling to walls, as alreally noticed. Their bodies being lat, they can enter a very narrow crevice; and where they cannot pafs on their bellies, they will turn up edgewife.-In London a pariy of fwifis fiequents the tower, playing and feeding over the river juit below the bridge: others haunt fome of the churches of the borough next the fields; but do not ventare, like the houfe-marein, into the clofe crowded part of the town. The Swedes have beftowed a very pertinent name on this fwallow, calling it ring. Fura, from the perpetual nings or cincles that it takes round the feene of its nidification. - As thefe birds are apt to catch at every thing on the wing, many have taken them by a bait of a cockchafer tied to a thread, which they have fwallowed as frecly as a fith theirs. In the 1he of Zant, the boys are faid to get on an clvated place, and merely with a hook baited with a feather, have cavght five or fix dozen of them in a day. Belides our illand, the fwift is known to inhabit the whole of the European continent; and has alfo been noticed at the Cape of Good Hope, and Cotolina in North America. Hence, moll likely, a general inhabitant of both the old and new ermanents.
12. The ambrofiaca, or ambergris fwallow, is about the fize of a wren, with grey plumage and a very forked tail; the bill is blackim, and the legs are brown. It ishabits Senegal, and is faid to finell very frong of ambergris.
${ }^{1} 3$. The pelafyia, or aculeated fwallow, is fome what lefs than our chimuey-fwallow: is phumage is brown, but at the throat whitih, and all the tail feathors are terminated by a bare pointed hlaft. It inlabits Caro. lina and Virginia in the fummer time, and builds in chimneys. Sce fir. 3 .
14. The mellba, or white-bellied fwift, is in length 8 $\frac{1}{5}$ inches, and weighs two ounces five drams: the bill is half an inch, fomewhat bent, and black: the epper parts of the body are of a grey brown; the wings and tail deepeft, with a glofs of red and green in fome lights: the threat, breall, and belly, are white; on the neck is a collar of grey brown, mised with blackith : the fides are dukfy, and white mixed; luwer part of the belly, and under tail-coverts, the fame as the back : the legs are fleth coloured, and covered with feathers on the fore part and infide: all the toes are placed forward, as in our fwift. This bird inhabits the mountainous parts of Spain; buiding in the holes of rocks. It is found alfor on the borders of the Rhone, in Savoy, the ine of Malta, Alps of Switzerland, and rock of Giluraltar. It comes into Savoy the beginning of A pril, and frequents the ponds and marthes for 15 or 20 days; after which it retires to the mounsainous parts to breed. It flies higher than our fwift; but feeds on the fame food, and its foth is accounted a delicate morfel. This fpecies is not numerous. Scopoli fays it builds on the fummit of the mountains of 'Tyrol.
15. The evennenfe, or white-coloured frallur, is
about the fizc of the martin: the lead and bill are Hirundo. black; the chin and throa: white, palfing from the lall in a narrow collar round the reck: between the bill and eye is a freak of white, which fork sof into two; one paffing a little above aul the other a litele way beneath the eve: the relt of the plumage is black, with a glofs of viole:; but the greater coverts, nearent he body, are bown, edged with white: the quills and tuit are black; the iaft forked: the legs are black; and all the four toes placed before as in our fivife, and covered with feathers ts the claws. - This bird makes is nefl in the houfes at Cayenoe. It is of a large fize, in thape of a truneated conc: five inches one way by three the other, and nine inches in length. It is compured of the dowa of dogs-bane, well wove tugether; the ca. vity divided ubriquely auout the middle, lengthays, by a partition, which freads itfelf over that part of the nett where the eggs lic, which is pretty near the bafe: a fmall parcel of the fame foft down, forming a kind of Flug, is placed over the top, ferving to keep the young trond from the impreffion of the air ; from which we may fuppofe them to be very tender.
16. 'the erythrocephala, or red-beaded fwallow, has a red head, with a thort flat dufiy bill : the back is dufky, the feathers edged with white: the under parts of the body are white, the tail coverts pale brown: the wings are buth dufky; as is alfo the tail, which is a litele forked. It inhabits India; and is only the lize of a fmall humming-bird.
17. The nigra, or black fwallow, meafures near fix inches in length: the colour of the bird is wholly black, and the tail is furked. It inhabits st Domingo and Cayenre; but is not numerous. It is often feen to perch on dead trees; and only inhabits dry favannas inland. It fcoops out a hoie in the earth, half a foot in length, the movala of it very fmall, fo as juil to permit entrance: in this cavity it conteucts the be? and rears the young.
18. The dominicenas, or St Domitgo fwallow, is 7 inches in leagth, and wholly black, with the glofs of polithed acel, except the belly and meder tail coveris, which are white: the tail is very little forked: the legs, bill, and claws are brown. It inhabits S: Domingo, and other of the Weft Incia iflanjs, in May, June, and July; and is faid to imita:e a lark in its fong.
To this article we may not impropetly farion the following paper (from the Genteman's Magazine) on the usiliy yof enculraging the breed of fwills...s, fuifts, and martins. "The adrantages that acciue to man, from the docility with which the domellisated animals accommodate themfehes to his ufes, are obvious. But there are others, who attend on him of their own accord, whofe beneficial exertions are litile known or obferved. Among thefe I firal! at prefent only notice the family of fwallow ( (irumbints); of the four kinds of which bird found in our iflond thrte attach themfelves to his dwolling as if pectuianty fulicitous for his welfare. This connextion feems for reciprocal, that where men do not intahit, few frallews can find proper convenicuces for their fummer-rsfidences; and as their foud conitits wholly or minets. the mof diligent inquirer hath not becn able to di:cover that they infuc in the Rifhter degrec the produatious of the in tu uegarder: a ciocumbare nearly for
copving the Crecian writers, brings againt them, of killing bees, is in wis country groundlefs, and I apphlend it to be fo in every other:

$$
\text { Cerg.t. } 4 \cdots 23 .
$$

Yor the mouths of the fwallow tribe are by no ineans adaped to catch llinging infects with impunity. 'I'he binds who prey on bees lave a long extended bill eonflructed for that purpole, very different from that of the fwallow.
"By the nyriads of infects which every fingle brood of twallows deflroys in the courfe of a fummer, they detert us in a great meafure from the perfonal and domeltic annoyance of fies and gnats; and, what is of infmitely more confequence, they keep down the wambers of our mimute enemies, who, either in the grab or winged itate, wonld otherwife render the labours of the hufondman fruitlets. Since then firallows are guadians of our corn, they fhould every where be protecied by the fame popular veneration which in Egypt defencs the Ibis and the fork in Holland. We more frequently hear of unproductive harvefts on the Continent than in this country; and it is well known that fwallows are caught and fold as food in the markets of Span, France, and Italy. When this practice has been very general and fuccefsful, I have little doubt that it hath at times contributed to the fearcity of corn. In England we are not driven to fuch refources to furnif our tables. But what apology can be maje for thofe, and many there are, whole eencation and rank fionld have tanght them more innocent amufements, who wantonly murder fwallows, under the idle pretence of improving their kitl in fhooting game? Setting afide the crucliy of farving whole nelts of young by killing the dain; they who follow this barbarous diverfion would do well to reflect, that by every twallow they kill, they affitt blatts, mildews, and vermin, in cauling a fcareity of bread. Every lord of a manor flould reftrain his game-keeper from this exe. crable practice; nor thould he permit any perion to fport on his lands who does not refrain from it. For my part, I am not athamed to own that I have tempted martins to build around my honfe, by fixing efcallop hells, in places eonvenient for their pendant beds and procreant cradles ; and have been pleafed to obterse with what caution the little archited raifed a buttrefs under each fhell before he ventured to form his neft on it.
"What has induced me to fend you thefe flrictures at this time, are the accounts of the ravages commit. ted on the cultivation of corn in the United States of North America, by an infect calted the $H_{i}$ fan F . $/ \mathrm{y}$. (See the article Hfissisin-Fly.) How far there is danger of this defolating fcourge being imported into this cuuntry by the admiffion of Ameriean wheat, I muft leave to abler entomologitls to decide. Bui that this deftructive infect fhould, as hath lately been afferted, totally difappear in one feafon, after having. for a mumber of years fuccelfively laid wathe wide extended diftricte, is a plaxnomenon hardly to be affented to by

$$

" Might I not here enlarge on the importance of Hi reftarches into the works of the creation, when we fee fatefmen, as in the prefent intance, making folemn applications to thofe who are Rudions of mature, requelling their dircction how to avoid the calamity apprehended from a fly? And may we not then add, that the minutet obfervations of this kind are only deemed trivial by the indolent and uninformed?
" I recollect but a fingle complaint againft the fwallow, and that is made by Anacteon, Od. 12. who bitterly reproaches this bird for diturbing him by its twittering while he was dozing away the iatoxication of the preceding night. Yet, had the poet been temperate, like Milton, he would with pleafure have arifen from his bed at the charm of earliell birds.
" With what joy the Grecians welcomed the return of the fwalluw, appears by the very ancient carol preferved by Athenxus; of which the following is a tranflation:-

[^15]HISPA, in zoology ; a genus of infects belonging to the eolcoptera order, the eharacters of which are thefe: The antenne are fufform, growing gradually larger from each extremity towards the middle; and CC: are fituated between the eyes: the thoras and elytra are covered with protuberances or fpines. The larva of this infeet feems to be yet wholly unknown. There are but two fpecies of the perfect animal met with in Europe ; one of which, the atra, is found in Britain, and is all over of a decp unpolifhed black, and has the up. per part of its body entirely covered with long and ftrong pines, which render it briftly like the fhell of a chefnut. There is even a fpine at the cafe of the antenne: the thoras lias a row fet tranfverfely, which are forked; and the elytra are firnifhed with a very great number that are fingle. Its being thus covered with fpines, makes it refemble a hedje-hog in miniature, It is rather hard to catch, letting it lelf fall down on the ground as foon as approached. It bears its antenre upright before it.

HISPALIS a town of Brtica, in the Farther Spain ; an ancient mart or trading town on the Bretis, navigable quite up to it for hips of burthen, and thence to Corduba for river barges. Called Colonia Romulenfis. It has alfo a conventus juridicus, a court of juftice, or aftizes, (Pliny). Now called Seville. W. Long. 6o. N. Lat. 37.

HISPANIA, called Hefperia Uhima, (Horace), becaufe the weltmont part of Europe; alfo Iberia, from the river Iberus. Its name Hifania, or Spania,

## H I S

iolz. (Greck), is of Phanician original, from its great number of rabbits : the Phonicians, who fettled feveral colonies on the coaft calling it Spanjab from thefe an:mals. It has the fea on every fide, except on tha: next to Gaul, from which it is feparated by the Pyrences. The Romans at firt divided it into the Farther and Hither Spain, under two protors. In that flate it continued down to Augutus; who divided the Farther Spain into Bratica, which he left to the people to be governed by a pro conful; and into lutiana, which he alded to his own provinces: calling the Hither Spain Tarraconenfis Hifpania was a c cuntry celcbra. ted for its fertility, of which it has greatly fallen fhort in modern times. 'lhe people were of a warlike turn, (Strabo); and their bodies being formed for hardhips and labour, they ever preferred war to peace, and were remarkably prodigat of life (Jultin, Sil. Italicus). Sipain produced feveral great men, buth in a literary and a political capacity. See Span.

HISPANIOLA, called alfo St Dusixgo, the larget of the Antilles or Caribbee illands, extending about 420 milcs from ealt to wett, and 120 in breadeh from norsh to fouth; lying between $17^{\circ} 37^{\prime}$ and $20^{\circ}$ of N. Lat. and between $67^{\circ} 35^{\prime}$ and $74^{\circ} 15^{\prime}$ W. Long. The climate is hot, but not reckoned anwhulefome; and fome of the inhabitants are faid to arrive at the age of 120. It is fometimes refrefhed by breezes and rains; and its falatrity is likewife in a great meafure owing to the beautiful variety of hills and valkeys, woods and rivers, which every where prefent thenfelves. It is inteed reckoned by far the finell and molt pleafant in and of the Antillis, as being the bett accommodated to all the purpofes of life when duly cultivated.

This ifland, famous for being the carliear fettement of the Spaniards in the new world, was at fint in light eltimation for the quantity of gold it fupplied: : his wealth diminifhed with the inhabitants of the country, whom they obliged to dig it out of the bowels of the earth; and the fource of it was entirely dried up, when they were exterminated, which was quickly done, by a feries of the mont flocking barbarities that cver difgraced the hiftory of any nation. Denzoni rilates, that of two millions of inhahitants, contained in the inand when difcovered by Columbus in $1^{1+92}$, fearce 153 were alive in 1545 . A vehement detire of openiag again this fource of wealth infpired the thought of getting flaves from Africa; but, befides that the fo were found unfit for the labours they were dellined in, the multitude of mines, which then began to be wrought on the continent, made thofe of Hifpaniula no longer of any importance. An idea now fuggeited itfelf, that their negroes, which were healthy, Itrong, and patient, might be ufefully emplayed in hulbanilry ; and they adopted, through neceffity, a wife refonusion, which, had they known their owa interef, they would have embraced by choice.

The produce of their indultry was at firl extremely fmall, becaufe the labourers were few. Charles V. who, like moll fovereigns, preferred his favcurites to every thing, had granted an exclufive right of the flave.trade to a Flemih nobleman, who made over his privilege to the Genoefe. Thofe avaricious republicans conducted this infamous commerce as all mono-
polies are conduâted; they refulved to foll dear, and Hifariole they fold but few. When time and competition had fixed the natural and neceffary price of flaves, the number of them increaied. It muy eafly be inazined, that the Spaniards, who had been aceufomed ts treat the Indian: as bealts, did not entertain a bisher opinion of thefe negro Atricans, whons they fubtlituted in their place. Desraded still farther in their cyes by the price they has paid for them, even religion could not rettrain them from aggravatiog the weight of their fervituds. It became intulerabic, and thefe wretched fives made an eniort to recover the unalicnable righs of mankind. Their atempt proved mancefofal ; but they reaped this benetit firm their defpair, that they were afterwards treated with lef inhumanity.

This moderation (if tymany cramped by the apprehenfion of revole can deferve that name) was a:tended with good confequences. Cultivation was purfued with fome degree of fuccefs. Soon after the middle of the 16 th century, the mother conatry drew annually from this colony ter millinns weisht of Sugar, a large quantity of wood for dyins, tithacco, cocoa, caffia, ginger, cotton, and peltry in abminjance. One might imsorine, that fuch favourable hegionings would give both the defire and the means of carrying then firther; bu: a train of ceents, more fatal each than the other, ruined thefe hopes. ${ }^{\text {w }}$

The tirf misfurtune arofe from the depopulation of the inlans. The Spanifh ennquefts on the continent thould naturally have contribated to promote the fuccefs of an illand, which gature feemed to have formed tu be the centre of that vall dominion arifing aronnd it, to be the itaple of the different colonies. But it foll out quite otherwife: on a view of the inmenfe fortunes raing in Mexico, and other pates, the richell iuhabitants of Hifpaniola began to deipife their fetthements, and quit:ed the true fource of riches, which is on the fueface of the earth, to go and rawack the bowels of it for veins of gold, which are quiekly cx. hauted. The government endeavoured in vain to pat a ftop to this emigration; the laws were always either antully eloded, or openly wistated.
The weaknefs, which was a neceflary confequence of luch a conduct, leaving the coafs without defence, encouraged the enemies of Spain to ravage them. Even the capital of this inh was taken and pillaged by that celabrated Eaglifh Cailor, sir Francis Dudke. The cruizers of hefs confoguence con:en:ed themfelves with intercepling veffels in their parage through thote latitudes, the bell known at that tiase of any in the new world. To cample:e thefe rrisfortuncs, the CaAilians themfeles commerced pirates. They attacke! no Mips but thofe of their oan mation; which were more rich, worle provided, and worfe defeoded, than any others. The cuftom they had of fiting ont hips clandutinely, in order :o procurc flaves, prevep:ed them from being known; and the aftitance they pirchafed from the thips of war, commifioned to protect the trade, infured to them impuaisy.

The foreign trade of the colory was its only refource in this diatrefs; and that was illicit: but as it continued to be carried on, notwithitanding the vigilance of the governors, or, pethaps, hy their connivancen
difanda the pulior of an cxafperated and thot- hghted cont exerted itfof in demoliding mot of the lea-ports, and deving the miferable inthatants into the inlamb comery. "rlas ate of folence threw them in'o a late of dejection; which the inemrions and lettenent of the Fremh on the ifand aftewards carricd to the utmot piteh. 'The latter, after having made fome nufuccefforal attempts to fette on the itland, had part of it vielded to them in song, and now erjuy by far the belt hare.

Spain, totaily taken op, with that vall empire which the had formed on the continent, ufed no paims to diffipate this lethargy. She even refufed to lillen to the folicitations of her Flemill futieets, who camently pressed that they might have perminion to clear thofe fertile lands. Rather than ram the iok of keing them carry on a contrabond traie on the coalt, the chofe to blery in oblivion a lettlement which hal beea of confequence, and was likely to become fo a rain.

This enfory, which had no longer any intercourfe with the mother conntry but by a fingle thip, of no great burthen, that arrived from thence cecry third year, confilled, in $1-17$, of 18,410 inhabitants, including Spaniards, Mellece, Negrues, or Mulattocs. The complexion and charefter of thefe people differed aecording to the difficent propurtions of American, European, and African blood they had received from that natural and tantient union which retores all races and conditions to the fame level. Thice demi-favages, plunged in the extreme of hoth, lived upon fruits and roots, dwelt in cottares withont furniture, and mool of them without clothes. The few amone then, in whom inQulence lad not totaily fuproctied the fenfe of decency and tate for the conveniences of life, purchafed chenhes of their neightours the French in return for their cattle, and the money iout to them for the maintenance of two hendred foldiers, the prietts, and the goverment. It doth not appear that the company, formed
 the re-ethathithentat of St Donsingo, hath as get made any contiderable prorrefi. 'I'hey fead out only two fmall whels annualle, whic! are freighted back with tix thouland hicks. and fonve sther commoditics of little wolue. Suce St Das: vos.

HASMER, ir zoclogy; a genis of the coleoptera order of infects. 'lhe dint atticulation of the antennx is comprufted and carvet; the lat is confiderably larger than the others, and appeats to be a folid knob: the head i, chama within the bosy: the mouth is forcipated; the elytra are fherter than the body; and the forelegs are dentates. The body of thefe creatures is polifhed and rery hining, and their form almoll fquare; the chorax lage, and highly polithed: anteriorly it is made with a fope, in the cavity of which is lodged the head, the poftion of which is often crly difcovered by the projection of the masiinie; for the head, for the mod part, is fo witherawn under the thorax, that the infect looks as if is had none. The elytra are as if it were cut or towards the extremity, and do not cover the whole of the abdomea. They are extremely footh, and only lave a few Arix, fearce perceptible, lituated chichy towards their outward dide. Lafly, the hinder part of the abdomen, which projeats beyond the elytra, is round and blunt. Thefe infects are fometimes found in cow dung, and often on fand. They vary prodigiounly in lize; but differ very little either in form or colour, they being all very dark. The larva, as well as the perfect infects, are frequently met with in the dung of horfes, cows, \&c.

HISTORIOGRAPHER, a profeffed hiftorian, or vriter of hiftory. See the next article.

The hitioriographer to his majetty is an officer under the lord chamberlain; his falary 2 CO . fer annam. There is an office of the fame kind in Scotland, with the fame falary.

## $\begin{array}{llllll}\mathrm{H} & \mathrm{I} & \mathrm{S} & \mathrm{T} & \mathrm{O} & \mathrm{R} \\ \mathrm{Y} .\end{array}$

1
 fome rematable facts which have happened in the worlj, ananged in the trae order in which they actually tork place, tofether with the caufes to which they were owing, and the different effects they have produced, as far as can be diforerti.-The word is Greck, :rraz and liteally denotes a fearch of curious thing or a detire of knowiug, or even a rehearfa! of things we have feen ; being formed from the yerb $\mathrm{I} \cdot \mathrm{v}$, which properly fignities to know a thing b; having feen it. Byat the idea is now much more ex. tenfive, and is applicd to the knowledge of things taken from the report of others. The origin is from the verb snuc, " 1 know ;" and hence it is, that among the ancients fercral of their great men were called Palyifines, i. e. perfons of various and general knowlodge.

Sometimes, however, the word hifory is wfed to figrify a difcripution of things, as well as an account of facts. Thu Theophatus calls his work, in which he las trated of the natare and properties of phats, ar higory of entits; and we have on tratice of in itute, 21 154
intitued an hifory of animals; and to this day the defcription of plants, animals, and minerals, are called by the general name of naturul hijpory.

But what chiefly merits the name of hiftory, and Hira what is here confidered as luch, is an account of the how priscipai tranfactions of mankind fince the beginning ded. of the world ; and which nat!rally divides itfelf into two paits, namely, civil and ect-ffalical. The firtt contains the hillory of mankind in their various relations to one another, and the ir behar:our, for their own emolument, or that of others, in common life; the fecond conliders them as acting, or pretending to act, in obedience to what they beliere to be the will of the Supreme Being.-Civil hillory, therefore, includes an account of all the differert thates that lave exifted in the world, and likewife of thofe men who in different ages of the world have moll eminently dititinguihed themfelves either for their good or cvil actions. This latl part of civil hiltory is wfually termed Brocraphy.

Fithory is now contidered as a very confiderable branch of polite literature: fow accomplihnents are more vaiued than an accurate knowledge of the hiftoriee
ries of different nations; and fcarce any literary production is more regarded than a well-written hiftory of any nation.

With regard to the Itudy of hiftory, we mult confider, that all the revolutions which have happened in the world, have been owing to two caules. I. The connections between the different flates exifting together in the world at the fame time, or their different fituations with regard to one another; and, 2. The different characters of the people who in all ages conflituted thefe flates, their different geniufes and difpofitions, \&e. by which they were either prompted to undertake fuch and fuch actions of themfelves, or were eafily induced to it by others. The perfon who would fudy hiftory, therefore, ought in the firlt place to make himfelf acquainted with the flate of the world in general in all different ages; what nations inhabited the different parts of it ; what their extent of territory was; at what particular time they arofe, and when they declined. He is then to inform himelf of the various events which have happened to each particular nation; and, in fo doing, he will difcover many of the caufes of thofe revolutions, which before he only knew as facts. Thus, for inflance, a perfon may know the Roman hiftory from the time of Romulus, without knowing in the lealt why the city of Rome happened to be built at that time. This cannot be underftood without a particular knowledge of the former flate of Italy, and even of Greece and Afia; feeing the origin of the Romans is commonly traced as high as Neneas, one of the heroes of 'lroy. But when all this is donc, which indeed requires no fmall labour, the hiftorian hath yet to fludy the genius and difpofitions of the different nations, the eharacters of thofe who were the principal directors of their actions, whether kings, minifters, generals, or priefts; and when this is accomplifhed, he will difcover the caufes of thofe tranfactions in the different nations which have given rife to the great revolutions above mentioned: after which, he may affume the character of one who is perfectly verfed in hiftory.
The firl outline of hiftory, as it may be called, is moft eafily obtained by the iufpection of an hittorical chart; and that fubjoined to the prefent treatife will anfwer the purpofe as well as any. Along with this it will be proper to perufe a fhort abridgement of general hiftory, from the creation of the world to the prefent time; but in this way there have been but very few attempts attended with any tolerable fuccefs. The following is collected from refpectable authorities, and may ferve to help the ideas of the reader on this fubject.

## Sect. I. Civil Hifory.

History, though feemingly ineapable of any natural divifion, will yet be found, on a nearer infpection, to refolve itfelf into the following periods, at each of which a great revolution took place, either with regard to the whole world, or a very contiderable part of it. I. The creation of man. 2. The flood. 3. The beginning of profane hillory, i. e. when all the fabulous relations of heroes, demi-gods, \&̌c. were expelled from hiforical narrations, and men began to relate facts with fome regard to truth and credibility. Vol. VIII. Partll.
4. The conquet of Babylon by Cyrus, and the deAtruction of the Babylonian empire. 5. The reign of Alexander the Gieat, and the overthrow of the Perfian empire. 6. The dellruction of Carthage by the Romans, when the latter had no longer any rival eapable of oppofing their deligus. 7. The reign of the emperor Trajan, when the Roman empire was brought to its utmoft extent. 8. The divifion of the empire under Conftantine. 9. The deflruction of the weflern empire by the Feruli, and the fettlement of the different European nations. 10. The rife of Mahomet, and the conquelts of the Saracens and Turks. 1t. The crufades, and all the face intervening between that time and the prefent.

Concerning the number of years which have elapled fince the creation of the world, there lave been many difputes. The compilers of the Ltiverfal Hitory determine it to have taken place in the year 430 B. B. C. fo that, according to them, the woild is now in the Gogoth year of its ayse. Others think it was ereated nnly 4000 years $B$. C. Fo that it hath not yot attained surtaceits bocoth year. Be this as it will, however, the c whe of whole account of the creation re"s on the truth of the becreation Mofaic hiftory; and which we mut of neceffity ac- iton'thyy cept, becaufe we can find no other which does not pronc. either abound with the groffelt abfurdities. or leat 115 into abfolute darknels. The Chincfe and Egyptian pretenfions to antiquity are fo abfurd and ridiculous, that the bare reading muft be a fufficient confutation of them to every reafonable perfon. See the articles Chisa and Egypt. Some hiftorians and philofophers are inclined to difcredit the Mofaic accounts. from the appearances of volcanoes, and wther natural phicnomena : but their objections are by no means fuffeime to invalidate the authority of the facred writings; not to mention that every one of their own fyttems is liable to infuperable ohjections. See the article Eartu. It is therefore reafonable fur cuery perfon to accept of the Mofaic acenunt of the creation as truth : but an hiftorian is under an abfolute neceflity of doing it, becaufe, without it, he is quite dellitute of any ilandard or fcale by which he might reduce the chronoligy of different nations to any agreemene; aucl, in thort, without receiving this account as true, it would be in a manner impofible at this day to write a general hiltory of the world.

1. The tranfactions during the fint period, viz. from He ${ }^{5}$ the creation to the flood, are very much unknown, no. fonm the thing indeed being recorded of them but what is to be creation te found in the firt fix chapters of Genelis. In getieral, the food. we know, that men were not at that rime in a favage flate; they had made fome progreis in the arts, had invented mulic, and found out the method of working metals. They feem alfo to lave lived in one ratt commantiö, without any of thofe divilions into different nätions which have fiuce takeu place, and which evidernly proceeded from the confurion of languages. The molt material part of their hittory, however, is, that having once begun to tranfortefs the diviae comnands, they proceded to greater and greater lengths of wickednefs, till at laft the Deity thought proper to fend a flood on the earth, which dellryed the whole hatman race except eight perfons, viz. Noah and his family. This terrible cataftrophe happened, according to the Hebrew copy of the Bible, $16 j$ je years aficr
$+A$ the
the creation: accorting to the Samaritan copy, 1307. For the dille ear conjectures concerning the natural caufes of the food. we the article Diluge.
2. For the hatury of the fecond period we muft again hase recourle to the Suptures, almolt as much as for that of the firlt. W"e now find the human race reduced to cighe pertions proltoffed of on thing but hat they hand faved in the whe ant the whate wold to he kad with animals trom thofe which had been prefered along whin thefe cigt pertoris. In werat country their origimal fettememt was, ha new $i$ ns is made. The ark is fopponded have reted wom Mont Ararat in Ar. men id * ! !nt it is imporithle to k ow whether Noals and his Cous made any llay in the notighoumhool of this mountain of not. Certan it is, that, fome time affer, the whole or the mreatiol put of the human nace were allambicl in Babylonia, where they enaged in building a tower. This gave offence to the Deity; fo that he punithed them by confounding their lanEvage; whence the divifion of mankind into different nations.

According to a common opinion. Noah when dying left the whole woll to his rias, griving Alia to shem, Africa to llam, and Earope tu Japlect. But this

Nation- de tien.ed 2ften JaI lace. hath mot the leal fommation in scripture. By the mot probathe acomuts, Gomer the fon of Japhet was the father of the Gomsisus or Celtes; that is, all the harbanobe na ions who inhabied the wonthern parts of Limope anicr the vanom names of Gauls, Cims. Lrians. Goths. \&ce and w'on allo migrated into spain, when they nors called Celtiterians From Bjagug, Meffech, and Pubal, three of Comer's brethern, pro. ceeded the Leythan. Samatian, Partars, and Moguls. The threc other hons of Japhet, Madai, Javan, and Tiras, are fad to buve been the fathers of the 8 Mede, the Imiatr, Greks, and Phra tans
From shem Thesthlien of Shem wele Elma, Ahar, Arphaxad, Lud, and Arans. "The lint fettled in Peride, watere fee wan the father of that mirghey nation: 'The defeen. dants of A!hur peopled Angria, (now Curdellan): Arphaxad fettled in Chaktaza. Lud is fuppoled by Jofophas to have taken up his relidence in Lydia; thragh this is much controverted. Aram, with more certainty, is thought to have fettled in Mefopotamia and Syria.

The childen of Ham were Cuh, Mizraim, Phut, and Caraan. Ther firl is thourht to have remainal in Bablonia, and to have been king of the fouthcathern pats of it afteruards catled Khbueflen. His delcendants are fuppofed to have removed into the callero parts of Arabia; from whence they by degrees migerated into the correfonding part of Africa. The fecond peopled Egrpt, Ethiopia, Cyraaica Libya, and the reft of the ourthern pasts of the fane continent. The place where Phut fettled is not known : but Cansan is miverfatly allowed to have fettled in Phomicia: and tehave founded thofe nations who inlrabited juldea, and were atterwards exterminated by the Jews.

Atmoll all the countries of the word, at leaf of the caltern continent, being thus furnibed with inhabitants, it is probable that for many yeare there would be few or wo quarrels between the different nations. The pancity of their numbers, thei- dillance from one
another, and their diverfity of language, would contribute to keep them from having much commnnication with each other. Hence, according to the different circumbances in which the different tribes were placed, fone wouk! be more civ lized and others more barbarous. In this mtcrval, alle, the different nations probably acquired different characters, which afterwards they obttinately retaised, and masifefted on all occafions; hence the propenfity of fome nations to monarchy, as the Aliatics, and the enthutatic detire of the Grecks for libuty and republieamim, \&e.

The hegimine of monarchical government was very early; Nimrod the fors of Cult naving found means to make hinfelf king of babylonia. In a thort time A. Thun emprated from the new kingrdom; buile Nincereh, Afyria, 8 afterwards capial of the Affyian empire; and two other cities calli-d Reaen and Nebaboth, concerning the lituation of which we are now much in the dark. Whether Athur at this time fet up as a king for himfelf, or whether he held thefe cities as vaffal to Nimrod, is now mknown. It is probable, however, that about the fame time varions kingdoms were founded in different parts of the world; and which were great or fmall according to different circumilances. Thus the feripture mentions the kings of Egypt, Gerar, Sodom, Gomotrah, \&e. in the time of Abraham; and we may reafonably fuppofe, that thefe kings reigned over nations which had exilted fur fome conliderable time Unfore.

The frit confiderable revolution we read of is the Mirrat migation of the Ifraclites out of $1 \cdot y y p t$, and their of the eltablifhment in the lan! of Canaan. For the hittory of trachse thefe tanfactions we mult refor to thi Old Tiftanent, from Eg where the reader will fee that it was attended with the moll terrible cataltrophe to the Egyptiaus, and with the utiter extermination of fome nations, the defeendants of Han, who inhabited Iudxa. Whether the overthrew of Pharaoh in the Red Sea could aflcet the Egyptian nation in fuch a manner as to deprive them of the greatell part of their former learning, and to keep them for fome ages ater in a barbarous llate, is not ealily determined; but unlefs this was the cate, it feems excetdingly difficult to account for the total filence of their records concerning fuch a remarkable event, and indeed for the general confufion and uncertainty in which the early hittory of Egypt is involved. The fettlemeot of the Jews in the promifed land of Canaan is fuppofed to have happened about 149 BC . C.

For near 203 years after this persod we find no Hilary accounts of any other nations than thofe mentioned in the Gre fripture. About 1280 B. C. the Greeks began to make other nations feel the effects of that enterprifing and martial fpirit for which they wert fo remarkable, and which they had monoubtedly exercifed upon one another long before. Their firtt enterprife was an invafon of Colchis (now Mingrelia), for the fake of the golden Aleece. Whatever was the nature of this expedition, it is probable they fucceeded in it ; and it is likewife probable, that it was this fpecimen of the siches of Alia which inclined them fo much to A fatic expeditions ever after. All this time we are totally in the dark about the fate of A fia and Africa, except in fo far as cali be conjectured from feripture. The ancient cmpires of Babylon, Affyria, aud Perfia, pro-
bably fill continued in the former continent, and Egypt and Ethopia feem to have been confiderable kingdons in the latter.

About $118+$ years B. C. the Greeks again diftin. guifhed themfelres by their expedition againit Troy, a city of Phygia Minor; which they plundered and burnt, maflacring the inhabitants with the mofl unrelenting cructty. Eneas, a Trojan prince, efcaped with fome followers into Italy, where he became the remote founder of the Roman empire. At this time Greece $\boldsymbol{x}$ as divided into a number of fmall principalities, mott of which feem to have been in fubjection to Agamemnon king of Alycene. In the reign of Atreus, the father of this Agamemnon, the Heraclide, or deicendanes of Hercules, who had been formerly banimed by Euryfthe us, were again obliged to leave this country. Under their champion Hyllus they elaimed the king. dom of Mycenze as their right, pretending that it belonged to their great ancettor Herculcs, who wds unjuftly deprived of it by Euryfheus*. The controverfy was decided by lingle combat; but Hyllus being killed, they departed, as had been befure agreed, under a promife of not making any attempt to riturn for 50 years. About the time of the 'Trojan war, alfo, we find the Lydians, Mylians, and fome other nations of A. fia Minor. firft mentioned in hiltory. The names of the Greek fates mentioned durng this uncertain period are, 1. Sicyon. 2. Leleg. 3. Meflna. 4 Athens. 5. Crete. 6. Argos. 7. Sparta. 8. Pelafgia. 9. 'Iheffaly. 10. Attica. 11. Ihocis. 12 Locris. 13. Ozela. 14. Cormeh. 15. Eleuana. 16. Elis. 17. Pilus. 18. Arcadia. 19. Egina. 20. Ithaca. 21. Sephalone. 22. Phthia. 23. Phocidia. 24. Ephyra. 25. Eolia. 26. Thebes. 27. Calitia. 28 . E. tolia. 29. Duloppa. 30. Oechalia. 31 Mycenx. 32. Eubcea. 33. Myna. 34. Doris. 35. Phera. 36. Iola. 37. Trachina. 38. Thrafprocia. 39. Myrmidonia. 40. Salamine ti. Scyros. 42. Hyperia or Melité. 43. The Vulcanian ifles. 44. Megara. 45. Epirus. 46. Achaia. 47. The illes of the Egean Sca. Concerning nauy of thele we know nothing befides their names: the moft remariable perticulars concerning the reft may be found under their sefpective articles.

About $104^{8}$ B. C. the kineriom of Judea under king David approached its urmult extent of puwer. In its molt flourithing condition, however, it never was semarkable for the largenefs of its territory. In this refpect it fearce exceeded the kingdum of seutland; though, according to the acconnts ifiven in feripture, the magnificence of Solomon was fuperior to that of the moft potent monarchs on earth This extraordinary wealth was oxing partly to the fpoils amafted by king David in his conquefts over his varions ememies, and partly to the commerce with the Eall Indies which Solomon Iad edablifted Of this cunmerce be owed his thare to the friendthip of IHram king of 'Tyre", a city of Phonicia, whole inhabitants were now the mof famed for commerce and fkill in maritiune affairs of any in the whole world.

After the death of Solomon, which happened about 975 B. C. the Jewulh empire began to declinc, and foon after many powerful fistes arole in different parts of the world. The difpoliton of markind in gemeral feems now to have taken a new turn, not ealily ac.
counted for. In former times, whaterer uars mignt have taken place betwern nerghbonring nations, we have no acennent of dry extenfive empice in the whole world, or that any prince undertook to reduce far diIlant nation. :o his fubjection. "The empure of Ereypt indeed is faid to have been extended immenfely w the calt, even before the days of Sefolltis. Of alis country, however, our accounts are fo imperfect, that farce any thing can be concluded from them. But now, as it were all at once, we hidd almoft every nation aiming at univerfal monarchy, and refuline to fot any bounds whatever to is ambition. The firl thock given to the Jewifh grandeur was the divifion of the kingdom into two through the imprudence of Keho. buam. 'This rendered it more ealily a prey to Sh- fhak king of Egypt; who five ytars after ca"ue and pillaged Jerufatem, and all the fortified cities of the kingdon of Judah. "The commeree to the Ealt Indies was now difcontinued, and conirquently the fources of wealeh in a great meafure fopped; and this, added to the perpetual wars bewween the kings of Ifrael and Judah, contributed to that rematable and Speedy decline which is now fo ealily to be obfersed in the Jewifh affairs.

Whether this king Shifhak was the Sefoltris of profane writers or not, his expedition againft Jorufalem as recorded in feripture feems very much to refemble the: defultory conquatts aferibed to Scfotris. His infantry is faid thave been innumerable. compofed of different African nations; ana his cavaliry 60,000, with 12.0 chariots; which agrees pretty well with the mighty armament aferibed to Sefoltris, and of which an account is given under the aticle Egypt, no 2. There indeed his cavalry are faid to have been only 24,000; but the number of his chariots are increaled to 27,000 ; which lat may not mareafonably be reckoned an exaggeration, and thefe fuparnumerary chariots may have been only cavalry: but unlefs we allow Sefottris to be the fame with Shifat, it feems imponfibie to fix on any other king of Eirypt that can he fuppofed to have undertaken this expedition in the days of silomor.

Thourh the Jows obtained a temporary deliverance from Shifhak, they were quickly after attacked by new encaties. In 94, B.C. one Zerah an Eehiopian invaded Judra with an army of a milli $n$ of infantry and 300 charints; but was deivated woth great 気authter hy Afa king of Judah, who engared him with .f. It an army of 580,000 neen. Abuut this time alfo we rians. find the Syrians grown a confinerable people, and bitere enemics beth to the kinge of 1 frael and Jucah; aming in fact at the conquett of buih nations. I lacir kingecom conmenced in the days of David, under Hadadeser, whofe capital wa. Zobah, and who prohelly was at latt ubliged to become David's triburaly, after having been defeated by him in feveral engagements. Before the death of David, however, ane Keron. who it feems had rebelled againt Hadadezer. haviniz fonind means to make himfelf malker of Damaleus, crected there a new kingdom, whicl! foon became very fowerful. The Syrian princes being thus in the ncighbourhood of the wo tival ftates of Ifrael and J niah ( - hofe capitals were Samaria and Jetulalem), fuund it an eafy matter to weaken them both, by pretendins: to affif the one againt the other; but a detail of he
tranlactions
tranfactinns between the jews and Syrians is only to he found in the Old 'retament, to which we refer. In $\quad f 0$ B C. lowever. the Syrian empire was totally defroyed uy lighath Hider kine of Afyria; is was alo the kingeon of Samaria by Shamanefer his fucceffor in 721 . 'The people were cither maflucred, or carricd into captivity into Mcdia, Pernia, and the countries abon: the Cafpian Sea.

While the nations of the call were thas deltroying each other, the founda:ions of very formidable emfires were laid in the weth, which in procifs of time were to fivellow up atmon all the eatcrn ones. In Africa, Carthage was founded by a 'lyrian colony, about rion B. C. according to thofe who aforibe the híhet actiquty tollore city : but, according to others,
 a very confaterable revelution took place about goo 8.. C. The Heraclida, whom we have formerly feen expelled from Grecec by Aireus the father of Agamemnon, after fereral unfucesfoful attempts, at haf conquat the shole Peleponnefus. From this time the Erectan thates became rome civilized, and their hithory becones 1 fis obfure. The intlitution, or rather the revival and continuance, of the Olympic games, in $7-6 \mathrm{~B} . \mathrm{C}$. alfo greatly facilitate the writimg not only of their hitlory, but that of other nations; for as each Olympiad conlitted of four years, the chronology of every important event becamic indubitahly fixed by referving it to luch and fuch an Olympiad. In $748 \mathrm{~B} . \mathrm{C}$. or the latk year of the feventh Olympiad, the foundations of the city of Rome were laid by Romulus; and, 43 years after, the Spartan llate was new modethod, and received from Lyeurgus thofe laws, by obferving of which it afterwards arrived at fuch a pitch of Plendor.
State of the 3 . With the beginning of the 28 th Olympiad, or 598 woill at D.C. commences the third general period above menthe beginr: arithe thard yene :41 evind. tioned, when profane hiftory becomes fomewhat more clear, and the relations coucerning the different nations may be depended upon with fome degree of cer- tinucy. The general flate of the world was at that time as follows. - The northern parts of Europe were wher thioly inhabit.d, or filled with unknown and barbarous nations, the ancellors of thofe who afterwards deltroned the Roman empire. France and Spain were inhabited by the Gomerians or Celtes. Italy was divided into a number of petty tates, ariling partly from Gaulith and partly from Grecian colonies; among which the Romans had already become formicdale. They were governed by their king Ser, ius 'lullius; had increafed their city by the demolition of Alba Longa, and the removal of its inlasbitants to Rome; and had enlarged their dominions by feveral - itics taken from their neighbours. Greece was alfo sivided into a number of fmall flates, amnog which the Athenis:s and Spartans, being the moft remark. atle, were rivaio to each uther. The former had, about 593 B C. reccived an excellent legiflation from sulon, aid were entiching themfelves by navigation and commerce : the later were become formidahle by the martidindtintions of Lycurgus; and having concueted Mdfan, and added its turitory to their own, were juflyett cented the mon powerful people in Greece. The other Itates of moll condderation ware Corinth, 'fhates: Amer, and arcadia-In Ala great revoln-
tions had taken place. The ancient kingdom of $A[$. fyria was deftroyed by the Medes and Babylonians, its capital city. Ninevel utterly 1 dined, and the greateat part of its inhabitants carried to Babylon. Nay, the very materials of which it was built were carried off, to adorn and give ftrength to that tately metropolis, which was then undoubiedly the firft city in the world. Nobuchadnezrar, a wife and valiant prince, now fat on the throne of Babyon. By him the kingdom of Judar was totally overthrown in 587 B . C. 'Three years before this he had taken and razed the city of I'yre, and over-ran all the kingdom of Egypt. He is con faid by Jolephns to have conquered Spain, and reigned there nime years, after which lot abandoned it to the Carthaginians ; but this feems by no means probatble. The extent of the Babylonian empire is not cestainly known : but from what is recorded of it we mas conclude, that it was not at all inferior even in this refpect to any that ever exilted; as the feripture tulls us it was fuperior in wealth to any of the fucceeding ones. We know that it comprehended Phocnicia, Palettine, Syria, Babylonia, Media, and Pertia, and not improbably India alfo; and from a confideration of this valt extent of teritory, and the riches with which every one of thefe countries abounded, we may form fome idea of the wealth and power of this monarch. When we confider alfo, that the whote Arength of this mighty empire was employed in beautifying the metropolis, we cannot look upon the wonders of that city as related by Herodotus to be at all ineredible. See Babyloy; and Architrcture, n ${ }^{1}$ 3. As to what paffed in the republic of Carthage about this time, we are quite in the dark; there being a chafin in its hiftory for molefs than 3 vo years.
4. The fourth general period of hiftory, namely, from Fourth the end of the fabulous times to the conquath of Ba. riol. fory of
bylon by Cyrus, is very thort, inchading no more than Buylor 3i years. This fudden revolution was occafioned by entpirc. the mifconduct of Evil merodach, Nebuchadnezzar's fon, even in his father's lift-tine. For having, in a great hunting match on occalion of his mariage, entered the conntry of the Medes, and fome of his troops coming up at the fame time to relieve the garrifons in thefe places, be joined them to thofe already: with him, and without the leall provocation began to plunder and lay watte the neighbouring country. 'This produced an inmediate revolt, which quiekly extended over all Media and Perfar. The Medes, headed by Aftyages and his fon Cyaxares, drove back Evil-merodach and his party with great flughter ; nor doth it appear that they were afterwards reduced even by Nebuchadnezzar himfelf. The new empire continued daily to gather ftrength; and at lall Cyrus, Aftyages's grandfon, a prince of great prudence and valour, being made generaliffimo of the Median and Perlian forces, took. Labylon itfelf in the year 538 Bl . C. as related under the article Dabruon.

During this period the komans inereafed in power of the under the wife adminillration of their king Servius Tullius, who, though a pacific prince, rendered his pcople more Cormidable by a peace of 20 years than and Pe his preleceffors had done by all their victories. The fians. Greeks, even at this early period, began to interfere with the Perfiams, on account of the Lonians or Grecian colonies in Afia Minor. Thefe had been fub-
dued by Crofus king of Lydia about the year ${ }_{5} \mathrm{O}_{2}$, the time of Nebuchadnezzar's death. Whether the Lydians had been fubdued by the Batylonifh monarch or not, is not now to be afcertained; though it is very probable that they ware ether in fubjection to him, or greatly awed by his power, as before his death nothing confiderable was undertaken by them. It is indeed probable, that during the infanity of Nebuchadnezzar, fpoken of by Danicl, the affairs of his kingdom would fall into confution; and many of thofe princes whom he formerly setained in fuljection would fet up for themfelves. Certain it is, however, that if the Babylonians did net regard Croefos as their fubject, they looked upon him to be a very faithful ally; infomuch that they celebiated an amual falt in commemoration of a victory obtained by him over the S'cythians. After the death of Nehuchadnczear, Creefus fubdued many nations in Alia Minor, and among the reft the Ionians, as already related. 'They were, however, greatly attached to his govermment ; for though they paid him tribute, and were obliged to furnith hin with forme forces in time of war, they were yet free from all kind of oppreffion. When Cyrus therefore was proceeding in his conquefts of different parts of the Babylonifh empire, before he proceeded to attack the capital, the Ionians refufed to fubmit to him, though he offered them very advantageons terms. But foon after, Crocfus himfelf being defcated and taken prifoner, the Ionians fent ambafladors to Cyrus, offering to fubmit on the terms which had formerly been propofed. Thefe terms wete now refufed; and the Ionians, being determined to refilt, applied to the Spartans for aid. Though the Spartans at that time could not be prevailed upon to give their countrymen any affitance, they fent ambaffadors to Cyrus with a threatening meflage; to which be returned a contemptucus anfwer, and then forced the Iomians to fubmit at diferetion, five years before the taking of Babylon. Thus conmenced the hatred between the Greeks and Perfians; and thus we fee, that in the two fint great monarchies the feeds of their deftruction were fown even before the monarchies themfelves were eftablithed. For while Nebuchaduezzar was railing the Babylonifn empire to its utmont height, his fou was dellroying what his father built up; and at the very time when Cyrus was eltablifhing the Perfian monarchy, by his ill-timed feverity to the Greeks he made that warlike people his enemies, whom his fucceftors were by no means able to relint, and who would prohably lide overenme Cyrus himfelf, had they united in order to atack him. The tranfactions of Africa during this period are almol entirely unknown; though we cannot doubt that the Carthaginians entiched themfelves by means of their commerce, which enabled them afterwards to attain fuch a conliderabic thate of powtr.
5. Cyrus having now become matter of all the eat, the Afiatic affairs continued for fome time in a llate of tranquillity. The Jews obtained leave to return to their oivn country, retuild their temple, and again efablifh their workip, of all which an account is given in the facred writings, thougl undoubtedly they muit have been in a llate of dependence on the Perliats from that time forward. Cambyfes the fucceffor of $\mathrm{C} y-$ rus added Egypt to his empire, which had either not fubmitted to Cy:us, or revolted foon after his death.

He intended alfo to have fubdued the Carthaginians; but as the Phoenicians refufed to fupply him with hlips to fight againlt their own countrymen, he was obliged to lay this defign afide.

In 517 B . C. the Babylonians finding themfolves grievounly oppreffed by their I'erfian mafters, refolved to fhake off the yoke, and fet up for themfles. For this purpofe, they took care to fore their city with all manner of provifions; and when Darius Hyllafpes, then king of Perfia, advanced againit them, they took the moft barbarous method that can be innagined of prevating an umecelfary confumption of thofe provifions, which thay had fo carcfully amaffed. Ilaving collected all the women, old men, and children, into one place, they flangled them withour dilfinction, whether wives, fathers, mothers, brothers, or filters; every one being allowed to fave only the wife he liked bett, and a maid fervant to do the work of the houfe. This cruel policy did not avail them: their city was taken by treachery (for it was impoffible to take it by foree) : after which the king caufed the walls of it to be beat down from 200 to 50 cubits height, that their flrength might no longer give encouragemeut to the inhabitants to revolt. Darius then turned his armes againt the Seythinns; but finding that ex. pedition tun out both tedious and unproftable, he directed his courfe eatward, and seduced all the comtry as far as the river Ladus. In the mean time, the Ionians revolted; and being affited by the Greck:, a war conmenced between the two nations, which was not thoroughly extinguifhed but by the delf:action of the Perian empire in $330 \mathrm{~B} . \mathrm{C}$. The Ionians, however, were for this time obliged to fubmit, aftu at war of fix ycars; and were treated with grat feverity by the Perfians. The concquelt of Grecece ifflf was ther. projected: but the expedicions for that purpofe anded molt nufortunately for the Perfians, and enconta od the Creeks to make reprifats on them, in which they fucceeded acoording to their utmoft withes; and had it only been pollible for them to bave agreed amorig themelves, the downfal of the Perfian empice would have happened much fooner than it did. See Athlas, Sparta, Macedon, and Persia.

In 459 B. C. the Egyptians made an attempt to recover their liberty, but were reduced after a war of fix years. 111 413 B. C. they revalted a fecond time: and being affilled by the Sidonians, drew upon the latter that terrible deftruction foretold by the prophets; while they themfelves were fo thomughly humbled, tiat they never after made any atiempt to recover their liberty.

Thie year 403 B. C. proved remarkable for the reyolt of Cyrns dyaint his brother Artaxeras: Myemon; in which, through his own rafluefs, he mifearried, and tont his life at the battle of Cumasa in the province of Babylon. Tou thoufand Greeh mercenaties, who ferved in his army, made their way back into Greece, though) :0 furrounded on all fides by the enemy, and in the lieart phon's reof a hothle country. In this retricat they were com- traca. manded by Xenophon, who has received the higheit praifes on account o: his conduct and military Rill in minging it to a happy conclution. Two years after, the invalions of Agclilaus king of Sparta threatenecl the Perfian empire with total diftruction; from which, however, it was retieved by his being recalled in order

## Hittory of

 the Giselisto defend his own country a $\sin$ ft the other Grecian flatss: and after this the Pulfina affairs continned in a more profperons way thll the time of Alexander.

During all this time, the volatile and gieldy temper of the Giseck, to ether with their enthufiditic defire of romantic exploits, were preparing fetters for themfelves, which indeed feemed to be abrolutely neceflary to prevent them from deftrosing one another. A geal for tiberty was what they all protended; but on ceery occation it appearcd, that this lose of libert? vas only a detine of domimion. No Hate in Grecece could bear to fee another equal to iffle: and hence the ir perpetual contults for pre-eminence, whicin could not but waken the whole budy, and render them an tafy prey to an ambitious and polit c priace, who was capable of ta king adrantage of chofe divifions. Being all equally impatient of rellaint, they never could bear to fubmit to any regular gevernment; and henee their determinations wote anthing but the decifions of a mere mobs. of which the had afterwards almolt con tamity reafon to repent. Hence alfo their bafe treatment of thofe eminent men whon they oughe moit to have honoured; as Miltiades, Aritides, Triemittocks, Alcibiales, Socrates, Phocion, \&c. The various tramlations between the Grecian llates, thongh they make a very confiderable figure in particular tiflory, make none at all in a general tketeh of the hillory of the world. We thatl therefore only ohferve, that in 404 B . C. the A. thenian power was in a manner cotally broken by the taking of their city by the Spartans. In $3 ; 0$, that of the Spartans received a fevere check from the The bans at the batule of Leuctia; and eight years after was ftill further reduced by the battle of Mantinea. Epaminondas the great enemy of the Spartans was killed; but this only proved a more fpeedy means of fubjugating all the llates to a foreign, and at that time defpicable, powr. The Macedonians, a barbarous vation, lying to the north of the liates of Greece, were two years after the death of Epaminondas reduced to the lowelt ebb by the lllyrians, another nation of barbarians in the neighbouh hood. The king of Macedon being kithed in an engagement, Plilip his brother departed from Thebes, where he had itudied the art of war under Epaminiondas in order to take poffeftion of his kingdom. Being a man of great prodence and policy, he quickly fetted his own affairs; vanquifhed the Ilyrians; and, heing no ftranger to the weakened fituation of Greece, began almolt immediately to meditate the conquelt of it. The particulars of this enterprize are related under the article Macedon: heie it is fuf. ficient to take notice, that by lirt attacking thofe he was fure he conid overcome, by corrupting thole whom he thought it dangerous to attack, by fometines pretending to aflit one thate and cometimes ancolter, and by impofing upon all as belt leved his turn, he at latt put it out of the power of the Grecks to make any refitance, at tail fuch as could beep him from gaining his end. In $33^{8}$ B. C. he procured himfelf to he clected general of the Amphictyons, or commeil of the Grecian ftates, mider pretence of fetting fome troubles at that time in Grece: bur having onec vetained liberty to enter that country with an atmy, he quickly convinced the liates that they mult all humit to his will. He was oppofed by the Athenians and Thebans; but the intefline wars of Gertece had cut of
all her great men, and no general was now to be found capathe of oppung Philip with finceds.

The king of Macedon, being now mafter of all Greece, projected the conquett of Afia. To this he was eneouraged by the ill luccefs which had attended the Pertians in ther expeditions againt Greece, the fuccettes of the Greeks in their invations, and the retreat of the ten thoufand under Xenophon. All thefe events thoved the weaknefs of the Perlians, their valt infetiority to the Greeks in military kill, and how eafily their empire mighe be overthrown by a proper union among the tlates.

Philip was preparing to enter upon his grand defign, Conqu when lie was murdered by fome affalfins His fon A. Perfia lexander was polfeffed of every quality neceffary for alexar the exccution of fureat a plan; and his impeturfity of temper made hin execute it with a rapidity unheard of ein!er before or fince. It mult be conteffed, inderd, that the Pertian empire was now ripe for deAtruction, and conld not in all pobability have withflood an enemy much lets powerfol than Alexande:The A liaties have in all ages been much inferior to the Europan mations in valour and military thill. They were now funk in luxury and effeminacy; and what was worf, they feem at this period to have been feized with that infatuation and diftrastion of counfelt whieh farce ever fails to be a foremumer of the deflruction of any nation. The Perfian miniters perfuaded their fovereign to reject the prudent advice that was given him, of ditreffing Alexander by laying walte the country, and thas forcing him to return for want of provifions. Nay, they even prevented him from engaging the enemy in the mot proper maner, by dividing his forces; and perfuaded him to put Chatidemus the Athenian to death, who had promifed, with 100,000 men, of whom one third were mercenaries, to drive the Greeks out of Alia. In hort, Alexander met with only two checks in his Perfan expedition. 'The one was from the city of Tyre, which for feven months refilted his utmot efforts; the other was from Memnon the Rhodian, who had undertaken to invade Maeedonia. The firlt of thefe obitacks Alesander at laft got over, and treated the governor and inhabitants with the utmoth crusty. The other was ficarce folt; for Memuon died aficr reducing fome of the Grecian illands, and Darius had no other general eapable of conducting the underaking. The puwer of the Perfian empiite was totally broke by the victory gained over Dansus at Abctain 331 13. C. and next year a total und was put to th hy the murder of the king by Beflus c.ne of his fubjects.

The ambition of Alcxander was not to be fatisfied Hise ${ }^{2}$ with the pelfethun ot the kingdom of Perfia, or indeed quef of any other on carth. Nothing lefs than the total ther futjoction of the worded itfelf fetmed fulicient to lim; ; ons and therefore he wa now prompted to invade every country of which the could only leara the name, whether th had belonged tu the Peffians or not. In condequence of this difforition, he invaded and reduced Hywania, B. ctria, mogdia, and all that valt tract of comatry now calted Budharia. At lath, having entered India, tex reduced all the nations to the riser Hyphafis, me of the banches of the hodus. But when he would have proceceled iarther, and extended his conquefts quite to the eaftern extremities of Alia, his

Shirurintr．
troops pofitively refufed to follow him farther, and he was conftrained to return. In 323 , this mighty conqueror died of a fever; without having tine to fettle the affars of his valt extended empire, or even to name his fucceffor.

While the Grecian empirc thus fuddenly fprung up in the eaft, the rival flates of Rome and Carthage were making confiderable advances in the well. The Romans were eftablifhing their empire on the mof folid foundations: to which their partucular fituation naturally contributed. Being oricinally littie better than a pareel of lawlefs bandicti, they were defifed and hated by the neighbouing flates. This foon produced wars; in which, at firll from acendental circumflances, and afterwards from their fuperior valour and conduct, the Komans proved almolt contandy vietorions. The jea loulies which prevailed among the Itdian flates, and their ignorance of their true intereft, pevented them from combuning againlt that afpiring nation, and cruthing it in its intaney, which they might aftily have done; while in the mean tirae the Romans, being kept in a ftate of continual warfare, became at laft fuchexpert foldiers, that no onker ftate on carth could relit them. During the time of their kings they had made a very confiderable figure among the Italian nutions; but after their expulition, and the commencement of the republic, their conqueds became much more rapid and extentive. In 51 B . C. chacy fubdued the Sabines: eight years after, the Luttins; and in 399 the city of Vei, the frongeft in Italy excepting Rome it. felf, was taken after a liege of ten years. But in the midt of their fuccelfes a fudden irruption of the Gauls liad almont put an end to their power and nation at once. The city was hurnt to the ground in $3^{8} 3$ B.C. and the capitol on the point of being furprifed, when the Gauls, who were clinbing up the walls in the night, were accidentally difcovered and repulfed *. In a fhort time Rome was rebuilt with inuch greater fplendor than before, but now a general revolt and combination of the nations formerly fubdued took place. The Romans, however, filll got the better of their enemies; but, even at the time of the eeldrated Camil. lus's death, which liappened about 352 B C. their territories farce extended fix or fexen leagryes from the capital. The republic from the bermming was agitated by thofe diffenfons which at hat proved its ruin. The people had been divided by Ronulus into two clafles, namely Patricians and Piclcians, anfweting to our notility and commonalty. Between thete two bodies were perpetual jealoufies and contentions; which setarded the progrefs of the Roman compuells, and revived the hopes of the nations they had conguer. ed. The tribunes of the people were perperualiy oppofing the confuls and inilitary tribuncs. The fente had often recourfe to a dictatur endowed with abfolute power; and then the val ur and experience of the $R$, man troops made them vistorious: but the return of domelfic leditions gave the futjurated nations a: op. portunity of flaking off the yoke. Thus had the Rumans continued for near 400 years, runuing the fame round of wars with the fame enemies, and reap. ing very little advantage from their conquell., till at latt matters were componaded by eloofing one of the confuls from among the plebeians; and from this time chielly we may date the proferity of Rome, fo that
by the time that Alexander the Great ditu they were held in confiderable eflimation amoner foregn nations.

The Cathaginians in the mean time continned to enrich themfelves by commerce; but, being lefo converfant in multary affairs, were by no meangectual to of the carthe Romans in power, though they excetlet thein in and of $\mathrm{S}_{1}$ wealth. A new ftate, however makes its appiarance cily. during this period, whill may be faid to have tanght the Carthaginians the ars of war, and by bringiop them into the nei, hbourh od of the Romans, promed the firtt fource of contention betwen thefo wopowerful nations. 'This was the inlond of Bicily. At what time people were finf fetted on it, is not now to be afcertained. The lirf inhabitanis we lead of were called Sicani, Siculi, Lafrigumes, \&s. but of liefo we know little or nuthing. In the fecond year of the 17th Olympiad, or 7:0 13. C fome Greek colonics are faid to have arrived on the ifland, and in a thurt time founded fersal citics, of which Syracufe w is the chief. The Sy racufans at laflimbdued the origimal imbabitants ; thongh it doth not appear that the latter were ever well aflected to their governanent, and therefore were on all uccafions ready to revolt. 'The dirlt conliderable prince, or (as he is called by the Greeks) tyrant of Syracufe, was Gelon, who obiained the fovercignty about the year $4^{83} \mathrm{~B}$. C. At what time the Carthayinians firlt carried their arms into Sicily is not certainly known; only we are ailured, that they poffefud fome part of the illand as early as 505 13. C. For in the time of the firf confuls, the Romans and Carthaginians entered into a treaty chiely in regard to mathers of navigation and commerce; by which it was flpolated, that the Romans whon flould touch at Sardinia, or that part of Sicily which belonged to Cartlage, fhould be received there in the fame manner as the Carthaginians themfelves. Whence it appears, that the dominion of Carthage alrcady extend. ed over Sardinia and part of Sicily: Lut in 29 years after, they had been totally driven out by Getho: which probably was the firlt exploit performed by him. This appears from his fpeech to the Achenisn and Spartan ambaffacors who defreal his affllance againt the forces of Xirxes king of Perfia. The Carihasio nians made many attempetsto regain heir polefram in this illand, which occafioned long and bloody wars between them and the Grecks, as related under ble drtives Carthage and Siculy This illand ales praved the foene of much flaghter and bloodibed in the wars of the Criceks with one anothor ${ }^{+}$. Before the year see Atpers. $\hat{j}=3$ B. C. however, the Cartharimians hat nate them. ${ }^{\text {and Sparts. }}$ Lilves mallers of a very confiderable part of the inand; form whence all the power of the Creeks eonld not diflodge them. It is proper alfo to obetere, that afo ter the deltruction of Tyre by Alexater the Great, almoll all the comenerce in the wethen part of the world tell to the thare of the Carthaginians. Whether they had at this time male any fettements in Spain, is no: known. It is cerain. that they traded to that ceantry for the fake of the filver, in which it was very rich: as they poolsably alfo did to Britain for the tin with which it abounded.
6. Thi hegnang of the fixth period prefents us with rixth fee. a thate of the world entirely different from the fore- itory of the going. We now behold all the eattern part of the Nacedo. world, from the contines of Italy to the river Indus, ninnc.

$\qquad$

$\qquad$

$\qquad$

$\qquad$
and beyond it, newly anited into one vaft empire, and at the fame time teady to fall to picces for want of a proper head; the wettern world filled with fierce and fawge nations, whom the rival republics of Carthage and Rome were preparing to ennlave as fat as they could. 'The lutt remarkable events took place in the Macedonian empire.- Alexander, as already wferved, had not diltinctly named any fucceffor; but loe liad loft behind him a victorious, and, we may lay, invincible army, commanded by molt expert officers, all of them ambitious of fupreme anthority. It is not to be fuppofed that peace could long be preferved in luch a fituation. For a nomber of years, indeed, nothing was to be feen or heard of but the mof horrid flaughters, and wiekednefs of eresy kind; until at latt the mether, wives, ehildren, brothers, and even filters, of Alexander were cat off; not one of the family of that great conqueror being left alive. When matters were a little feteded, four new empires, each of them of no fnall extent, had arilen out of the empire of Alexander. Caffander, the fon of Antipater, had Macedonia, and all Crecce; Autigonas, Afia Minor; Seleucus had Babylon, and the caltern provinees; and Ptolemy Lagus, Egypt, and the wellenn ones. One of thefe empires, however, quickly fell; Antigonas being defeated and killud by Seleucus and Lytimachus at the battle of Ipfue, in $301 \mathrm{~B} . \mathrm{C}$. The greatelt part of his dominions then fell to Seleueus: but feveral provinces took the opportunity of thefe confofions to Shake off the Macedonian yuke altogether: and thus were formed the kingdons of Pontus, Bithynia, Pergamus, Armenia, and Cappadocia. The two moft powerful and permanent empires, however, were thone of Syria founded by Stlocus, and Egypt by Piolemy Lagus. The kinge of Macedon, thungh they did not preferve the fame authority over the Grecian thates that Alexander, Antipater, and Caflander, had done, yet effectually prevented them from thofe outrages upon one another, for whict. they had formerly been to remarkabie. Indeed, it is fomewhat difficalt to determine, whether their condition was better or worfe than before they were conquered by Philip; fince, though they were now prevented from dentroying one ewother, they were moll grievoolly opprefled by the Nacedomian tyrants.

While the eallern parts of the world were thus deluged with blood, and the fucceflors of Alexander were pulling to pieces the empire which he had eftablimed; the Rumans and Carthagimians pruceeded in
their arms out of it; and this pretence was foon found out. Being invited into Sicily to affift the Mamertines againt Jliero king of Syracufe and the Cartharimians, thoy immediately commenced a war with the lattor, which continued with the utmoll fury for 23 years. 'Ilhe war ended greatly to the difadvantage of the Carthagimians, chiefly owing to the bad condact of their generals; none of whom, Hamilear Barcas alone excepted, feem to have been poffeffed of any degree of military fkill; and the ftate had fuffered too many misfortunes before he entered upon the command, for him or any other to retrieve it at that time. The confequence of this war was the entire lofs of Sicily to the Carthaginians; and foon after, the Komans feized on the illand of Sardinia.

Hamilear perceiving that there was now no alternative, but that in a flort time either Carthage mult conquer Rome, or Rome woold conquer Catthage, bethought himfelf of a method by which his country might become equal to that haughty republic. This was by redocing all $S_{p a i n}$, in which the Carthaginians had already confiderable poffeflions, and from the mines of which they drew great advantages. He had, therefore, no fooner finithed the war with the metcenaries, which fucceeded that with the Romans, than he fet about the conquet of Spain. This, however, he did not live to aecomplift, though he made great progrefs in it. His fon Afdrobal continued the war with fuccefs; till at latt, the Romans, jealous of his progrefs, perfuaded him to enter into a treaty with them, by which he engaged himelf to make the river Iberas the boundary of his conqueits. This treaty probably was never ratified by the fenate of Carchage; nor, though it had, would it have been regarded by Hannibal, who fuceecded Afdrubal in the command, and had fworn perpetual enmity with the Romans. The tanfations of the fecond Ponic war are perthaps the moft remarkable which the hiftory of the world can afford. Certain it is, that nothing can how more clearly the llight foundations upon which the greateft empires are built. We now fee the Romans, the nation mof remarkable for their military fkill in the whole world, and who, for more than 500 years, had been conitantly victorious, unable to refilt the efforts of one fingle man. At the fame time we fee this man, though evidently the fint general in the world, lolt folely for want of a night fupport. In former times, the republie of Carthage fupplicd her generals in Sieily with hundreds of thonfands, thongh their enterprizes were almof contantly anfuccefsful; but now Hannibal, the conqueror of Italy, was obliged to alfandon his defign, merely for want of 20 or 30,000 men. That degeneracy and infatuation, which never fails to overwhelm a falling nation, or rather which is the caufe of its fall, had now infeeted the counfels of Carthage, and the fupplies were denied. Neither was Carthage thie only infatoated nation at this time. Hamibal, whue prudenee never forfook him either in profperity or adverfity, in the height of his good fortane had concluded an alliance with Philip king of Macedon. Had that prince fent an army to the affitance of the Carthaginians in Italy immediately after the battle of Canns, there can be no doubt but the Romans would have been forced to accept of that
peace

## H I S T O R Y.

peace which they fo haugitily refufed $\dagger$; and indeed, this ofier of peace, in the midft of fo much fuccefs, is an inflance of moderation which perhaps does more honour to the Carthaginian general than all the military exploits he performed. Philip, however, could not be roufed from his indulence, nor fee that his own ruin was connected with that of Carthage. The Romans had now made themfelves matters of Sicily: after which they recalled Marcellus, with his victorious army, to be employed againt Hannibal ; and the confequence at laft was, that the Carthaginian armies, unfupported in Italy, could not conquer it, but were recalled into Africa, which the Romans had invaded. The fouthern nations feem to have been as blind to their own intereft as the northern ones. They ought to have feen, that it was noceftary for them to preferve Carthage from being deftroyed; but, inttead of this, Mafiniffa king of Numidia allied with the Rumans, and by his means Hannibal was overconte at the battle of Zama*, which finifhed the fecond Punic war, in 188 B . C.

The event of the fecond Punic war determined the fate of almoll all the other nations in the world. All this time, indeed, the empires of legypt, Syria, and Grecce, had been promoting their own ruin by mutual wars and intedtine divitions. The Syrian empire was now governed by Antiochus the Great, who feems to have had little right to fuch a title. His empire, though diminifhed by the defection of the Parthians, was fill very powcrful; and to him Hannibal applied, after he was obliged to leave his country, as related under Carthage, $n^{\circ} 152$. Antiochus, however, had not fufficient judgment to fee the neceflity of following that great man's advice; nor would the Carthaginians be prevailed upon to contribute their affilance againlt the nation which was foon to deltroy them without any provo. cation. The pretence for war on the part of the Ro. mans was, that Antiochus would not declare his Greek fabjects in Afia to be free and independent flates; a requifition which neither the Romans nor any other mation hat a right to make. The event of all was, that Antiochus was every-where defeated, and foreed to conclude a peace upon viry difadvantageous terms.

In Europe, matters went on in the fame way; the flates of Grecce, weary of the tyranny of the Macedonians, ertered into a refolution of recovering their liberties. For this purpofe was framed the Achaan
Grece. League $\dagger$; but, as they could not agree among themfelves, they at laft came to the imprudent determination of calling in the Romans to defend them againt Philip king of Macedon. This produced a war, in which the Romans were victorious. 'The Macedonians, however, were ftill formidable; and, as the intencion of the Romans to enflave the whole world coukl no longer be doubted, Perfeus, the fucceffor of Philip, renewed the war. Through lis own cowardice he lolt a decefive engagement, and with it his kingdom, which fubmitted to the Romans in 167 B . C.

Macedon being thus conquered, the next flep was rthage utterly to exterminate the Carthaginians; whofe republic, notwithftanding the many difallers that had befallen it, was ftill formidable. It is true, the Carthagiuians were giving no offence; nay, they even Vol. VIIL, Part II.
made the moft abject fubnuifions to the republic of Rume: but all was not fullicient. War was declared a third time againt that unfortunate date ; there was now no Hannibal to command their armics, and the city was utterly dettroyed 146 B . C. . The fame yeat the Romans put an end to the liberties they had pretended to grant the cities of Grecee, by the entire de. ftruction of Coninth. See that article.

After the death of Antiochus the Great, the af. Hary of fairs of Syria and Egypt went on from bad to worle. Jigyts, SyThe degenerate princes which tilled the thrones of fis and thofe empires, regarding only their own pleatares, either fpent their time in opprefing their fub. jects, or in attompting to deprive each other of their dominions, by which means they hecame a more cafy prey to the Romans. So far indeed were they from taking any means to fecure themfelves againt the overgrown power of that republic, that the kings both of Syria and Egypt fometimes applied to the Romans as protectors. Their downfal, however, did not happen within the period of which we now treat. - I'he only other tranfaction whieh makes any confiderable tigure in the Syrian empire is the oppretion of the Jews by Antiochus Epiphanes. After their return from the Babylonifh captivity, they continued in fubjection to the Perfians till the time of Alexander. From that time they were fubject to the kinges of Egypt or Syria, as the fortune of either happened to prevail. Egypt being reduced to a low ebb by Antiochus Epiphanes, the Jews fell under his dominion; and being feverely treated by him, impradently howed fome ligns of joy on a report of his death. This brunght him againlt them with a powerful army ; and in 170 D. C. he took Jerufalem by form, committing the moft horrid cruttits on the inhabitants, inlo:nuch that they were obliged to hide themfelves in caverns and in boles of rocks to avoid his fury. Their religion was totally abolifined, their temple profaned, and an image of Jupiter Olympius fet up on the altar of burntofferings: which protanation is thought to be the alomination of difolation mentioned by the prophet Damel. This revolution, however, was of no long continuance, In 167 B . C. Mattathias reflored the true worlhip in moll of the cities of Judea; and in 165 the temple was puriticd, and the worhip there rettured by Judas Maccabseus. This was folloned by a long feries of wars between the Syrians and Jews, in which the latter were almoft always victorious; and before thefe wars were finilhed, the detlruction of Carthage happened, which puts an end to the fixth gencral period formerly mentioned.
7. The beginning of the feventh period pefents us siveneh pe. with a view of the ruins of the Greek empire in the riod wedeclining Atates of Syria and Ligypt; both of them neral tate much circumferibed in bounds. The cmpire of Syria worte. at firlt cumprehended all Afia to the river Indus, and beyond it; but in 312 B . C.. moft of the Indian pro. vinces were by Seleucus coded to one Sandrocothes. or slndrocolus, a native, who in return gave him 500 elephants Of the empire of Sandrucottus twe know nuthing farmer than that he fubdued all the countries between the lndus and the Ganges; fo that from this time we may reckon the greatell part of ludia independent on the Syro-Macedonian princes. In 250 13. C. however, the empire fultained a maeh greater

lofs by the revolt of the Parthians and Bactrians from Antinchus Theus. The former could not be fubducd; and as they held in fubjection to them the vall trak: which now goes under the name of $P$ orfia, we nut leok upon their defection as an irreparable lofs. Whether any part of their comitry was afterwards reenerad by tickings of Egypt or Siaia, is mot vely certain; nor is it of mach confequence, tince we are allurad that in the teginninge of the feventh period, i. e. $14^{\text {th }}$ D. C. the Greck enipires of Syris and Egypt were :cduccel by the lofs of India, Periax, Ammia, Ponans, Buhnia, Cappotocia, Puranus, \&e. The ECheral tate of the work in $1+6 \mathrm{BC}$ C. therefore was as follows. In Alia were the empires of India, I'arthis, and Syria, with the lefler thates of Armenia, pontus, Se. ahove mentioncd; to which we mutt add thet of Arabia, which during the fisth period had gown into fome confequence, and had manained its independency from the days of Ithmael the fon of Abrabam. In Africa wele the kingdons of Egypt and lithiopia; the Cathaginian territories, now fubject to the Romars; and the kingdoms of Numidia, Mauritania, and Getulia, ready to be fwallowed up by the fame ambitious and infatiable power, now that Carthage was deftroyed, which ferved as a barrier againit it. To the foutb lay fome unknown and barbarous nations, fecure by reafon of their fituation and infignificance, rather than their ftrength, or dillance fron Rome. In Europe we find none to oppofe the progrefs of the Roman arms, except the Gauls, Germans, and fome Spanifh nations. Thefe were brave indeed; but through want of military Kiill, incapable of contending with fuch mafters in the ant of war as
the Romans then were.
The Spaniards had indeed been fubdued by Scipio Africanus in the time of the fecond Punic war: but, in 155 B . C. they revolted; and, under the conduct of one Viriathus, formerly a robher, held out for a long time againft all the armies the Romans could fend mino Spain. Him the Conful Capio caufed to be murdered about 138 E C. becaufe he found it impoffible to reduce him by force. The city of Numantia defied the whole Ronnan power for fix years longer ; till at laft, by dint of treachery, numbers, and perfeverance, it was not taken, but the ithabitants, reduced to extrearity by famine, fet fire to their houfes, and perifhed in the flames, or killed one another, fo that not one remained to grace the thiumph of the conqueror: and this fur the prefent quieted the sett of the Spaniards. About the fame time Autalus, Ling of Peigamus, left by will the Roman people heirs zo all his goods; upon which they immediately feized on his kinglom as part of thofe goods, and reduced it to a Roman province, under the name of Afia Profer. Thus they continued to enlarge their dominions on every lide, without the leal regard to juticc, to the means they employed, or to the miferies they brought upon the conquered peopic. In 122 B . C. the Baiearic iflands, now called Micjorca, Minorca, and Ivica, were fubdued, and the inhabitants extermiuated; and, foon after, feveral of the nations beyond the Alps were obliged to fubmit.

In Alrica the crimes of Jugurtha foon gave this ambitious rer,ublic an opportunity of conquering the kingdoms of Numidia and Mauritania : and indece
this is almot the only war in which we find the Ro. mans engaged where their pretentions hat the kalt colour of jultice ; though in no cafe whatever conid a nation thow mone degencracy than the Rumans did on this occation. The particulars of this war are related under the artictes Numbia and Rame. The: event of it was the total acduction of the former about. the year 105 B . C. but Mamritanis and Getulia preferved their liberty for fome time longer.
In the call, the empire of Syria continued daily to decline; by which means the fow not outy had an opportunity of recovering their liberty, hat even of becoming as powerful, or at leat of extending their duminions as far, as in the days of l lavid and Solomon. 'I'his declining empire was itili father reduced by the civil difienions tutween the two brothers Antiochuz. Grypus and Antinchus Cgzicenus; during which thectites of Tyre, Sidon, Ptulemais, and Gaza, declared. themfelves independent, and in other eities tyrants. Itarted up who refufed allegiance to any forcign power. This happened about 100 I. C. ; and i: years after. the whole was reduced by Tigranes king of Armenia. On his defeat by the Romans, the latter reduced Syriato a province of their empice. The kingdom of Armenia iffelf, with thofe of Pontus, Cappadocia, and Bithynia, foon hased the fame fate ; Pontus, the molt powerful of them all, being fubdued about $G_{+} \bar{D}$. C. The kingiom of Juda alfo was reduced under the fame power much about this time. This tate owed the lofs of its liberty to the fame caufe that had ruined feveral others, vamely, caliing in the Rumans as artitrators between two contendiag partics. The two fons of Alexander Janneus (Hyrcanus and Arittobuhus) contended for the kinrdon. Ariftobulus, being defeated by the party of Hyranus, applied to the Romans. Pompey the Great, who acted as ultirate judge in this affair, decided is: againlt Ariltobulus, but at the fame time deprived, Hyrcanus of all power as a king; not athowing him even to aflume the regal title, or to extend his territory beyond the ancient horders of Judea. To fuen: a length did Pompey cariy this laft article, that heobliged him to give up alt thote cities in Colofyia. and Phernicia which had becn gained by his predecef-: fors, and added them to the newly acquired Roman: province of Syria.

Thus the Remans became maters of all the caftern parts of the world, from the Mediterranean fea to the. borders of Parthia. In the weff, however, the Ganls; were fill at liberty, and the Spanith nations bore the Roman yoke with great impatience. The Gauls isfetted the territories of the republic by their frequent. incurfions, which were fometimes very terrible; and tho" feveral attempts had been made to fubdue them, they always proved infufficient till the time of Julius Cxfar. By him they were totally reduced, from the river. Rhine to the Pyrenzan mountains, and many of their. nations almolt exterminated. He carried his arms. alfo into Germany ant the fouthern patts of B:-tain; but in neither of thefe parts did he make any permarent conquefls. The eivil wars between him and Pompey gave him an opportunity of feizing on the kingdom of Mauritania and thofe pats of Numidia which had been allowed to retain their hiberty. The kingdom of Egypt alone iemained, and to this
nothing belonged except the country properly fo called. Cyrenaica was bequeathed by will to the Romans about $5^{8}$ B. C.; and about the fame time the iflond of - Cyprus was feized by them without any pretence, ex--cept a defire of pofferfing the treafure of the king. The kingdom of Egypt continued for fome time longer at liberty; which in fome meafure mult be aferibed to the internal diffentions of the republic, but more efpecially to the amours of Ponpey, Julins Cefar, and Mare Antony, with the famous Cleopatra que-n of Egypt. The batte of Actium, however, determined the fate of Autony, Cleopatra, and E.gypt it felf; which talt was reduecd to a Roman province about $9 \mathrm{~B} . \mathrm{C}$.

White the Romans thus employed all means to redace the world to their obedience, they were ma. king one another feel the fame miferics at hone which they inflicted upon other nations abroad. The firtt civil diffentions took their rife at the liege of Numantia in Spain. We have already offerved, that this fmall city reflited the whole power of the Romans for tix years. Onee they gave then a moft terrible and thameful defeat, wherein 30,000 Romans fled b:fure 4000 Numantines. 'Twenty thouland were killed in the battle, and the remaining ten thouland fo flout up, that there was no polibility of efeaping. In this extremity they were obliged to negociate with the enemy , and a peace was concluded upon the following terns: \&. That the Numatincs thould fuffer the Romans to retire ummolefted; and, 2. 'Tl'azt Numanzia thould maintain its independence, and be reckoned among the Roman allics.-The Ruman fenate, with an inju flice and ingratitude hardly to be matched, broke this treaty, and in retuin ordered the commander of their army to be delivered up to the Nunantincs: but they refufed to aecept of him, unlefs his army was delivered along with him; upon which the war was renewed, and ended as already related. The fate of Numantia, however, was foon revensed. Tiberins Sempronins Gracehus, brother-in haw to Scipio Africanus the fecond, had been a chicf promoter of the peace with the Numantines already mentioned, and of confequence had been in danger of being delivered up to them along with the commander in chicf. This difrace he bever forgot; and, in order to revenge himfelf, undertook the canfe of the Plebeians againte the Patrecians, by wham the former were greatly oppreffed. He began with reviving an uld law, which had emated that no Roman citizon fhonkl palfers mure than 500 acres of hand. The overpius he detigned to diftribute among thofe who had no lands, and to reimburfe the rich out of the public treatiry. This law met with great oppolition, bred many tumalts, and at laft ended in the death of Gracelus and the perfecution of his friends, feveral bundreds of whom were put to crucl deaths without any form of law.

The difturbances did not ceafe with the death of Gracchus. New contefts enfued on accome of the Sempronian law, and the giving to the Italizo allies the privilege of Roman citizens. This latt not maly produced great commotions in the city, but occafioned a general revolt of the tlates of Italy againtt the republic of Rome. This rebelion was not ewelled without the utmote difficulty: and in the mean time, the eity was deluged with blood by the contending
factions of Sylla and Marius; the furmer of whom fided with the patricians, and the latter with the plebeidns. Thafe dillurbaces ended ia the perpeetual dis. tatorfhip of Sylla, about $80 \mathrm{~B} . \mathrm{C}$.

From this time we may date the lof of the Roman liberty; for though Sylla retigned his dickatorthip two years after, the fuceeeding contetts between Cafar and Pompey proved cqually fatal to the republic. Thefe contelts were decided by the batte of Pharialia, hy which Cafar became in effect matter of the enpire in 43 B. C. Without lofs of tume he then erofied ove: into Africa; totally defeated the repablican army. in that contincat; and, by reducing the country of Mauritania to a Roman province, completed the Roman conquefts in thele parts. llis victory over the fons of Pompery at Munda 40 B. C. Cecured him fromi any further apprehentions of a rival. Deing therefore fole maller of the Roman empire, and having all the power of it at his command, he projected the greatett fchemes; tendine, accordang to fome, not hefs to the happinefo than to the glory of his country: when he was affalfinated in the fenate-houfe, in the guth year of his age, and $39 \mathrm{~B} . \mathrm{C}$.

Without inveligating the political jurtice of this action, or the mutives of the perpetrators, it is impoffible not to regret the death of this great man, when we contemplate his virtues. and the deligns which the is faid to have formed: (See Rowe) Nor is it pollible to jultify, from ingratitude at leatt, even the moth vituous of the confpirators, when we confider the obligations under which they lay to him. And as to the meafure ittelf, even in the view of expediency, it feems to be gencrally condemaed. In fact, from the tranfuctions whech had long preceeded, as well as thole which immediately followed, the murcer of Cr far, it is evident, that Rome was mapable of preferving its laberty any longer, and that the peopic lad become unfit for being tree. The efforts of Lrutus aud Caflius were therefore unfuccefsful, and ended in their cown deflruction and that of great numbers of their fol lowers in the battle of Philippi. The defeat of the republicans was fullowed by numberteis dillurbances, murders, proferiptions, \&ec. till at latt Octavianus, ha-nauv ving cut off all who had the emarage to oppole him. : mes a end and fitually got the better of his resals by the victory othe reat Actium, put an end to the republic in the year public. 22. B. C.

The defluction of the Roman commonwealth proved advantageous to the few nations of the world who ftill retained their liberty. That outrageous delire of conguetl, which had fo long marked the Roman character, now in a great mealure ecafed ; becaufe there was now another way of fatisfying the defires of ambitious men, namely, by courting the favour of the emperor. After the finalreduction of the Spaniards, therefore, and the conquett of the countries of Matia, l'annonia, and fome others adjacent to the Roman territories, and which in a manace feensed naturaliy to belong to them, the empire enjoyed for fume time a profound peace.

The only remarkabie tranfactions which took place during the remainder of the period of which we treat, were the conquett of Britain by Claudius and Agricola, and the delltuction of Jenfakm by Vefpalian and Titus. The war with the Jews began A. D. 67; and
was occafoned by their cidithately claiming the city of Crefarea, which the Rumans had added to the province of Syia. It ended in 73 , wids the molt terribe deftruction of their eity and nation; fince which time they have never been able to affemble as a diftinet peophe. The fouthern parts of Britain were totally fubiued by Agricola about ten years after.

It the gith year of the Chrittian era, Tragan was created emperor of Rome; and being a man of great valour and experience in war, carried the Roman conqueils to their utmoft extent. Having conquered the Duians, a German nation beyo:d the Danube, and whou had of late been very troublefome, he turned his arms eatward: reduced all Mefopotamia, Chaldexa, Alfyria: and having taken Ctefiphon, the capital of the Parthian empure, appointed them a king, which he thought would be a proper method of keeping that warlike people in fubjection. After this, he propofed to return to Italy, but died by the way; and with his reign the feventh general period abovementioned is coneluded.
8. The beginuing of the eightla period prefents us with a vew of one walt empire, in which almot all the nat ouns of the world were fwaliowed up. This empire comprehended the beit part of Britain, all Spain, France, the Netherlands, Italy, part of Germany, Egyp:, Barbary, Baldulgerid, Turky in Europe, TurKy in Alia, and Perfia. The flate of India at this time is unknown. The Clinefe lived in a remore part of the world, unheard of and unmoleted by the wiflern nations who thruggled for the empire of the world. The northera parts of Europe and Afia were filled with barbarous nations, already formidable to the Rowans, and who were foon to beeome more fo. The vall empire of the Romans, howeser, had no fooner attaned its utmolt degree of power, than, like others before it, it beran to deeline. The provinces of Ba . bylonia, Mefopotamia, and Affyria, almoft inflantly revolted, and were abandoned by Adrian the fucceffor or Trajan in the empire. The Parthians having recovered their liberty, continued to be very formidable enemies, and the babarians of the northern parts of Europe continutd to inereafe in Arength; while the iromaus, weakened by intelline divifions, became daily lefs able in refit them. At different times, howeser, fome wanlike emperors arofe, who put a flop to the incharfons of thefe barbarians; and about the year 215 , the J'arthiza empire was totally overthown by the PerLians, wha had long been fubject to them. This revoLution proved of little advantage to the Ronans. The Perfins weite enemies ftill more tronblefome than the $J^{\prime}$ athions had been; and though often defeated, they till cominued to infelt the empire on the eaf, as the latibarous nations of Europe did on the north. In 260 , the defeat and captivity of the emperor Valerian hy the Perfians, with the dilurbances which followed, threatened the empire with utter deftruction. Thinty tyrants feized the government at once; and the barbanians pouring in on all fides in prodigious numbers rasaged almoll all the provinces of the empire. By the vigorous conduć of Claudius, Aurelian, 'Tacitus, Prohas, and Carus, the empure was rcllored to its former luftre ; but as the barbarians were only repulfed, and never thoroughly fubdued, this proved only a temporary relief. What was worfe, the Roman foldiers, growa impatient of reftraint, commonly murdered thofe
emperors who attempted to revive among them the ancient military difeipline which alone could enfure the viltory over their enemies. Under Dioelelian, the diforders were lo great, that though the government was lued by two perfons, they found themfelves unable to bear the weight of $i t$, and therefore took other two partners in the empire. Thus was the Roman empire divided into four partz; which by all hiftorians is faid to have been productive of the greatet mifehiefs. As each of the four fovereigns would have as many officers both civil and military, and the fame number of forces that had been maintained by the fate when governed only by one emperor, the people were not able to pay the furm neeeflary for fupporting them. Hence the taxes and impolls were increaled beyond mealure, the inhabitants in feveral provinees reduced to beggary, the land left untilled for want of hands, \&c. An end was put to thefe evils when the empire was again united under Conflantine the Grat; but in 330 a mortal blow was given to it, by removing the imperial feat to Byzantium, now Conflantinople, and making it equal to Rome. The introduction and efta. blifhment of Chrifianity, already cortupted with the groffeft fuperftitions, proved allo a moft grievous detriment to the empire. Inflead of that ferocious and obfinate valour in which the Romans had folong been accuftomed to put their truf, they now imagined themfelves fecured by figns of the crofs, and other exteroal fymbols of the Chriftian telizion. Thefe they ufed as a kind of magical incantations, which undoubtedly proved at all times ineffectual; and hence alfo in fome mealure proceeded the great revolution which took place in the next period.
9. The ninth general perind hows us the decline Ninth ${ }^{37}$ and miferable end of the wettern patt of the Roman riod. empire. We fee that mighty empire, which formerly of the occupied almolt the whole world, now weakened by wenern divition, and furrounded by enemies. On the calt, empire the Perfians; on the north, the Scythians, Sarmatians, Goths, and a multitude of other barbarows nations, watched all occafions to break into it; and mifcarricd in their attempts, rather throush their own barbarity, than the llrength of their enemies. The devaltations committed by thofe barbarians when they made their incurlions are incredible, and the relation flocking to human nature. Some authors feem much inclined to favour them; and even inlinuate, that barbarity and ignorant ferocity were their chief if not their only faults: but from their hitory it plainly appears, thei not only barbarity and the moft foocking cruelty, but the highen degrees of avarice, perfidy, and difregard to the moft folemn promifes, wese to be numbered among their vices. It was ever a fufficient reafon for them to make an attack, that they thanght their enemics could not refilt them. Their only reafon for making peace, or for keeping it, was becaule their enemies were too llrong; and their only rcafon for eommitting the molt horvid malfacres, rapes, and all manner of erimes, was becaufe they bad gained a victory. 'The Romans, degenerate as they were, are yet to be efteemed much better than thele favages; and therefore we find not a fingle province of the empire that would fubmit to the barbarians while the Romans could polfhly defend them.

Some of the Roman emperors indeed withftood this inundation of favages; but as the batter grew daily
more numerous, and the Romans continued to weaken themfelves by their inteftine divifions, they were at lan obliged to take large bodies of barbarians into their pay, and teach them their military difcipline, in order to drive away their countrymen, or otbers who invaded the empire. This at laft proved its total defiruction; for, in 476 , the barbarians who ferved in the Roman armies, and were dignibed with the title of allies, demanded the third part of the lands of Italy as a reward for their fervices: but meeting with a refufal, they revolted, and made themfelves mafters of the whole country, and of Rome itfelf, which from that time ccafed to be the head of an empire of any confequence.

This period exhibits a mon unfavourable vics the of the weltern parts of the world: The Romans, from the height of grandeur, funk to the loweft flavery, nay, in all prubability, almon exterminated ; the provinecs they formerly governed, inhabited by human beings fcarce a degree above the brutes; every art and fcience loft; and the favage conquerors eren in danger of ftarving for want of a fulficient knowledge of agriculture, having now no means of fupplying themfelves by plunder and robbery as before. Britain had long been abandoned to the mercy of the Scots and licts; and in 450 the inhabitants had called in the Saxons to their a Gillance, whom they foon found worfe enemies than thofe againit whom they bad implored their aid. Spain was held by the Goths and Suevians; Africa (that is, Barbary and Bildulgerid), by the Vandals; the Burgundians, Goths, Franks, and Alans, had erected feveral fmall fates in Gaul; and Italy was fubjected to the Herwli under Odoacer, who had taken upon him the title of ling of Italy. In the eaft, indeed, matters wore an afpect fomewhat more agreeable. The Roman empire continued to live in that of Conftantinople, which was Aill very extenfive. It comprehended all Alia Minor and Syria, as far as Perfia; in Africa, the kingdons of Egypt; and Grecce in Europe. The Perfianswere powerful, and rivalled the emperors of Conltantinople; and beyond them lay the Indians, Chinefe, and other nations, who, unheard of by the iuhabitants of the more weftern parts, enjoyed peace and liberty.

The Conflantinopolitan empire continued to decline by reafon of its continual wars with the Perfians, Bulgarians, and other barbarous nations; to which alfo fuperflition and relaxation of military difciplinc largely contributed. The Perfan empire alfo declined from the fame caufes, together with the intefine broils from which it was feldom free more tban that of Conilautinople. The hiftory of the eaftern part of the world during this period, therefore, conifts only of the wars bet ween thefe two great empires. of which an account is given under the articles Constantinople and PEXSIA; and which were productive of no other confequence than that of weakening them both, and ma1.ing them a more eafy prey to thofe enemies who were now as it were in embryo, but thortly about to erect an empire almofl as extenfive as that of the Greeks or Romans.

Among the weftern nations, the revolutions, as might naturally be expected from the character of the people, fucceeded one asother with rapidity. The Heruli un-
der Odoacer were driven out by the Goths under Theodoric. The Goths were expelled by the Romans; and, whice the two parties were contending, both were attacked by the Franks, who carried off an immenfe booty. The Romans were in their turn expelled by the Goths : the Franks again invaded lealy, and made themfelves mallers of the province of Venetia; but at lat the fuperior fortune of the emperor of Conftantinople prevailed, and the Goths were finally fubdued in 553. Narfes, the conqueror of the Goihs, governed ltaly as a province of the eaftern empire till the year 508, when longinus his fuccellor made conliderable alterations The Italian provinces lad ever fince the time of Conflantine the Great been governd by confulures, correitares, and frafudes; no alteration having been made cither by the Roman emperors or the Gothic kings. But Longinus, being invelted with abfolute power by Juftinian, fuppreffed thofe magitrates; and, ioltcad of them, placed in each city of note a governor, whom lie ditinguifhed with the title of duhe. The city of Rome was not more honoured than any other; for Longinus, having abolifined the very name of fonote and confids, appointed a duke of Rome as well as of other cities. To himfelf he affumed the title of caurch; and, refiding at Ravenna, his government was ftyled the exarchate of Ravenna. But while he was eflablithing thio new empire, the greatelt part of Italy was conquered by the Lombards.
in France a confiderable revolution alfo took place. Or France. In $4^{87}$. Clovis, the funder of the prefent French monarchy, poffefed himfelf of all the countries lying between the Rline and the Loire. By force or treachery, he conquered all the petty kingdoms which had been erected in that country. His dominions had been divided, reunited, and divided again ; and were on the point of being united a fecond time, when the great impoltor Nahomet began to make a figure in the world.

In Spain, the Vifigoths erected a kingdom ten years or ${ }^{4,}$ pain. before the conqueft of Rome by the Heruli. This kingdom they had exteoded ealtward, about the fame time that Clowis was extending his conquets to the weff; fo that the two kingdoms met at the river Loire. The confequence of this approach of fuch balbarcus conquerors towards each other was an immediate war. Clovis proved victorious, and fubdued great part of the country of the Vifigoths, which put a fanal flop to their conquells on that lide.

Another kingdom had been founded in the weltern parts of Spain by the Sucvi, a confiderable time before the Rumaos were finally' expelled from that country. In 409 this kingdom was entirely fubverted by Theodoric king of the Goths; and the Suevi were fo pent up in a fmall diftricy of Lulutania and Galicia, that it feemed inpoffible for them to recover themfelves. During the abovementioned period, howerer, white the attention of the Goths was turned another way, they had found means again to ereet themfelves into an independent flate, and to become mafters of coofiderably extended territories. But this fuccefs proved of hort duration. In $5^{8}+$ the Goths attacked them ; totally dettroyed their empire a fecond time; and thus became mafters of all Spain, except fome fnall part which fill owned fubjection to the empe-

rars of Contaninoflic．Of this part，however，the Goths became matlers alto in the year 623；which concludes the oth general periond．

Africa，properly fo called．had changed its matters aluee times durng this period．The Vandals had ex． pothed the Romans，and erected an independent king－ dom，which was at latt overturned by the emperors of Conllaninople；and from them the greatell part of it was tuhen by the Gothe in $6: 0$

10．At the comencement of the tenif general pe－ riod（which begins with the nighe of Mahomet ia the year $6=2$ ，from whace his followeres date the in era cathed the hocira），we fee every thing prepared for the great revolution which was now to take place： the Reman mpire in the well antihilated；the Per－ fian cupire and that of Contlantinople weakead by their mituat wars and intelline divifons；the Indians and other eathon mations unaceutomed to war，and ready to fall a pey to the firtl invader；the fouthera parts of Earnpe in a diltracted and harbarous flate； whike the inhabitants of Arabia，from their earliell origin，accuthered to war and plunder，and now unit－ ed thy the moft wotent fuperlition and enthutiatic de－ fire of conqueft，were like a llood pent up，and ready io overwheta the rel of the world．－The northern na－ tions of Europe and Afin，however formidable in after－ times，were at prefont unknown，and paceable，at Leal with refpect to their fouthern neighbours；fo that there was in no quarter of the glube any power capa－ Whe of appoling the coaçnetis of the Arabs．With amazing celerity，herffore，they over－ran all Syria， Paldtine，Pesfa，Pukharia，and India，extending their conguefts farther to the eatlward tran ever Alswander had done．On the weft hide，their empire extended ower Equt，Iarbary，and Spain，together with the illands of Sicily，Sardinia，Majorca，Minorca，Esc． and many of the Archipelago inands：nor were the coats of laly itfelf free from their incurfions：nay， they are even faid to have resehed the ditant and bar－ In cuminy of Icland．At laft this great empire，as woll as others，began to decline．Its ruin vas very fudden，and owing to its internal divifons．Mahomet had not taken care to efallith the apollts hip in his fanily，or to give any farticular dircetions about a fuccifor．The confequence of this was，that the ca－ Siphat，or fueceffion to the aqufterhip，was frized by many ufirpers in different parts of the empire：while the true calithe，who refreded at Bagdad，gradually lon atl power，aml were regarded only as a kind of high－ prichs．Of thefe divifions the Tuks took advantage to cllablith their anthority in many provinees of the Moliammedan empire ：but as they cmbraced the fame religion with the Arabe，and were fill．d with the fame erithefontic ative of conguen，it is of little ennfe－ quence wo dibinguin buween them；as inded ir for－ nitiod litte to the word in gencral whether the Turks or Saracers，we e the conguenon，lince both were crued， barbarous，ignorant，and fiperlitious．

While tie barbarians of the fal were thas arafping at the empire of the whole wotd，great diturbances happened anows the no kefs barbarous nations of the weft．Superlition feems to lave been the ruling mo－ tive in buth cales．The Saracens and Turks conquer－ ed for the gleyy of（Goh，or of his apothe Mathomet and his fuccefurs；the wefern nations profefied an e－
qual regard for the divine glory，but which was only to be perceived in the refpect they paid to the pope and clergy．Ever fince the ettabliflment of Chilli－ anity hy Conflartine，the bilhops of Rome had been gradually extending their power；and attempting not ouly to render thentwes indepentent，but even to af－ func an authority over the emperors themfetves．The dettrution of the empire was fo far from weakening their power，that it afforded them opportunties of greatly extending it，and beconing judges of the fovereigns of Italy themflues，whofe barbarity and ignorance prompted them to fubmic to their decilimes．All this aime，however，they themfelves lad been in fubjec－ tion to the emperors of Conltantinople；but on the decline of that empire，they fond means to get themfelves exempted from this fubjection．The prin－ cipal authority in the city of Rome was then engroff－ ed by the burnp；though of rizht it belonged to the duke appointed by the exarch of Ravenua．But tho＇ they had now little to fear from the eaftern empe－ rors，they were in great langer from the ambition of the Lombards，who aimed at the congueft of all Italy－ This afpiring people the bifhops of Rome deterninct to check；and therefore，in 726 ，when Luitprand king of the lombards had taken Ravenna and expel－ led the exarch，the pope undertook to reftore him． For this purpofe he applied to the Venetians，who are now lirll mentioned in hillory as a ftate of any con－ feguence；and by their means the exarch was rettored． Some time before，a quarrel hat happened between the pope（Gregory II．）and Leo emperor of the ealt， about the worthip of images．Leo，who it feems， in the midat of fo much barbarifm，had ftill preferved fome thare of commont fenfe and reafon，reprobated the worhip of images in the ftronget terns，and com－ manded them to be dellroyed throughout his danni－ nious The pope，whofe caufe was fasoured by the moll abfurd lupertitions，and by thefe only，refufed to obey the empror＇s commants．The exarch of Raverna，as a duljuct of the rmperor，was ordered to force the pope to a complance，and even te feize or af－ faffinate him in cafe of a refufat．This excited the pions yeal of Luitprand to affill the pope，whom he had formerly defigned to fubdue：the exarela was firt excommanicated，and then tom in preces by the enra－ ged multitule：the duke of Napks hared the fame fate；and a vall number of the Iconochghs，or Image－ breakers，as they were called，were flaughtered with－ out morcy：and to complete all，the fubjects of the archate，at the intigation of the pope，renounsed theil allegrance to the emperor．

Len was no fooner informed of this revolt than be ordered a poweaful army to be raifed，in order to re－ duce the rehels，and take vengeance on the pope．A－ larmed at thefe warlike preparations，Gregory looked round for fume power on which le mighe depend for protertion．The Lombards were poffefed of fuffi－ cient force，but they were too near and too danger－ ous neighbenurs to be trufted：the Venetians，though zealous Catholics，were as yct unable to withtand the force of the empire；Spaill was over－van by the Sa－ racens：the French feemed，therefore，the only peo－ ple to whom it was advifeable to apply for aid；as they were able to oppofe the emperor，and were likewife enemics to his edict．Charks Matel，who at that
time governed France as major of the palace, was therefore applied to; but before a treaty could be concluded, all the parties concerned were removed by death. Conftantine Copronymus, who fucceeded Leo at Conftantinople, not only perfitted th the oppulition to inage-worfhip, begun by his predeceflor, but prohibited alfo the invoeation of faints. Zachary, who fucceeded Gregory III. in the pontincate, proved as zealous an adverfary as his piedeeeflurs. Pepin, who fucceeded Charles Martel in the fovereignty of France, proved as poweifula a friend to the poper as his father lad been. 'The prople of Rome had nothing to fear from Corilantinople; atd therefore drove out all the empcror's oflicers. The Lombards, awed by the yower of France, for foat time allowed the pope to govern in peace the dominions of the exarchate; bue in 752, Allulphus king of Lombardy not only reduced the greatelt part of the pope's territories, but threatened the eity of Rone itfelf. Upon this an application was made to Pepin, who obliged Altolphus to rellore the places he bad taken, and gave them to the pope, or, as he faid, to St Peter. Thic Greek emperor, to whom they of right belunged, remonttrated to no purpofe. The pope from that time became poffefled of confiderable territorics in Italy; which, from the manner of their donation, go under the pame of St I'cter's P'atrimony. It was not, however, before the ycar 774 that the pupe was fully fecured in thefe new dominions. This was accomplified when the kingdom of the Lombards was totally deltroyed by Charlemagne, who was thereupen crowned king of haly. Sonn after, this monarch made hindelf mafler of all the Low Conntries, Germany, and part of Hungary; and in the year 800 , was folemnly crowned emperor of the weft by the pope.

Thus was the world once more flared among three great empires. The empire of the Arabs or Saracens extended from the river Ganges to Spain; comprehending almolt all of Afia and Africa which has ever been known to Europeans, the kingdoms of China and Japan excepied. The eattern Roman cmpire was reduced to Greece, Afia Minor, and the provinees adjoining to Italy. The empire of the weft under Charlemagne, comprehended Fraace, Germany, and the greatert part of Italy. The Saxons, however, as yet poffefled Britain onmolefled by external enemies, tho' the feven kingdoms erected by them were engaged in perpetual contedts. The Venctians alfo enjoyed a nominal liberty; though it is probable that their intuation would render them very much dependent on the great powers which furrounded them. Of all nations on earth, the Scots and Picts, and the remote ones of China and Japan feem to have enjoyed, from their fituation, the greatell hare of liberty; onlefs, perhaps, we except the Scandinavians, who, under the names of Danes and Normans, were foon to infelt their fouthern neighbours. But of all the European potentates, the popes certainly exercifed the greateft authority; fince even Charlemagne himflef fubmitted to accept the crown from their hands, and his fucceffors made them the arbiters of their differenees.

Matters, however, did not long continue in this Alate. The empire of Chariemagne was on the death of his fon Lewis divided among his three children. Endlefs difputes and wars enfued among them, bill at.
lat the fovercign power was feized hy Hugh Capet in 987. The Saxua heptarchy was diffolved in $82 \%$, and the whole kingdom of England reduced under one head. The Danes and Normans began to make depredations, and infell the acightorang thates. The former conquered the Englih, Sazons, and feized the goveroment, but were in their turn expelled by the Normans in 1066. In Gernany and laty the greateit dularbances arofe from the cometts between the popes and the emperors. To all this if we add the internal contents which happened through the amhition of the powerfui barons of every kingdom, we can leatce form da id a of times more calannineses than thofe of which we now treat. All Europe, ny, all the world, was une geat beld of battle; for the empire of the Mathonctais was nut in a more fettled thate than tha: of the Eurupeans. Caliphs, fuleans, emirs, ac. wao ged continnal war with each other in cvery quarter; new fovereignties every day fprung up, and were as quickly defiruyed. In flourt, thro' the ignorance and barbarity with which the whole world was overfpread, it feemed in a manoer impolfible that the human race eou'd long eontinue tu exilt; when happily the crufades, by directing the attention of the Eluropeans to one partieular object, made them in fome neafure fufperd their flangheers of one another.
11. The erufades originated from the fepertition of the two grand parties into which the world was at that time divided, namely, the Chritians and Mathometans. Doth looked upon the fnall territory of 1'atelline, which they called the Holy Loant, to be an invaluatle aequilition, for which no lum of money could be an equivalent; and both took the moll unjufiniable method's to accomplifh their delizes. The fupertition of Omar the fecond caliph had prompted him to invade this country, part of the territories of the Greck emperor, who was doing him no hurt; and now when it had been fo long under the fobjection of the Mahometans, a limilar fuperitition prompted the pope to fers an army for the recovery of it. The crufauers accordingly poured. forth in moltitudes, like thofe with which the siags of Perfia formerly invaded Greece; and their fate was pretty limilar. Their impetuous valour at liett, in: deed, earried every thing before them : they recovered. all Paleftine, Phocuicia, and part of Syria, from the infidels; but their want of conduct foon loft what their valour had obtained, and very few of that valt muliitude which had left Europe ever returned to their native countries. A fecond, a third, and fereral other crufades, were preached, and were attended with a like fuccefs in both refpects: wat numbers took the crofs, and repaired to the Holy Land; which they polluted by the mot abominal maflaceres and treacheries, and from which very few of them returned. In the third crufade Richard 1. of England was cmbarked, who feems to have been the bell general that ever went into the calt : but even his valour and kill were not fult. cient to repair the faults of his companions; and he was obliged to return tven after he had entirely defeated his antagonilts, and was within fight of Jerufalem.
But while the Chriktians and Mahometans were thus $\mathrm{Cm}^{47} \mathrm{~m}^{7}$ fuperitiounly contending for a fmall territory ia the of the aion: weftern parts of Afia, the nations in the more calterly $\mathrm{g}_{\mathrm{g}} \mathrm{ma}$. parts were thrcatencd with total extermination. Hittory.
E.event ${ }^{46}$
ghiz Khan, the greatef at well as the molt bloody conqueror that ever exilled, now makes his appearance. The rapidity of his conqueits feemed to emulate thofe of Alexander the Great ; and the crueltics he committed were altogether unparalleled. It is worth obferving, that Jeughiz Khan and all his followers were neither Chilftians nor Mahometans, but frict deilts. For a long time even the fovereign had not heard of a temple, or any particular place on earth appropriated by the deity to himfelf, and treated the notion with ridicule when it was firl mentioned to him.

The Moguls, over whom Jenghiz Khan affumed the fovereignty, were a people of Eaft Tartary, divided into a great number of petty governments as they are at this day, but who owned a fubjection to one fovercign, whom thy called J'ans-kikn, or the Grear Khan. Temujin, afterwards Yenghis. Khan, was one of thefe petty princes; but uajoutly deprived of the greatell part of his inheritance at the age of 13, which he could not recover till he arrived at that of fo. This correfponds with the year 1201, when he totally reduced the rebels; and as a fpecimen of bis lenity caufed 70 of their chiefs to be thrown into as many caldrons of boiling water. In 1202, he defeated and killed Vangkhan himelf (known to the Europeans by the name of Prefir 等bin of Afia); and pofefling himfetf of his valt dominions, became from thencefurward altogether irretiltible. In 12c6, having fill continued to enlarge his duminions, he was declared klan of the Moguls and Tartars; and took upoa him the title of Fongbin Khan, or The mofl Great Khan of Khons. This was followed by the reduction of the kingdom of Hya in China, Tangut, Kitay, Turkeltan, Karazm (the kingdom of Galna funded by Mahmud Gazui), Great Bukharia, Peffia, and part of India; and all thefe valt regions were reduced in 26 years. The devaftations and naughters with which they were accompanied are unparalleled, no fewer than $14,470,000$ perf ns being computed to have been maflacred by Jenghiz Khan during the laft 22 years of his seign. In the begimning of 1227 lie died, thereby freeing the world from a mof bloody tyrant. His facceflors completed the conquett of China and Korea; but were foild in their attempts on Cochin-china, Tong-king. and Japan. On the weftern tide the Tarta: dominion, were not much calarged till the ume of Hulaku, who conquered Media, Babylonia, Mefopotamia, Affyria, Syria, Georgia, Armenia, and atmot all $A$ fa Minor; putting an end to the empire of the Saracens by the takiug of Bagdad in 1258.

The empire of Jengliz Khan had the fate of all whers. Being far too extenfive to be governed by one head, it fplit into a multitude of fmall kingdoms, as it had been before his time. All thefe princes, owever, owned allegiance to the family of Jenghiz Khan till the time of Tinur Bek, or Tamerlatue. The Curks, in the mean time, urged torward by the inuudation of Tartars who poured in from the call, were forced up. on the cemains of the Greck cmpire; and at the cime of Tametanc above mentioned, they had almolt confined this once mighty empire within the walls of Conflantinople.

In the year 1335, the family of Jenghiz Khan hecoming extinet in l'erlia, a lung civil war enfued; du-
ring which Timur Bek, one of the petty priaces among which the Tarear dominions were divided, found means to aggrandize himfelf in a manner limilar to what Jenghiz Lihan had done about 150 years before. Jenghiz Khan, indecd, was the model whon he propored to imitate; but it mult be allowed that Timur was more merciful than Jenghiz Khan, if indeed the word can be applied to fuch inhuman tyrants. The plan on which Jenghiz Khan conducted his expeditions was that of total extermination. For forme time he ntterly extirpated the inhabitants of thofe places which he conquesed, defigning to people them anew with his Mogals; and in confequence of this refolution, he would employ his army in beheading 100,000 prifoners at once. Timur's crucley, on the other hand, feldom went farther tha: the pounding of 3000 or 4000 people in large mortars, or building them among bricks and mortar into a wall. We mult obferse, howsver, that Timur was net a deifl, but a Mahometan, and conquered exprefsty for the purpofe of Spreading the Mahometan religion; for the Moguls had now acopted all the fuperticions and abfurdities of Mahomet. Thus was all the ealtern quarter of the world threatened anew with the molt dreadful devathotions, white the wettern nations were exlauting themfolves in fruitlefs attempts to regain the Holy Land. The Turks were the only people who feem at this period to have been gathering Itrength, and by their perpetual encroachments threatened to fwallow up the wellern nations as the Tartars had done the eaf. tern ones.

In 1362 , Timur invaded Bukharia, which he icduced in five years. He proceeded in his conquelts, though not with the fame celerity as Jenghiz lihan, till the year ${ }^{3} 8_{7}$, when he had fubdued all Perfia, A rmenia, Georgia, Karazm, and great part of Tartary. After this he proceeded weftward, fubduing all the countries to the Euphrates; made himfelf mafter of Bugdad; and even entered Ruffia, where he pillaged the city of Mofcow From thence he turned his arms to the eaft, and totally fubdued India. In 1393, he invaded and reduced Syria; and having turned his arms againlt the Turks, forced their fultan Bajazet to raife the fiege of Conitantinople. This brought on an engagenent, in which Bajazet was entirely defeated and taken prifoncr; which broke the power of the Turks to fuch a degree, that they were not for fome time able to recorer chemfelves. At lalt this great conqueror died in the year 1405, white on his way to compuer China, as Jenghiz Khan had done before him.

The death of Timur was followed almort immedi-Ste ately by the diffolution of his cmpirc. Moft of the we nations he had conquered recovered their liberty, thi The Turks had now no further obflacle to their conqu. It of Conftantinople. The weftern nations having exhanted themfelves in the boly zibars, as they were cailed, had lotl that infatiable thirlt after conquet which for fo long time poffeffed the minds of men. They had atready made confiderable advances in civilization, and began to flndy the arts of peace. Gunpowder was invented, and its application to the purpoles of war already known ; and, theugh no invention tirreatened to be more delfructive, perhaps none was ever more beneficial to the human race. By the ufe
of fire-arms, nations are put more on a level with each other than formerly they were: war is reduced to a regular fyltem, which may be ftudied with as much fuccefs as any other fcience. Conquefs are not now to be made with the fame eafe as formerly; and hence the laft ages of the world have been much more quiet and peaceable than the former ones. In $1+53$, the conquest of Conilantinople by the "Purks fixed that wandering people to one place; and though now they poffefs very large regions both in Europe, Afia, and Africa, an effectual fop hath long been put to their further progrefs.

About this time, alfo, learaing began to revive in Europe, where it had been long loft; and the invention of printing, which lappened about the fame time, rendered it in a manner impoflitle for barbarifm ever to take place in fuch a dertee as formerly. All nations of the world, indeed, feem now at once to have laid afide much of their former ferocity ; and, though wars have by no meass been uncommon, they have not been carried on with fuch circumitances of fury and favage cruelty as before. Intead of attempting to enrich themfelees by plunder, and the fpoils of their neighbours, mankind in general have applied themfelves to commerce, the only true and durable fource of riches. This foon produred improvements in narigation; and thefe iniprovements led in the difcovery of many regions fomerly unknown. At the fametime, the European fowers, teing at laft thoroughly fenfible that extenfive conquels could never be pumanemt, applied themfleses more to provide for the fecerity of thofe dominions whiclu they already poffefled, than to attempt the conqueft of one another: and this produced the policy to which fo much attention was lately paid, namety, the freferving of the lalance of Europe; that is, preventing aty one of the nations from acquiring fufficient Itrengeth to overpower another.

In the end of the 15 th centary, the vatt continent of America was difencered; and, almolt at the fame time, the paffage to the Caft-Indies by the Cape of Good-Hope. The difcovery of thele rich countrits gave a new turn to the ambition of the Europeans. To enrich themfilees, either by the gold and dilver produced in thefe conutries, or by traffic with the natives, now bucane the object. The Portnguefe had the advantage of being the firt difenverers of the caftern, and the Spaniards of the weftern conntries. The former did not neglect fo favourable an opportunity of enriching the rafelses by commerce. Many fettlements were formed by them in the Eall-India inands, and on the continent ; but their araice and perfidious beha. vinur towards the natives proved at laft the caufe of their total expulfion. The Spaniards enriched themfelves by the vaft quantities of the precious metals imported from America, which were not obtained but by the molt horrid mattacres committed on the natives, and of which an account is given under the different names of the American countries. Thefe porfeftions of the Spaniards and Portugnefe Conn excited other European nations to make attempts to Mare with them in their treafures, by planting colonies in dillereat parts of America, and making fettioments in the Eafl.Indies: and thus has the rage of war in fome meafure been transferred from Enrope to thefe diftant regions; and, after various contefts, the Ditifh at laft

Vos. VIII. Part 11.
obtained a great fuperiority both in America and the Ealt-Indies.

In Europe the only confiderable revolutions which happened during this period, were, The total expulion of the Moors and Saracens from Spain, by the taking of Grenada in 1491 ; the union of the kingdoms of Arragon and Cattile, by the marriage of Ferdinand and Ifabella; and the revolt of the fates of IInlland from the Spaniards. After much contention and blond. thed, the fe lat obtained their liberty, and were declared a free people in 1609 ; lince which time they have continued an independent and very condiderable nation of Europe.

In Alia nothing of importance hath happened fince the taking of Conftantinople by the Turks. That continent is now divided among the following nations. The molt northerly part, called Siteria, extending to the very extromity of the continene, is under the power of Rulfia. Io the fouthward, from Afia Minor to China and Korea, are the Tartars, formidable indeed from their numbers, but, by reafon of their barbarity and want of union, incapable of attempting any thing. "The Turks poffers the weftern part of the continent called Afra Minor, to the river Euphrates. The Arabs are again contined within their own peninfula; which they poffefs, as they have ever done, without owning fubjection to any foreign power. To the eatl of 'Turky in Afia lies Perfia, now more confined in its limits than before; and to the ealtward of Perfia lies India, or the kingdom late of the Mogul, comprebending all the country from the Indus to the Ganges, and beyond that river. Still farther to the ealt lie the kingdoms of Siam, Pegu, Thibet, and Cochin-China, little known to the Europeans. The vall empire of China occupies the molt cafterly part of the continent; while that of Japan comprehends the illands which go by that name, and which are fuppofed to lic at no great diftance from the weftern coalls of America.

In Africa the 'Turks poffefs Egypt, which they conquered in 15 ty , and have a nominal jurifdiction never the ftates of Barbary. The interior parts arc filled with barbarous and unknown nations, as they have always been. On the weftern coafts are many Settlements of the European nations, particularly the Britith and Portuguefe; and the fouthern extremity is poffeffed by the Iutch. The eaftern confts are al. moft totally unknown. The Afiatic and African inand; are either poffeffed by the Europeans, or inhabited by farage nations.

The European nations at the beginning of the $17^{\text {th }}$ century were, Sweden, Mufcovy, Denmark, Poland, Britain, Germany, Holland, France, Spain, Portugal, Italy, and 'iuky in Europe. Of thefe the Ruffians, though the molt barbarous, were by far the moit confiderable, both in regard to numbers and the extent of their empire; but their fituation made then little feared by the others, who lay at a diflanec from them. The kingdom of Poland, which was firtt fot up in the year 1000 , proved a barrier betwixt Ruffia and Germany; and at the fame time the policy above mentioned, of keeping up the balance of power in Europe, rendered it probable that no one Euro. pean nation, whatever wars it might be engaged in. would have been totally deltroyed, or ceafed to cxita $+\mathrm{C}$
as a ditinct kingons. The late difmemberment of Poland, however, or its partitnon between the three powcr: Rufla, Hungary, and Prufia, was a ttep very incontitent with the above political fyltem; and it is furpiting with what tamenefs it was acquicieed in by the other powers. Sublequent circumfances, particularly the palivenefs with which the ambitious delions of Rufliagaintt the Porte lave been folong betheld, feen to indicate a tutal dereliction of that feheme of equalibrium, formeriy to wilely, though perhaps fometimes too anxiouny, attended to.

The rewult of the Britith colonies in America, it was heped ty the cacmics of Britain, wonld have given a fa:al thock to her tirength and wonied fuperiurisy. The confoguences, however, have been sery dilferent. Thole colonies, it is trite, have been disjoined from the mother country, and have athaned an independsat rank amone the nations. But Britain has had nocaufe to repiae at the feparation. Divefted only of a felendidencumbrance, an expenive and iovidious appanage, the has been kfo to erjoy the undivided benelits of her natiee bigone, and to difplay mew energics, which promife her mild sapite a lony and profperons duration. On the other hand, the flame which was to have blazed only :o her prejudice, has brought confufion on her chief foe; and the ambision and tyranny of that braach of the houke of Buabon which has been long the peit of Europes, now lie humbled in the dutt. 'The French, indeed. have thus become a mati on of freemen as well as ourfelves, and as well as the Americins; who, by the way, were never otherwife, mur crer latew what oppreflom was except in inthetiot it unon their Atricat brethom. But neither is the French revolution an cvent which Brite ab, as luvers of lioesty and frie nds to the rights of mankint, thoud regret ; or which, even in a political vien, if doly condideres, sught to excite ether theiryealoufy or apprehention. In line, we feem $t$ be advancing to a greit cra in the hitory of human aflinis. The emancipation of Prance, it is not us be doubted, will in time be followed by that of Spain and other countries of Europe. 'The papal pover, too. that ferurge of nations, is dechining; and the period feems to be approading whon the kioman poniff witl be reduaed to his origmal and fimple title of tifores of Rome. More liberal idas both in politics aud rethion are every where graning ground. The regulation, and pethes in time the abclition, of the Anc-trade, with the endeancurs of the focieties for dicovering Africa, may had to the civitization of fome parts of that immenfe continent, and open new markets for our manufactures. Finally, the Ameri. eans approach faft to a fettled govermment; and will probably then tecome a great commerial people.

## Sect. M. Evclefrafical hificry.

The hiftcry of religion, among all the different mations that have cxilled in the world, is a fubject no lefs important aid interelling than that of civil hiflory. It is, hawter, kfo fertile of great events, affords an acoumt of fewer revolutions, and is mately more uniform, that civil hillory. The reaton of this is plain. Religion is conserian about thins whin carmot be fen; and whish of confuguence carnot futdenly and hongly affict the fenfes of mankind, as
natural things are apt to do. The expectation of world!y riches can ealily induce oue nation wattack another ; but it is not eafy to find any thing which will induce a nation to change its religion. blie invinble nature of fpiritual things, the prejudice of habit and of early education, all thand in the way of chan pes of this kind. Hence the revolutions in reli. gion have been but few, and the daraton of al moit any religion of longer ftandiag than the mat ceicbra: ed empires; the clanges which have happened, in general have acquired a bur tine to briag them about, and hitory icarce affords an intlance of the religion of any nation being effembally and fuddealy changed for another.

With regard to the origin of religion. we mult 'rave recourfe to the Seiptures; and are as necedarily conAtrained to adopt the acconnt there given, as we are to adopt that of the creation given in the fome book; uamely, becaufe no wher hath nade its appearance which feems in any degree rational, or confiftent with iticif. - In what manner the true icligrion given to Adam was falfilied or comptei by his cecteen fantobefure the food, woth not cliasly apper from Scripture. Idalatry is not mathoned: ne vorihclets we are affured that the inhalitants of the vorld were then exceedingy wicked; and as their wickednefs did not contilt in workipping falfe gold, it may be concluded that they workipped none at all ; i. e. tha: the crime of the antedilumans was deifm on atherm.

After the Alood, idolatry quickly mule its appearance; but what gave rife to it is not certainly known. igi This luperkition inded feems to be natural toman, cfeceialy waen placed in fuch a lituation that he hath l the opporanity of indruction, or of improving his rational facnities. This feems nifo probable from a cauriongiven to the Jews, lell, when they looked up to the fin, moon, and thars, and the reat of the hot of haten, they thould be difien to arombis than. The oncin of idulatry amons the syrians and A:abians, and also in Greece, is theofore acounted for with great promatitity in the following monner by the an: thot of The Ruissof Baibeck. "In thole menombertable defaris, where the day peefents nothing to the view but the mifom, tedious, and mehncholy perpect of barren fade, the aight biflufes a root delightful and masritivent fpertacle, and appars arraved wish charms of the mor atractive k'ul. For the mont part uncionded and forme, it exhibits to the womsoring eye the holl of heavea in all tivir varicty and g!o. ry. In the view of this itupendous foene, the trantition from admiration to idulatry was too eafy to winfrused mimds; and a peopic whole elimate uftered no beanties to contemplate bat thare of the farmanment, would naturally look thither for the obj cts of their wormip. The form of idolatry in Creece was different from that of the Syrians; which perhaps may be attributed to that fmiling and variegated fenne of mountains, valkys, rivers, woods, groves, and fommains, which the tranfored imagination, in the mide of its platins attonimatat, iuppufed to be the fiats of inviinble dutics."

A dificulty, however, arifes on this fuppofaion; for if idolatry is naturally produced in the mind of untatracted and favare man from a siew of the cre. ation, why hath not iculatry of fome kind or oher
taken place among all the different nations of the world ? This certainly hath not been the cafe; of which the mot Ariking examples are the Perfians of old, and the Moguls in more modern times. Both there rations were frit deft: fo that we mulllow dome other causes to concur in producing idolatry befides thee already mentioned; and of there causes an imperfect and obscure notion of the true religion feems to be the moll probable.

Though idolatry, therefore, was formerly very prevalent, it neither extended over the whole earth, nor were the fuperfitions of the idolaters all of one kind. Every nation had its refpective gods, over which one more excellent than the reft was fad to prefide; yet in fuch a manner, that this fupreme deity himself was controuled by the rigid empire of the fates, or by what philofophers called trinal neceffity. The gods of the eat were different from those of the Gauls, the Germans, and the other northern nations. The Grecian divinities differed widely from tho fe of the Egyptians, who deified plants, animals, and a great variety of the productions both of nature and art. Each people alto had their own particular manner of worhipping and appealing their respective deities, entirely different from the faered rites of other coontries. All this variety of religions, however, produed neither wars nor diffenfions among the different nations; each nation suffered its neighbours to follow their own method of worhip, without difcovering any difpleafure on that account. There is nothing furprifing in this mutual toleration, when we confider, that they all looked upon the world as one great emfire, divided into various provinces, over each of which a certain order of divinities prefided; for which reafon they imagined that none could behold with contempt the gods of other nations, or force Arrangers to pay homage to theirs....The Romans excreifed this tolerasion in the molt ample manner; for though they would not allow any change to be made in the eligoons that were publicly proffer in the empire, nor any new form of worthip to be openly introduced, yet they granted to their citizens a full liberty of offerring in private the faced rites of other nations, and of honouring foreign deities as they thought proper.

The heathen deities were honoured with rites and facrifices of various kinds, according to their refpeclive natures and offices. Their rites were afford and ridiculous; while the priets, appointed to prefide over this Arange worship, abufed their authority, by deeeiving and impoling upon the people in the groffert manner.

From the time of the flood to the coming of Christ, idolatry prevailed among almond all the nations of the world, the Jews alone excepted; and even they were on all oceafions ready to run into it, as is evident from their hiflory in the Old Teltament. At the time of Christ's appearance, the religion of the Romans, as well as their empire, extended over a great part of the world. Some people there were among the heathens who perceived the absurdities of that fyltem; but being deltitute of means, as well as of abilities, to affect a reformation, matters went on in their old way. Though there were at that time various feces of philosophers, yet all of them proceeded upon false prinsipies, and confequently could be of
no fervice to the advancement or reformation of eligion. Nay, forme, annong whom were the Epicureans and Academies, declared openly again't every kind of religion whatever.

Two religions at this time flourifhed in Palefline, viz. The Jewih and Samaritan; between whole refestive followers reigned the mot violent hatred and contempt. The difference between them rems to have been chiefly about the place of worfhip; which the Jews would have to be in Jerufalem, and the Samaritans on mount Gerizaim. But though the Jews were certainly right as to this point, they had greatly corrupted their religion in other reflects. They expeeked a Saviour indeed, but they miftonk his character ; imagining that he was to be a powerful and warlike prince, who Should fer them free from the Roman yoke, which they bore with the utmol impatience. They alto imagined that the whole of religion confitted in observing the rites of Moles, and forme others which they had added to them. without the kelt regard to what is commonly called morality or virtue; as is evident from the many charges our Saviour brings again ll the Pharifees, who had the greatell reputedion for fanctity among the whole nation. To there corrupt and vicious principles they added feveral abfard and fuperltitious notions concerning the divine nature, invisible powers, magic, \&e. which they had partly imbibed during the Babylonian captivity, and patly derived from their neighbours in Arabia, Byria, and Egypt. The principal feet among them were the Essenes or Effenians, Pharisees, and Saddeuces. The Samaritans, according to the mon general opinion, had corrupted their religion fill more than the Jews.

When the true religion was preached by the Saviour of mankind, it is not to be wondered at if he became on that account obnoxious to a people fo deeply funk in corruption and ignorance as the Jews then were. It is not here requifite to enter into the partieulars of the doctrine advanced by him, or of the oppofition he met with from the Jews; as a full account of there things, and likewise of the preaching of the golpel by the Apollos, may be found in the New Teflament. - The rapid progress of the Chinitian religion, under the ie faithful and inspired minifters, fool alarmed the Jews, and railed various perfections again its followers. The Jews, indeed, hem at firn to have been every where the chief promoters of perfecaution ; fur we find that they officiously went from place to place, wherever they heard of the increate of the gofer, and by their calumnies and fall fuggeltions endeavoured to excite the people again the Apoftes. The Heathens, however, though at frt they towed no very violent flirt of perfection again the Chiflans, Goon came to hate them as much as the Jews themfelves. Tacitus acquaints us with the eaufes of this hatred, when freaking of the firfl general perfectton under Nero. That inhuman emperor having, as was fuppofed, fut live to the city of Rome, to avoid the imputation of this wickedness, transferred it on the Chiflans. Our author informs us that they were already Tacitus's abhorred on account of their many and enormous crimes. acc ant of "The author of this name (Chrifians)," fays he, "was the fife Christ, who, in the reign of Tiberius, was exsect- be faction ted under P'ontius Pilate, procurator of Judea. The by Nero. peftilnt fuperlition was for a white fuppreffed: but it revived again, and fpread, not only over Judrea, where this evil was tirf broached, but reached Rome, whiter from every quatier of the earth is contantly flowing whatever is hideous and abominable amongt men, and is there readily embraced and practifed. Firt, therefore, were apprehended fuch as openly avowed thenfelves to be of that fect; then by them were diforeved an immenfe multitude; and all were convicted, wot of the crime of buning Rome, but of hatre? and enmity to mankind. 'lheir death and tortures were aggravated by crus] derifon and fpott; for they were cither cobered with the fkins of wild bealts and torn in picees by devourin: dogs, or faftened to evolles, or wrapped up in combutible garments, that, when the day-light failed, they might, like rorches. forve to difpel the darknefs of the night. Hence, towards the miferable lufferers, however guilty and deferving the molt exemplay punifloment, couniaffon arofe: feeing they were doomed to purth, not with a view to the pollic good, but to gratify the cenelty of onic man."

That this account of situs is downright mifteprefentation and calumny, muft he evident to every one who reads it. It is impoffible that any perton can be convicted of hatred and tnmity to mankind, without fpecifying a wimber of facts by which this hated thewed itfelf. The burning of Rome would indeed have been a very plain indieation of comity to mankind; but of this Tacitus himfelf clears them, and mentions no other crime of which they were gruil. 1y. It is probable, therefore, that the only reafon of this charge againt the Chriftians, was their abfo. lute refulal to have any flare in the Roman worfhip, or to countenance the abfurd fuperftitions of Paganifm in any degree.
fible to fay any thing with certainty. Neither is the church order, government, and difcipline, during this period, afcertained with any degree of exactnefs. Each of thofe parties, therefore, which exift at this day, contends with the greated earnefnefs for that particular mode of worthip which they themfleses have adopted; and fome of the molt bigo:ed would willingly monopolize the word church in luch a manner as to exclude from all lape of latuation every one who is not attached to their particular pariy. It doth not however appear that, excepting bapiifn, the Lord's fupper, and anointing the dick with oil, any external ce. remonies or fymbois were properly of divine app intment. According to Dr Moultein, " there are fiveral citumbances which incline us to think, that the filends and apotles of our bkited Lord either tolerated through neceffity, or appointed for wife reafons, many o:her external rites in various placts. At the fame time, we arc not to imagine, that they cver confersed upon any perfon a perpetual, indeldble pontitical authority, or that they enjoined the fame rites in all churches. We learm, on the contrary, from autheatic records, that the Chriflian worhip was from the beginning celebrated in a different manner in different places ; and that, no doubt, by the orders, or at leat with the approbation, of the apoltles and their difciples. In thofe early times, it was both wife and neceffary in bow, in the eflablithment of ontward forms of workip, fome indulgence to the ancient opiaions, manners, and laws, of the refpective nations to whom the goipel was preached."

The fecond century commences with the thind year Hinury ${ }^{56}$ of the emperor Trajan The Cheillians were till per-the feet fecuted; but as the Roman emperors were for the moll contury part of this centmy princes of a mild and moderate turn, they perfecuted lefs violently than formerly. Marcus Aurchas, notwithanding the clemency and philolophy for which he is fo much celebrated, treated the Chriltians worfe than Trajan, Adrian, or even Severus himfelf did, who was notel for his cruelty. This refpite from rigorous perfecution proved a very favourable circumftance for the fpreading of the Curittian religion; yet it is by no means eafy to point out the particular countries through which it was diffufed. We are, however, affured, that in the fecond century. Chrift was wortipped as God almoll through the whole eaft ; as alfo among the Germans, Spaniards, Celtes, and many other nations: but which of them received the gorpel in the firlt century, and which in the fecond, is a quethion unanfwerable at this difance of time. The writers of this century attribute the rapid progrefs of Chillianity chiefly to the extraordinary gifis that were imparted to the firf Chriltians, and the miracles. which were wrought at their command; without furpoling that any part of the fuccefs ought to beafcribed to the intervention of human means, or fecondary caufes. Many of the moderns, however, are fo far from being of this opinion, that they are willing either to deny the authenticity of all miracles faid to have been wrought fince the days of the apottles, or to afcribe them to the power of the devil. To enter into the particulars of this controverfy is foreign to our prefent purpofe; for which reafon we mult refer to the writers of polemic divinity, who have largely treated of this and other points of a fimilar nature.

The corruptions which had been introduced in the firft century, and which were almont coeval with Chriflanity itfelf, continued to gain ground in the fecond. Ceremonies, in themfelves futile and ufelefs, but which mult be confidered as highly pernicious when joined plied. to a religion incapable of any ether ornament than the upright and virtous condu't of its profeffors, wate multiplied for no other purpofe than to pleafe the ignorant mukhitude. The immediate confequence of this was, that the attention of Chifitians was drawn afide from the important duties of morality; and they were led to inagine, that a careful obfervance of the ceremonies might make amends for the neglect of moral cuties. This was the mort pernicious opinion that could polibly be entertained; and was indeed the very foundation of that enormous fyftem of ecclefialti. cal power which afterwareds took place, and held the whole world in llavery and barbarifin for many agcs

Another mifchief was the introduction of myferies, as they were called, into the Chriftian religion; thas is, infinuating that fome parts of the wormip in common ufe b.ad a hidden efficacy and power far fuperior to the plain and obvious meaning afigned to them by the vulgar: and by paying peculiar refpect to thefe mylteries, the pretended teachers of the religon of Jefus accommodated their doctrines to the tafte of their heathen neiglibours, whofe religion conffled in a heap of myflerics, of which nobody knew the meaning.

Dy thefe, and other means of a fimilar kind. the Chriftian pallors greatly abridged the liberty of their flock. Being mathers of the ceremonies and myflesies of the Chriftian religion, they had it in their poswer :o make their followers worm:p and belic ve whatever they thouglit proper ; and this they did not fail to make ufe of for their own advantage. They perfuaded ele: people, that the minifters of the Chrifian church faceeded to the character, rights, and privileges, of the J with pristhood; and accordingly the biflops confudered therafelves as invefted with a rank and character fimilar to thofe of the high. Frieft among the Jews, white the prebyters reprefonted the piadls, and the deacons the Levites. This notion, which was firll introduced in the reign of Adrian, proved a fuarce of very confiderable honour and profit to the clergy.
The form of ecclefraftical government was in this century sendered permanent and uniform. One infpector or bithop prefided over each Chriftian aftembly, to which office the was elected by the voices of the whole people. To affit him in his office, he formed a council of prefoyters, which was not conlined to any flated number. To the hifhops and prefbyters the miniflers or deacons were fubject; and the latter were divided into a variety of clafles, as the different exigen. sics of the church required. During a great part of this century, the churches were independent of each cther; nor were they joined together by affociation, confederacy, or any other bonds but thofe of charity. Each aflembly was a little flate governed by its own laws; which were either enaSted, or at leaft approved of, by the fociety. Bat in procefs of time all the Chriftian churches of a province were formed into one large ecclefiaftical body, which, like confederate flates, affembled at certain times, in order to deliberatc about the common interefts of the whok. This inflitation had its origin among the Greeks; but in a fhort time
it became univerfal, and fimiar aftemblies were form. Ecelffa. cd in all places where the gofpcl had been planted. Thofe affemblies, which couthed of the deputies or fical ${ }^{\text {Hitary. }}$ commiffioners from feveral clurches, were called fino.is by the Greeks, and counciis by the Latias; and the laws enacted in thefe general mrectings were called odnoms, i. e. rules.

Thefe counzils, of which we find not the fmallent $6 x$ trace before the midale of this ceniury, changed the promeet whole face of the church, and gave it a new form; for thy the i:". by then the ancient privileges of the people were cund finu:anos fiderably diminified, and the power and authority of ${ }^{\text {souacilo }}$ the bufh aps greatly augmented. The humility, inleed, and prudence, of the fe pinus prelates hindered them from affuning all at once the power with which they were afterwards invefted. At their fir! appearance in thefe general councils, they acknowledged that they were no mure than the delegates of their refpective churches, and that they acted in the name and by the appointincnt of their propte. But they foon changed this lumble tone; imperseptibly cxeerded the limits of their authority; turned hew ir:l:ence into domiman, their coundelo into laws:and at leneth opeatiy aferten!, that Chrit had empowered them to preferibe to his people auth, ritaive rules of fuilib and manacos. Another effect of thefe corncils was the gradual abolition of that perfect equality which reigned among all h:Mops in the primitive times: for the order and decency of thefe anemblies required, that fome one of the provincial bithops met in council thould be inverted with a fuperior degree of power and authoriey; and hence the aghts of Merrupolitans derive their origin. In the mean time, the bounds of the ciburch were eniarged; the ctathom of holding councils was followed wherever the found of the gofpel had reashed; and the univerfal church had now the appearance of one valt republic furmed by a combination of a grat number of litele Hates. This occafioned the creation of a new ordor of ecclefraftics, w!o were appointed in different parts of the would as heads of the church, and whofe ofice it was to preferve the confiftence and unim of that inmenfe body, whofe members were fo widely difperfed throughout the nations. Sach was the nature and office of the Patridichs; anong whom, at length, ambition, being arriwed at its mof infulent pcriod, formed a new dignity, invefting the bihop of Rome with the title and authority of the Prisze of the Partiarchs.
$6:$
1)uring the fecond century, all the fects continued stountos which had froung up in the firt, with the addition of the Ascefeveral others; the molt remarkable of which were the tion. Ajfertits. Thefe owed their rife to an cror propagated by fome doktors of the church, who arierted that Chrit had thablifhed a double rele of jithaty and virtue for two different orders of Chritians. Of theferules. one was ordinary, the other extrandinary; the one of a lower digaity, the other more fubline : the frot for perfons in the active ferese of life; the other for thofe who, in a facred retreat, appired after the glory of a celceitial itate. In confegrence of this fyltem. they divided into tro patts ail thofe moral duetrines and inftructions which they had received either ha writing or tradition. One of thefe divifions they callied precepts, and the other counfols. They gave the nans of frocepts to thofe laws that were univerfally ohliga.

Fe"lefis. tical Hancrv.
truy upny all urders of men: and that of compels to thote which related to Chritians of a more fubline rank, who popofed to themilves great and glorious onde, and breathed after an intimate communion with the supreme Being.. Thus were proluced all at once a new fet of men, who made preserfions to mammon fancrity and vittes, and declaral their refolution of wheging all the procepts and comblts of Chriak, in order to thio enjoyment of commanion witt: God tete, and alfo that, after the difioluion of their mortal bodies, they might afeend to him with the greater ia. cility, and find nothing (o retard thicir approach to the rentre of happinets and perfection. They looked upon themfelves as prohibited from the ufe of things which it was lawful for other Chilkians to enjoy; fuch as wine, Hefh, matrimony, an! commerce. They thought it their indifenfabie duty to extenuate their body by watchings, ab: mence, libour, and hunger. 'They looked for fticity in folitary retreats, and defart places; where, by fevere antalisuous efforts of fublime meditation, they raifed the foul above all external objecte, and all fenfual pleafures. 'They were diftinguinhed from other Chritians, not ouly by their tite of diavics, E :usani, Exary by their garb. In this centure, indeed, thofe who embraced fuch an aulfer kind of life, fubmitted themfelves to all thicfe mortincations in private, witheut breaking afunder their focial bands, or withdrawing themelves from mankind; but in procefs of time they retired into defarts, and, after the example of the Effenes and Therapeuta, they formed themfelves into certain companies.

This audtere fect arofe from an opinion which has been more or lefo prevalent in all ages an in all countries, namely, that retigion confits more in prayer, meditations, and a kind of fecret intercourfe is ith God, than in fulming the focial dutes of life in acts of benevolence and humanity to mankind. Nothing can be more evidert than that the Seripture reckons the futheng of thefe infinitely fuperior to the obfervance of all the cermrnies that can be imarined: jet it fomedow or other happens, that almoll every hody is more inctined to obferve the ceremonial part of devotion than the moral: and hence, according to the differ, nt humvers or conilitutions of different perfons, there have been mumberifs fon of of Chrillianity, and the mot twotent contentions amonc thofe who profeffed thenflves followers of the Prince of Peace. It is obvious, that if the moral conduct of Chrifians was to be made the andard of faith, infead of ipecolative opmions, all the fe divifons mut ceafe in a moment ; ut while Chritilanity, or any part of it, is made to conflut in fruenlation, or the oblervance of cermonies, it is imponible there can be any end of fects of herdies. Do upinions whateser is fo abfard, but fome people have protended to argue in its defence ; and no cctemony fo inffgiticant, but it hath been explaned and ractificd by hot-headed enthutiats: and henee cormonics, fects, and abfirditues, have been multiplicel withont unnter, to the prejudice of fociety and of the Chuilian relieion. This fhort relation of the rife of the Atcotic fuet will alio ferve to eccount for the aife of any other; fo that we apprebent it is wethe fo to chter into particulars concerning the ath: as they all took their origin from the fame
general principle varioufly modified, according to the different difpofitions of mankind.

The Afretic fect began tirlt in Errypt, from whence it paled into Syria and the neighbouring countrics. At length it eached the European nations: and hence that train of auftere and fuperflitions vows and rites which totally obfeured, or rather annihilated, Chintianity; the celbacy of the clergy, and many other abfordities of the like kind. The errors of the Afcetics, however, did not Itop here: In compliance with the doctrines of fome Pdyan philofophers, they affirmed, that it was not only lawful, but even praifeworthy, to deceive, and to ufe the expedicnt of a lie, in order to advance the caule of piety and truth; and hence the picus frauds fur which the church of Rome hath been fo notorious, and with which the hath been fo often and jultly reproached.

As Chriluans thes deviated more and more from the true practice of their religion, they became mure wedous in the external profeffion of it. Anniverfary fellivals were celebrated in commemoration of the death and refurrection of Chritt, and of the effufion of the Holy Ghuft on the apoftles. Concerning the days Contef ${ }^{63}$ on which thefe fellivals were to be ktpt , there arofe conceri vilent contefts. The Aliatic churches in general dif-fefival fcred in this point from thofe of Europe; and towards the com tution of the fecond century, Vistor bilhop of Kom trok it in his head to force the ealtern churchesto follow the rules laid jown by the wettern ones. 'This they abiontely 1 fafud to comply with: upon which Victor cut them off from communion with the church of Rone; thonga, by means of the interceflion of fome prudent peopic, the difference was made up for the prefent.

During moth of the third century, the Chriftians rhird were allowed to enj.y their religion, fuch as it was, turywithout molettation. The emperors Maximinus and Decius, indeed, made them fed all the rigours of a fevere perfecution; but their teigns were thort, and from the death of Decius to the time of Dioclefian the church enjoyed tranquillity. Thus vall multitules were converted; but at the lame time, the doctrine grew daily more corrupt, and the lives of profeffed Chritians more wicked and fandaluns. New ceremonies were invented in great numbers, and an unaccountable pafion now prevailed for the oricntal fupertitions concerning demons; whence proceeded the whole train of exoreifms, fpells, and fears for the apparition of evil fpirits, which to this day are nowhere eradicated. Hence alfo the cultom of avoiding all connections with thofe who were not baptifed, or who lay under the penalty of excommanication, as perfons fuppofed to be under the dominion of fome evil foirit. And hence the rigour and feverity of that difcipline and penance impoted upon thofe who had incurred, by their immoralities, the cenfures of the church. - Several alterations were now made in the manaer of celobrating the Lod's fupper. 'l'he praye:s ufed on this occalion were lengthened, and the folemnity and pomp with which it was attonded were confiterably increafed. Gold and filver veffels were ufed in the celebration; it was thought effential to falvation, and for that reafon adminitered even to infants.- Baptiin was celebrated twice a ycar to fuch as, after a long courfe of trial and preparation, offeted themfelves candidates.
clefia. The remiffion of fins was thought to be its immediate confoquence: white the bith $p$, be praver aml inipo. fition of hatuds, was furpoped to confer chofe fanctifying eifts of the How chart that are noceffry to a life of righteoufnefs and vatue fon cond demon was fuppofed naturally to retide in every peofon, who was the author and fource of all the corrage difperitoms and unrighteons actions of that perfon T'ne driving out of this demon was therefore an effertinl requilite for baptifm: and, in conferprence of this opinion, the baptized perfons returned home dothed in white garments, and adorned with crowns, as facred emblems, the former of their inward purity and innocence, and the latter of their victory nver lin and the world.Falling tegan now to be heth in more cldeem than formerly. A ligh degree of fanctiey was attributed to this pratice; it was even looked upon as indilpenfably meculary, from a notion that the demons dinceted their force chiclly againt thofe who pampered them. fetves with delicious fare, and were tefs troublefome to the lean and hangry who lived under the feverities of a rigorons ablinence.-. The fign of the crofs atfo was fuppofed to adminitter a victo: ions power ower all fores of trials and calamities; and was more cfpecially confidered as the furell defence againlt the fnares and ftratagems of malignant fpirits: for which reafon, no Chrillian undertook any hing of moment, withut arming himfelf, a, he imasined, with the power of this timmphant lign. Tin herefies which troplbed the church durinat this century, were the Gvostics. (whote doctrints were new-modithed and improsed by Mance, from whom they were aterwards chithy called Manicbears), he Heraches, Noethas, Shelhase, and Nusatians; for a particular acconat of which, fee thofe articles.

The fourth century is remarkable fore the eltahlifhment of Chrillianity by iaw in the Roman empire; which, how ever, did not take place tili the year $3=+$. In the beginning of the century, the empire was go. verncd by four chiefs, viz. Dinctefian, Maximian, Conitantius Chorus, and Galerins, undir whom the chureh enjoyed a perícet toleration. Diock fian, tho' much addicted to fuperfition, had no ill-will againt the Chrilians: and Contantins Chorus, having abandoned polytheifm, treated them with condecention and benevoknce. This alarned the Paran prietts, whofe interents were fo clufely commetul with the contiruance of the ancient fuperititons; and who apprehended, not whonent reafon, that the Chriilian religion would at length prevail throughout the empire. To prevent the downfal of the Pagan fuperti. tion, therefore, they applied to Diocetian and Galerius Cafar; by whom a mofl bloody perfecution was comroneed in the year 303 , and continued till 311. An afylum, however, was opened for the Chrittians in the year 364. Galerius having dethroned Dioclelian and Maximian, declared linifelf emperor in the eat ; leaving all the weftern provinces, to which great numbers of Chrillians reforted to avoid the cructey of the former, to Contantius Chborns. At Keneth Calerius, being overtaken with an incurable and dreadiul difeafe, pubiifhed an edict ordering the periccation to ceafe, and reforing frectom to the Chridann, whom he had ract inhumanly opprefied for ciaht years. Galerius died the fame year: and in a fhurt tims if.
ter, when Conftatine the Great afceneled the throne, the Chriflians werc fieed from any farther uneafinefs, by his abrosating all the penal laws agantl them; and afterwards itninge cdicts, by which wo uther relision than the Chratian was tukeated throughout the em. pire.

This event, bowerer, for favourable to the nutward peace of the church, wat far from promotine its internat harmony, or the riformaction of its laders. The nat harmony, or the retormation of its laders. The oy
clergy, who had all this time been ausmemting theirencreafen powce at the expence of the bbenty of the pcople, wow ${ }^{\text {the corrup. }}$ Fet no bounds to their ambition. The tilhup of Rome was the firt in rank, and dillinguifhed by a fort of pre-eminency above the rell of the prelates. The firspafied all his bethren in the magnificence and iplendor of the church orer which he prefided, in the riches of has revenues and poffefions, in the number and varity of his minillers, in his credit with the people, and in ais fumptuous and fipkndid manner of livus. Hence it happened, that when a new pontiff was to be cholen by the prebyters and people, the city of kome was generally agitated with diffentions, tumm!ts, anci canals, which often produced fatal confe. quences. 'The intrigues and diturbances which prevailed in that city in the year 366 , when, upon the death of Liberius, another pontiff was to be chofen in his place, are a fulficient proof of what we have advanced. Upoir this uccalion, one faction elected Damafus to that high dignity" while the oppofite party chofe Urfurinus, a deacon of the vacant chureh, to fucceed Liberius. This double election gave rife to a dangerous folnim, and in a fort of civil war within the eity of Rome; which was carricd on with the utmoft bartarity and fury, and produced the moil cried matractes and defolations. The inhuman conteft ended in the victory of Damafus; but whether his caufe was more jutt than that of Urlicinns, is not fo eafily determincd.

Nuthithtlanding the pomp and fulengor which furrounded the Ronian fee, it is certain that the bihops of Rume had not yet aequired that precminemece of power and jurifdietion which they afterwards enjoyed. In the ecelctiatical commonwealth, indecd, they were the moll cminent order of eis zens; but thill they were citizens as well as their brechren, and fulbject, liki. them, to the laws and edicts of the emperors. All religious canfes of extranthary importance w. re examined and determined, cither by judres apposinted ty the emperors, or in conncils aftembici fer that porpofe ; whate thofe of interior monent were decided in each oillriet by its refpecrive bithop. The eccleliallical laws were enacted cither by the emperor or councils. None of the bibops acknowledged that they derived their antherity from the permilhonamd appoint. ment of the binos of Rome, or that they were created bithepi by the favour of the afoflolic fie. On the conerary. they all maintaned that they were the anhafia. dors and manithers of Je fus Chatit, and that their atuthority was derived from abowe. It mult. however, Le defered, that even in thia century feveral of thole deps were lail by which the bithops of Rome mounted aticruads to the foms it of eectitatlical power and deiputifm. This hapreacd partly by the imprudence of the emperors, fatiy by the dexterity ef the Roman prelates itemblics, and party by the incondice.

よ.…lend.
rate real and precipitate judgment of certain bihops. Thic inpudace of the emperor, and precipitation of the hithops, were renarkably difcovered in the followbug event, which favoured extremely the ambition of the Roman pontiff. About the year 372 , Valeutinian enacted a lax, empowering the bihhop of Rome to ex. anime and julae other bihops, that religions difputes night not be decided by any profane or licular judges. The bimops affermbed in council at Rome in 378 , not conikerins tise futal confequences that muth arife from this imprudent law both to themfelyes and to the church, declared their approbation in the ltronget temas, and recommended the execution of it in their aderef to the emperor Gratian. Some think, indeed, that chis hew empowered the Roman bithep to judge o:ly the bifhops within the limits of his jurifdietion; whites, that his power was given only for a certain time, and for a particular purpofe. 'This latt notion feems the moll probable; but thill this privilege muit have been an execllent inftrument in the bands of facerdetsl ambition.

By the remoral of the feat of empire to Contantinople, the emperor raifed up, in the bilhop of this new metropolis, a formidalle opponent to the bilhop of Rome, and a bulwatk which threatened a virornus oppofition to his growing authority. For as the em. jeror, in order to render Conflantinople a fecond Rome, eariched it with all the rights and privileges, honours and ornaments, of the ancient capital of the world; fo its bihop, meafuring his own dignity and wak by the magnificence of the new city, and its enimence as the refidence of the emperor, aftumed an equal degree of dignity with the biflop of Rome, and fhimed a fupeniority over the reft of the epifcopal ordur. Nor dul the emperors difapprove of thefe high pretenfiens, fuce they coufidered their own diguity as chmected in a certain meafure with that of the bilhop of their imperial city. Accordingly, in a council held at Conlantinople in the year $3^{81}$, by the authority of Theodulus the Great, the bithon of that city was, during the abfence of the bifhop of Alexandria, and againft the confent of the Roman prelate, placed by the third canon of that council in the firlt rank after the bihop of Rome, and confequently above thofe of Alexandria and Antioch. Nectarius was the firft bithop who enjoycd thefe new honours accumulated upon the fee of Conftantimple. His fucceffor, the celebated Joln Chryfoltom, extended Hill farther the mivileges of that fee, and fubmitted to its jurifdiction afl Thrace, Afia, and Pontus; nor were the fucceeding bitheps of that imperial city deftitute of a fervent real to angment their privileges and extend their dominion. Dy this unexpected promotion, the molt difagrceable cffects were produced. The bilhops of Alexandria were not only filled with the moll inveterate laatred againt thofe of Conftantinople, but a contention was excited between the hilhops of Rome and Conftantinople: which, after being carried on for many ages, woncluted at laft in the feparation of the

Greek and Latin churches.

Curllantine the Great, in order to prevent eivil com. motions, and to lix his authority on a table and folid foundation, mase feveral changes not only in the laws of the empire, but alfo in the form of the Roman government. And as there were many important rcafons $\mathrm{N}^{\circ}{ }^{155}$.
which induced him to fuit the adminifration of the church to there changes in the civil conltitution, this necefarily introduced among the bimops new degrees of eminence and rank. The four bihop, of Rome, Conftantinople, Antioch, and Alexandria, were ditinguilhed by a centan degree of pre-cminence over the refl. Thefe four pelates anfwered to the four pra. wian prefeets created by Conkantine; and it is porfible, that ewon in this century they were ditinguithed by the Jewih tithe of putriarths. A fier thefe followed the exarcis, who had the infection of Everal provinces, and anfiverel to the appointment of certain civit officers who bore the came title. In a lower clafs were the inetrepolitions, who had only the government of one prowince; under whom were the arcibiflops, whofe infrection was confined to certain diftriets. In this gradation the lifloops brought up the rear; but the phace of their authority was not in all places equally extentive; being in fome confiderably ample, and in others confined within narrow limits. To thefe va. rious ecclefiatical orders we might add that of the charepifcopi, or huperintendents of the country-churches: but this latt order was in moft places fuppreffed by the bilhops, with a defign to estend their own authority, and enlarge the fphere of their power and jurifdiction. The adminittration of the church itfelf was divided by Contantine into an exticral and internal in. fpection. The latter, which was committed to bifhops and councils, related to religious controverfies, the forms of divine worfhip, the flices of prietts, the vices of the ceclefialtical orders, $\mathfrak{k e}$. The external adminitration of the church the emperor affumed to himfelf. This comprehended all thofe things which related to the outward ttate and difcipline of the church; it likewile extended to all contelts that hould arife between the minillers of the church, fuperior as well as inferior, concerning their poffelfons, their reputation, their rights and privileges, their offenees againtt the laws, \&.c. but no controverfes that related to matters purtly finitual were cognizable by this external infpection. In confequence of this artful divifion of the ecclefaltieal goverument, Conflantine and his fucceffors called councils, prefided in them, appointed the judges of religious controvelies, terminated the differenees which arofe between the bilhops and the people, fixed the limits of the ecelelialtical provinces, took cognizance of the civil caufes that fubtifted between the minilters of the church, and punifhed the crimes committed againtt the laws by the ordinary judges appointed for that purpofe; giving over all caufes purely ecclefiallical to the bifleps and councils. But this famous duvition of the adminiltration of the church was never explained with fufficient accuracy; fo that both in the fourth and lifth centuries, there are frequent inflances of the emperors determining matters purely ecclefiattical, and likewife of bihops and councils determining matters which related merely to the external form and government of the church.

After the time of Conftan:ine many additions were Scan made by the emperors and others to the wealth and lives honours of the clergy; and thefe additions were fol- clerg lowed by a proportionable increafe of their viees and luxury, particularly, among thofe who lived in great and opulent cities. The bifhops, on the one hand, con. tended with each other in the moft feandalous manner $\sigma$
con-
concerning the exient of their refpective jurifdistions; while, on the other, they trampled on the riglts of the people, violated the privileges of the inferior minillers, and imitated in their conduct and in their manner of living the arrogance, voluptuoufnefs, and luxury of magiftrates and princes. This pernicious example was foon followed by the feveral eecletiatical orders. The preßyters, in many places, affumed an equality with the bifhops in furint of rank and authority. Many complaints are alfo made by the authors of this century abum the vanity and effeminacy of the deacons. Thufe more particularly of the prefoyters and deacons who filled the firt Atations of thefe orders, carried their pretentions to an extravagant length, and were offended at the notion of being placed on an equality with the colleagues. For this reafon they not only affurred the titles of arch-prefbyers and arch-deacons, bue alfo claimed a degree of authority and power much fuperior to that which was velted in the other members of their refpećtive orders.

In the fiftb century, the bihops of Conftantinople having already reduced under their jurifdiation all the Aliatic provinces, begian to grafp at till further accer. fions of power. By the 28 th canon of the council held at Chatcedon in 45 , it was refolved, that the fame rights and honours which lad been conferred on the bihop of Rome were due to the bihop of Contantinople, on account of the equal dignity and luthe of the two citics in which thefe prelates exercifed their authurity. The fame council confirmed alfo, by a folemn aft, the bihop of Conftantinople in the fpiritual government of thofe provinces over which he had ufurped the juriddition. Leo the Great, bihop of kone, oppofed with vehemence the paffing of thefe laws; and his oppofition was feconded by that of feveral other prelates. But their efforts were vain, as the empernes threw in their weight into the balance, and thus fupported the decifins of the Grecian bimops. In corifequence, then, of the decifient of this famuns council, the tihop of Confantin ple began to contend obitinately for the furremacy with the Roman pontilf, and to cruth the bithops of Autiuch and Alexandria. About the fame time, Juvenal, bifhop of Jerufalem, attempted to withdraw himfelf and lis church from the jurifdiction ef the bihop of Cxiarea, and affired after a place among the firth prelacs of the Chirlian world. The high degree of veneration and efleern in which the church of Jerufalem was held among all other Chrifian focieties (on account of its rank among the apoltolical churches, and its title to the appellation of mother.church, as having fucceeded the firll Chritian alfembly formed by the Apultes), was extremaly favourable to the ambition of Juvenal, and rendered his project much more practicable than it would otheruife lave teen. Encouraged by this, and likewife by the proteftion of Theodofius the younger, this a piring prelate not only affurned the dignity of patiareh of all Paleftine, a rank which rendered him independent of all fpiritual authority; but alfo invaded the rikhes of the biflop of Antioch, and ufurped his jurifdittion over we provinces of Phcenicia and Arabia. Hence arofe a warm conteft between Jurenal and Ma. ximus bihup of Amtioch; which the council of Chatcecon decided, by refloring to the latter the provinces of Itacnicia and Arabia, and confaming the furmer
in the firitual poffeffion of all Palefine and in the high
rank which he had affumed in the church.
10 588 , Juhn, bifhop of Contantinople, furnamed the Fafler, either by his own authotity or that of the emperor Mauritius, fummoned a council at Conflantinople to inguire intu an accufation brought againft Gregory, bifhop of Antioch; and upon this occafton affumed the title of acumenical or unizerjal bifbop. This title had been formerly enjoyed by the bifhops of Con. Atantinople without any offence; but now, Gregory the Greas, at that time kilhop of Kome, fufpecting that John was aiming at the fupremacy over all the chuicbes, oppofed his claim with the greatett vigour. For this purpofe he applied by letters to the emperor, and others, whom le thought capable of affiting hire in his uppofition: but all his effurts were without if. fect; and the billops of Contantinople were allowed to enjoy the difputed title, though not in the fenfe which had alarned the Roman pontiff.

Gregory, however, adhered tenaciouly to his parpofe, raifed new tumults and difientions among the clergy, and aimed at worhing lefs than an unlimited fu. premacy over the Chriftian church. This ambitious dagn fucceeded in the wett; while, in the eatern provinces, his arrogant pretenfions were faarcely refpected by any but thofe who were at enmity with the bis thop of Conllantinople. How much the people were at this time deluded by the Roman poniffs, appeary from the expreffion of Ennodius, oue of the flatterers of Symmachus (who was a prelace of but ambiguous fame), that the Ruman pontiff was couftituted judge in the place of God, which he tilled as the vicegerent of the Mofl High. On the other hand, it is certain, from a variety of the non authentic records, that buth the emperors and the nations in general were far from being difpofed to bear with patience the yoke of ferritude which the fee of Rome was arrogantly impoling on the whole church.

In the beginning of the feventh century, according origin of to the mott learned hilonians, Bunifacelll. engaged che fuprePhocas, emperor of Conitantirople, to take from the masy of the bithop of that metropolis the title of acumarical or pope. niveryjal difbop, and to confer it upon the Roman pentiff: and thus was firt intrucuced the fopremacy of the pope. The Roman pontiffs ufed all methods to maintain and colarge this authority and preeminence which they had acquired frem one of the mot odious tyrants that ever difgraced the annals of hi?ary.
In the tighth century, the paner of the bilhop of Rome, and of the ciergy in general, increaled prodi. givelly. The chief caufe of this, befides the fupertittion of the people, was the method at that time ufed by the European princes to fecure themfelves on their thrones. All thefe princes being then employed either in ufurpation or in felf-defence, and the whole continent being in the moft unfettled and barbarous condition, they endeavoured to attach warmly to their interells thofe whom they confidered as their friconds and clieuts. For this purpofe they diatributed among them extenfise territories, cities, and fortreffes, with the various rights and privileges belonging to them; referving only to themfelves the fupreme douninion. and the military fervice of thefe powerful vaffals. For this reafon it was by the European princes reckuned a high infance of policial prodence to diftribute among the 4 D
bithops

Ecclefia.
bithops and other Chrititian doktors the fame fort of ity, thefe ignorant profelytes confounded the excomdonations which had formerly been given to their generals and clients. By means of the clerge, they

 If

She converion of the barbarous nations to Chrifian-
eclefia- the church of Rome, and new laws fubtituted in their nical intry. place. The European princes fuffered themfelves to be divefted of the fupreme authority in seligious matters, which they had derived from Charlemagne; the power of the bifhops was greatly diminifhed, and sven the authority of both provincial and general councils began to decline. The popes, clated with their overgrown profperity, and become arrogant beyond meafure by the daily acceffions that were made to their authority, were cagerly bent upon eftablifing the maxim, That the bilhop of Rome was conftituted and appointed by Jefus Chrilt fupreme legifator and judge of the church univerfal; and that thesefore the bifhops derived all their authority from him. This opinion, which they inculcated with the utmot zeal and ardour, was oppofed in vain by fuch as were acquainted with the ancient ecclefiatical conilitutions, and the government of the church in the earlier ages. In order to gain credit to this new ecclefiantical code, and to fupport the pretenfions of the popes to fupremacy, it was neceffary to'produce the anthority of anciert deeds, in order to ltop the mouths of fuch as were difpofed to fet bounds to their ufurpations. The bithops of Rome were aware of this; and as thofe means were looked upon as the moit law. ful that tended beft to the accomplifhment of their purpofes, they emploged fome of their mot ingenious and zealous partifans in forging conventions, aets of councils, epitles, and fuch-like recurds, by which it might appear, that in the firit ages of the church the Roman pontiffs were clothed with the fame firitual majelly and fupreme authority which they now affumed. There were not, however, wanting among the bifhops fome men of prudence and fagacity, who law through thefe impious frauds, and perceived the chains that were forging both for them and the church. The French bihops difinguifed themfelves eminently in this refpect : but their oppofition was foon quafhed; and as all Europe was funk in the groffell ignorance and darknefs, none remained who were capable of detecting thefe odious impoftures, or difpofed to fupport the expiring liberty of the church.

This may ferve as a general fpecimen of the character and behaviour of the pretended vicegerents of Jefus Chrift to the 16 th century. In the 11 th century, indeed, their power feems to have rifen to its utmoft height. They now recsived the pompous tites of Mafers of the W'orld, and Popes, i. e. unizerfal fathers. Thes prefided every where in the councils by their legates, affumed the authority of fupreme arbiters in all controverfies that arofe concerning religion or churchdifcipline, and maintained the pretended rights of the church againt the encroachments and ufurpations of kings and princes. Their authority, however, was confined within certain limits: for, on the one hand, it was reftrained by fovereign princes, that it might not arrogantly aim at civil dominion; and, on the other, it was uppoled by the bifhops themfelves, that it might rot arife to a \{piritual defpotifm, and utcerly deftroy the privileges and libert y of fynods and councils. From the time of Leo IX. the popes employed every method which the moft artful ambition could fuggett to remove thofe limits, and tu render their dominion buth defpotic and univerfal. They nut only afpired to the character of fupreme legiflaturs in the church, to an unlimited juriddiction over all fynods and councils whe-
ther general or provincial, to the fole diftribution of all ecclefiaftical honours and benefices, as divinely authorifed and appointed for that purpofe; but they carried their infolent pretenfions fo far, as to give themfelves out for lords of the univerfe, arbiters of the fate of kingdoms and empires, and fupreme rulers over the kings and princes of the earch. Hence we find inttances of their giving away kingdoms, and loofing fubjects from their allegiance to their fovereigns; among which the hiftory of John king of England is very remarkable. At laft they plainly affumed the whole earth as their property, as well where Chrittianity wa preached as where it was not; and therefore, on the difcevery of America and the Eat Indies, the pope, by virtuc of this fpiritual property, granted to the Portuguefe a right to all the countries lying eallward, and to the Spaniards all thofe lying to the weftward, of Cape Nun in Africa which they were able to conquer by force of arms; and that nothing might be wanting to complete their character, they pretended to be lords of the future world alfo, and to have a power of reftain. ing even the divine julice itfelf, and remitting that punifhment which the Deity hath denounced again?t the workers of iniquity.

All this time the powers of rupertition reigned chritian. triumphant over thofe remains of Chriftianity whichny घrcatig had efcaped the corruptions of the frat four centuries. corru; ted. In the fifh century began the invocation of the hap. Invocations py fouls of departed faints. Their affilance was in "f faints, treated by many fervent prayers, while none flood up reace, purto oppofe this prepoltcrous kind of wormip. The irmoducced. images of thofe who during their lives had acquired the reputation of uncommon fanctity, were now honoured with a particular worfhip in feveral places; and many imagined that this drew into the images the propitious prefence of the faints or celteftal beings which they were fuppofed to reprefent. A lingular and irrefitible efficacy was attributed to the bunes of martyrs, and io the figure of the crofs, in defeating all the attempts of Satan, removing all forts of calamitics, and in healing not only the difeafes of the body, but alio thofe of the mind. The famous Pagan doctine conecrning the purification of departed jusls by means of a certain kind of fire, i.c. purgatory, was alfo conlirmed and explained more fully than it had formerly been; and every one knows of how much confequence this abfurd doctrine hath been to the wealth and power of the Romifh clergs.
In the lixth century, Gregory the Great advanced an opinion, that all the zeords of the becred writings were imates of invifible and firitual things; for which reafon he loaded the churches with a multitude of ec. remonies the mott infignificant and futile that can be imagined; and hence arofe a new and molt difticuit fcience, namely, the explication of the fe ceremonies, and the invelligation of the caufes and circumfances whence they derived their origin. A new method was contrived of adminittering the Lord's fupper, with a magnificent affemblage of pompous ceremonies. This was called the conon of the mafs. Baptifm, except in cafes of neceffity, was adminulertd only on the great feitivals. An inceredible number of temples wers arecol eratu ted in honour of the faints. The places fet apart for tion of the public workip were alfo very numerons: but now they mis. were conidered as the means of purchaing the protec-
(ion and favour of the faints: and the ignorant and barbarous multitude were perfuaded, that thefe depatted fpirits defended and guarjed again! evils and calamitics of exery hind, the prowinces, lands, cities, and villazes in which they were honoured with temples. The sumber of thefe temples was almolt cqualided by thas of the fetho..1s, which leem to have been invented in oneer to bring the Chritian religion as near the model of Patanifm as puffible.

In the ferenth eentury, rificion feemed to be altogether buriad under a heap of fupertition ceremoncs; the worthip of the trace Goud and senvour of the world was exchamed for the worthp of boncs. bits of ronol (faid te be of the crof), and the amages of faints. Tlie etomal hate of mifery thratencd in Scrpatme to the wicked was cxchmari for the tempory punith. ne: nit of pursatoy: and the expreffins of faich in Chrith ty an upright and vituous conduct, for the augmentation of the riches of the clergy by duations to the church, and the obfervance of a heap of ide ceremonies. New fettivals were fill added; ne in particular was inflituted in honomr of the trace orefo on which our Suw, ur fufired: and churches were declared to be fanctuaies to all fuch as fled to them, whatever their crimes might have been.
Supertition, it wonll ferm, hall now attained its highett pitch; mor is it ealy to concture a degree of ignorance and detencrace bejond what we have alteady mentioned. If any thinf can poffibly be imagined more contrary to true religion, it is an opinion which prevaile 1 in the erght centurs, namely, 'That Chrithans minht appeate an offended Deity hy voluntary acts of murntication, or hy gifts and oblations lavih. ed on the church; and that people ought toplace their confidence in the works and merits of the faints. The pitely in this and fome faccerding ages confited in buiding and embellithing churches and chapels; in en towing monaftwits and batilics; hunting after the relics of faints and martyrs, and treating them with an athard and exceffive buration: in procuring the in Ercefion of the faints ly rich oblations, or fuperthitious rites; in worthipping imares; in pilgrimages to thofe plates which were eflecmed holy, particuTarly to Palehime, Sc. The genuine religion of Jefus was now utterly unknown both to clergy and moulh, if we except a fow of its general dectrines containct in the cre d. In this century alfo, the fuperfirtions cullom of folitary muftes had its origin. Thefe were calbated by the priell alone in behall of fouls detained in porgatory, as well as upon fome other necafions They were prohibited by the laws of the church, but proved a fouter of immenfe wealth to the dergy Unter Charlemagne they were condemned by a fynud affembled at Mentz, as criminal effects of avarice and fhoth. A new fuperllition, however, fill fpung up in the tenth century. It was inagined, from Rev. xx. 1 that Antichrilt was to make hes appearance on the earth, and that foon after the world itfelf would be deftroyed. An univerfal panic enfued; watl numbers af poople, abandoning all their connections in fociety, and divng "ver to the churches and nonatteries all thin woaldy efects. repaired to Paletine, where they imagined that Clirith would defeend from heaven so judee the wirld. Others devoted themfelves by a Evlemn and volumary dath to the fervice of the churches,
convents, and priethood, whofe navee tiney became, in the molt rigorous fenfe of that word, performing daily their heavy tafks: and all this from a notion that the fupreme judge would diminith the feverity of their fentence, and louk upon them with a more favourable and propitious eye, on account of thear having made thenfelves the flaves of his miniters. When the eclipfe of the fur or moon happened to be vilible, the cities were defetted, and their miferable inhabitants fer for refuge to hollow caverns, and hid themfelves anong the cragay rocks, and under the benning fumme of fiece monntains. The opulent attempted to bribe the faints and alue Deity himelf by rich donations conferred upon the facerdutal tribe, who were looked upon as the immediate vicegerents of heaven. In many places, umples, palaces, and noble edifices both public and private, were fuffered to decay. tay, were delibeately pulied down, from a notion that they were no longer of any ufe, as the final difflution of all things was at nand. In a word, no language is fufficient to exprefs the confulion and defpair that cormented the minds of miferable mortals upon this occafion. The gencral delufion was iudeed oppofed and combated hy the diferning few, who endcavoured to difpel thefe terrors, and to efface the notion from which they arofe in the minds of the people. But their attempts were ineffectual; nor could the dreadful appreirentions of the fuperititious mulcitude be removed before the end of the century, and thas terrer became one of the accidentai caules of the Cporsades.
'That nothing might now be wanting to complete that antichrillian fyttem of religion which had overfpread all Europe, it was in the 11 th century detarmined that divine worfhip flould be celebrated in the Latin tongue, though now unknown throughout the whole continent. During the whole of this century, alio, Chrittians were employed ia the rebailding and ornamenting their churches, which they had delfroyed through the fuperftitions fear already taken notice of.

In much the fame way with what is above related, or worfe if poffible, matters went on till the time of the reformation. The clergy were immenfed in crimes of the deeptft dye: and the laity, imagiuing themfelves able to purchafe pardon of their fins for money, followed the examples of their paitors withont remorle. The abfurd principle formerly mentioned, namely, that religion confits in ats of autterity, and an unknown mental correfpondence with God, produced the motl extravasant and ridiculons bedaviour in the fants. devotees and reputed faints. They not only lived among the wild bealts, but alfo after the manner of thefe favage unimals: they ran maked through the lonely defarts with a furious afpeet, and all the agitations of madnef, and frenzy; they prolonged their wretched life by giafs and wild herbs, avoided the fight and converfation of men, remained almolt motionlefs in certain places for feveral years exporied to the rigour and inclemency of the feafons, and towards the conclufion of their lives that themfelves up in narrow and miferable luts; and all this was contidered as true piety, the only acceptable method of warhipping the Deity and attaining a thare in his favour.- But of all the inflances of huperilitious frenzy which difgraced the times we now fpeak of, none was held in higher veneration, or exeited more the wonder of the multi-

## $\begin{array}{lllllll}H & I & S & T & R & \end{array}$

tude，than that of a certain order of men who were called Stilises by the Greeks，and Sanai Columnares， or Pillar Saints，by the I，atins．Thefe were perfons of a moft fingular and extraragant then of mind，who flood motiondefs on the tops of pillurs exprefsly raifed for this extreife of their patience，and remained there for feveral years amid！t the admiration and applanfe of the fupid populace．The inventor of this trange difcipline was one Simecn a Syrian，who began tis follie＇s by changing the agreeable employment of a mepherd for the anderities of a monkin life．He be－ gan his devotion on the top of a pillar fix cubits high； but as he increafed in fanctity，he alfo increafed the height of his pillar，till，touards the conclufion of his life，be had got up on the top af a pillar 40 cuthits in height．Many of the inhabitants of byria and Pa－ leltine，feduced by a falfe anbition and an utter igno－ rance of true religion，followed the exanple of this fa－ natic，though nut with the fame degree of aufterity． This fuperflitious practice bugan in the fiffh century， and continued in the ealt for 600 years．The Lations， however，had too much wifton and prudence to imi－ tate the Syrians and Orientala in this whimfical fugeter－ flition：and when a certain fanatic，or impoltor，na－ med I＇alflatus，exected one of thefe pillars in the country of＇Treves，and propofed to live on it after the manner of Simeon，the ucighburiag bilhups or－ dered it to be pulied down．

The practices of auttere worlhip and difcipline in other refpeets，howerci，gained graund throughout all parts of Chriftendum．Monks of various kinds were to be found in every country in prodigious num． bers．But though their difeipline was at firll esceed－ ingly fevere，it becane gradually iclaxed，and the monks gave into all the prevaling vices of the times． Other orders fuccetded，who pretended to it ill great－ er degrees of fanctity，and to reform the abnies of the preceding ones；but thefe in their turn became corrupted，and fell into the fame vices they had bla－ med in others．The mofl violent animali ies，diputes， and hatred，alfo reigned anong the diferent orders of monks：and，indeed，berween the clergy of all ranks and degrees，whetlier we confider them as claffed in different bodies，or as individuals of the fame body． ＇To enter into a detail of their wranglings and dif－ putes，the methods which each of them tonk to ag－ grandife themitues at the expence of their neigh． bours，and to kecp the reft of inankind is fubjection， would require many whiumes．Wic mail only ubferve， therefore，that even the external profedion of the an Atere and abfurd piety which took place on the fourth and ifth centuries，contimerd gradually to decline． Some there wete，indeed，who boltily＂ppofed the tor－ rent of fuperfition and wickednefs which thercasened to overflow the whole woild：but thicir oppotition proved fruitlefs，and all of thefe towards the era of the reformation had been either filenced or ce！lroyed ： fo that，at that time，the pope and clergy reignod over mankind without controni，had made themfolves ma－ ners of almoft all the wealth in evety country of Lin． rope，and may truly be tail to have been the only fouereigns；the reft of the human race，even hings and． princes，being only their valfals and ilaves．

While the Popih fupetintion reigred the viohnt． $l_{y}$ in the wett，the abfurd duEtrines of Mahomet over－
fpread all the eatt．The rife of this impolnor is rela－ ted under the article Arsbia．His fucceffors con－ quered in order to eftablifl the religion of their apofte； and thus the very name of Chrilianity was exting oifh． ed in many places where it had formerly flourihed． Tlbe conqueits of the Tartars having intermingled them with the Mahometans，they greedily enbraced the fuperititions of that religion，which thus almon entirely overfpread the whole continents of Afia and Africa；and，by the conquett of Conftantinople by the ＇Iurks in 1453，was likewife eftablifhed throughout a confiderable part of Eurape．

About the beginaing of the t the century，the Ro． man pontifis lived in the utmoft tranquillity；nor had they，according to the appearance of things at that time，any teafon to fear an oppolition to their autho． rity in any refpect，fince the comarations which had been raifed by the Waldenfes，Abigenfis，Sce were now entircly fuppreffed．We muit not，however， conclude，from this apparent tranquiliity and fecerity of the pontiffs and their adherents，that their meafures were naiverfally applanded．Not only private perfons， but alio the mof powerful princes and foversign flates， exchamed loudly againt the tyranny of the popes， and the unbided licentioufnes of the elergy of all denominations．They demanded，thereforc，a refor－ mation of the chureh in its hal and members，and a general council to accomplih that neceffary purpufe． But thefe complaints and denands were not carried to fuch a length as to produce any grode effeet ：lince they came from perfons who never entertained the leat doubt abont the fupreme authority of the pope in re－ ligious matters，and who of confequace，inilead of attempting themfelves to bring abom that reformation which was fo ardently defired，remained entirly in－ active，or looked for redrefs to the court of Rome，or to d geneal comacil．But while the fo much detired re． formation feemed to be at fuch a great cillance，is fud－ den＇y arofe from a quarter whence it was no：a：a．l expected．A fingle perfon，Mertin Luther，a monk of the order of St ．hu yuttine，veatured to oppofe himiele to the whole torrent of papal power and defpotion． This buld atempt was lirtit made pablic on the 3 th of September 1517 ；and，notwithitanding all the eflorts of the pope and his adherents，the dottrines of Lather continned daity to gain gromad Others，encouraged by his fuccefy，lent their afillance in the work of re－ formation；which at lall produced new chutches， fomaded upon principles quite difierent from that of Rome，and which ttill contmae．But for a patticular account of the trandactions of the firll reforin：r，the oppoficion they met with，and the final fettlement of the reformed churches in dificrent natiens in Europe， fee the atticles Lutiaen and Reformation．

The thate of religion in other parts of the world feems as ret to be but litele altcred．A hia and Africa are tunk ill the grofef fuperfitions either of the NFa－ hommedan ur Pagan kinds．The funthern continent of America，belonging to the Spaniards，cominues immerfer in the in ablurd fuperlitions of Popery． The northeria continent，being molly peopled with． colonies from Great Britain，profeffes the reformed re－ lugion．At the fame time it nut be owned，that fone kind of ceformation liath taken place even in Popery and Mahomenedanitn themfelves．The popes have no

longer that authonity over fates and princes, even thofe mott bigeted to Popery, which they formerly has. Neither are the lives either of the clergy or laity fo cormpt as they were before. The increafe of learning in all parts of the world has contributed to canfe men open their eyes to the light of reafon, and this hath been attended with a proportional decreafe of fuperftition. Even in Mahommedan countries, that furious enthufafin which formerly emboldened the inhabitants to face the greatelt dangers, hath now almof vanithed; fo that the credit of Mahomet himfelf feems to have funk much in the eftimation of his followers. 'This is to be underitood even of the molt ignorant and bigoted multitude; and the fenlible part of the Turks are faid to incline much towards deifm. With regard to thofe nations which fill profefs Paganifm, the intercourfe of Europeans with them is fo fmall, that it is impofible to fay any thing concerning them. As none of them are in a flate of civilization, however, it may be conjectured, that their seligion is of the fame unpolihed cat with their manners; and that it contilts of a heap of barbarous fuperititions which have been lianded down among them from time inimemorial, and which they continue to obferve without knowing why or wherefure.

## Sect. III. Of the Compofition of Hipery.

Cicero has given us the whole art of compofing hiftory, in a very hort and comprehenfive manner. We fhall firlt tranferibe what he fays, and then confiser the feveral parts of it in their proper order. "No one is ignorant (fays he), that the fift law in writing hifory is, Not to dare to fay any thing that is fulfe: and the next, Not to be afraid to fpeak the truth: that on the one hand there be no fufpicion of affection, nor of prejudice on the other. Thefe foundatinns are what all are acquainted with. But the fupertructure confifts partly in things, and partly in the ligle or language. The former require an order of times, and deferiptions of places. And becaufe in great and memorable events, we are delirous to know firl their caules, then the actions themfelves, and laftly their confequences; the biftorian mould take notice of the fprings or motives that occafioned them; and, in mentioning the facts themfelves, fhould not only ralate what was done or faid, but likewife in what manuer ; and, in treating upon their confequences, flaw if they were the effects of chance, wifdom, or imprudence. Nor thould he only recite the actions of great and eminent perfons, but likewife deferibe their characters. The flyle ought to be fluent, fmooth, and even, free from that hat fhnefs and peignancy which is ufual at the bar." Thus far Cicero. An libtory written in this manner, and furnilhed with all thefe properties, inult needs be very entertaining, as well as inftructive. And perhaps few have come nearer this plan than Tacitus; though his fubject is attended with this unhappy circuntlance, or at leart unpleatant one, that it affords us examples rather of what we ought to avoid than what to imitate. But it is the butinefs of the hitorian, as well as of the philofopher, to reprefent both virtues and vices in their ploper colours; the latter doing it by procepts, and the former by examples. Their manner is difGerent ; but the end and defign of both is, or fhould
be, the fame: And therefore hillory has not improperly been faid by fome to be moral philofophy exemplified in the lives and actions of mankind.

We thatl reduce thefe feveral things mentioned by Cicero to three heads, Matter, Order, and Style ; and treat upon each of them feparately. But as Truth is the balis and foundation of all hillory, it will be neceffary to confider that in the firt place.

## Art. I, Of Truth in Hifory.

Truth is, as it were, the very life and foul of hiftory, by which it is dittinguined from fable or romance. An hiftorian therefore ought not only to be a man of probity, but void of all palfion or hias. He muit have the fteadinefs of a phillofopher, juined with the vivacity of a poet or orator. Without the former, he will be infenfibly fwayed by fome paffion to give a falfe colouring to the actions or characters he defcribes, as favour or dinike to parties or perfons affect his mind. Whereas he ought to be of no patty, nor to have either friend or foe while writing ; but to preferve himfelf in a flate of the greatef indifferency to all, that he may judge of things as they really are in their own nature, and not as connected with this or that perfon or party. And with this firm and fedate temper, a lively imagination is requiate; without which his defcriptions will be flat and cold, nur will he be able to convey to his readers a jult and adequate idea of great and generous actions. Nor is the alliftance of a good judgment lefs neceflary than any of the former qualities, to direct him what is proper to be faid and what to be omitted, and to treat every thing in a manner fuitable to its importance. And fince thefe are the qualifications neceflary for an hiftorian, it may perhaps feem the lefs Atrange that we have fo few good liftories.

But hillorical truth confifts of two parts: one is, Nut to fay any thing we know to be falle: Though it is not fufficient to excufe an hiflorian in relating a falfehood that he did not know it was fo when he wrote it, unlcis he firft ufed all the means in his power to inform himaflf of the truth; for then, undoubtedly, an invincible error is as unpardonable in hiftory as in morality. But the generality of writers in this kind content themflees with taking their accounts from hearfays, or tranfcribing them from others; without duly weighing the evidence on which they are founded, or giving themfelves the trouble of a ftrict inquiry. Few will ufe the diligence neceffary to inform themflves of the certainty of what they undertake to relate. And as the want of this greatly abates the pleafure of reading fuch writers, while perfons read with diffidence; fo nothing nore recommends an hiforian than fuch indultry. Thus we are informed of Thucyddes, that when he wrote his biltory of the Pcloponncfian war, he did not fatisfy himfelf with the bet accounts he could get from lis countrymen the Athenians, fearing they might be partial in their own caufe; but fpared no expence to inform himfelf how the fane fasts were related by their enemies the Lacedemonians; that, by comparing the relations of both parties, he might better judge of the truth. And I'olybius took greater pains than he, in order to write his hiltory of the Roman affiars; for he travelled into Africa, Spain, Gaul, and other parts of the world,
that by viewing the feveral feenes of action, and in. forming himfelf from the inhabitants, he might come at a greater certainty of the facts, and reprefent them in a jufter light. But as an hiflorian ought not to alfert what he knows to be falfe; folle fronld likewife be cautious in relating things which are doubtful, and acquaint his readers with the evidence lie goes upon in fuch facts, from whence they may be able to judge how far it is proper to credit them. So Herudotus tells us what things he faw himfelf in his travels, and what he heald from the information of the Egyptian priefts and others with whom he converfed. And Curtius, in the life of Alexander, fpeaking of the affairs of India, ingenuouly confe fles, that he wrote mere than he fully believed. "For (fays he) I neither dare to affirm pofitively what I doubt of, nor can I think it proper to omit what I have been told." By fuch a conduct the author fecures his credit, whether the things prove really true or falfe; and gives room for furbler inquiry, without impofing on bis readers.

The other branch of hillorical truth is, Not to omit any thing that is true, and neceffary to fet the matter treated of in a clear and full light. In the actions of paft ages or dillant countries, wherein the writer has no perfonal concern, he can have no great inducement to break in upon this rule. But where intereft or party is engaged, it sequires no fmall candour, as well as firmnefs of mind, contantly to adhere to it. Affection to fome, averfion too thess, fear of difobliging friends or thofe in power, will often interpufe and try his integrity. Befides, an omifion is lefs obvious to cenfure, than a falfe afiertion: for the one may be ealily afcribed to ignorance or furgetfulnefs; whereas the other will, if difcovered, be commonly looked upon as defign. He therefore, who in fuch circumftances, from a generous love to truch, is fuperior to all motives to betray or fithe it, jully deferves the character of a brave as well as honelt man. What Polybius fays upon this head is very well worth remarking: "A good man ought to love his friends and his country, and to have a like difpofition with then, both towards their friends and enemies. But when he takes upon him the character of an hittorian, they muft all be forgot. He mull often fpeak well of his enemies, and commend them when their actions deferve it; and fometimes blame, and even upbaid his greatelt friends, when their conduct makes it neceffary. Nor mult he forbear fometimes to reprove, and at other times to commend, the fame perfons; fince all are liable to mittake in their management, and there are farce any perfons who are always in the wrong. 'Therefore, in hittory, all perfonal conladerations fhould be laid aide, and regard had unly to their actions."

What a different view of mankind and their actions should we have were thefe rules oblerved by all hifrorians? Integrity is undoubtedly the principal qualification of an hiftorian; when we can depend upon this, other imperfections are more eatily paffed over. Suetonius is faid to bave writen the lives of the filt twelve Roman emperors with the fame freedom wherewith they themfelves lived. What better character can be given of a writer? The fame ingenuous temPer appears in the two Grecian hillorians above inentioned, Thucydides and Pulybius: The furmer of whom, though banithed by his couctrymen the Athe-
mians, yet expreffes no marks of relentment in tis Compofihithory, either againft them in reteral, or even a- sic\%is gainit the chief authors of it, when lee has esceation lanery. to mention them ; and the latter does rut forber cenfuring what he thonght blameable in his nearelt relations and friends. But it is often no cafy matterto know whether an hiftorian 「peaks truth or not, and keeps up to the feveral claracters here mentioned; tho' it fecms reafonable, upon the common principles of juttice due to all mankind, to credit him where no marks of partiality or prejudice appear in his writinge. Sometimes, indeed, a judgment may in a good nuea. fure be formed of the veracity of an author from his manner of exprefling himfelf. A certain candour and franknefs, that is always uniform and confiltent with itfelf, runs through their writings who have nothing in view but truth, which may be jutly efleemed as a very good evidence of their lincerity. Whereas thofe who have partial defigns to anfwer are commonly more clofe and covert ; and if at other times they affume an air of opennefs and freedom, yet this is not conftant and even, but foon followed again with the appearance of fome bias and referve: for it is very difficult to act a part long together without lying open to a difcovery. And therefore, thoush craft and defign is exceeding various, and, Protcus-like, affumes very different thapes, there are certain characters by which it may often be perceived and ecte ted. Thus, where things are uncertain by reafon of their being repurted various ways, it is partiality in an historian to give into the moft unfavourable account, where others are as well known and equally credible. Again, it is a proof of the fame bad temper, when the facts themfelves are certain and cvident, but the defign and motives of thofe concerned in them are anknown and obfeure, to aflign fome ill principle, fuch as avarice, ambition, malice, iuteref, or any other vicious habit, as the caufe of them. 'Ihis conduct is not only unjult to the perfons whofe actions they relate; but hurfful to mankind in genctal, by endeavouring to deltroy the principal motive to-virtue, which Cprings from example. Others, who affect to be more covert, content themfclves with fufpicious and fly infinuations; and then endeavour to come off, by intimating their unwillingnefs to believe them, tho' they wonld have their readers do fo. And to mention no more, there are others, who, when they have loaded perfons with unjuil calumnies and reflections, will allow them fome flight commendations, to make what they have faid before look more credible, and themfelves lefs partial. But the honelt and faithful hiftorian contemns all fuch low and mean arts; he confiders things as they are in themfelves, and relates them as he finds them, without prejudice or affection.

## Art. II. The Subject or Argument of Hiftory.

The fuljed in general is facts, together with fuch subject ces things as are cither connected with them, or may at ditiury. leall be requifite to fet them in a jull and proper light. Jut although the principal detign of hittory be to acquaint us with facis, yet all facts do not merit ille regard of an hiftorian ; but fuch only as may be thought of ufe and fervice for the conduct of haman life. Nor is it allowable for him, like the poet, to form the plat and fcheme of his work as he pleafes. EIa tulinefs
conple is to report things as he finds them, without any co-
louring or difguife to make them more plealing and palatalie to liin reader, which would be to convert his hintory into a novel. huteed, fome hatorics affird more phafure and entertaimment than others, from the nature of the things of which they confilt; and it may be ctlcemed the biappinefo of an hifforian to meet with fuch a furgict, but it is net his fault if it be otherwife. Thus Reromotus besins his hiflory with nowing, that the bartharians gave the tirt occation to the wars between them and the Greeks, and ends it with an account of the punithment which, after fome ages, they fuffered from the Greeks on that aecomnt. Such a relation mut not only be very abrecable to his countrymen the Grecians, for whofe fakes it was written; Lut likewife very inflructioc, by informing them of the jultice of Providance in punithing public injuries in this world, wherein focietics, as fuch, are only capable of punithment. And therefore thofe examples might be of wie to caution then againt the like practices. On the contrars, Thecydides begins his hidory with the unhappy tate of his countemen the Athenians; and in the comfe of it plainly insimates, that they were the caufe of the calamitons war between them and the Lacedemonians. Whereas, had lee been more inclined to pleafe and gratify his countrymen than to write the truth, he might have fet things in fuel a light as to have made their enemies appear the aggrefions. But he foomed to comrt applafe at the expence of truth and jullice, and has tet a noble example of integrity to all future hillorians. But as all actions do not merit a plaee in hiftory, it requires no fmall judgement in an hufterian to felcet fued only as are proper. Cieero obfelves very juftly, that hillury "is converfant in ${ }^{\text {rreat and memorable actions." For this rea- }}$ fon, an hiftorian flould always keep poflerity in view; and relate nothing which may not, upon fome account or other, be worth the notice of after-ages. To defoend to trivial and minute matters, fueh as frequently cecur in the common affairs of life, is below the dignity of hiflory. Sueh writers ought tather to be deemed journalifts than hiftorians, who have no view or expectation that their works fould furvive them. But the Rilful hiflorian is fired with a more nuble ambition. His defign is to acquaint fueceeding ages with what remarkable ocemrences happened in the world before them ; to do juftice to the memory of gicat and virtuons men; and at the fame time to perpetuate his own. Pliny the younger has fome fine effections upon this head, in a letter to a friend. "Y'ou advile tae (fays he) to write an hiltory; and not you only, for many others lyave done the fame, and 1 am myfetf inclined to it. Nut that I believe mytelf quabitied for it, which would be ralh to think till I have tried it; bur becanfe I efteem it a genervus action not to fufler thofe to be forgoten, whofe memery ought to be etemized ; and to perpetuate the names of others, together with onc's own. For there is unthing I an fo defirons or ambitions uf, as to be remembered hereafter; which is a thing worthy of a man, efpeciall; of one who, confcions of no guilt, has nothing to fear from poilterity. 'therefore 1 am thinking day and might hy what means, as Virgil fays,

$$
\begin{aligned}
& \text { To rafeatofs: } \\
& N^{\circ} 155 \text {. }
\end{aligned}
$$

That would fuffice me; for it is abore my wifh to add with him,

> Eur oh!

However, this is enough, and what hitlory alone feems 2 ib. to promife." 'This was Pliny's opinion with regard to the ufe and advantage of hidory; the fubjects of which are generally maters of weight and importance. And therefore, when a prudemt hiforian thinks it convenient to take norice of things in themfelves lefs comiderable, hee cither does it with brevity, or for fome apparent reafon, or accounts for it by lome juit apology: So Dion Caffius, when he has mentioned foce things of iefs noment in the life of Commodus (as irded that enperor's life was chiefly filled up with crucly and folly), makes this excule for himfelf: "I would not have it thought that 1 defeend below the gravity of hiftory in writing thefe things: For, as they were the actions of an emperer, and 1 was pretent and faw them ath, and both heard and converfed with lim, k did not think it proper to omit them." He feems to think thofe actions, when performed by an emperor, might be worth recording, whech, if done by a perfon of inferior rank, would farce have defenved notice. Nor dows he appear to have judged amifs, if we conlider what an intuence the conduct and behaviour of princes, even in the common circumllanees of lifc, have upon all beneath them; which may fometimes render them not unworthy the regard of an huttorian, as examples either for imitation or caution.

But although facts in general are the proper fubject of hillory, yot they may be dilferently confidered with regard to the extent of them, as they relate either to palticular perfons or communities of men. And from this confideration hiftory has been diftin. $\begin{gathered}\text { and }\end{gathered}$ guithed into three forts. viz. biugraphy, particular and hilto general biflory. The lives of lingle pertons is called liogruphy. By particular hifory is meant that of particular hates, whether for a fhorter or tonger fipace of time. And general hifory contans an account of feveral fates exifting together in the fame period of time.

1. The fubjects of begraphy are the lives either of pubibic or private perions; for manly ufful obfervations in the conduct of human life may be made from jult accounts of thofe who have been eminemt an! beneficial to the world ia either flation. Nay, the lives of vicions perfons are net without their ufe, as warningrs to wihers, by obferving the fatal contequenées which fooner or bater generally follow fuch practices. But, for thofe who expofed ilcer lives, or otherwife employed their time and labour, for the fervice of their fellow creatures, if feems but a jull debe that their memoriss flowld be perpetuated after them, and poRerity acquaimed with their henefactors. The expectation of this as forall incentive to virtue in the Pagan woild. And perhaps every one, upon due reflection, will he convinced how natural dhis paffion is to mankind in gencral. And it was for this reafon, probably, that Virgil flaces not only his herwes, but allo the inventurs of ufful arts and feienees, and other perfons of ditinguithal merit, in the klyfian Fields, where he thas deferibes them:

Here patriotalive, wha, for their euntry'gnod, In fighting field, were prodgsi of blood:

Iriells

Pricte of unblomin'd liven here nake abode, And poetw worthy their infpri:igend; And fearching wits of more netchanic parts, Whongacid their agc whem mereedares; Thore whero worth eher liosnty did exe net. Ard thefe who knew that homaty to commend : The be do of defe with hooy filcets boum!,
 AEvin, l.vi v.66.

In the lives of publie perfons, their public characters are principally, but not folely, to be regarded The world is inquifitive to know the conduct of princes and other great men, as weth in private as public. And both, as has been faid, may be of fervice, cumtidering the influence of their examples. But to be over-inquititive in fearching into the weakneffes and infirmities of the greatelt or be't of incm, is, to fay no more of it, but a needlefs curiolity. In the writers of this kind, Piutarch is juftly allowed to excel.

But it has been a mater of cilpute among the learnel, whether any one ought to write his own liftory. It may be pleaded in favour of this, that no one can be fo much malter of the fubject as the perfon himfelf: and befides, there are many in flances, both ancient and modern, to jullify fuch a conduct. Dut on the other hand it mult be owned, that there are many incouveniencies which attend it; fome of which are mentioned by Cicero. "If (fays he) there is any thing commenozble, porfons are obliged to fpeak of themfelves with greater modefty, and to onit what is blameable in others. Befides, what is faid is not fo foon credited, and has lefs anthority; and aitur all, many will not Atick to cenfure it." And Pling fays very well to the fame purpofe, "Thofe who proclaim their own virtues, are thought not fo much to proclaim them becaufe they did them, as to have done them that they might prochaim them. So that which would have appeared great if told by another, is lof when related by the party limfelf. For when men cannot deny the fact, they refect upon the vanity of its author. Wherefore, if you do thangs not worth mentioning, the actions themelves are blamed: and if the things you do are commendable, you are blamed for mentioning them." Thefe reflections will be generally allowed to be very juft ; and yet confidering how natural it is for men to love themfelves, and to be inclined in their own favour, it feems to be a very difficult tath for any une to write an im. partial hiftory of his own actions. There is fcarce any treatife of this kind that is more celebrated than Crefar's Commentaries. And yet Suetonius tells us, that "Afinius Pollio (who lived at that time) thought they were neilher writen with due care nor integrity : that Cxfar was often too crodulous in his accounts of what was done by other perfons; and mifreprefened his own attions, either defagnedly, or through forgetfolnefs: and therefore he fuppofes be would have revifed and corrected them." However, at fome times it may doubtlefs be juftifiable for a perfon to be his own hiforian. Plutarch mentions two cafes wherein it is allowable for a man to commend himelf, and be the publifher of his own merits. Thefe are, when the doing of it may be of confiderable advantage either to himfelf or others. It is indeed lefs insidious for other perfons to undertake the proviuce. And Vol. Vill. Part II.
efpceatl! for a perfon to :alk or write of his own virfues, ait a three when vice and a general curruption of mamets frerait, let what lie fays be ever fotrue, it will be apt at halt to be token as a reflection upos otlens. "A Acciently (fars 'I'acitus), many wrote their own lewes, tather as a idhimony of their condece, than trum pride." Uron which he makes this jucticious remark: "That the rote virtue abound, the fooner the reports of it are credius." But the asscient writers liad a way of taking ofl the reader's at. tention from themfelves in recordin: their own ac. tions, and fo rendering what they faid lefo imidiuss: and that was, by fpeaking of thenfelves in the thind perfon, and not in the dirit. Thus Cefor never fuys, "I did," or, "I faid, this or that ;" but always, "Cafar dd, or Caid fo and fo." Wily" tlec moderns have not more cholea to follow them in this, we know not, fince it feems leas exceptionable.
2. In a conti:ured hinaty uf fortowior Rates, form account may be given of their utiginal, awd founders; the nature of their foil. and fituation; what acianntages they have for their fupport or iaprovement, either wathin themfelves, by foreign tratio, or conquelts; with the form of their fovernenent. There notice ouuld be taken of the methods by which they increated in wealth or power, till they gradually advanced to their his! aft gitch of grandetor; wether by their virtue, the goodnefs of their conflitution, trade, ind t!? ry, wars, or whatever caufe. After this the reafons of their declenf(n)s thould be hown; what were the wices that principally occationed it for that is generally the cafe); whether avarice, ambition, lusury, clitcord, cruelly, or feveral of thefe in conjunction. Aad tatly, where that has been their unhappy fate, how they received their final ruin and fubwerfion. Mut of thefe things Livy had in view when he wrote his hiftory of the Roman flate, as he acquaints his readers in the preface. "The accounts (fays he) of what happened either before or while the city was building, conlilling rather of poctical fables than any cettain records of facts, I fhall ncither affert nor confute them. Let antiquity be allowed to make the origin of their citics more venerable, by uniting things human and divine. But if any mation may be fuffered to fetch their onigin from the gods, fuch is the military glory of the Romans, that when tbey reprefent Mars as the father of their funder, other nations may as cafly acquicfer in this as they du in their goverument. Bus I lay no great fteff upon thefe things, and others of the like nature, whatever may be thought of them. What I am defirous every one thould carefully attond to, are our hives and manners: by what men, and what arts, civil and military. the empire was buth acquired and enlarged: then let him obferve, how our manners gradually declived with our difcipline ; afterwards greew worle and worfe; and at length fo far degenerated, that at prefeit we can neither bear with our vices nor fuffer them to be remedied. This is the clicf benctit and advantage to be reaped from hifory, to fetch inltruction from eninent examples of bath kinds; in urder to imita:e the unte, which will be of ufe both to yourfelf and your country, and avoid the otber, which are cquilly bafe in their rife and event." "Thus far Livy. And 4 E how

Corncic 12. 1:n.1 ! ! 131.261)

1liftery.
how well he has escented this defign mult be acknowledged ty all who will be at the pains to pernfe his work.
3. But as a particuiar hiftory confats in a number of facts relating to the fame thate, fuitably connected and laid together in a proper feries; fo a gencral hithary is made up of feveral particular hitur.ces, whofe feparate tranfactions with the fame period of time, or part of it, fhould be fo ditlinetly ruated as to canle no corfulion. Such was the hiftory of Dioturus Siculus, which contained an accomen of mot of the cnirient flates and kingdoms in the work, thumbh far the greatet! part of it is now unhappily luth. Of the fame nature is the hiltory of Herodous, though not fo extenfive; to whom we are efpecially indebted for the Perfian affars. And to this kind may likewife be referred Jutin's hilory, though it be only the epitome of a larger work writucn by another hand. The ruks proper for conducting fuch hittories are much the fame as thofe above mentioned concerning particalar bitories; excepting what relates to the ordir, of which we flall have occation to fpeak hereafter.

But the hillories both of particular flates and thofe which are more general frequently cuntain only the affairs of fome fhort period of time. Tius the hiftoly of the Peloponnefian war, written by Thucydides, comprifes only what was done in the fift twenty years of that war, which lafted feven years longer than his account reaches; though indeed the reafon of that might be, becaufe Thucydides died before the war was finifhed, otherwife he woold very probably have continued his hillory to the cunchution of it. But the hittory of the war between the Romans and King Jugurtha in Africa, given us by Sallual, as alfo Cofar's hittories of the Gailic and civil wars, are all confined within a much lefs number of years than that of Thucydides. Nay, fometimes one fingle tranfation is thought fufficient to furnift out an hiftory. Such was the confpiracy of Catiline to fubvert the Roman flate, written likewife by Sallult. As to more genesal hitories, Xenophon's hiltory of Grcece nay be efteened as fuch; which in order of time fucceeds that of Thucydides, and contains the aftairs of fortyeight years. And Polybius called his a gentral hijlory; which, though it principally contained the Roman af. fairs, yet rook in the moll remarkable tranfactions of feveral other Rates, for the fpace of fifty-three years: though it has met with the fame hard fate as that of Diodorus Siculus, fo that only the firl five bouks out of forty, of which it confifted at frit, now remain entire. And to mention no more, the celebrated hilfory of Thuanus is another inflance of this fort, in which the principal tranfactions of Europe for ahout 60 years, chiefly in the 1 Gh century, are defcribed with that judgment and fidelity, and in a manner fo accurate and beautiful, that he has been thought farcely inferior to any of the ancient hifto. rians. Now, in fuch hitories as thefe, to go farther back than is neceffary to fet the fubject in a juat light, feems as improper as it is unneceifary.

The general fubject or argument of hifory, in :ts feveral hranches, may be reduced to thefe four heads;
actions, with fuch things as are receeramy conneked with them; nandy, perfons, time, place, delign, and event.

As to affors themflese, it is the buffrefo of the hillorian to acquaint his readers with the maner in which they were perforacd; what treations were concerted on ali bieles, and how they were conducted. whether with vigilance, conrase, prudence, and cauthan, or the contrary, according to the natere of the action; as hkewife, if any unforcieen accidents feit out, by which the defigned medines were either promoted or broken. All actions may be referred to two forts, military and civil. And as war arifes from ingultiee and inguries received on mete fode or the other, it is the the reader honuld be informed who were the aggrellors. For though war is avet to be defired, yet it is functimes nectiary. In the defeription. of battles, regard thould be had equally to both parties; the number of forces, conduct of the generals, in what manner they engaged, what turns and chances happened in the engagemeat, either from aceidents, courage, or Atratagam, and how it iffued. The like circumflances thould all be obferved in lieges and other actions. Eut the moll agreable fecne of hitory arifes from a late of peace. Here the writer aequaints us with the conititution of fates, the nature of their laws, the manners and cotoms of the whabitants, the ad. vantages of concord and unanimity, with the difadvantages of contention and difcord; the invention of arts and fciences, in what manner they were improved and cultivated, and hy whom; with many other things, both plealant and profitable in the con. duat of life.

As to picfons, the charaders of all thofe fhould be defcribed who act any confiderable past in an hittory. This excites the cuniolity of the reader, and inakes him more attentive to what is faid of them; as every one is more inquifitive to hear cehat relates to others in proportion to his knowledge of then. And it will likewife be of ufe to obferve, how their actions agree with their characters, and what were the eifect of their diferent qualifications and abilities.

The circuminances of time and fluce are carefully to be regarded by an hillorian, wittout whicls his accounts of facts will be frequently veng lame and iniperfet. And therefore chronology and geograpiry feem not improperly to have been called the two eyes of hiflory. Befides, they very much affill the memory: tur it is much ealier to remember any thing. faid to te done at fuch a time, and in fuch a place, than if only related in general; nay, the remembrance of thefe often recalls thofe things to mind which otherwife had been obliterated. By time is meant not only the year of any particular era or period ; but likewife the feafon, as fummer or winter; and the age of particular perfons. For it is oftentimes from hence that we are principally enabled to make a jult ellimate of facts. Thus Cicero commends Pompey for undertaking and finifhing the Piratic war at a feafon of the year when other generals would not have thought it fafe to venture out at fea. This double danger, as $P_{r o} I$ well from the weather as the enemp, conlidering the Man, neceffity of the cafe, heightens the glory of the action; fince to have done the fame thing in fummer would not bave been an equal groof of the courage
and intrepility of the general. Ard there is nothing more furprifing in the conquelts of Alexander than that he fhould fubdue fo large a part of the world by the time he was litte more than 30 years olld; an age at which few other generals have been much diflinguithed. Had we not known this, a confiderable part of his character hat been loit.
The like advanages arife from the other circumflances of place. And thercfore in marches, battles, and oher military actions, the hiftorian Mould take netice of the nature of the country, the pafles, river, ditancts of places, fituation of the armies, and flrength of the towns cither by nature or art ; from which the reader may the better form a julgment of the diffroulties and greathe!s of any enterprile. Cafar is gemerally very particular in thefe things, and feems to have thought it highly requifite in order to give his readers a jult idea of his actions. The defcriptions of countries, cities, and rivers, are likesife both ufefut and pleafint ; and help us to judge of the probability of what is related concerning the temper and genius of the inhabitants, their arts, traffic, wealth, puwer, or whatever elfe is remarkable among them.

But an accurate hittorian goes yet further, and confiders the caufes of actions, and what were the defigns and views of thofe perfons who were principally concerned in them. Some, as Polybius has well obferved, are apt to confound the beginnings of attions with their fprings and caules, which ought so be carefully feparated. For the caufez are often very remote, and to be lonked for at a couliderable dillance from the actions themfelues Thus, as he tells uf, fome have reprefented Hannibal's belieging Saguntum in Spain, and palling the LEbo, contraty to a former agreement between the Romans and Cartlaginians, as caties of the fecond Punic war. But thefe were only the beginnings of it. The true caufs were the jealoufies and fears of the Carthaginians from the growing power of the Romans; and Hannibal's inveterate hatred to them, with which he had been impreffed from his infancy. For his father, whom he fucceeded in the command of the Carthaginian army, had obliged him, when but nine years old, to take a moit folemn oath upon an altar never to be reconciled to the Romans: and therefore he was no founer at the liead of the army, than he twok the fift oppartunity to bieak with them. Again, the true frings and caules of actions are to be dillinguibled from fuch as are only feigned and pretended. Fiur generally the worfe detigns men lave in riew. the more falicitous they are to cover them with fecious pretences. $1 t$ is the hillorian's bufinefs, therefore, to lay open and expufe to view thefe arts of politicians. So, as the fame judicious hiforian renarks, we are mot to imagine Alexander's carrying over his army into Atia to have been the caufe of the war hetween him and the Perfians. That had its being long tefore. The Grecians had formerly two armics in Afia, one under Xe. ropbon and the other commanded by itgeflans. Now the A fiatics did not venture to oppofe or molett cither of thefe armies in their march. This made king Philip, Alexander's father, who was an ambitious prince, and afpired after univerfal monarchy, think it might be a practicable thing tu inake a conqueft of Atia. Accordingly, he kept it in his vicw, and nade preparations for it; but did net live to execute it. That was
left for his fon. But as kirig Philip cond not lase dune this without firt bringing the other Itates of Grecce into it, his pretence to them was only to avenge the inguries they had all Cuffered from the Perfians; though the real defign was an univerfal governmen:, both over them and the Perfians, as appeared afterwards by the event. But in order to our beitg well affured of a perfon's real defigns, and to niake the ancounts of them more credible, it is proper we hould bc acquainted with his difpolition, manners, way of life, virtucs, or vices; that by comparing his actions with thefe, we may fee how far they agree and fout each other. Fur this reafon Sallutt is fo particular in his defcription of Catiline, and Livy of Hannibal ; by which it appears credible, that the one was capable of entering into fuch a confpiracy againlt his country, and the other of performing fuch great things as are related concerning him. But if the caufes of actions lie in the dark, and unknown, a prudent hitlorian will not trotbie himfelf or his readers with rain and trifling conjectures unlefs fomething very probable offers itfelf.

Lafty, an hittorian fhould relate the i/fue and evens of the actions he deferibes. This is undoubtedly the moft ufeful part of hillory; fince the greatelt adrantage ariling from it is to teach us experience from what has happened in the world before us. When we learu from the examples of others the happy effects of wifdom, prudence, integrity, and other virtues, it naturally excites us to an imitation of them, and to purfue the lame meafures in our own conduet. And, on the contrary, by perceiving the unhappy confequences which have foliowed from violence, deccit, rafhnefs, or the like vices, we are deterred from fuch practices. Bue fince the wifett and moft prudent meafures do no: always meet with the defired fuccefs, and many crofs accilents may happen to fruftrate the bett concerted deligus; when we meet with inflances of this nature, it preparcs us for the like events, and keeps us from too gieat a coufdence in our own fchemes. However, as this is not commonly the cafe, but in the ordinary courfe of human affairs like caufes ufually produce like effects; the numerous examples of the happy confequences of virtue and wifdom recorded in hiltory are fufficient to determine us in the choice of our meafures, and to enconrage us to hope for an anfwerable fuccefs, though we cannot be certain we flall in no inttance mect with a difappointment. And therefore Polybius very jualy obferves, that " he who takes from hiHory the canfes, manner, and end of actions, and o. mits to take notice whether the event was anfwerable to the means made ufe of, leaves no:hing in it but a bare amufement, withont any benclit or inlluetion." 'I'hefe, then, are the feveral things neceflary to be attended to in hiflorical narrations; but the proper dirpofition of them mull be left to the ikill and prudeace of the writer.

I1. R.fertiosts made by the writers. Some have con- of ef ele. demned thefe, as having a tendency to bias the reader; fions. who fhould be left to draw fuch conclutions from the accounts of facts as he fees proper. But fince all readers are not capable of doing this for themfelves, what diadrantage is it for the author to fuggett to them fuch obfervations as may affin them to make the beft ufe of what they read? And if the philufupher is

## $\xrightarrow{\square}$

athured th daw fach inferencis from hisprecepts as he thinks jut？aml proper，why has not the hiftorian an equal risht to make redections upon the facts he re－ lates？The reader is equally at liberty to judere for cimelf in botin eafes，withont danger of being prejn－ dices．And therefore we find，that the bell hifto－ rians have allowed themictes this liberty．It wom be cafy to prove this by a large number of intan－ ces，bat one or two here may fuffiec．When Sal－ fult has geven a very difinet accomst of the de－ byns of Catilice，and of the whole fcheme of the confpiracy，he concludes it with this refoction： ＂All that time the empire of the Romans feems to the to have beca in a very unhappy llate．For when they had extended their conquels through the whole world from ealt to weil，and enfoyed both peace and plenty，which mankind efteem their grea：eft hap－ pinets；fome perfons were obllinately bent upon their own ruis，and that of their country．For notwith－ Atanding two decrees were publifhed by the fenate，not one out of fo great a multitude was prevailed with，hy the rewads that were offered，either to difeoter the compliacy or to leave the army of Catiline．So defpe－ rate a difeafe，and as it were infection，had feizet the minds of moll people！＂And it is a very handiome obfervation that Livy makes upon the ill－conduct of Hanuibal in quarterivg his army in Capua after the battle of Cantax；by which means they lot their mar． thal vigour through luxury and caif．＂Thofe（fays he）who are thilled in military afairs reckon this a greater faul：in the general，than his not marching his army immediately to Rome after his victory at Can－ nix ；for flech a delay might have feemed only to defer the victory，but this in flep deprived him of the power to grain it．＂The modelty of the hitorian in this pas－ faste is worth remarking，in that he does not reprefent this as his own private opinion，and by that means un－ icrtake to cenfure the conduct of fo great a general as Hanuibal was，but as the fenfe of thofe who were Nithed in fuch affairs．However，an hiflorian hould be bricf in fuch remarks；and conlider，that although he docs not exceed his province by applauding virtue， exprething，a jull indignation againft vice，and intcrpo－ hing his julgment upon the nature and conferuences of the fects he relates；yet there ought to be a diffe． fonce betwest his reflections and the encomiums or ss declamations of an orator．
Sufpectaes．Mi．Saceles inferted by hitorians．Thefe are of two forts，obligue and direct．The former are fuch as the hilusiun recites in his own perfon，and not in that of the fpeaker．Of this kind is that of Hannibal in Juthin；hy which he endcavours to perfitade king Antiochus to carry the feat of the war againt the Romans into Italy．It runs thus：＂Flaving delired Wenty to prak（he faid），none of the prefent coun－ fis and Lifigns plafed him；nor did he approve of Giece for the icat of the war，which might be mana－ ged in Italy in greater advantage ：becaufe it was im－ pofible weonqua the Romans but by their own arms， in to fublue laly but by its own forces；fince both Hhe nature of thiofe men，and of that war，was diffe． sent from all others．In oher wars，it was of great im－ pontance to gainan afasitare of place or time，to ra－ Fage the countries and plumder the towns；but though gou gain fome adranage over the Romans，or defat
them，you mult thll fighe with then when beaten． Whercfore，thould any one engage with them in lealy， it was poffible for him to conquer them by their own power，ilrength，and arms，as he himfolf had done； but thould he attempt it out of Italy，the fource of their power，he would be as much deceived，as if he cmicavoured to alter the comfe of a river，not at the fountain－head，but where its ftraans were largett and deepett．This was his judgment in private，and what hie had offered as his adice，and now repeated in the prefence of his friends；that all might know in what namner a war ought to be carried on araintt the Romans，who were invincible abroad，but might be conquered at home．For they might fooner be driven out of their city than their cmpire，and from Italy than their prowince；having been taken by the Gauls，and almolt fubcued by himfelf．That he was never defeat－ ed till he withdrew out of their country；but upon his return to Carthage，the fortune of the war was charaged with the place．＂He feems to intimate by this fpeech，that the Romans were like fome fierce and impetunns animal；，which are no otherwife to be fubcuad than by wounding them in fome vital part． In fpeechos related after this manner，we are not ne－ eeffarily to fuppofe the hiftorian gives us the very words in which they were at firf delivered，bat only the fenfe．But in direct fpeeches，the perfon himfelf is in－ troduced as addrefing his audience；and therefore the words as well as the fenfe are to be fuited to his character．Such is the fpeech of Eumenes，one of A－ lexander＇s captains and fucceffors，made to his foldiers when they had traterouny bound him in chains，in order to deliver him up to his enemy Antigonus，as we have it in the fame writer．＂You fie，foldiers（fays he），the babits and ornaments of your general，which have not been put upon me by mine enemies；that would afford me tome comfort ：it is by you，that of a conqueror I am become conquered，and of a general a captuve；though you have fivorn to be faithfal to me four times within the fpace of a year．But I omit that，fince rellections do not become perfons in calami－ ty．One thing I intreat，that，if Antigonus muft have my life，you would ht me die among you．For it no way concerns him how or where I fuffer，ard I hall efcape an ignominious death．If you grant me this， I free you from your oath，with which you have been fo often engaged to me．Or，if hame reftrains you from offering violence to me at my requeft，give me a fword，and fuffer your general to do that for you with－ ont the obligation of an oath which you have fworn to do for your qeneral．＂

But this likewife is a matter in which crities have been divided in their fentiments；whether any，or what kind，of fpeeches ought to be allowed in hitory． Some have thought all fpeeches fhunid be excluded： and the reafon given for that opinion is this；that it breaks the thread of the difcourfe，and interrupts the reader，when he is defirons to come to the end of an action，and know how it iffued．This is true，indeed， when fpecches are cither very long or too frequent； but ohierwife they are not only entertaining，but like－ wife inftructive．For it is of fervice to know the fyrings and reafons of actions；and thefe are froquently opened and explained in the fpeeches of thofe by whom they were performed．Others therefore have not been
againf all fpeeches in general, but only direat ones. And this was the opinion of Trogus Pompcius, as JuAin informs us; though be did not think fit to follow him in that opinion, when the abridged him, as we have fecn already by the fiech of king Eumencs. The reafon offered againtt direct fpeeches is, becaufe they are not true; and truth is the fondation of all hittory, from which it never ought to depart. Such fpeeches, therefore, are faid to weaken the credit of the writer: fince he who will tell us that another perfon fpoke fuch things which he docs not know that he ever did fpeak, and in fuch haguaye as he could not ute, may take the fame liberty in reperfenting his actions. Thus, for cxample, when livy gives us the fpecthes of Romulus, the Sabine wonen, Brutus, and others, in the firtt ages of the Roman ftate, both the things themfelves are imaginary, and the language wholly difagreeable to the times in which thofe perfons lived. secordingly we find, that when feveral hiftarians relate fome particular fpeech of the fame perfon, they widely difier both in the fubjectmatter and expreflions. So the speech of Veturia, by which the diffuaded her fon Coriolanss from befieging Rome when he came againft it with an army of Vollcians to avenge the injaties he had reccived, is very differently related by Livy, Diony hus of IIalicarnaflus, and Plutarch. Such fittitions fpeeches therefore are judged more fit for poets, who are allowed a greater liberty to indulge their fancy than hillorians. And if any direct fpeceles are to be inferted, they fhould be fuch only as were really fpoken by the perfons to whom they are afcribel, where any fuch have been preferved. Thefe have been the fentiments of fome critics both ancient and modern. However, there is fearce an ancient liftoriaa now extant, cither Greek or Latin, who has not fome fpeeches, more or lefs, in his works; and thofe net orily oblig̣te, but alfo direct. They feem to lave thought it a neceftary ornament to their writings: and even where the true fpeeches might be come at, have chofen rather to give them in their own worda; in order, probably, is preferve an equality in the Ityle. Since therefore the bef and mof faithful hitorians have generally taken this liberty, we are to dithaguifh between their accounzs of facts and their fpecches. In the forner, where aothing appears to the contrary, we are to furpofe they adhere to truth, according to the beit information they could get; but in the latter, that their view is only to acquaint us with the caures and fipringrs of aeions, which they chofe to do in the form of fpecel!es, as a method mol ornamental to the : ark, and entertaining to the reader: Though the bett hidorians are cautious of inferting fpceches, but where they are very proper, and upon fome folemn and weighiy occafions. Thucydides is faid to have been the fint who brought complete and finithed fpecches into hidory, thofe of Herodotus being but flor: and imperfect. And though Dieny fus of Halicarnafus, in his cenfure upon Thucydides, feems then to have difliked that part of his conduct; yet he afterwards thouglit fit to imitate it in his Antiquisties of Rome, where we find many not only oblique, but alfo direct fpeeches.

What has been faid of fpecches, may likewife be underfond of letters, which we fometimes mat with in hiftories; as that of Alexander to Darius in Q .

Curtius, thoí of 'liflerias and Drufus in T'anitus, and many others. Some ketters are wholly fietitions; and in others perhaps the hitorians reprefents the fubitance of what was really faid, but gives it his own drefs. Lic. im Thus we find that fhort leteer of Lentulus to Cataline : 1 . at the time of his confpiracy differently related by Ci- fiv, 2.26 cero and Saluit. The reafon of which feems to be ${ }^{\text {a }}$, ii $5^{5}$, this: That as Ciccro recited it publicly to the peopla of Rome in his third oration againt Catiline, it is reafonable to imagine he did it in the very words of the letter, which he hasd by him; whereas Salluft, as an !aitorian, might thiak it fufficient to give the fenfe of it in his own words.
IV. Digrefions. Thefe, if rightly manared, afford the reader buth delight and protit. Like fpeeches, they fhould neither be too long nor frequent; left they interrupt the courfe of the hifory, and divert the reader from the maia defign of the work. But now and then to introduce a beautiful defcription, or fome remarkable iacident, which may give light to the fubject, is to far from an interruption, that it is rather a relief to the reader, and excites him to go on with greater pleafure and attention. See further on this licad, Ozatory, no 37.

## Art. III. OíOrder.

Siver mot liftories confilt of an introduction and of ordet the body of the work, in each of which fome order is requitite, we fall forak to them feparately.

1. The deflign of the introdutation is the fanc liere as in orations. For the hiltorian propofes three things by his introduction, which may be called its parts: to give l.is reader fome general wiew of the fuhject, to engage his attention, and to poffers him with a candid opinion of himfelf and his performance. Some have thought this hat unnecefliry for an hittorian. But if we confider how difficently mankind are apt to judare of the fame perfons and actions, it feems as requifite for an hillorian to be well efteemed as an orator. And therefore we find fome of the bef hitorians have not omiteed this part. Livy's introdution has been wery much applauded by the learned, as a malter.piece in ita kind. It begins with an account of his decign. "Whether (fays he) it may anfwer any valuable end for me to write the hilory of the Roman affairs from the begianing of the city, I neither am certain, nor if I was fould I rinture to declare it." Soon after he endeavours to propare the reader's attention, hy reprefenting the grandeur and ufefulnefs of the fubjed in the following words: "Either I am prejuliced in fasour of my fubject, or there never was any fate greater, more virtnous, and fruitful of good examples, or in which asarice and luxury liad a later admittance, oir poverty and thifinefs were either more highly or longer etteemed, they always coveting lefs the lifs they enjeyed." And then he prefently proceeds to ingratiate latisfeif with his readers, and gain their favourable urimion: "Although my name is obfeure in fo great a number of writera, yot it is a comfort that they clond it by their fame and character. But I fhall gain this advantage by my labour, that I hall be diverted for a time from the profpect of thofe evils which the age las feen for fo many years; while my mind is wholly intent upon former times, free from all that care which gives the writer an uneatinefis, though it camot
bias
bias him againt the truth." In this paffage we fee he endeavours to gain the good efteem of his readers from two very poncrful motives, modefy and a lirict regard to truth. It may farce feem neceffary to obrferee, that thofe introductions are cheomed the bet which are mont matural; that is, fuch as are taken from the fubject-matter of the hifing it felf, and clofe$1 y$ connected with it. Such are thote of Herodotus, Thueydides, Livg, Tacitus, and others. And therefore Salluat is greaty blamed by (Qnintilian on the account of his introductions, which are fo general, that they inight fuit other hifforks as weil as thofe to which they are prefised. Introductions fhould likevile be proportioned to the lengti of the work. We meet with fome few hiftories, in which the writers innmediately enter upon their fubject, withoat any introGuttion; as Xenophon inhis Expedition of the younger Cyme, and Cefar ia his Commentaries of the Gallic and Civil Wars. But the later does not profefs to write a jut hifory; and therefore left himfelf morc at liberty, as well in this refpect as in fome others.
2. But order is principally to be regarded in the Lonly of the work. And this may be managed two ways: either by attending to the time in a chronolo. gical foriec, or the different nature and circnmflances of the things contained in the hiRory. Houctor, as thefe two mechods do not equally fuit all fubjects, we thall a little confider to what kind of hillorics each of them fecms more properly adapted. All hiflory then, as we have obferved already, may be reduced to three forts; liarrophy, the hiflory of particular Rales, and the gencral lifiory of ficmal fates exifting at the fame rime.

In biographry, or the lives of particular perfons, mort writers follow the order of lime; thongh fome seduce them to certain general heads, as their virtues and vices, or their public and pisate characker. Plutarch and Cornelizs Nepess have taken the former method, and Suetonius the inter.

As to the liftory of paricular frates, the order of time is geverally ben, as heing moft natural and eafy. And therefore it has ufually licen obferved by the beft hiftorians, as Thucydides, Livy, and others. Tacifas, inded, wrote two dilinatt works; one of which he called Anmals, and the viher Hijarias. And as in both he has kept to the order of time, critics have been at a lolis to aftiga any ouher reafon for thefe different ritles, und fs that in the former work he confines himfilf more clofely to the facts themfelves, and does not treat fo largely upon the caufes, manner, or event of them, as he has cone in the latter. And even in the circumitances of facts, there is a celtain order proper to be obferved, for rendering the account more plain and intelligibl:. Thus, for inllance, in the defcription of a bartle or licge, the time flould firt be known, then the chief pelicn or perfons who conducted it, then the number of forces, and other requifites, afterwards the nature of the place, then the attion itfulf, and lally the event. But fomctimes it is neceffary to add thie time in which feveral of the other circumtlances happened, efpecially in actions of any confiderable length. Where the order of thefe circumftances is confufed, it perplexes the account, and renders it both leffentertaining to the reader, and more difficult to remember.
$O R Y$.
In a gencral hittory, the order of time cannot al. ways be preferved; though, where the actions of different communitics lave refpect to one as the principal, they floould all, as far as polfible, be refetred to the tranfactions of that fiate. But even liere the feveral afairs of thofe different flates ought to be related feparately, which will neceffarily occalion the anticipating fome chings, and pofponing others, fo that they cannot all Rand in the order of time in which they were puformed. However, Vailcius Pate:culus fays very jutliy with regard to this fubject, "That every eatire acion, placed together in one view, is much better appreliended than if divided by different tincs." In this cafe, therefore, for better preferving the chronology, it is ufual with hittorians, when they have finithed any particular marrative, in paffing to the pext, to exprefs the time by fome fhort and plain tranfition; and fometimes to apologize for themfelves, by afliguing the reatons of their conduct. So Polybius, whofe hiitory is of this kind, fays concerning himfelf: "As in writing the actions of each year, in the order of time, I endeavour to reptefent thes affairs of the fame natiun together in one fummary view, it is plain that inconvcnience muft of courfe attend this way of writing." Curtius profeffes only to write the actions of Alexander king of Macedon; but his hiftory contains in it the principal affairs of the greateit ftates in the world during that period. Now although, in the courfe of thofe tranfactions, the war between Asclelaus governor of Macedonia, and Agis king of Sparta, happened before the battle of Alexander at Arbela; yet the hittorian not only relates that battle firll, but carries on the account of Alexander's allairs in Afia to the death of Darius without interruption; for which he gives this reafon: "If I hould rehte the affairs of Alexander, which happened in the mean time, cither in Grece or Illyrium and Thanee, each in this proper order and tome, I mult interrupt the affairs of Alia; which it is much better to reprefent together in one continued feries as they fell out, to the fight and dath of Darius." Such anachronifins, $i$ 汸. $\square$ thercfore, are nothing more than what necoffarily arife init. fometines from the nature of the fubject: As every thing, the more complex it is, and contains under it a great number of parts, is more difficult to he digelled in a regular order. But in an hiflory compofed of feveral ftates, whofe affiais are independent of one another, the actions of each nation mult nceeflarily be feparated, in order to reprefent them in a jutt view, and prevent confufion. This is the method which Herodotus has taken, as likewife Diodorus Siculus and jultin. Now both the pleafure and benetic which fucl hiftorics afford, arife from obferving the condust of each tlate feparately in the courfe of their affairs, and then comparing on: with the other. And as the order of time muil frequently be inter rupted, it is not unufual to continue the chronology at proper ditances in relating the affairs of each nation; which preferves an unity in the whole, and connects it mone confillent body.

The divifion of hildories into books was defigned only for the better dittinction of the fuhject and eafe of the reader. And the dividing thefe books again into chapters, is rather a practice of later editors (founded, as they lave thought, on the fame rea-
tion of writers. Hiftory. Writers.

## Art. IV. Of Style,

A* hiftorical layie is faid to be of a middle nature, hetween that of a poet and an orator, differing from both not only in the ornamental parts, but likewife in the common idiums and forms of expreffion.

Cicero obferves, that "nothing is more agreeable in hiflory than brevity of expreffom, joined with purity and perfpicuity." Purity indeed is not peculiar to hitlory, but yet is aldiolutcly neceflary; for no one will ever think him fit to write an hiftory who is not matter of the language in which he writes: and therefure "heci Albinas bad written an hillory of the Roman affairs in Greek, and apologized for ary fips
or improprietits that might be found in the langudge or improprietits that might be found in the language
upon the account of his being a Roman, Cato cailed upon a trifer, for choofing to do that which, after be hime a trifler, for choolloged to akk pardent for doing. Nor is perficuiey hefocepuif:e in an hithorical dyle. The nature of the fubjeet plainly diree es to this. For as hiffory confils principally in narration, clearnefs and perfpicuity is nowliere more necelfary than in a relation
of facts. Bur thefe two propertics are to be accompaof facts. Bur thefe two properties are to be accompa-
nied with brevity, lince nothing is more ditagrctable than a long and tedious narratise. Aud in this refpect an biftorical thyle differs both from that of pretry and oratory. For the poet ircquently heighiens and enlarges his deferiptions of facts, by dwelling upon cvery circumitance, phacing it in different views, and cmbellifling it with the finet ornaments of wit and lan-
guage, to render his images more agreate and guage, to render his images mure agrecable; ant the orator often does the like, with a defign to Atrike the paffions. But fuch coluring is not the bufinels of ano hillorian, who aims at nothing mure than a jolt and faithful reprefentation of what he relates, in a way belt fuited to its nature, and in tuch language as is moll proper to fet it in a plain and eafy light.
Again, Cicero, treating of an hitturical fyle, fays: "It ought to be floent, fmooth, and even, frec fiom that harthnefs and poignancy which is ufual at the bar." The propertics bere nentioned dultus, thith this Ityle from that of judicial difcourfes, in which the ora tor often finds it neceflary to vary his manuer of fipcak-
ing, in order to anfwel different views, cither of por ing, in order to anfwel differnt views, cither of por-
foing an argument, preffing an adverfary, addrefhing a judge, or recomanending the notres of his ciude. This occations an inequatity in his lizh, white he fpraks Lometimes direetly, at other tines by was of quellion, and intermixes Mont and concifecxplificho wh th reund and flcwing reciods. But the hithorian has no necet-
fity for fuch vaciations in thit fiey for fuch variations in his thle. It is hat province to efpoufe to paty, to have neither fiered not foce, but to appear wholly difuterelled and incifirent to all ; and thercfore has langlage thould be fmooth and equal in this redations of perforis and their actions.
But further : Diongfius makes "da ency" a principal vituc in an hiftorian:" which he explains Ly fusing, that "he ought to preferve the choracters of the perfons and digsity of the actions of whath be treato." And to do this it fecms neca fiary thas an hillorical
figle lhould be atimated with a food derrer of life and wigour ; without which whelher the characters of eniment perfoos, nor thacir renadabiole actions, which
make up the main bufinefs of hiftnry, can be duly reprefented: for even things in themfelvers great and excellent, if related in a cold and lifelefa manner, of. ten do not affect us in a degree fuitable to their dignity and importance. And this feems particularly neceffary in feceches, in order to reptefont what evety oue fays, according to his difierent country, age, temper, and fation of life, in the fame maner we may fuppore he either really did, or would have fpoken himferf on that cceation. Beffides, there are fome ficenes of action which require very pathetic and moving tanguage to reprefent them agreably to their nature. And in deferiptions, the in ut beau:iful tropes an! lively tigures are often necefinty to fet the ideas of things in a preper lizht. From whence it appears, that painting and imayery make up no fmall part of the hiftorian's province, though his coloar are not fo, trong and ghittering as thofe either of the poct or orator. He ought therefore to be well acquained with the manners of men and the nature of the pafions, fince he is often obliged to deferibe both; in the former of which Herolotus execls, and Thucidides in the latter. as Dionytios has obferved.

Now from thefe feveral properties laid down by ancient writers, as requilite for an hiltorical Ayly, it fecms upon the whole to agrec belt with the midile character. And this will farther appear, by what they lay relating to the ormamental parts of thyie; nandy, compofition and dignty. As to the corane of thefe, which refpects the throcture of fentencen, ani the feveral parts of them, Denetriu: ramabs, that "An hittorical perion onght nexther : , ife very high, for firik vety low, but cupreferse a m-1....." this fimplicity (he fays) "becomes the , wity and credit of hatory; a add ditinguines it fion wat ny on the one hand, and dialugue on the other." II meaning $f_{\text {io }}$, that hiftorical periods thenld nerther be so full and fomerous as iofreq ent in ulat $1 y$; nor yed fo hart and flat, as ill diakuan the former of which, as he hays, require a itrong vasce to pronobice them; and the later have feares the aperanace of prions. So that according to this judicious writer, the periods betl luited for hith ry anc thate winch, being up a noderate lonach, wis athat of a jail rife and cadency, and may be prowenced with eafe. And Domblims tells us, that "Hiany fluald how fometh and o.en, every whert conliflent with ithol, witasut roughfa or chatm, in the hand." "hio relates to cine barmony of petios, which arifis from fuch a pultien of the words, as rewders the found pleafant and agreable, and, as he chinks, ought to be ateended to in hatory. $\therefore$ Ind as to cigmey, which refpects the ufe of tropes and tigures, the fame author fays, that "Hillory theald be embeilined with fuch figure as are reither veliement nor carry in then the appearance of art." Thi, is agrecable io what Cicero obferions is comparime Xenophon and Calithenes, two Greck hithorians. "Xinophon the Socrasic ( (fyys hit) was the firtt phiilofopher, and after him Calithenes, the foholar of 1. rillote, who wrote as hiltory: he latter almont like a rhetoricion; bat the tyle of the forener is mote mo. detate, and has not the force of an orator, lefs vehe- De Oret, neat peridups, but in iny upinion more fweel ald platas if. fant." The difference betwers thefe two uriters, withor. regard to their tyle, confuled chichy in the chaice of

Cumpur their heures; which in Xenopinon were more gentle uno of Hifory. and muderate, and therefore in the judgment of Ci. cero more adreeable to hifury.

But notwithanding this general account of the feveral properties which condtitute an hiftorical Atyle, it admits of conliderable varicties from the different na. ture and dignity of the fabject. The lives of particu. lar perfons do not require that Arength and majndy of exprefion, nor all thofe omaments of langergege, as an hillory of the Roman cmpire. And aceordingly we tin. we tlyle of Nepos and Suctonius very different from that of Livy. The former is fmooth and eafy, fearee rining above the low character: but the latter often approaches near to the fublime. And other hittorians again have kept a medium between thefe. Upon the whole, cherefure, we may conclude, that the midde Hyle is the proper character for hiltory; though hithorians may fometimes ink into the low charecter, and at other times rife to the grandeur and magnifi. cence of the fullime, from the different nature of their fubject, or fome particular parts of it. For that is to be ellec.med the proper character of any writing which in the general beit fuits $1 t$.

## EXPLANATION of the CHART.

Pate By this plan event-may be referred to th: year of the wollt; coxsxiv. and, within the ir per periods, to the ace of the Ofympiadt, If Nahonation, art if Rome; but the principal reference is to the histh of Chem, marke 1 by a deep black hes.
The j"m ex"en is miy to the Floal; the preceding yeriod of wisto yeare i therefurchefe blak in the chart.
The e boing 2349 year from the llood to the birth of Chrin, the $f_{f}$ ace $l$ enween then in divided into 23 parte, wach reprefenting an lumhed jears or centry, and a fration relrefenteng the romion iny foy year.

Is wedec now in the asth century, die fface from the birth
of Chrilt downwards is divided int eighteca parts or ce. huries: Conpof m! all the le prots, forether with fome conturics preceding the wath ef Chant, are fuishvided into te:s.

## H O A

HOADIEY (Beaman), frceefivery hifor of Bangor. Hereford, Salitumy, wald Winchether, was loon in 5060 . Hes firt preferment in the church was the rectore of St l'eter le Poor, and the lecturefhip of St Midenúa 10 the Poultry. In the year I7oh, he pubifferl tome Remarks on the late bifhop Atterbury's fernon at the funeral of $\mathrm{Mr}^{+}$Benret, in which Dr Atterbury had, in the opinion of Mr Hoadley, laid dorn feme dangernus propofitions Two yers after, Mr Hoadey again entered the litts again? his formidable antagonild ; and in his cxcentions a dairfa a iermon whbllied by 1) Atterbury, intited "The Power of Charity to cover Sin," he attacked the d, Etor wih his ufual trength of reaforing and difpafirnate in. quiry. In tro9, anether difpute arofe between thefe two leaned combatan:s, corcernise the doatine of non-relifiance, cocafiond iw a performance of Mr Hoadly's, iatifled "The Mcailraa of Cbedience;" fore pofitione in which 5 estobery endeavoured to corfute in his elegan: Latin formern, preacted hat year teture the londen cicrgy. In this debate 1 Hr Hoadey fignatized himfelf in fo eminert a degree, that the henourable lionfe of remmons gave him a paricular mark of their regard, by reprefenting, in an addrefs to the gucen, the fignal fervices he laad done to the caufe of civil and religious libcres.The principles, however, which he elponfed being repugnant to the general temper of thofe times, drew on him the virulence of a party; yet it was at this perignd ( $1-10$, when, as he himfelf exprefled it, fury femed to te let loofe thon him) that the late Mrs Howland preferted him to the rectory of Streatham in Surry, unafked, umapplicd to, and without his either baving feen her or been feen by her. Soon after the acseffion of king Genere I. Mr Hoadky was confecrated to the fee of Bangor; and, 1;17, having broached fome npinions concernitig the nature of Chrilt's kingdom, \&c. he arain hecame the object of popular cla. mour. At this jureture he was diftinguithed by another particular mark of the royal regard, by means of'which the convocation was fucceffively pror gued, and it was mot pormited to lit, nor do any bufinefs, till that refentment was entirely fubfeded. In 172 i lie was tranflated io Ilereford; and from thence, in 1723 , to Saliberes. In 1734, he was tranflated to Winchicter (on the demife of Dr Willis), and publinhed his Phim Acount of the Sacrament: a performnoce whin ferved as a butt for his adverfaries to fhoot at, et impartially owns it to be clear, rational, and manly, wrote with great candour and jurgment, and fureed to the capacity of cuery derious and contiderate irquirer after truth. - His latter days were embitered ly a molt vile inflance of fraud and ingratitude. The bithop took a French priefl. wloo pretended to atjure his religion, under lis pintetion, with no other reconmendation than that of his necefities: in recurn for which act of humanity, the priell foud an apportunity of getting the bifhop's name written by his nut hand, arid, caufing a note of fome thoufind pounds to be placed befure it, offered it in payment. Lut the binhop denying it to be his, it was brouglt before a court of jultice, and was there found to be a grofs impofition. The ungrateful villain had now recourfe to a pamplilet, in which the charged the binop with being a drunkard; and akeged that he had the note of $1 . \mathrm{im}$ when he was Vol. VIII. PartII.
in liquor. To this calume the bifhop maje a fuli and rietrous onfucr ; in which he expofed the man's faliclood, and folemrive averred that he was never drunk in his whole life. The ward with hecemung ardour enbraced his defonce, and he lad the I pipnefs to hind hatiflf perfect!y acquited sen of any fufpicinn of fuch a charge. As a witer, he pottifed nrommon ahilities. His formons (pmblithed in 17 it and 1,75 ) as ectecmed inferion to few wruings in the Enytifi languase. for plainerts and peefpicuiey, ererSy and trench of raforing, and a frec and marorys manncr. In private life, he was naturally factions, cafy, and complying; fond of compary, yee would frequenty leave it for the purpores of ithady or derotion. He was every where happy: and particulaty in his own family. where he took all opportunities of in haneting by his influcace and example. He died in 1,6r, aged 8?. Betules the works already mentiored, he wroe, r. "lerms of Aciep'ance, Svo. 2. Reafomablenefs of Confomity 3. On the Sacrament. His tredts and pamphlets are extremcly numerous; and the rcader may fee a complete catalogue of them in his life inferted in the fupplement to the Dographia Britannica.

Hoanley (Benjimin, MJ. D.), fon of the former, was born in $1-06$; and lludied at Bennct college Cambridge, under the tuition of 1)r Herring afterwards archbifhop of Canterbury. He took lis degree in ptyfic ; and particularly applying himfelf to mathemarical and philofophical indirs, was, when very young, admited a menber of the royal focicty. He was made regitter of Hereford whike his father filled that ice, and was early appointed plyfician to his majefly's houfehold, but died a: his houfe in Chelfea in 1757. He wrote, s . Three Lettets on the organs of refpiration, 4to. 2. The Sufpicious Hufard, a comety. 3.Obfervations on a feries of elcetrical experiments; and, 4. Oratio annizerfaria, is Ficatro Col.Med.

HOAI-ngavernu, a city of China, in the province of Hiang.nan. According to Grotier, it is filmated in a marfh, and is enclofed by a triple vall. As the ground on whici it itands is mwer than the bed of the canal, the inhabitants live in continual dread of an inundation. The fuburbs extend to the ditance of a league on each fide of the canal, and form at their extremity a kind of port on the river Hoarg ho. This place is very populous, and every thing in it announces an schive and brifk trade: One of thofe great mandarirs who have the infpection of the carals and navigation, and who are alfo obliged to fupply the court with necefiary proviitons, refudes herc. This city has eleven other tinder it. jurithiction; two of which are of the fecond, and nitie of the thind clafs.

## HOAR-houvd, in botany. Scemarvbium.

HOARSENESS, in medieine, a diminution of the voice, commenty athonded with a preternatural afperity and roughnefs thereof. The parts aifected arc the afpera atteria and larynx. For its caufes and cure, foe (the Index fubjoined to) Miedicasi.

HOBAL, in mytholegy, an idol of the ancient Arats, the wornip of which at Mecea was deftreyed by Mahomet.

IHOBBES (Thomas), a famons writer, lecrn at Malmhury in 158 , was the fon of a clergyman. Fle - 4 F cora-
 completed his fludies at Oxford, and was afterwards governor to the eldeł fon of William Cavendifh earl of Deronhire. He travelled through France and Italy with that young nobleman, and at length applied himfelf entirely to the fludy of polite literature. He tranfinted Thucydides into Englini ; and publifhed his tranflation in 1628 , in order to fhow his countrymen, from the Athenian hiftury, the diforders and confufions of a democratical government. In 1626 his patron the earl of Devonthire died; and in 1628 his fon died alfo: which lofs affeeted Mr Hobbes to fuch a degree, that he very willingly accepted an offer made him of going abroad a fecond time with the fon of Sir Gervafe Clifton; whom he accordingly accompanied into France, and flaid there fome time. But while he continued there, he was folicited to retura to England, and to refume his conecrn for the hopes of that family to whom he had attached himfelf fo early, and to which he owed fo many and fo great obligations. In 1631, the countefs dowager of Devonhire defired to put the young earl under his care, who was then about the age of 13 . This was very fuitable to Mr Hobbes's inclinations, who difcharged that trull with great fidelity and diligence. In 1634, he republifhed his tramfation of Thucydides, and prefixed to it a dedication to that young nobleman, in which he gives a large character of his father, and reprefents in the ffrongef terms the obligations he was under to that ilJufrious family. The fame year he accompanied his noble pupil to Paris, where he applied his vacant hours to the fludy of natural philofophy, and more efpecially to the perfect underflanding of mechanifm, and the caufes of animal motion. He had frequent converfa. tions upon thefe fubjects with father Marin Merfenne; a man defervedly famous, and who kept up a correfpondence with almoft all the learned in Europe. From Paris he attended his pupil into ltaly, where at Pifa he became known to that great altronomer Galileo Gatidei, who communicated to him his notions very freely; and after having feen all that was remarkable in that country, he returned with the earl of Devonfhire into England. Afterwards, forefeeing the eivil wars, he went to feek a retreat at Paris; where, by the good offices of his friend father Merfenue, he became known to the famous Renatus des Cartes, and afterwards held a correfpondence with him upon feveral mathematical fubjects, as appears from the letters of Mr Hobbes publifhed in the works of Des Cartes. But when this pliilofopher printed afterwards his Meditations, wherein he attempted to eflablifh points of the highelt confequence from innate ideas, Mr Hobbes took the liberty of diffenting from him ; as did alfo the French king's mathematical profeffor, the illuftrious Peter Gaffendi, with whom Mr Hobbes contracted a very clofe friendhip, which was not interrupted till the death of the former. In 1642, Mr Hobbes printed a few copies of his famous book $D_{e}$ Cive, which, in proportion as it became known, raifed him many adverfaries, who charged him with inftiling principles which had a dangerous tendency. Among many illuflrious perfons who, upon thipwreck of the royal caufe, retired to France for fafety, was Sir Charles Cavendifh, brother to the duke of Newcallle: and this gentleman, being akilled in every branch of the mathematics, proved a
conftant friend and patron to Mr Hubbes; who, by Holbee embarking in $16_{45}$ in a controverfy about fquaring the circle, was grown fo famous for it, that in $16+7$ he was recommended to inftruct Charles prince of Wales, afterwards king Claarles 1I. in that kind of learning. His care in the difcharge of this office gained bim the efteem of that prince in a very bigh degree: and tho ${ }^{\circ}$ he afterwards withdrew his public favour to Mr Hobbes on account of his writings, yet he always retained a fenfe of the fervices he had done him; fhowed him various marks of his favour after he was refored to his dominions; and, as fome fay, had his picture langing in his clolet. This year alfo was priated in Holland, by the care of M. Sorbiere, a fecond and more complete edition of his book De Cive; to which are pre fixed two Latin letters to the editor, the one by Mr Gaffendi, the other by father Merfenne, in commendation of it : and in 1650 was publifhed at London a fmall treatife of Mr Hobbes's, intitled, Human Nature: and another, De corpore politico, or "Of the elemenio of the law."
All this time Mr Hobbes had been digefting with great care and pains his religious, political, and moral principles, into a complete fyttem, which he called the Leviuthan, and which was printed in Englifh at Loudon in 1650 and 165 r . After the publication of his Leviathan he returned to England, and pafled the fummer commonly at his patron the earl of Devonfhire's feat in Derbythire, and fome of his winters in town, where he had for bis intimat fiiends fome of the greatelt men of the age. In 1660, upon the refloration, he quitted the country, and came up to Lundon, where he ubtained from the king aflurance of protection, and had an annual penfion of L. 100 fettled upon him out of the privy purfe. Yet this did not render him entirely fafe: for, in 1666, his Leviabban and his treatife De Cive were cenfured by parliament; which alarmed him very much, as did alfo the bringing in of a bill into the houfe of conmons to punifh athelfin and profanenefs. When this tlorm was a little blown oven, be began to think of procuring a beautiful edition of bis pieces that were in Latin; but finding this impracticable in England, he caufed it to be undertaken abroad, where they were publinhed in quarto in 1668, from the prefs of Juhn Bleau. In 106y, he was vifited by Cofmo de Medicis, then prince, afterwads duke of Tufcany, who gave him ample maks of his elleem and refpect; and having received his picture, and a complete collection of his writings, cauled them to be repofited, the former among his curiofities, the later in his noble library at Florence. The like vifits he received from fureign ambafladors and other titrangers of dillinction; who were curious to fee a perfon whofe fingular opinions and numerous writings had made fo much noife all over Europe. In 1672, he wrote his own life in Latin verle, when, as he obferves, be bad completed his $84^{\text {th }}$ year: and, in 1674 , he publithed in Englifh verfe four books of Humer's Odyffey; which was fo wetl received, that it encouraged him to undertake the whole lliad and Odyffey, which he likewife performed and publifhed in 1675 . About this time he took his leave of London, and went to fpend the remainder of his days in Derby hire: where, however, be did not remain inaşive, notwithutanding his ad-
bes. vanced age; but publifhed from time to time feveral pieces, to be found in the collection of his works. He ditd in 1579 , aged 92.
As to his character and manners, they are thus defcribed by Dr White Kennet, in his Memoirs of the Caverdith family. "The earl of Devonfhire (fays he) for his hole life entertained Mr Hobbes in his family, as his old tutor, rather than as his friend or contident. He let him live under his roof in eafe and pleaty, and in his own way, without making ufe of him in any public, or fo much as domeftic affairs. He would often exprefs an abhorrence of fome of his principles in policy and religion; and both he and his lady would frequently put off the mention of his name, and fay, ' He was a lhumorit, and nobody could account for him.' 'There is a tradition in the family, of the manners and cuttoms of Mr Hobbes, fomewhat obfervable. His profeffed rule of health was to dedicate the morning to his exercife, and the afternoon to his Atudies. And therefore, at his firt riling, he walked out, and climbed any hill within his reach; or if the weather was not dry, he fatigued himfelf within doors by fome exercife or other, to be in a fecat : recommending that practice upon this opinion. that an old man had more moilture than heat, and therefore by fuch motion heat was to be acquired and moiflure expelled. After this, he took a comfortable breakfall ; and then uent round the lodgings to wait upon the earl, the countefs, and the children, and any confiderable Arangers, paying fome thort addreffes to all of them. He kept thefe rounds till about 12 o'clock, when he tiad a little dinner provided for him, which he eat always by himfelf withont ceremony. Soon af. ter dinner he retired to his tludy, and had his candle with 10 or 12 pipes of tobacco laid by him; then flutting his door, he fell to finoking, thinking, and writing, for fevera] hours. He retained a friend or two at court, and "ppecially the lord Arlington, to protect him if occafion thould require. He ufed to fay, that it was lawful to make ufe of ill inflruments to do ourfelves grood: ' If I were celt (fays he) into a deep pit, and the devil hould put down his cloven foot, I would take hold of it to be drawn out by it.' After the reforation, be watched all opportunities to ingratiate himfelf with the king and his prime minitters; and looked upon his penfion to be more valuable, as an earneft of favour and prosection, than upon any other account. His future courfe of life was to be free from danger. He could not endure to be left in an empty houle. Whenever the earl removed, he would go along with him, cren io his latt flage, from Chatforth to Hardwick. Whien he was in a very weak condition, he dared not to be left behind, hut made his way upon a featber-bed in a coach, though he furvived the journey but a few days. He could not bear any difcourfe of dea:h, and feemed to calt off all thoughts of it : he delighted to reckon upon longer life. The winter before he dred, he made a warm coat, which he faid mult laft him three years, and then he would have fuch an. wther. In his lalt fickuefo his frequent queltions were, Whether his difeafe was curable? and when intimations were given, that he might lave eafe, but no remedy, he ufed this expecfion, 'I nall be glad to find a hole to creep out of the world at;' which are reported to have been his laft fenflite words; and his lying fome
days following in a filent flupefaction, did feem owing to his mind more than to his body."

The reverend Mr Granger obferves, that Hobbes's Atyle is incomparably better than that of any other writer in the reign of Charles I. and was for its uncommon frength and purity fcarcely equalled in the fucceeding reign. "He has in tranflation (fays he) done Thucydides as much juttice as he lias done injury to Homer; but he looked upon himfelf as born for much greater things than treading in the Aeps of his predeccffors. He was for friking out new paths in fcience, government, and religion; and for removing the land-marks of former ages. His ethics have a Arong tendency to corrupt our morals, and his politics to deftroy that liberty which is the birthright of every human creature. He is commonly reprefented as a fceptic in religion, and a dogmatill in philofophy; but he was a dogmatitl in both. The main principles of his Leviathan are as little founded in moral or evangelical truths, as the rules he has laid down for fquaring the circleare in mathematical demonfration. His book on human nature is efleemed the beft of his works."

HOBBIMA (Minderhout), an eminent landfeape painter, was born about the year 1611 at Antwerp; hut the mafler from whon he received his inflruction is net known. He Rudicd entirely after nature, fketching every feene that afiorded him pleafure, and his choice was exceedingly picturefque. His grounds are always agreeably broken, and he was particularly fond of defcribing flopes diverfified with fhrubs, plante, or trees, which condufted the eye to fome building, ruin, grove, or piece of water, and fiequently to a delicate remote diftance, every object peripectively contributing to delude our obfer vation to that point. The figures which he himfelf defigned are but indifferent, which was a defect imputahle to Claude Lorraine and Gafpar Youflin as well as to Hobbima ; but the latter, confcious of his inability in that relpect, admitted hut few figures into his defigns, and thofe he ufually placed fomewhat removed from the immediate view at a prudent diftance from the front line. However, moit of his pictures were fupplied with figures by Oftade, Teniers, and other very famous mafters, which muit always give them a great additional value. They are now exceedingly fearee, and indultrioufly foughe for.
HOBBY, the name of a lawk called by fome authors fubluteo. See Falco.

It is a hawk of the lure, and not of the filt ; and is very like the faker, only much lefs. It makes excellent fport with net and fpaniels; for when the birds fee the hobby, they dare not conmit themfelves to the wing, hut lie clofe to the ground, and fo are ta ken in nets.

Hobsy is alfo a name formerly given to flrong active horfes of a middling fize: they are reported to have been originally ratives of Ircland, and were much liked and ufed. Nage anfwer the fame defription as to fize, qualities, and employnents.

HOBGOBLIN is a name vulgarl) applied to fairies or apparitions. Skinner calls the word robgobitins, and derives it from Robin Goodfellow, Hob being the nick-name of Robin: but Wallis and Junius, with greater probability, derive it from bofollins, empu/a,

Holshet.

HOMLERS, or HomaERS, Holdarif, in our ancient coal ms, were men who, by the ir tenure, were
 tifying any invalion towards the fow fide.- The name was al bolded for certan bith knithes, who uled to ferve as igght horfemen upan hobhies.
 in fluecing a hably or litele horfe.

HOB NOL; or Har-nab, acant uord formed from hat netath, and denoting an ceent which happens at random or by mere chance.

HONOO, a name given by the people of Otabcite, and in the neighbouring iftands of the South Sra, io their fupertime doth. It is the thaneft and mott finithed preparation of the aouta.

HOBSHEE-coerrees, a kind of Abyflmian na*es very frequent in the empire of Hindettan. 'Ihey conce motly from a province fubject to the Negus of Sthopia, called lomariah, to the fouth of his other dominions, and borderimg upon Negreeland in Afria; from whence they are felected, and a great inatice inade of them over all Mugolitan and Perfia; but it is chiclly from the pots of Arabia and the Red Sea that they are brought. Nothing can be imagined more fmouth or glody, and perfectly black, than their kin ; in which they far furpals the negroes on the coalt of Guinea; and, generally freaking, have not any thing of theis thick lips, thongh otherwife as woully haired as they. 'they are highly valued for their coatage, thddity, and thetwdnefs; in whith they fo far cacel, as often to rife to pols of great honour, and are made governors of plates under the tiale Sac!.a's.

HOBSON's choIce, a vilcar proverbial expreflon, applice to that kind of choice in which there is no alternative. It is fad to Le derived from the name of a caricr at Cambrige, wholet out hackney hories, and oblired each cutomer to take ia his tam inat horle which itood next the table daot.

HOCUS-POCUS, a cant exprefl on with which the exhibiturs of legerdemin tricks generally prefice their feats. They are thou the tu be derived from that arch !egerdenain trick of the liomith prints convertiag the facramental bread into Deity ; in which wondenfllmotamonfholis the words hae of iopors made a confricuous part of the coreniony, and whath words may be contidened as the prububle root of ver modern bowis pocus.

HOD, a fort of tray for carrying mortar, in tue among bricklayers.
HODEGOS, a term purely Greek, ofnyoc, fignifying gaide. The word is chiefly ufed as the title of a book compoled by Anaftalius the Sinate, towards the chofe of the filth century; being a method of difputing againf the heretics, particularly the Acephali.

Mr Toland has alfo publimed a difertation under the fame title. Its fuhject is the pillar of fire, \&e, which

HODG: PODCE. Sce Horeh-pot.
HODMAN, a cant term formerly ufed for a young fcholar admitted from Welminiter fchool to be itudent in Chrin church in Oxford.

HODK (Hinnphry), a learned Englith divine, was bons in : 659 . At $=1$ years of age, he publithed his ce-
 interpaters; which was revired woith great applanfe by all the lamod, lidac herhis exceped, who comid not bear t's have his opinions oppuediby fuch a vouth. 'I'wenty years after, he treated the luhioci more fully

 wrote t's Jrolr pomeas to Juhan MAlala's Cla onicke, printed at Oxford ; and the J ear after was made chap. lain to Dr seilhingteet bihop of Worcellor. "19e deprivation of the norgerme thitops eneased ham in a controverfy with Mr Dodwell; which recommend d hin to archbith op Fillotizen, to whom, and his ficcceflor 1)r Pemiton, he was domaftic chaplain. In 1608 lee was made regius profethor of the Greck tongue at Oxford, and andwaton of Oxford in 1,0q. On occafion of the consiceerfy about the convocations, he, in 1701, publifaed A hithory of Ength comacils and convocacions, and of the clergy's littirer in parlia. ment, \&e. He died in i-CO, keaving in MS. Nua:count of thofe learned Grecians who retired to I aly on the taking of Contantinopic, Sce, whish was pub. lithed in $174^{2}$ by Lir Jeb.

HOR, or Hos, a huivandman's toul, made like a cooper's adz, to cut up woeds in gardens, ficlds, 太心. This inttrment is ur great ufe, and ought to be nuels more employed thas is is in hacking and clearing the feyeral corners and patches of land in fpare times wit the year, which would be no fnail advantare to it.

Horjo-Hoe a large kind of hoe drawn oy hores, and ufed to Atir the intervals in the new dulbandry, and clear the conn from weeds. Sce Acracuiture.

HOEING, in the new hubandiy, is the buaking or dividing the foil by tillage while the coriz or other plents are growing thereon. - It differs from cummon tillage (whach is aways performed before the conn or plants are fown or planted) in the time of performing it; and it is much more benclicial to the crops than any other tillage. Ilhis fust of tillage is performed various ways, and by means of different initurments, as deforibidundor the article Agreculaure.

HOEI-Tcheov, the mot lonthem city of the pro-
 the empine. The people are tconwinal and temperate, but they are active and enterprifing in trade: they boat of their tea, varnifh, and cogravings, which are indoced the mont eltemaed in Chima. It has de pencest upon it lix cities of the third chafs ; the monntains which furround this canton coutan gold, fiver, and coppar mines.

HOEMATOPUS, in ornithology ; a genus of birds, of the order of grallx. It has a long comproffed bill, with the end cuncated; the notrils are linear, and the feet have only three toes. 'There is bat one fpecies, the oftralegus, fea-pie, or oythercatcher. They are very common on mot of our coats; feeding on marine infects, oyters, limpets, \&c. Their bills, which are comprefed fideways, and end obtuldy, are very fit infloments to infmuate between the limpet and the rock to which thefe factls adhere; which they do with great dexterity to get at the hifh. On the coatt of Erance, where the tides recede fo far as to leave the beds of oyllers bare, thele birds feed on them, forcing the faells open with their bills. They keep in fummertime in pairs, layiag their eggs
man on the bere zround: they lay four ot a whitith-bousu hee. thinly footed and triped with black; and when any one applnaches their yuunz, thas forke a land and thrill notie. In winter they allemble in wat tocken, and are very wild. The licad, neek, fapulars, a:nd coverts of the wings of this bind, are uf a tian hiach; in fome the neck is matked with white; the wiress dulky, with a broad transerfe band of white: the bill three inches long, and of a richorange coluor.

HOLFMMAN, the name of Exveral cminert pliyli. cians ; of whon Mausice Howman, and John Manice Hoffman his Son, practifed at Aitors. Naurice died in $16 g s$, leaving behind him many works; and wes fuccecded by his fon Juln Manrice, bho wrote as wall as his father, and died in 1727, hinghy efteemod by the faculty.-Frederic liofinan, probabiy of the bame family, was born ut Magdeburg in 1660. The prin. cipad known circumblates of his life are, lis jonuney into Hojand and Eigland, where he became intimately acquainted with Paul Helinan and Rubert Boyle; never taking any fees, being fuppoited by lis annual Kipend; his curing the emperor Chatle. Vl. and Frederic I. Kinge of Prufia of invoterate difeales; to which may be added, his accumate knowhedge of the nature and virtues of mintal waters. He furvived his. 8oth ycar; and his works, which are in great encem, were printed in lix volunes folio at Geneva, in 1740.

HOFPMANISTS, in ecelefatical hiftory, denote thene whe fooused the fentiments of Daniel Hofimann, profefor of the univerlity of I Ampath, who, from the jear 1598 , menintained, that phituloply was a mortal enemy to religion; and that wha was true in phiboiophy was falfe in theology. Thele abturd and pernicious tenets occalioned a warns and extentise controverfy: at longth Hodlimann was compelicd by Julius duke of Brmafwick to retiae his invectives againt philofophy, and to acknunledge, in the motl open manner, the harmony and union of found philotophy with true and getuine thoology.

HOG, in zouluzy. Sae Sus.
Hoc, on buatd of a thip, is a fort of flat fermbbing broom, formed by incloting a number of thort twigs of birch or fuch wood between two pieces of plank fattened together, and cuting off the ends of the twigs, and fersing to Scrape the filth from a Mip's bottom under water, particulaily in the act of boottopping. For this purpofe they fit to this broom a long faff with two ropes; one of which is ufed to thruft the hog under the Mip's botom, and the other to guide and pull it up again clofe to the planks. This butioefs is commonly performed in the nip's loot, which is confined as clofe as poffible to the velfel's fule during the operation, and hiffed from one pat of the fide to another till the whole is completed.

Hoc's Dung is by Mortimer reckoncd one of thic richelt manures we are acquainted with, and the next in value to theep's dung; and is found to be equal in virtue to twice the quantity of any other dung except this. The ancients feem to have been difpleafed with it on accoutt of its brecding seeds; but this is only acculing it of being tou rich, for any dung will do this when laid too thick. It is an excellent manure for palture-grounds, and exeels all otlarr kimbo of dungs
for trees. The fammers who une this dung for their lands, frenc:ally take cure to fave it, by well paving the tyecs and itercafe the quaterty by throwing in beandtalks, subble, and meny other things of a libes nature: and, by grod manasenicut of thin kiad, may lamers have procured 50 or 60 load; of exoclicut matare a ycar vut of a fmall it?c. The vory bel way of ufoge this dune is by mixing it with horfedung; and for ithes reaton it is beit to have the tyenear the tlable, that the tion cleamings may be mixed in one irap, and wiod cogather.
'They have in many parts of Stafiend hire a poor, light, fhullow latad, on which they fow a kind of white pea: the land is neither able to bear this nor ally thing die to advantage for their reaping ; but, when the peas are rips, they turn in as many hogs as the quanity of peafe will fatten, furforing them to live at large, atd to remain there day and nighe: in confe. quence of this, the land will produce good crops of lady for feveal years afterwards; or, if too poor for that, it will as wort raife grais enough to make it good patkure growind.

## How's Hart. See Axuxgia.

HOGARTII (Wianam), a traly great and original genius, is faid by lie Durn to lave bern the defeendant of a fanily originally from Kirkby Chore, in Weamoncland. His ia her, who had ixen a fehoomater in the fame connty, went carly to London, where he was cmployed as a coirettor of the prefs; and appears to have becn a man of tome learning, a dictionary in Latin and Eaglif, which he compufed for the ufe of fchools, being ftill exifing in MS. He marricd in London; ancl kept a fchool in Ship Court, in the OldButey. Our hero was borm in 1607 or 1698 , in the parith of St Martin Ludgate. The outfot of lis lific, bowev.r, was unprowifing. "He was bound," fays *Ir Walpole, "to a mean engraver of arms on plate." Hugarth prol ably clofe this occupation, as it required fome kill in drawing; to which his genius was particularly turned, and which he contrived affiduoully to chltivate. His maficr, it lince appears, was Mr Ellis Gamble, a filvermith of cminence, who refided in Cran-bourn-flreet, Lecefter-fulds. In this profeftion it is. not unufual to bind apprentices to the lingle brench of engraving arms and cyphors on every foccies of metal; and in that particular department of the bulinefy young Hogarth was placed; "but, before his time was ex" pired, he fele the impulfe of genius, and that it d:"reeted him to paintines" During his apprenticeMip, he fot out one Sunday, with two or three compations, on an cxcurfion to Highgate. The weather being hot, they went into a public-houfe, where they had not been long lefore a quarrel arofe hetween fome perfons in the fanc room. One of the difputants itruck the otber on the head with a quart pot, and cut him wo much. The blood rumning doun the man's face, together with the agony of the wruod, which had diftorted his features into a molt lidenus grin, pretented Fogath, who howed himtelf thas early "apprifed of the mode Nature had intended be thould parluce," with too laughalle a fubject to be overlooked. He drew out his puncil, and prodeced on the fpot one of the moit ludicrous figures that ever was Centi. What rendered this ficce the note valuable was, that it cyhinitel?
ciog, Hogartio.
fincerth. hibited an exat likenefs of the man, with the portrait Leqof his antagonift, and the figures in caricature of the principal perfons gathered round him.

How long he continued in obfeurity we cannot ex. actly learn ; but the frit piece in which he ditinguifled limfif as a painter is fuppofed to have been a reprefentation of Wantead Affembly. The figures ia it, we are told, were drawn from the life, and without any circumftances of burlefque. The faces were faid to be extremely like, and the eolouring rather better than in fome of his late and more lighly finifhed performances. From the date of the earlieft plate that can be afcertained to be the work of Hogarth, it may be prefumed that he began bufinefs on his own account at leall as carly as 1720 .

His firft employment feems to have been the engraving of arms and fhop bills. The next was to defign and furnifh plates for booksellers. Mr Bowles, at the Black Horfe in Cornhill, was one of his earlieft patrons, whofe prices were very low. His next friend in that lisse was Mr Philip Overton, who paid him fomewhat better for his labour and ingenuity.

Therc are ftill many family pictures by Hogarth exiling, in the fyle of ferious converfation-pieees. What the.prices of his portraits were, Mr Nichols flrove in vain to difenver; but he fufpects they were originally very low, as the penple who are beft acguainted with them choofe to be filent on that fubject.

It happented, in the early part of Hogarth's life, that a nublenian who was uncommonly ugly and deformed came to fit to him for his picture. It was executed with a fill that did honour to the artift's abilities; but the likenefs was rigidly obferved, without even the neceflary attention to compliment or flattery. The peer, difgulted at this counterpatt of his dear felf, never once thought of paying for a reflector that would only infult him with his deformities. Some time was fuffered to elapfe before the artilt applied for his money; but afterwards many applications ware made by him (who had then no need of a banker) for payment, without fuccefs. The paister, however, at laft hit upon an expedient, which he knew muft alarm the nubleman's pride, and by that means anfwer his purpofe. It was couched in the following eard: "Mr IIogarth's dutiful refpects to lord _; finding that he does not mean to have the picture which was drawn for him, is informed again of Mr H.'3 neceffity for the money: if, therefore, his lordhip coes not fend for it in three days, it will be difpofed of, with the addition of a tail, and fome other little appendages, to Mr Hare, the famous wild-beaft man ; Mr H. having given that gentleman a conditional promife of it for an exhibition-pictare on his lordhip's refufal." This intimation had the defired effect. The picture was fent home, and committed to the flames.

Mr Walpole has remarked, that if our artit "indulged lis fpirit of ridicule in perfonalities, it never proceeded beyond fketches and drawings;" and wonders " that he never, without intention, delivered the way features of any identical perfon." Mr Nichols affures us, from unqueltionable authority, that almot all the perfonages who attend the levee of the Rake were undoubted portraits : and that in "Southwark Fair," and the "Moserp Midnight Converfation," as many
more were difenvemble. While Hogarth was painting the "Rake's Progrefs," he had a fummer refidence at Illowarth; and never failed to queltion the company who canc to fee thefe pietures, if they knew for whont one or another ligure was defigned. When they gueffed wrong, he fet them right.

The Duke of Leeds has an original feene in the "Beggar's Opera," painted by Hogarth. It is that in which Lucy and Polly are on their knees, before their refpective fathers, to intercede for the life of the hero of the piece. All the figures are either known or fuppofed to be portraits. If we are not mifinformed, the late Sir Thomas Robinfon (perhaps better known by the name of Lont Sir Thomas) is Itanding in one of the fide-boxes. Macheath, unlike his fpruce reprefentative on our prefent ftage, is a floneling bully; and Polly appears happily difencumbered of fuch a hoop as the daughter of Peachum within our younger memories has worn. Mr Walpole has a picture of a fcene in the fame piece, where Macheath is going to execution. In this alfo the likeneffes of Walker and Mifs Fenton, afterwards duchefs of Bolton (the firft and original Macheath and Polly) are preferred. In the year 1726, when the affair of Mary Tofts, the rabbit-breeder of Godalming, engaged the public attemtion, a few of our principal furgeons fubleribed their guinea a-picee to Hogarth, for an engraving from a ludicrons fketel he had made on that very popular fubject. This plate, amongt other portraits, contains that of the St André, then anatomitt to the royal houfehold, and in ligh credit as a furgeon. In 1727, Hogarth agreed with Morris, an upholferer, to furnifh hin with a defign on canvas, reprefenting the element of earth, as a pattern for tapeftry. The work not being perfurmed to the fatisfaction of Morris, he refufed to pay for it ; and our artif, by a fuit at law, recovered the money.

In i 730 , Mr Hogarth married the only daughtee of Sir James Thornhill, by whom he had no cliild. This union, indeed, was a folen one, and confequently without the approbation of Sir James, who, confidering the youth of his daughter, then barely 18 , and the flender finances of her hufband, as yet an oblcure artift, was not eafily reconciled to the match. Soon after this period, however, he began his "Harlot's Progrefs," (the coffin in tbe laft place is inferibed Sept. 2. 1731) ; and was advifed by lady Thornhill to have fome of the feenes in it placed in the way of his father-in-law. Accordingly, one morning early, Mrs Hogarth undertook to convey feveral of them into his dining-room. When he arofe, he inquired from whence they came; and being told by whom they were introduced, he eried out, "Very well; the man who can furaifh reprefentations like thefe can alfo maintain a wife without a portion." He defigned this remark as an excufe for keeping his purfe Atrings clofe; but, foon after, became both reconciled and generous to the yount people. An allegorical cieling by Sir James Thornhill is at the houfe of the late Mr Huggins, at Headly Park, Hants. The fubject of it is the Itory of Zephyrus and Flora; and the figure of a fatyr and fome others were painted by Hogarth.

In : 732, Hogarth ventured to attack Mr Pope, in a plate called "The Man of Tafte;" containing a
h. view of the Gate of Burlington-houfe, with Pope whitewafhing it and befpattering the duke of Chandos's coach. This plate was intended as a fatire on the tranflator of Homer, Mr Kent the architect, and the earl of Burlington. It was fortunate for Hogarth that be efcaped the lafh of the former. Either Hogarth's obfcurity at that time was his protection, or the bard *as too prudent to exafperate a painter who had aheady given fuch proof of his abilities for fatire.
Soon after his marriage, Hogarth had fummer lodgings at South Lambeth; and being intimate with Mr Tyer3, contributed to the improvement of the Spring Gardens at Vauxhall, by the hint of embellifhing them with paintings, fome; of which were the fuggeftions of his own truly comic pencil. For his affittance, Mr Tyres gratefully prefented him with a gold ticket of admififion for himfelf and his friends.

In 1733, his genius became confpicuouny known. The third feene of his "Harlot's Progrefs" introduced him to the notice of the great. At a board of treafury wbich was beld a day or two alter the appearance of that print, a copy of it was fhown by one of the lords, as containing, among other exeellencies, a ftriking likenefs of Sir John Gonfon. It gave uni. verfal fatisfaction : from the treafury cach lord repaired to the print-fhop for a copy of it, and Hogarth rofe completely into fame.

The ingenious Abbé Du Bos has often complained that no hittory painter of his time went through a feries of actions, and thus, like an hiftorian, painted the fucceffive fortune of an hero from the cradle to the grave. What Du Bos wifhed to fee done, Hogarth performed. He lanches out his young adventurer a fimple gill upon the town, and conducts her through all the viciffitudes of wretchednefs to a premanure death. This was painting to the underflanding and to the heart; none lad ever before made the pencid fubfervient to the purpofes of morality and intruc. tion: a book like this is fitted to every fuil and every obferver ; and he that runs may read. Nor was the fuecefs of Hugarth confined to his perfons. One of his excellencies confilled in what may be termed the furniture of his pieces; for as, in fublime and hiftorical reprefentations, the fewer trivial circumilances are permitted to divide the fpectator's attention from the principal figures, the greater is their force; fo, in fcenes copied from familiar life, a proper variety of little domettic images contributes to throw a degree of verifmilitude on the whole. "The Rake's leveeroom," fays Mr Walpole, "the nobleman's dining. room, the apartments of the hufland and wife in Marriage á la Mode, the alderman's parlour, the bedchamber, and many others, are the hiftory of the manners of the age."

In 1745 , Hogarth fold about 20 of his capital pictures by auction ; and in the fame year acquired additional reputation by the fix prints of "Marriage á la Mode," which may be regarded as the ground-work of a novel called "The Marriage Aet," by Dr Shebbeare, and of "The Clandeftive Martiage."

Soon after the peace of Aix la Chapelle, he went over to France, and was taken into cultody at Calais while he was drawing the gate of that town; a circumftance which he has recorded in his picture, intiukd, "O the Roaft Beef of Old England l" pub-
lifhed March 26. 1749. He was actually carried be. Hagwth. fore the governor as a fpy, and after a very ftrict exa. -d mination committed a prifoner to Granfire, his landlord, on his promifing that Hogarth fhould not go out of his houfe till he was to embark for England.

In 1753, he appeared to the world in the claracter of an author, and publifhed a quario volume, intitled, "The Analylis of Beauty, written with a view of fixing the fluctuating ideas of tafte." In this performance he thows, by a variety of examples, that a curve is the line of beauty, and that round fwelling figures are moft pleafing to the eye; and the truth of his opinion has been countenaneed by fublequent writers on the fubject. In this work, the leading idea of which was hieroglyphically thrown out in a frontifpiece to his woiks in 1745 , he acknowledges himfelf indeb:ed to his friends for affifance, and particulatly to one gentleman for his corrections and amendments of at lealt a third part of the zuording. This friend was Dr Benjamin Hoadley the phyfician, who carritd on the work to aboot the third part, Chap. IX. and then, through indifpofition, declined the friendly office with regret. Mr Hogarth applied to his neighbour M. Ralph ; but it was impoffible for two fuch perfons to agree, both alike vain and pofitive. He proceeded no farther than about a thect, and they then parted friends, and feem to have continued fuch. The kind office of finilhing the work, and fuperintending the publication, was lallly taken up by Dr Murell, whowent through the remainder of the book. The proface was io like manner corrected by the Rev. Mr Townley. The family of Hogarth rejoiced when the laft theet of the "Analyfis" was printed off; as the frequent cifputes he had with his coadjutors, in the progrels of the work, did not much harmonize his difpolition. This work was tranfated into German by Mr Mylins, when in England, under the author's infpection; and the tranflation was printed in London, price five dollars. A new and correct edition was in 1754 propofed for publication at Berlin, by Ch . Fr. Vok, with an explanation of Mr Hogarth's fatirical prints, tranlated from the French; and an Italian tranflation was publifherl at Leghorn in tysi.

Hogarth had one failitig in common with moft people who attain wealth and eminence without the aid of liberal education.-He affected to defpife cvery kind of knowledge which he did not poff.fs. Having eftablifhed his fame with litile or no ubligation to literature, he cither conceived it to be peedlefs, or decried ir becanfe it lay out of his reach. His fentinents, in. Thort, refembled thole of Jack Cade, who pronounced Sentence on the clerk of Chatham becaufe he could write and read. Till, in evil hout, this celcbrated artift commenced author, and was obliged to employ the friends alrcady mentioned to correct his "Analy fis of Beauty," he did not feem to liave difcovered that even: fpelling was a nece(fary qualification; and yet he had ventured to ridicule the late Mr Rich's defieiency as to this particular, in a note whicls lies before the Rake whofe play is refufed while he remains in confinement for debt. Previous to the time of which we are now fpeaking, one of our artill's common topies of declamation was the ufeleffinefs of books to a man of his profeffion. In "Beer-ftreet," among other volumes configned by him to the palry coots, we find Turn-

 gatid thould hase been abic on und whand before he benturd to condem. Garrick himide, how ver, was not more ductile to flattery. At word in pratie of "Sinifmunda," he farourite work, might have connomded a prowi print, or foeced an oripinal thetch ous of our artills hands. Thac following authenticato ftons of our atith will alio fence to how how math moic caly it is to detect ill placed or hyperbalical adulaton refpeating othes than when applied to marfelver. Ilogath being at dinmer with the great Che felhen and fome other company, was told that MIr Iolm Frike, furgeon of St Batholomew s-liopital, a Guw cwaings bfore, at Dick's Coffer houfe, had afferced that Greme was as eminent in compofition as Hamk.. "That Emlow Freke." repliedEogath, " is alway thooting his bo't abfurdy one way or another! Thande is a giant in mufe; Greene only a light 11). inmel kind of a cumpufer."-"Aye," fars our artit's mformant; "but at the fase tine Mr Freke declared you ware as good a portrait-puinter as Vandyck.""Than he wis in the right," adds Hogath; "aned for by $G$ - I am, give ma my time, and let me chooic my Fuhject!"

A frocimen of Hozarth's propentity to mertiment, on the mont trivial oecalions, is offervathe ia one of his cards regueting the compzay of Dr Aroold King to dive with him at the Ditre. Within a circle, to which a knife and fork are the fupponters, the written part is contaned. In the centre is crawn a pye, with a mitre on the top of it; and the invitation of our artilt condudes with the following fport on the G-eck letters-to Eta B.ta Pi. The reit of the infeription is not very a acurately fecit. A quiblle hy Hogarth is functy as refpectable as a conundrum by Swift.

In one of the carly exhibitions at Spring (Gardons. a vely pleaing imall picture by Hogarih made its firlt appearance. It was painted for the Earl of Charlcmont, in whofe collection it remains, and was antiled "Picquct, or Vitue in Danger;" and fhows us a young lady who during a tito isto had juth tof all her moncy to a handfome offece of her own age. He is reprefented in the ate of retumser her a handful of bank bills, with the hape of exchanging them for a fofter acquintion and more delicate plander. On the chimney picce a watch cafe and a figure of Time over it, with this mot:o-NUNC. Horarth has caugh his herume during this moment of hentation, this Arugale with herfelf, and has maked her feelings with uacemmon fuccefs.

In the "Mifcr's Tcaf," Mr Hogrth thought r"). per to pilhory Sir laace Shard, a genteman proverbially arericious lataring this, the fon of Sirlfade, the late Iface Puatus Shard, Efq; a young man of fpinit, jut uturned from his travele, called at the painter's to fee the pisture; and, among the relt, aking the Cicsrone "whether that odd tigure was in. tuded for any partichar perfon;" un his replyind "thas it was thashat to be very like one sir loase S. Tw." he immoliatly drew his fword and fathed the canas. Lusun appeared intanty ingreat wrath

 that i.c was the ingued paty's fon, and hat he was
 never inflituted.
$1 \mathrm{~N}^{\circ} \mathrm{I} 50$.

Abent: 175\% his bro er-in-aw, IIr 'Thornhill, refirmal the pase of kins's iempant-panter in favour of Mr. Hoparth.

The bat remarkebl circumlanee of his life was his corten with tir Cimarehill It is aid that buth met at Wenminter-hait: ilygarth to take by his eye a midiculnaz likenofo of the pere, and Churchill to furnifh a defcription of the painter. Bat Hogarith's print of the prext was not mach eknemed, and the poct's letter to him was hat litte adminct. Some pretend, inded, to fay that it broke the painter's heart ; but this we can from good authorty foy is not true. Indeed the report falls of itfllf; fir we may as whll fay, thate Hucartl's pencil was as cficacions as the poct's pen, face neither hong farsived the conteft.

It may be truly cofercul of liogarth, that all his poweri of dighting were uefraind to his pencil. Hawn rarely been admeted into polite circles. none of his tharp corners had been rubbed oft, fo that he contmued to ther iaft a wrofs mentivated man. The Fichtelt contadiction tranported him imo rage. To fome condence in himfelf he was cotainly intitled: for, as a comic painter, he could have cuimed no honom that would not mon ressity have been allowed him ; tut lae was at once unprincipled and variable in his political conduct and attachments. Ile is a!? fuid to have beheld the rifing eminence and popalarity of Sir Johea Reynoles with a degree of cary: and, if we are not mifinformed, frequently fooke with afperity both of him and his performuces. Juftice, however, oblizes us to ade, that our artift was liberal, hofpitable, and the mot punctual of paymathers; fo that, in fite of the emuluments hi; works bed procured to him, he left but on incorfiderable fortuns to his widow. His plates inded are fice.. refources to her as may not ipeedily be exhauted. Some of hio domeltics haid lived many years in his ferviee; a circumitance that always reflects creait on a matter. On moll of thefe he painted Atong likeneffes on a canvas fill in Mrs Mogarth's poffefion.

Of Hogarh"s leffer plates many were defroyed. When he wanted a picce of copper on a fudden, he would take any from which he lad already worked off fuch a number of imperfions as he fuppofed the thould fell. He then feat it to be effacced, beat oat, or otherwife altered to his prefent purpole. The plates which remained in his poileffion werefecured to Mrs Hogarth by his will dated, Aug. 12. 176 ${ }_{4}$, chargeable with an annenity of L. 80 to his fiter Aune, who furvived him. When, on the death of his oher filter, the left of the bulinefs in which the was engared, he kindly took her home, and generomy fnpported her, making her it the fame time, weffil in the difpoial of his prints Wart of tembenefo ard liberality to his relations was not among the failings of Hoearth.

The following charater of Ilogarth as an artit is given by Mr Gilpin in his Ifry on Prints. "The woiks of this maler abound in true humour: and fatire, which is generally well directed: they are admirable moral lefons, and a fund of entertainment fuited to every tafte; a circomblance which hows iheon to be jull copics of mature. We may conileer then too as saluable repolitonies of the manners, culoms, and dreffes of the prifent age. What a fund of entertainment woald a collection of this kind afford, dawn fron cvery pariod of the hitory of Britain? - How

## H O G

ath. far the works of Hogarth will bear a critical examina tion, may be the fubject of a little more enquiry.
"In difign, Hogatth was feldom at a lufs. His invention was fortile, and his judgment accurate. An improper incident is rarely introduced, a proper one rarely omitted. No one could tell a ftory better, or make it in all its circumftances more intelligible. His genius, however, it mult be owned, was fuited only to hov or fomiliar fubjects; it never foated above common life: to fubjects naturally fublime, or which from antiquity or other accidents borrowed dignity, he could not rife. In compofition we fee little in hin to admire. In many of his prints the deficiency is fo great as plainly to imply a want of all principle; which makes us ready to believe, that when we do meet with a beautiful group, it is the effect of chance. In one of his minar works, the Idte Prentice, we feldom fee a crowd more beautifully managed than in the lat print. If the Theriff's ollicers had not been placed in a line, and had been brought a little lower in the piêture, fo as to have formed a pyramid with the cart, the compolition had been unexceptionable; and yet the tolt primt of this work is fuch a ftriking inftance of difagreeable compofition. that it is amazing bow an artitl who had any idea of beautiful furms could fuffer fo unmafterly a performance to leave his hands. Of the difribution of figho Hogarth had as litih knowledge as of compufiuiun. In fome of his pieces we tee a grood effect, as in the Execution juit mentioned; in which, if the ligures at the right and left comers had been kept donn a little, the light would have been beautifully ditributed on the fore-ground, and a tine fecondary light fpread over pait of the crowd. But at the farne time there is fo ohvious a deficiency in point of effect in molt of his prints, that it is very evident he had no principles. Ncither was Hogarth a matter in drawing. Of the mulcles and anatomy of the heead and hands he had perfect knouledge; but his trunks are ofeen bddly monlece, and his limbs ill fet on: yet his tigures, upon the whole, are infpired with fo much life and meaning, that the eye is kept in goud-humour in fpite of its inclination to find fault. The author of the Analyfis of Bealuty, it might be fuppofed, would have givell us more inllances of grace than we find in the works of Hugarth; which thows trongly that theory and practice are nut alway united. Nany opportunities hos fubjects raturally afford of ineroducing graceful attituks, and yet we have very few exdmples of them. Widh inilances of piciurefque grace his wooks abumd. Of hascoperinn, in which the furce of his genius lay, we cannot ferak in terms two high. In every mode of it he was truly excellent. The paffions he thoroughly underllood, and all the effects which they produce in every pat of the human frame. He bed the nappy art alfo of conveying his ideas with the fame precilion with which he conceived them. He was exeellent too in expreffing any humorous oddity which we ufien fee llamped upon the luman face. All wis heads are caft in the very mould of nature. Hence that endelis variety which is difplayed thro' his work; and honce it is that the dificence anifes between $h$ is heals and the affected caricaturas of thofe mallers what idve fonictimes amufed themfilues with patching together all alfombld, e of features from their own ideas. Such are 'puindet's; which, though admirably executed, appear phainty to Vol. Vili. Part II.
have no archetypes in nature. Hogarth's, on the other Hozhead land, are collectious of natural curiofities. The Daford. beads, the Pbyafian's arms, and fome of his other pie- Hike.dap. cess, are expretaly of this humorous kind. They are truly comic, though ill-natured effutions of mirth: more entertaining than Spaniolet's, as they are pure nature ; but lefs imnocent, as they contain illdediected ridicule.- But the fyecies of expreffun in which this matter perthaps mult excels, is that happy art of catching thofe peculiarities of art and gellune which the ridicnlous part of every profeflion centract, and which for that reafon becume characteriftic of the whole. His counfllors, his undertakers, his lawyers, his ufurers, are all confpicuous at tight. In a word, almoft every profeffion may fee in his works that particular fpecies of affectation which they fiould mofl endeavur to avoid. The exccution of this mater is well fuited to lais fubjects and maner of treating them. He rethes with great fpirit, and never gives one unneceflary Atruke."

HOGSHEAD, in commerce, a meafure of capacity containing 63 gallons.

HOGUE, a town and cape on the north-welt point of Numnandy in France; near wheh admiral Rrok burnt the French admiral's thip called the $R$ fing Sitn, with 12 more large men of war, the day after the setery obtained by admiral Ruficll nearCherburg in May : 0yz. W. Lom. 2. C. N. Lat. 49. 50.

HOIST, in fatlanguage, denotes the perpendicalar height of a hay or entign, as oppofed to the fly, which liguitus ite breadth from the fatio to the outer edgr.

HOISTING fignifirs the operation of drawing up `any body by the affictance of one or more tackles. Hoilting is never applied to the ast of puiling up any body by the help of a fiugle hlock, exeept in the ex. ercle of extending the fails by drawing them upwards along the mats or llays, to which it is invariatly applied.

HOKEDAv, Hock-Duy, or Hock Twflyy, in our
 (ant), the fecond Thed dy after Eater week; a folemn feltival celcbrated fur many agis in England in memory of the great flaughter of the Dancs in the time of king E:thelred, they having been in that reign almolt all deAroyed in one day in different parts of the kingdom, and that principally by women. This is till kept up in fonc counties; and the women bear the principal fway in it, thopping all paflengers with ropes and chaing, and exactug fome fmail matter from the on to make merry with. This day was very remarkable in furmer times, infomuch as to be nfed on the fame forting with Michaclmas for a general term ortine of aceount. We find lates withowi date referving for num hent pryable

Ho kien, bowdace leave to celebrate hock-day, or loke-day, in Herbein. mernoy of the expultion of the domineering Danes.

HO-KlEN-fou, a city of China, and one of the principal in the province of $\mathrm{P}_{\mathrm{t}}$-tcheli. It has two cithes of the feeond, and fifteen of the third, chafs in its diftrif, lut is renarhabl: for nothing but the neatnefs of its facces.

IFOL, biEN (1has), a chetrate. painter, born at Baft in Switzolland in 1498 , laarned the rudhents If his art frum his father, who was a painter; but foon frowed his fugeriar genius. In the townhoufe ne Bafil he puinted "our Saviour's Paflon; and in the foh maket of the fame cily Death's bimee, and a bance if icafants, which wete extromely almired; and Erafmus was fo pleafed wath them, that he dafired hime to draw his pietue. and was ever after his friend. He Alad fonc ytars koneer at Balil, till his neceffities, cecafoned by his own extravegatice and an increaling funily, made him comply with Erafmus's perfuations to go to Enghad. In his jomeney he foid fume days at Straburg, where it is fail he applichtua very grat painter for work, who took him in, and ordered him to give a fpecimen of his keill. On which Holbein finilhed a piece with great care, and paimud a lly on the molt eminent part of it ; after which he privately withdrew in the abfence of his mater, and purfued his journcy, without faying any thing tua byoly. When the painter returned home, he was atlonithed at the beanty and elegance of the drawing; and efpccially at the fly, whith he at fift took for a real one, and endeavoured to remove it with hishand. Hle now fent all over the city for his jurneyman; but after many inquiries, difeovered that he had been thus deceived by the fanous Holbein --Hobrin baving in a namer begged his way to Eugland, prefented a better of recommendation from Erafmus to Sir Thomas More, and alfo thowed him Erafmen's pitiure. Sir Thomas, who was then lord chancellor, reetived him with all the joy imaginable, and kept him in his houfe between two and three yeurs; in which tine he deew Sir Thomas's pieture, and thofe of many of his relations and friends. Hobein one day happening to mention a nobleman who hors fome years before invited him to Englam, Sir Thomas was wery fulcitons $t$, know who it was. Ifolbein frid that he had forgot his title, but rememberel his face fo well, that he believed he could draw his likenefs; which he did fo perfectly, that the nobleman it is faid was immediately known by it. The dancellor having now aforned his apartments with the productions of this great painter, refolved to introduce hintollenry Vllf. For this parpofe, he invited that prince to an entertainnent; having. before he came, hung up all Hollein's picces in the great hall, in the bet ander, and placed in the bett light. The king, on his fint entrance into this room, was fo channed with the fight, that he afked whether fuch an artith was now alive, and t., be had for money? Upon this, Sir Thamas prefonted Holbein to his majetly; wha inmediately touk him inte his fervice, and hrought them into great cllem with the mobility and genter, thy which means lee detw a vaft number of pontidit. But while he was here there happened an affir whech might have prosed fatal to him, had he not been proweded by the hing. On the report of this painter's eharacter, a lurd of the firll gandity came to fie him
when he was drawing a figure after the life. Hullecin fert, to defire his lord!hip to defer the honour of his vifit to another day; which the nobleman takng for an affront, broke open the door, and very rudely went up itairs. Holbein hearing a noife, came ond of his chamber; and meeting the lord at his door, fell into a viohut palfon, and puthed him backwads from the tup of the fairs to the botton. However, imnediately reflecting on what he had done, he efoaped from the tmmolt he had raifed, and made the bett of his way to the king. The mobleman, much hurt, thengh not fo much as he pretended, was there foom after him; and upon opening his griewace, the king ordered Hobbein to aft his pardon. P.at this only irritased the nobleman the more, who would not be fatisited with lefor than his life; upon which the king Aternly erelied, "My lond, you have not now to do with Holbein, but with me: whatever pumilhmen: you may contrive by way of revenge againt him, flall certainly be inflicted on yourflf. Remember, pray, my loms, that I can whenever 1 pleafe make feven fords of feven plughmen, but I cannot make one Holbein of even teven lords." Holbcin died of the plages at his lodgeings at Whitchall in $155+$. "It is amazing (fays De Piles), that a man boin in Switzerland, and who had never been in Italy, thould have fagood a criflo, and fo fine a genius for painting." He painted alike in every manntr; in frefo, in water-colours, in oil, and in miniatuse. His genius was fufficiently fnown in the hitorical Ayle, by two celehrated compofitions which he pained in the hall of the Stillyad company. He was alio eninem for a ich vein of invention, whicis he hoved in a multitude of defirns which he drew for engravers, fatharies, jewellers, sec. and he had this tingularity, that lie pamed with his lefi hand.

HOLCUS, Indan malet or corn: A genus of the monocia order, helonging to the pelygamia chafs of plants; and in the natural mothod ranking noder the th order, Granins. The cabs of the homaphrodite is an anilorons of bifloous glune; the corolla is a glume whith an awn; there are three tamina, two Alylea, and one feed. The male calys is a bivaived glume; there is no corolla, but thece itamina.

Sjecties. Of this genus there are 13 fpreies, two of which are natives of Bitain. The motl remarkable of the fe is the lanatus, or cecepines foft-gradiof Hal.on; for the defeription and properties of which fee AgricurTUKF, $\mathrm{n}^{\circ} 59$. The most remarkable of the foreign fpecies is the forshum, or Guinea-corn. 'i'he falks are lurge, compact, and full eight leet high. In Senegal the fichls are cotirely eovered with it. The negroes, who call it gisamol, cover the eats when ripe with its own leaves to helter it from the farrows, which are very mifhicuos in that country. "lhe graia male into bead, or whermife ufed, is celetmed very wholefome. With this the flaves in the Weat Indies are ceneral!y fed, cach being allowed from a pint to a quart creiy day. The juice of the thalks is fo ayreeably lutcious, that, if prepared as the fugarcanes, they wuld affuld an excellent figar. "lae negroes on the corate of Ganea make of two kinds of millet a thick grained pup caliced confous, which is their cumm on frod.

HOLD, the whate interice cavity or belly of a thig, or all that part of her infiee which is comprehended

## $\mathrm{H} O \mathrm{~L} \quad\left[\begin{array}{lll}6 \mathrm{r}\end{array}\right] \quad \mathrm{H} O \quad$.

folder hended between the floor and the lower-deck through. out her whole length. - This capacious apartment ufually contains the ballatt, provilions, and ftores of a thip of war, and the principal part of the cargo in a mer. chantman. The difpotition of thefe articles with regard to each other, naturally falls under conlideration in the article Stowage; it fuffices in this place to fay, that the places where the ballan, water, provilions, and liquors are ftowed, are known by the general name of the bold. The feveral flore-rooms are feparated from each other by lull-beals, and are denaminated according to the articles which they contain, the fail-room, the bread-rocm, the ffß-room, the fpiritroom, \&c.

HOLDER (William), a learned and philofophi. cal Englihman, was born in Nottinghamthire, educated in Pembroke-hall Cambridge, and in 1642 became rector of Blechingdon of Oxford. In 1650 he procceded D. D. was afterwards canon of Ely, fellow of the Royal Society, canon of St I'dul's, fub-dean of the royal chapel, and fub-almoner to bis majelty. He was a very accomplifhed perfon, and withal a great virtuofo: and he wonderfully dillinguifhed himfelf, by making a young gentleman of ditinction who was born deaf and dumb to fptak. This gentleman's name was Alexander Pophan, ion of colonel Edward Poplam, who was fume sime an admiral in the fervice of the long parliament. The cure was performed by him in his houfe at Blechingdon in 1659 ; but Popham lofing what he had been tauglat by Holder after he was called home to his friends, was fent to Dr Wallis, who brought him to his fpeech again. Holder publithed a book, intitled " the Elements of Speech; an eflay of inquiry intu the natural Production of Letters: with an appendix concerning perfons that are deaf and dumb, $1662, " 8$ ro. In the appendix he relates how foon, and by what methods, ic brought Popham to Speak. Ln 1678 , he publifhed in 4 to "a Supplement to the Philofophical Tranfactions of July 1670 , with fome reflections on Dr Wallis's letter there inferted." This was written to claim the glory of having taught Popham to fpeak, which Wallis in the faid letter hat claimed to himfelf; upon which the Doctor foon af. ter publifhed " a Defence of the Royal Socicty, and the Philofuphical Tranfactions, particularly thofe of July 16,0 . in anfwer to the Cavils of Dr William Holder, 1678,2 qto. Hulder was tkilled in the theory and practice of mufic, and wrote " a Treatife of the natural Grounds and Principles of Harmory, 1694 ," 8vo. He wrote alfo "a Difcourfe concerning "l'ime, with Application of the natural Day, lunar Month, and folar Year, \&ec. $1004, " 8$ ro. He dicd at Amen Corner in London, January 24. Kg6.7, and was buried in St Paul's.

HOLDERNESS, a peninfula in the eaf-riding of Yorkfhite, having the German fea on the eaft, and the Humber on the furth. It had the title of an earldom, now extinct.

HOLDSWORTH (Edward). a very polite and elegant feholar, was born about 1688 , and trained at Winchefter fehvol. He was thence clected demy of Magdalen college, Oxford, in July $\%$; ; took the diegree of M. A. in April 71 I ; became a college.tutor, and had many pupils. In 1715 , when he was to be chofen
into a fellowhip, he refigned his demy hip and left the fioleraces. collcge, becaufe unwilling to fevear allegiance to the new government. The remainder of his life was fpent in travelling with young noblemen and gentlemen as tutor: in $17+1$ and $174+$ he was at Rome in this capacity. He died of a fever at Lord Digby's houfe at Colefhill in Warwickthire, 1)ecember 30.1747. He was the anthor of the "Muscipula," a poem, efteemed a mafter-piece in its kind, and of which there is a good Englifh tranllation by Dr John Hoadly, in vol. 5. of Dodfley's Mifcellanies. He was the author alfo of a differtation, intituled "Pharfaiia and Philippi ; or the two Philippi in Virgil's Georgies attempted to be explained and reconciled to Hintory, 17f1"" fto: $^{10}$ and of "Remarks and Differtations oa Virgil ; with fome ocher claffical Obfervations. puislifhed with foveral notes and additional remarks by Mr Spence, 1768 ,'" fto. Mr Spence Speaks of him in Polymeris, as one who undertood Virgil in a mure maiterly manner than any perfon he ever knew.

HOLERACEAE, (from kolus, " pot-herbs)"; the name of the $t 2$ th order in Linneus's fragments of a natural method, confiking of plants which are ufed for the table, and enter into the economy of dunsellic affairs. See Вотany, p. 459.
holibul', in ichthyology. See Pleurunectes.
HOLIDAY (Dr Barten), a learned divine and poet, was the fun of a taylor in Oxford, and born there about the year 1593. He ftadied at Chritchurch college, and in 1615 took orders. He was before admired for his fill in puetry and oratory; and now diftinguifhing himfli by his eloquence and pupu. larity as a preacher, he had two benefices conferred on him in the diocefe of Oxford. In 1618 , he went as chaplain to Sir Francis Stewart, when he accompa. nied Count Crondamore to Spain. Afterwalds he became chaplain to the king, and before the year :1626 was promoted to the archdeaconry of Oxford. In $164^{2}$ he was made doctor of disinity at Oxford; near which place he thettered himfelf during the time of the rebellion; but afeer the rettoration returned to his arch. deaconry, where he died in 1661. His works are, 1. Twenty fermons, publifhed at different times. 2. Philofopbix polito barbure jpecimer. quarto. 3. Sur* vey of the world, a poem in ten books, octavo. 4. A trandation of the fatires of Juvenal and Perius. 5. Technogamia, or the marriage of thie dats, a comedy.

HOLINESS, or sanctity ; a quality shich confitutes or denominates a perfon or thins bory; i. e. pure, or exempt from fin. The worl is atio uled in refpect of perfons and things that are faced, i. e. fet apart to the fervice of God, and the utes uf religion.

Holvess, is alfo a title or quality attributed to the pope; as that of majyly is to kings. Evenkings, when writing to the pope, adderfa him under the venerable appellation of rour Holimefs, or Holy Fother; in L.t. cin, Sanailfor or Beatifime I'aler. Anciently the fame title was given t.) all bihoos. The Greek empernrs allo were addrefled under the title of Holinefs, in regard of their being anointed with holy rit at their coronation. De Cange adds, that fome of the kings of Eggland have liad the lame attribute; and

4 G 2 that
$\underbrace{\text { Holiners. }}$

Holinfled that the orientals have frequently refufed it to the pope.
HOLINSHED (Raphact), an Englifh hillorian famons for the cheroniches under his name, was defernded from a fundy that lived at Bobly in Chethire; but nether the time of his birth, nor fareely any circumthatees at his life, are known. However, he appears whave heen a man of conted rable learning, and to have had a genius patioulaby adapted foo hithory.
 firll publ that at Lombsu int $\sqrt{2}$, in 2 vols fotion; and
 rall theets in the 24 and 34 volo were call rated for containing fome pablate ditagrecable of quect Eilizabeth and her miniters: but the callations have fance been printes apart. Holinthed waw not the tole compiler of this wonk, being affited in it by fereral other hands. The time of his death is unknown ; but from his with, which is prefixed to Heame's edtion of Cismbien's slum ats, it appears to have happened between $15-8$ and $15: 2$.

HOLLAND (Plikmond), M. D. commonly called the 'hamflater gencral of his age, was educated in the univerfty of Cambridge. He was for many years a fehoomaler at Coventry, where he alio pratifed phylic. He tran?ated Lisy, Piny's Natural Hitory 1'march's Morals, Suet mias, Ammianu, Marcellinas, Nen phon's Cyropedia, and Cambden's Britamia, in. to Engian: and the geographical part of Speed's 'lheatre of Great Britain into Latin The Britanna, to which he made many ufful ad Jitions, was the molt valuable of his works. It is furprimng, that a nan of two profetions could lind time to tranlate fo mueh; but it appears from the date of the Cyropredia, that he continned to thanlat, till he was 80 years of age. He died in 1636 , aged 85 . He made the following epigram upon writing a large folio with a fagle pen:

$$
\begin{aligned}
& \text { With me fole pen I wrote this book, } \\
& \text { Mase ofe grey porequil; } \\
& \text { Apsen wis when it trak, } \\
& \text { Antajan leavert flit. }
\end{aligned}
$$

HOLLAND, the largell of the feven United Provinces, divided into South and North Holland, the latter of which is atfo called $W^{T}$ ef Fricfland, is bounded on the wetl by the German ocean, or north fea; to the caft by the Zuyder-fee, the province of Utrecht, and part of Gelderland; to the fouth by Dutch Brabant and Zealand; and to the north by the Zuyderfee. Its greareft extent from north to fonth, including the illand of T'txel, is about yo Englifh milts; but from eaft to weth its extent varies from 40 to 25 . To defend it againtt the fea, dykes have been erected at an immenfe cxpenee, and innumerable canals cut to dain it, as being naturally very low and marhy. Some parts of the province are very fruitful in corra; but the greater parts comfitt of rich pallures, wherein are kept large herds of kine, which lupply the on with incredible quantities of butter and cheste. Of the latter, that of Edam, in North Holland, is highly etteemed. The many rivers and canals that interfect the province are of great advatuge to it commeree, but eontribute to render the air foggy and unwholefome. There is a communication by water betwixt almott every town and
$612] \quad \mathrm{H} \quad \mathrm{O} \quad \mathrm{L}$
village. Towards the middle alfo of the provinee are great numbers of turf pits. It is fo populons, that the number of the inhabitants is computed at $1,200,0,0$. In point of cleanlincfs no country turpafits, and few come up 10 it, efpecithly in Nenth Hollan!, and that even in the villages. From the counts of Holland this proviuee devolved, in $1+36$, to the dukes of Burgundy, and from them to the houfe of Aullria, along with the wher provinces. The States of Hullund and We f Friefland are compofed of the nobility and deputies of the town; of the latter there are, 8 that find deputies th the affemitly of the dater, which is held at the Hague. The grond pewhonary is a perfon of great digni $y$ and weight in this affembly, and his ollice requires extraodmary abilities. There are allo two councils compofed if deputies, one for South, and another for North Holland, who have the cogrizance of the revemue and miltary affuirs. The whole province fends one deputy from among the nobleffe to the thatesgeneral, who takes precedence of all othero, together with three or four more. There are two fupreme courts of julicature for Holland and Zealand; wis. the great council of Holland and Lealand, and the hof or court of Holland. To thefe appeals lie from the towns; hut the caufes of netbemen come before them in the finft inflanct. With refpet to the ecelefagitical rovernonent, there is a frood held annually both in isush and North Holland, of which the former contains eleven claffes, and the latter fix ; and the miniliters of boih together amount io 331 . In the whole province are 37 towns, 8 boroushs, and 400 villages. -For the hiliory, lee United Provinces.

Holland, one of the divifions of Lincolnthire in England. It fo much refembles the province of that name upor the continent, in mofl refpects, being low and marliny, with the fea on one fide, and canals running through it, that it mull either have had its name from thence, or on the fame aecomt. On the calt it has what the ancient geograplers call $A E /$ luarium $A M e$ taris, now the Wafles, which are overflowed at high water, and part of Cambridgcthire on the fouth. The lower part of it is full of bogz and marfhes, and has huge banks to defend it againtl the fea and land floods. The ground is fo ioft, that horfes are worked unthod; and it produces plenty of grafs, but little corn. The whole trats feems to have been gained from the fea; and is divided into Upper and Lower, the latter of which was unpaffable ; but fince the fens have been drained, the lands are grown more folid, and the inhabitants fuw cole-feed upon them to their great profit. Though there are no flones to be found in or upon the ground, yet moft of the churches are of flone. They lave no frefh water but from the clouds, which is preferved in pits: but if thefe are decp, it foon turns brackith; and if they are fallow, they foon become dry.

Nizu Holusnd, the largelt illand in the world, reaching from 10 to 44 deg . S. Lat. and between 110 and 154 of E. long. from London. It received its name from having been chiefly explored by Dutch navigators. The land firit difeovered in thofe parts was called Ecndragh (Concord) Land, from the name of the fhip on buard which the difeovery was made, in $1016 ; 24$ deg. and 25 deg. fouth. In 1618, another part of this coalt, nearly in 15 deg . fouth, was
difcovered

## H O L

Hol difcovered by Zeachen, who gave it the name of Arn. beim and Diemen; though a different part from what afterwards received the name of Diemen's Land from Tafman, which is the fou hern extremity, in latitude 43 deg. In 1619 , Jan Van Edels geve his name to a fouthern part of New Hulland. Anotiner part, fituated between 30 and 33 deg. received the name of Lecuwen. Peter Van Nilisz gave his name, in 627, to a coall which commuticates to Leruwen's Land towards the wetward; and a part of the weflern coal, near the tropig of Capricorn, bore the mame of De Wits. In 162 S , Puter Carpener, a Durchman, difcovered the great gutph of Carpentaria, between 10 and 20 deg. fouth. In 1687, 1)ampier, an Englthman, failed from Timor, and coalled the weftern pants of New-Holland. In 1699. he left England, with a defign to explore this counsry, as the Dutch fupprefled whatewer difeovenies had been made by them. He bale 1 alung the weftern coaft of it, from 2 sto 15 deg. He faw the land of Endraght and of De Wit. He then returned to Timor: from whence he went out again ; examined the ifles of laapua; coafked New-Gunca; difoovered the paffage that bears his name; called a great inland which forms this paflage or Atrait on the eatt fide, New Brituin; and failed back to Timor along New. Guinea. This is the fame Dampier who,-betwen 1683 and 1691 , failed round the world by changing his thips. Notwithflanding the attempis of all chefe navieators, however, the eallern part of this sadl tract was totally manown till Captain Cook made his late woyages ; and by tully exploring that part of the coalt, yave his country an undoubted title to the polfefion of it; which accord. ingly has fince been tatien poffeffion of under the mane of Necu South Whas.

Eome have difputed whether the title of ifund ean be properly applied to a country of fuch valt extent, or whether it onght not rather to be denominated a continent; while others have replied, that though the
word inand, and others funilar to it, do indeed fignify a tract of land furrounded by fea. yet in the ufual neceptation it means only a land of moderate exicht furrounded in ihis mamer. Were it otherwife, ve might call the whole world an illand, as it is ev.e.y where furreunded by the fien : and in fact, bion? bins Perigetes applies this term to it, with the addi ion of the word immanfe, to dutinguith it from other manty. The beth rule, according to Mr Stockdale, for elser-
 and begin to be calied a continemt, is when it be', 10 1 fo the advantares of an imular lituation. The pirit and priacipal of thefe, is the being capsble of an anion under onc gomermment, and thence deriving a focurity from all extenal attacks excepsing thofe by fea: 'yut in cotureriss of great extent this is not ouly diticent, Lut impulfible. Io we contider, therefore, New Hulland a extending about a thoufand miles every way, we thal! find that its clain to be called a continent is undrubsed; its length from call so wetl being about 2400 Englith miles, and 2300 from north to finth.

This coalt was lirit exploned by Captain Conk in copain the year 1770; but his. ftay was tuo flote to examme conk's ano the nature of the country with the accurase whan he whe of would otherwife have done had he continued longer the co. in it. In general, it was found rather harrea than otherwife. Many brooks and fprons were fown along the eaftern coalt, but no river of any confquence. They found only two kinds of trees ulefur ay umber, the pine, and another which protuees a tort of gun. Tlay found three kindo of palm-trecs; bur few efoulent plants, though there are abundance of fuch as might gratify the curiolity of the botanill. A great variety of birds were met with, which have fince been partienlarly deferibed; but the number of quadrupe is bears but a very fimall prop, rtion to that of the other animals. The mont scmarkable infects feen at this time were the green ants (a), who build tharar nefts upon trees in a very tingular manner.
(a) Thefe litele animals form their habitations, by bending down the leaves of trees, and gluing the ends of them together fo as to form a pu:fe. Though thefe leaves are as broad as a man's land, they puffurm this feat by main trength, thoutands of them being on ployed in holding down the leaves, while niultitudes of others apply the glutinous mater. Captain Cunk's people afeertanad thenfelves that this was the eafe, by fometimes diturbing them at their wok; in whisl cafe the leaf always 〔prung up with an rlaticity which they could not have fuppofed that fuch minute infuets were capable of overcoming. For this curiofig, buwever, they fmanted pretty feverely; for thoufancs of thefe litte enemies intantly threw themfelves upon the aggrefors, and revenged themflers by their bites or Bings for the interruption they had met with. Thefe were little lefs painful at firtt than the lling of a bee; but the pain did not lafl above a minute. Ancther fpecies of ants burrow themfelves in the rovi of a plant which grows on the bark of trees like the nifletoe, and which is commonly as big as a large turnip. When this is che, it appears interfectod with innumerable winding pafiages all filled with thefe animals; notwithtanding which, the segetation of the plane fuffers no injury. Thefe do not give pain by their lings, but produce an intokrable itching by crawling about on the ikin. They are about the fize of the fmall red ant in this country. Another fort, which do not molet in any manner, refemble the white ants (fee Termes) of the Eall Indies. They contruct netts three or four times as big as a man's head on the branches of wees; the ourides being eompofed of tome vegetable matter along with a glatinous fubflance. On breaking the outer crulls of the le lives, innumerable cells appear fwayming with intabiants, in a great variety of winding ditestions, all communicating with each other, and with feveral other nefts upon the fame tree. They lase alfo another houfe buith on the ground, generally at the root of a tree; formed like an irregularly fided cone; fometinses more than lix fect high, and nearly as much in diameter. The outlide of thefe is of well.tempered clay about two inches thick; and within are the cells, which have no opening outward. One of thefe is their fummer and the other their winter dwelling, communicating with each other by a large avenue leading to the ground, and by a fubierraneous paflage. The ground ftructures are proof againft wet, which thufe on the branceses are noi.

## H O I

ivew Hul!an!

(i), 1i+..ih culon) in New Hu: ! य! !

This country has now become an objeen of more comedrence than formetly, by reafon of the calablifhment of a Britila colony in it; where the criminals con!combedite be tranfported are fent to pafs their time of fervitude. Beture this plan was selolved on by government, another had been difeufed, viz. that of employing thefe criminals in workhoufer; and Judge Black. Hlone, with Mr Eden and Mr Howard, had confidered of the bett method of putting it in execution: bui though this plan had been approved by parliameut as carly as 177\%, fome difficulties always oceurred, whici prevenud its going forwad; and at length, ma the ohit of ly.comber :-35, urders were illued by his matidy in comacil for making a fettement on New Hidsad, ettiblithing a court of judicature in the colsuy, and cther regulations necellary on the oocatum. The whole receival the complete fanction of legn farure in the beginning of the year 1787. The fegnamonapprinted for pulting the delyng in execution
 reateruns:, in the the of light, on the ithe of March $178-$. It comilted of the Sirims frigate Capian finin Ilunter, the Supply armed tender Lieute1uni H. L. Pall: firee thore hips, the Golden grove, limburn, and Burowdele for carrying provifuns and thores tor twoyears; and lathy, fix tratsports, the icarbomush and lady I'enrhy n from Portmouth, the Friendfhip and Charlote from Plymouth, and the Prince of Wales and Alesander from Woohwich. Thefe were to carry the convicts, with a detachment of marines in cach phoportioned to the nature of the fervice; the largell where refillance was moth expected, riz. in thife which carricd the geatett number of male conrifts. (In the arrival of Governor Phillip at the Aatim, he hoited his thy on board the Sir us as commodore of the fquatron; and the embarkation being completed, he gave the lignalto weigh anchor on the 13th of Ming at day-break. The number of convicts was -7 , of whom 558 were men. They touched at the ifland of Tenerife on the 3 d of June, withous meesin 5 with any bad accident. Here they flaid a week, ia urder to procure fuch refrefhenents as were neceflary for proentieg the diforders molly to be deaded in fuch a harg and perilous wyage. In this they fucceeded to theer wih: and wele about to depart on the gth of June, when it was difenvere? that oue of the convieta had made has cifape, haviug iound mean on cut away a tous and matee ofll with it. Itcofered himfle as a foitonatoard a bath vellel at that thase in the harbone bat was refured; on which is atemped to conwal harefelt in a cove. In thin he would probaliy have fucceced, had it not been for the boat which the could nu): cunteral ; fo that he was fond difoovered and brought tack to the faip, where, however, he ubained his paidoan from the governor.
O) the wibl of june the geet fet fail from Santa Craz in the ifland of Tenerife, and on the a sth came in whe of the Cape Vierl illands, where they feered fir Se Jaso: but the want of a favourable wind and other ciocumances presented their getting in; fo that as Coverator Ihillp did not chufe to walle time, they cid nut touch land till they came to Rio Janeiro on the coul of Dianil. It may feem furprifing, that a voyage to the callward, which of iefolf may be accounted of fonciant longth, flowit the be wilfully mave fo muct
longer, by lailing twice aerofs the Atlantic. The New calins. however, to freguent on the coall of Africa, feem of themederes to be a futficiene inducement for navigators to preferve a welterly courfe; and even the iflauds at which it is fo neceffary to touch, are not far ditant from the Ainerican coalt. 'The returning tracks of Cap:aia Cook's three voyages are all withiu a little Pace of the 4 , th degree of well longitude, which is even 10 degrees farther welt than Cape St Roque: and that courfe appears to have been taken voluntarily, withont any extraordinary inducement.

Daring the time of their thay at Santa Cruz the weather had been very moderate; the barometer about 30 inches, and the thermometer never above 72 ; as they appoached the Cape Verd illauds it rofe to 82 , and dicl not exceed $82^{\prime} 51^{\prime}$ all the way fron thence to Ris Janciro. Here they met with a vory favourable reception, contrary to that which Captain Cook experienced on a limilar occation. Provilions were fo cheap, that though the allowance of mear was fixed by the governor at 20 ounces per day, the men were victualled completely at 3 de each, including rice, vegetables, and every other neceflary. Wine was not at this time to be ladexcept at an advanced price: but rum was laid in, and fuch feeds and plants procured as were thought mot likely to flourith in New South Wales: particularly coffer, indigo, cotton, and the cochineal tig. An hundred facks of caffada were likewife purclated as a fubditute for bread, if it thould happpen to be fearce. By the kindnefs of the viceroy alfo, fome deficuencies in the military llores were made up from the royal arfenal, and every affitance given which the place conld afford. They arrived here on the 5 th of Augut 1787 , and fet fail on the th of September, receiving as the latt compliment from the governor a falute of 28 guns.

From Rio de Jancir, the flect had a fine run to Table Bay, in the fuothern extremity of Africa, which they accomplifhed in 3y days; where they took in the refrefhenents meant to fupply them during the remainder of the voyage. Here they arrived on the $13^{\text {th }}$ of October; and having fupplied themfelves with a great number of lise tluck. they fet fail on the 12 th of Novernber, but were 100 g impeded by contrary winds from the foutheall. On the 2 ; th they were only 80 leagus diftant from the Cape, when Governor Phillip left the Sirits and went abuard the Supply tender; in hopes, by leaving the convoy, to gain fufficient time for examining the conatry round Botany Bay, that the molt proper fituation for the now colony mizht be chofen bifure the tranfoorts thould arrive. They now met whit favourable winds, blowing generally in very trong gules from the northwett, weit, and fouthwett. The wind thifted only once to the ealt, but did not continue in that direation above a few hours. On the 3 d of January $1-85$ the Supply came within fight of New South Wales; but the wiuds then became variable, and a current, which at times fet very Atrongly to the funth ward, impeded her courfe fo much, thas it was not till the sth of the month that the arrived at botany bay.

Governor Phillip no fooner landed than he had an Inte opportunity of convering with the natives, who were wiel a Fembled on more. As it was the intention of this nati gentleman to conciliate if pufible their friendhip, he uied every method at this firl interview to infpire them with a favourathe idea of the Europeans. For this pur-

## H O L

pofe he prefented them with beads and other triling ornaments, which they feemed pleafed to wear, though Captain Cook found them very indifferent about any kind of fincry he conld furnilh them with. They feemed, according to the aecount of that celebrated navigator, to be fo attached to their own ornaments, that they made no accomat of any thing elie. They recci$\mathbf{v}$ GJindeed fuch things as were given them, bat made no offer to return any thing in exchanze: nor could they be made to comptehend that any thing of the kind was wanted. Maty of the grofers which they bat received were found afterwards thrown away in the woods
Gowernor Phillip havigg pasted with his new acquantance in a friencly manuer, neve iet about an examination of the eventry alout Botany Bdy, which lad been flongly recommended by Captain Cook as the moft eligible place for a fettement He found, however, that the bay ifent was very incomenient for fhipping ; being expufed to the calterly winds, and for hallow that hips cien of a moderate birden could not get far enough wibhin land to be meitered fiom the fury of the ocean. Neither did the land about any part of this bay appear an cligithe lituation for a colony; being in fome places entirefy fwamp, in others quite delfitute of water. Point Sutherland feemed to afford the fituation moll free from oljgetions, but the flips could not approach it: and even here the ground leemed to be univerfaliy canap and founes : fustat, on the whole, finding no glace wethin the compals of the bay proper for the new :enkenert, they fund themfelves obliged i) remove fomewhere clfe.

The relt of the fleet arrived in two days after the Supply; and that no time might be lot, Govertior Phillip ordered the ground about Puint Sutherland to lee cleared, and preparations to be made for landing, white he went with leveral officers in :hared boats to exa mine Port Jickion, which was only three leagues diflant. Here they had the fatisfaction to hind one of the finelt barbours in the world, where iceo fail of the line might ride in perfect fafety. On examining the different coves, one was pieferred which had a tine run of lpring water, and where hips could anchor to clofe to the thore that at a very imall expence quays might be conltructed for loading and unloating the largat veflels. This was named by the governer Syiney Ciov, in honour of Lord Sydney, and the country atound it deftined for the place of fettlement. Is is about half a mile long, and a quarter of a mile broad ai the entrance. On the governor's rtiurn to Botany Bay, the reports made to him concerning the adjacent country were fo excecdingly unfavourable, that creders were immediately given for the remeval of the flect to Port Jackfon. On the morning of the 2 ath, therefore. the governor failed from Botany Bay, and was foon fol lowed by the whole fleet. In the mean time, they were furprifed by the appearance of iwo other Eurofean veficls, which had been irft feen (af Butany bey on the 2 th. Thefe were found to be two frencia Thips, named the Sfirolole and Buelfla, which had left France co a worage of dicovisy under the com. mand of M. Ia Peyroufe, in the year 1785. 'Ihey had touched at the inind of Sarta Catharina on the coait of Brafil, and from theme gove by the exicemity of Sourh America into the Pucific Octean, where they had
$615] \quad \mathrm{H} \quad \mathrm{O}$ L
run along by the coafts of Chili and California; afier vew ind. which they bad vifited Eafter Inand, Nooka Suunul, Conk's river, Kamtfchatka, Manilla, the IMes des Navigateurb, Sandwich, and the Friendly l!les. I'h.y had alfo attempied to lind on Norfolk Inond, but found it impolible on account of the furd D. rimg the whote voyage nouse were lof by ficknefs; but two boats crews had unfortunately peribed in a furs cuthe northwent coait of America; and at iIafuna, one of the If.s k's Navigaleurs, Mi. L'Angle, captain of the Asthuiabe, with 12 of his people, uficers a:d men, were murdered by the faragis. 'This was the more farprigng, as there lad been an minterrupted friendhip with them from the time the Frerch tonched at the illud, till that unformate moment M. L'Angle hal grone athese with twu long boas fur the purpofe us filling fome water-cafts. His party amnunted to is nem; and the natives, from whom the French had al. ready received abundance of refreflhments, did not fhon any figns of an huftle difoficion: But from whaterer motise their refentment was excited, the men had no fooner begun to get ont the boats, than the favages made a moft furious and unexpected affaule with themes. In this enconnter M. I.Angle himfelf, wi:h the perple above mentioned, fell a facrifice to the treachery of thefe barbarians. The romainder of the party efcaped with great difficulty ; the hips having at that time paffed a point of land which intercepted their view of the alfray.

The convicts and others deltined to remain in New Sunth Wales being landed, no time was lult in beginning to clear ground for an encampinent, ftorebonfes, \&c: The work, however, went on but llowly, fartly owing to the natural difficulties they bad to encounter, and partly owing to the habitual indolence of the convicts, which indeed was naturally to be expected confilering their former way of hile. Neverthelefs, by the cnd of the fint week of February, the plan of an encampment was formed, and places wefe marked out for dif. frrent purpofes, fo that the colony already b-gan to affume fome appearance of order and regularity. "The roatcrials and frame-worh of a dight tempordry habitation for the governor had been brought out from England ready formed, which were kended and put sogether with as much expedtion as cireumtances would allow. H, pitai ienta were alfo erectel; and the fratefowhin foun took flace flowed the propricty of fir daing. In the paffa efrom the Cape there had bien bus little fickneis, ant icw of the comvicts hace died; but a little time after they landed a dyfenterg began to prevail, which proved faral in feveral inllances, and the fenryy began so mexe with great violence, for that the hofpitaletents were foon fitied with patiens "the difurder proved the nome virulent as frefh provifions could but rarely be obeainsed: now were eteulent reqtiables often obsainend in duch plenty as coald prosuce ans material allevia. tion of the complaint : the only remety for the dyfentery was Found to be a kind of red gut, protuced in plenty by the tuees growing upon this coalt. The yedliw gum las the fame propertues, though in an inferour degree.

In the beginning of Fibraary, a mold vielent form of thander and lizhtning detiroged tive of the the po which had a med ercied for them bender a tree, which proved a preluce to other inisiontmies anwoy the ruthe. The encampment, however, was carried uis wioh gred:

## II

and every thing begut to wear a promifing apparance. On the 7 th of the month a regular form of govern. ment was ettablifhed in the colving, wh all the fotem. nity which could pethibly be given: the gove rnor made a proper fpeech to the combects, reminding them of the frtuation in which they toon? a a d hat mow of they comtinued the ir former practices, it was imp, llible they could hope for mercy it detected: nieither could they expect to efcape dituctum in to fimall a fociety. Of fenders, theteiore, he faid, would certainty be punimed with the utrontt ingur ; though fuch as behaved themfetves in a proper namer, might always depend tepon encourapement. He particulaly noticed the illegal internurfe betwixt the fexes, as a pradtice which encouraged puofigacy in crery relpect; tor which reafon he recomanended marriage: athe this exhortation feemed not to be abto ether in wain, as 14 marriages were celebrated that very week in confequence.

Heavy rans took place during the remainder of this month, which inved the needfity of going on with the work as foon as poffible. The want of carpenters, however, prevented this from being done fo expednti. oufly as could have been wifhed. Only 16 of thefe could be hired from all the flips; and no more than 12 of the convicts were of this profelfion, of whom Several were fick; fo that the party were by far too few for the work they had to perfurin. An hundred convicts were alded as labourers; but with every effort it was found inpoffible to complete either the barracks or the huts for the officers as foon as could be wifhed. On the ifth of Fetruary a fmall party was fent out to fette on Norfoik ifland, who bave fince eftablifhed a coluny there which promifes to be of conliderable utility $t$. It was from found, however, abfolutely neeeffary to make examples of fome of the convicts at Port Jack fon. Towards the end of F bruary it was found necef. fary to convene a criminal court, in which fix of the convicts received fentence of death. One who was the head of the gang way executed be fame day; one of the reft was pardoned; the other four were reprieved, and afterwards exiled to a fmall illand within the bay, where they were kept on bread and water. They had frequently robbed both the tures and other convies. The fellow who was exechted, and two nhers, had been detected in fealing the very day on which they received a weck's provifion; and at the lame time that their allowance was the fame as that of the foldicrs, firituous liquors only exeepted.

In the begrinaing of March the govemor went out witha fmall party to examine Broken Bay, Dying abrout eight miles to the morthward of Put Jeckis.t. This was found very extenfive, with many openinge. the of the latere ended in 'everal fmall branches, and a layge lagron, which they cond not at that time examine. Nult of the land about the upper part of this branch wes low and full of fwamps, with great numbers of pelicans, and other aquatic birds. Among the rett they met with an unconmon bird called at that time the Hoodd Gull but afurwards found to be the feecies saimed by Mr Latham the Cafpiun Terre.

From this burthwell branch they proceeded acrofs the bay to the fouthwelt branch, which is alfo very extenfive, with a fecend aperage to the wellward ca pable f affording nelter to almoll any number of $\mathrm{N}^{\circ}{ }_{5} 56$.
thipz, with depth of water for veffels of almot any bunden. The lamd was found much higher here than at Put Jackfon, more rucky, and equally envered with timber. Latge trees were feen growing even on the fummits of the mountains, which appeared totally inaccefible to the homan fpectes. Round the headiand whech forms the fouthern entrance iuto the bay is a third branch, which governor Plillip thought the finelt piece of water he had ever feen; which for that reafon he honoured with the name of Pifavate. This branch, as well as the former, is fufficient to contain all the navy of Great Bitann; but the latter has a bar at the entrance of only 18 feet at low water. Within are from 7 to 15 fathoms. The land bere is more level than on the fouthwell branch, and fome fitrations are proper for cultivation. The governor determined to bave returned by land, in order to explore the country betwist Port Jackfun and Broken Bay, but the continual rains prevented lim.

On the wh of March the Fren:h nips departed. Deat little intercourfe having paffes bet veen them and the Reee Eu, filh during the time of wheir tay. While the former remained in Botany Bay, Fathor la Receveur, who bad come out in the Altrolabe as a naturalith, died of the wound he had reccived in the battle with the inhabizants of Mafuna. A kind of monment was erected to his memory, with the fullowing infeription:

## Hic jacet Le Recerrur

## E. F. F. minimis Galli.e facerdos, Phy lieus in circumnavigatione Mundi

## Duce Dela Peyeouse,

Ob. 17 th, Feb. 1788.
This monument, however, was fiom after defroyed by the natives; on which Gevernor Phillip caufed the infeription to be engraved on enpper and wailed to a neighbouring trse. M. de la l'esronfe hai paid a limilar tribute to the memory of Captain Clerke at Kant fechatka.

On the $15^{\text {th }}$ of April. the governor, attended by Exer feveral (fficers and a imall party of matines, fet out on into an expedition into the interion parts of the conntry. natel Their firlt landeng was at the head of a fmall cove past named Shatl-cove, near the entrance of the harlour on the north fide. Pr ceeding in this direction, they arrived with great labour at a large lake furrounded on all fides with bog and mathy ground to a confiderable extent, and in which they frequently phanged up to the wail. Here they oblenved thac bird fo rare in other parts of the world, riz a black fwan. On being tired at, it wofe, and fhowed that its wings were edgen with white, the bill being tinged red. They fpent three days in a very laborious maner in pafing the mathes and fwamps which lie in the neightourboud of the harbour: and here they had an spportunity of oblerving, that all the fmall flreans which defiend into Port Jakfon proceed from fwamps, occafionel by the thagatation of the wator in the low grounds as it rifes from the forings. On caving thefe low ground, they found them hucceeded by a rocky and barren country; the hills covered with various Alswering. thrubs, thinghg frequently inaceefilte by reafon of various natural ob'lacles. At abont ; miles ditlance from the fea, the guvernori ha: a fine view of the internal parts of thic country, which were mountainnus.
w Hol- To the mof northerly clain of thefe he gave the name of Carmartion, and to the moll foutherly that of Lanjdown, Itills; and to one whicb lay between thefe he gave the name of Richmond Hill. It was conjectured, that a large river rruft rife from the fe mountains: but there was now a necufthy for seturning. On the 22 d , however, another expedition was undertaken. Governor Phillip with lis party landed near the head of the harbour. Here they found a gnod country; but in a fhor: time arrived at a clofe thicket through which They found it inpolfible to make their way, fo that they werc obliged to return. Next day, by keeping clofe to the banks of a fmaill creck, they made a llift to pafs that whflacle, and continued their courfe for three days to the weflward. The country was row extremely five, either entirely level or rining in fmall fills, the foil cxcellom, hut flony in a fow places. The trees grew at the diftance of from 20 to 40 feet from each other, in general totaily doffitute of underwood, Which was contined to the barren and Rony 'fpots. On the 5 thd day they fow fur the firft time in this fecond expedition Carmarthen and Lanfawn hith; Tut the country all round was fo beantiful, that Gosvernor Phillipgave it the name of bulle awe. They were fill appareutly 30 miles frem the mountains which they lad intenced on reach; fitt not having hernable to cam mache than $f x$ days provifons along wiht them, they ford it nectany to return; and corn with this frall llock the efficers as well as mom *were obliged to cany hearg leads. 1muing all this time they had not proceeded farther in a dient line Than 30 mile, fogreat were the ob? ractions they had met with from decp ravines, \&ic. 'Their retum, however, was effected whth much gitater caft, having cleared a track, and maked trees all the way as they went along to dirso them in their journey back. The country cxplored at this time appeated fofine, that Governor Phillip detenmined to form a fittlement there as foon as a fufficiett momber could be forated from thofe wonk which were imurediatly nectfiary. On Lis return he had the moritication to thed, that five ewes and a land had buth hillde very near the carip, and in the middie of the day. 'This mifchicf was - fuppofed to lave beco done by fome dogs leclonging to the natives.

All this time the fomery had cominned to rage with great violence; lo that ty the begiming of Niay near 200 people were incapable of wurk. For this cafon, and on account of the great difficulty of elearing the ground, no more than cight or ten acres of wheat and barley had beea fumb, be files what private incividuals had fown for them'ches; and it was even feared that this fnall crip would fuffer from the depredationsof ants and field-mice. Toprocure as much relis as poffitle therefore in the prefent arizence the Eupply was font in the begiming of May to Lord Howe land in bowes of procuring forme turtle and orther provifions; but unfortunately the veflil retumed withut any turtle, laving met with fqually weather, and being obliged to cut away her bell hower anchor. The natives now began to fhow an hofile difpofition whicb they had not hitherto done. One of the convites, who had wandercd away from the rett in qued of regetables, atumed with a very dangerous wound in the back; giving information alfo, that another who had gonic out for the Vor. Vlli. Paril.
fame purpore had becr carnied off in his fight by thic New Hol natives, after being wounded in the head. A hirt $\qquad$ and liat were afterwards found in fome of the buts of the natives, biat no intelligence of the man could be gained. This was followid by other misfortunes of the fame nature. On the 30 th of the month, two men who hat been employed in cutting rufues for thatels at fome ditiance from the camp were found daal. One of them had four fpears in bis body, one of which had pierced quite through it; but the other lad no marks of vinlence upon him. In this cafe, however, it was proved, that thofe who fuffered bad been the aystreifors; as they had been feen with one of the canoes of the natives which they had taken from one of the fithing p'aces. All porille inquity' was made after the natives who had been guilty of the murder, but to no purpofe. In the courfe of this inquiry, it was found that one of the natives had been nurdered, and feveral mounded, previons to the attack upon the rufh cutters. The rovernor promifed Ibcity to any conviet who fhould difcover the aggrefors; but no information was procurcd, though it is probathe that it may prevent accidents of that kind for the furne. About this time the two bulls and four cows belonging to govern. ment and to the governor, laving been liff for fome time by the man who had the claage of them, fhayed into the woods and could not be recovered, thengh they were afterwards tracod to fone didance.
'The 4 th of Junc being his majenty's birth day, was celdrated with as mach feflivity as circumblances woild allow; and on this occafion it was firl made putlic that the governor had given the name of Comberland Conn'y to this part of the tervitory. The apfuinted bomblaries were Carmathen and Lanfdown huths on the weft, the uorthern parts of Broken Bay on the north, and the fouthern parts of Butany Bay on the fouth; thus including thefe three prucipal Lays, with Sijdacy Cuve nearly in the centre.

The misfortunes which attuded thofe conviets who a convin Arayed to too great a diftance from $t^{1}$ e fertlement, esccuted. were not fulficient to prevent fone of them from ramWing into the woods, in liopes of futhining themfles there and regaining their liberty. One of thefe, who Iad been gulty of a roblery, Aod into the woods on the gth of Jone, blit was oblieced to return half harved on the zeth. He had found it invofithe to fulfint in the woods, and liad met with very little relief from the natives. One of them gave him a lifh, but made figns for him tugo away. According to his account, they themfelves wire in a vory miferable fituation; and he pretended to have feen four of them apparcnely dying of hunger, who made ligns to lim for tomenhing to cat. He protended alfo to tave fallon in with a party who would have therne him, and that tee mande his cicape from thim with difliculty. He fuid alfo, that he liad feen the remains of a human body lying nn a fire : and endeavourcd to inculedte the idea of the fe favages eating human fo th when oher frevifions were fearce. ithis poor wretch was tried and executed for the theft he had eemmitted before his depariurc, along with another crininal.

By this time the colony was fo fur atranced, that Regu's ${ }^{\text {I/ }}$ the plan of a regular town hall been marked out. The plan of a procipal Arect. when funihed, is to be 200 fect wide, towalaik terminated by the govenor's hocufe, the main guard, 4 H

## H O L

New Hol and criminal court. 'The plans of other fireets are likewife marked ont ; and it is the govenor's intuntion, that when houfes are built here, the grants of land fall be made with tode etandis as will prevent the building of more than wne hate on one allowent, which is to confit of 60 fiet in front and 150 in depth. Thas a kind of unioumity will be prefersed in the building, narrow Hects prevented, and many inconvenieaces aroided, which a rapid incrafe of in. habitants might otherwife uecafion. It has likewife been an object of the governor's attention to place the rublic buildings in fuch fieuations as will be cligible at all times, and particularly to give the ftorehoufes and hofpital fufficient fpace for future chlargement, fhould it be found necellary. The firtt huts ereated in this place were compofed only of the foft wood of the cabbage palm, in order to give imnediate fhelter, and which had the further noonvenience of being ufed guite grcen. The huts of the convits were conltucted only of upright polts ateled with flight twigs, and platered up with clay. Buildings of fone might cafily have been raifed, had thene becn any means of procuring lime for mortar. There were three kinds of ftone met with about Sydincy Cove, one cqual in gooduefs to Portland ftone, an indifferent kind of fand fone or firefone, and a fort which feems to contain iton; but nether chalk nor any fpecies of limeftone have yet been difeovered. Lime was indeed procured from oytter-fhells collected in the neighbouring coves to contruct a fmall houfe for the governer; but it cannot be expected that a fufficient quantity can thus be procured for many or very extenfive buildings. Good clay for bricks has been found near Sydney Cove, and wery good bricks have been made of it; the wood alfo, notwithfanding the many reports to the contrary, is found abundantly fit for various purpufes after being thoroughly feafoned. Such fpecimens as have been fent to England were fue-grained and free of knots, but heary.

On the point of land that forms the wefl fide of the Cove a frall obfervatory has been erected, the longi-
 eat from Greenwich, and the latitude $32^{\circ} 52^{\circ} 30^{\prime \prime}$ fouth. lutead of thatch they now make ufe of thingles made from a certain tree, which has the appearance of a fir, but produces wood like Englifh oak.

## Different

 accounts of the colony.With regard to the fate of this colony there have been various and difcordant accounts. Some of thefe have reprefented the comnery in fuch a light, that it would feem impoffible to fuhtilt on it; and it has been faid, that the prople who have lad the misfortune to fo thete already were in the ntmof danger of farving before any alflance could be fent from Iritaia. Thele reports, however, appeal not to be well feunded. Difficultics mull undoubtedly be felt at the firt fattement of every unintabited country; and we are not to expect that a colony, moth of whom are wretches ciited for ther crimes from their own countiy, can thrive in an estraordinary manner for fonse time. It appears, indece, that fo far from the tanfportation to this place having had any food effet in 2 eforming them, the grovernor has been obliged to excoute the utaget rigine of the law by hanging fevenal of then. A good run ber of othore have unaccountably difappeared, and are fappofed to have betn mordered by
the natives, or perimed with hunger in the woods; fo that, unlefs the numbers be recruited by more refpec table inhalitants, it is not likely that much can be expeeted irom the Port Jackfon fettlenent for a long time to come. Of this, havever, there fec.as to be little doubt: the general Spint of emigration which pruaiis throurla moll, indecd ine may fay all the countries of Curope, will uaduhbtedly fooal Cupply a fuffcient number; and even fome of the Americans, notwithftanding the extent and fertility of their own conner, and the libenty they enjoy in it, are faid to be willing to exchange the fe bleflags for the precarious hopes of what may be ebtained in New Holland among Britilh convicts and flaves. This rambling difpofition may perhaps be accounted for from an obfervation which has been made, six. that "it may adnit of a doubt whether many of the accominoda. tions of a civilized life be not more than counterbalanced by the artificial wants to which they give birth. That thefe accomriocations do no: give a fatisfaction equivalent to the trouble with which they are procured, is certain ; and it is to wonder, then, to find numbers of people in every country who are willing to ex. change them for independent eafe and tranquillity, which belong, comparatively fpeaking, to few individuals in thofe countries which are called civilized."

With regard to the geography of this extenfive country, which may perhaps be reckoned a fifth general divilion of the world, CaptainsCook and Furneaux fo fully explored its coafts, that fucceeding navigators have added nothing to their labours. The only part which \{ill remains unknown is that between the latitudes of $37^{\circ} 58^{\circ}$ and $39^{\circ}$ fouth; and as none of the fleet which lately failed from Bitain could be fuppofed to madertake any voyage of difocory, it is unknown whether or not a llrait interfects the continent in this place or not. Captain 'Tench, however, informs us, on the authority of a naval friend, "that when the fleet was of this part of the coaft, a ftrong fet-off flure was plainly felc."

A vall chain of lofy mountains run nearly in a nortla and fouth direction father than the eye can trace, about 60 miles inland. The reneral face of the country is pleafing, diverfified with gentle rifings and fmall winding valleys, covered for the moit pat with lange fpeading trees, affording a fucceffion of leaves in all feafons. A variety of flowering floubs, almoft all entirely new to an European, and of exquifite fragrance, abound in thofe places which are free from trees; and among thefe, a tall hrub, bearing an elegant flowst, which fmells like Englifh may, is peculiarly delightful, and perfumes the air to a great diHance. Thuse are but few trees; and, as Captain Tench and othars iclate, of fo bad a grain, that they canfearcely be ufed for any purpufe: This, however, Mr Stockdale afrribes to their being ufed in an unfeafoned fate, as has been already mentioned. In return for thefe Red an bad qualities, however, the trees yield valt quantities yellow. of the gum already mentioned as a cure for the dyfen. gumso tery. It is of an acrid quality, and therefore requires to be given along with opiates. The tree which yields it is of very confiderable lize, and grows to a grear height before it puts it any branches. The gum ittid is ufually conpare :o fingruis draconis, but differs from it in being perfectly foluble in water,

## 

*Hol which the fanguis draconis does not. It may be ex. tracted from the wool by tapping, or tasen out of the weins when dry. The leavea are narruw, and not unlike thofe of a willow; the wood fine grained and heavy, but warps to fuch a degree, when not proparly feafoned, as foon to beeome entirely ufedefs.

The yellow gum is properly a refin, being entirely infoluble in water. - it greatly refembles gambere, but has not the property of dainine. It is produced by a low foll plant with lon grafly leaves; bue the fructincation tho ts out in a furprifing manner fion the centre of the leaves on a lingle Atraight tlen to the heiglit of 12 or $1+$ fect this ftem is ttong and light, and is uned by the natives for making their fpears. The refin is generally dur up from the foil under the tree, not colleeted from it, aad may perhaps be the fame which ?'aman calls gum lue of the ground. It has been tried by Dr Biane phyfiem to St Thomas's herpital, who found it very efficacious in the cure of old fluxes, and that in many and obstinate cales. Many of the New Hulland plants have been already imported into Britain, and are now fourihing in perfection at the nuffery gardens of Mr Lee of Hammerfinith.

The foil immediately around Sydncy Cove is iandy, with here and there a fratum of clay; but hitherio the produce has not been remarkable. The principal cifficulty hitherto experienced in cleaning the ground arifes from the fize of the trees, which is laid to the fo enormous, that 12 men have been cmployed for live days in grubbing up onc. Captain Cuok fpeaks of fome fine meadows ahout Botiny Bay, but none of thefe lave been feen by the prefent fetters, and Go. vernor Pliallip fuppofes them to have been fwamps feen ai a diftance Grafs grows in almolt cvery place, but in the fwamps with the gratelt vigour and luxsrianey, though not of the finelt quality. It is found to agree better with cows and horfes than fheep. A few wild fruits are fometimes procured; among which is a kind of fmall purple apple mentioned by Captain Cuok; and a fruit which has the appearance of a grape, but tafting like a green goofeberry, and exceffively four.

From the firf difcovery of this continent, the ex. treme fearcity of freh water las been mentioned by every navigater. None have been fortunate enough to enter the mouth of any navigable river fuch as might be expected in a country of fueh extent. The fettlers about Port Jackion found enough for common purpofes of life; but Captain Tench informs us, that when he left the country, towards the end of 1788 , there had been no difcovery of a ftream large enough to turo a mill. Since that time, however, Governor Phillip has been mone fucceffful; as we are informed by a letter of his to Lord Sidney, of date Feb. 13. 1790: In this letter he relates, that foon after the fhips failed in November 1788 , he again made an excurfion to Botany Bay, where le thaid tive days; but the refearches the made there tended only to confrm him in the opinion he alrcady entertained that the country round it was by no means an cligible fituation for a colony. After having vifited Broken Bay feveral times with boats, a river was found, which has fince been traced, and all thofe branehes explored which afforded any depth of water. Theis river has
obtained the name of Hawhefoury, is from 300 to sos New folture wide and licons navigatle fur the lar yeit merchant hiph as far ap as Richtrond hill, at which it becontes $v=r y$ fhallow, and civide into two branches; on which account the gowernor cells Richmond Hiat the heat of the river. As after very fleavy rains, however, the water fumetimes rifes 3 ) feet aoove its level, it would not be fafe for thips to go up fo far; bat 15020 miles below it they would hie in feefh water, and be perfectly fafe.

The eountry about Broken Bay is at firth hiy', and rocky, but as we proceed up the river ic become, na re level, the banks being covcred with tim'ser, an! the foil a light rich mould, fuppofed to be very capinte of cultivation. The other branches of this river dee hatluw, but probably run many iniles up ino the countiy. Grat numbers of black fiwas and wild dack; were feen on thefe rivers, and the natives had fereed decors for catehing quail.

Richnond hill, near waich a fall prevented the bonta from proccediag farther up, is the most fonikerly of a large range of hills which run to the northward, and probably join the moundina nearly parallel to the conat from $; 0$ to 60 m:les inland. The full of this hill is good, and it lies well for cultivation. There is a very extentive profpect fron the top, the whole country around lecming a leval covered with timber. There is 2 hat of fix or feren miles betweea Richmond hill and a break in the nounains which leparates Lanfown and Carmarthen hills; in which flat the governor fuppoies that the Hawkebury continues its courfe; though the rives could not be fiea on account of the timbet with which the ground is every where coveted where the fivil is good. Six miles to the fonthward of Port Jack ion is a linall river; and 20 to the wellward is one mure confiderable, which probably enyeties itelf into the Hawkebury. As far as this river wis at that time explorad. the breadela was computed at from 300 to 400 feet. It was named the Nopaan, and, like the Hawkebary, fomeunes tifes $30^{\circ}$ fect above its level. A party who eroffed the river attempted to reach the mountains, but found it impulfible, probably for want of provilions. After the firte day's journcy they met with fuch a fucestion of deep ravines, the fides of which wete frequently fo inacee.fible, that in five days they could not proceed farther than 15 miles. As the tunc they turned back, they fuppoled themelves to be 12 miles from the foot of the mountains. With regard to the thate of the colony, it appears from this letter to be as flourifling as coald in any reafonable manner be expected. Another has been formed at a plase called Rofehill, at the ivead of the harbonr of Sydney Cove. At this place is a creck, which at half flood has water for large boats to go three niles up; and one mile lightar the water is freth and the foil good. $S$ ome ground having been cleared and cultivated. the governor in the above letter writes, that 27 aeres were fown with corn, and that in December the crop was gut io: That the corn was exeeedinghy goed; about 200 buthels of wheat and 60 of barley, with a finall quantity of hax, Iudian enrn, and oats; all which is preferved for feed: That if fetters are fent ont, and the eonvicts divided among! them, this fettlement will very thortly maintain itfelf; but without which this country cannot be cultuated to any adrantage.
$4 \mathrm{H}=$
prefeat

## H O I

Wew Hol- prefent (continues the governor) I have only one per- fun, who has about too convichs under his disetion, who is enployed in cultivating the ground for the pub. dic beaefit, and he hals retund the quantity of cora above meationed into the public fore: the officers hate not raifed fufficient to fupport the little stock they have: Someground I have had in coltavation will return abon to bulhels of wheat into ltore; fo that the produce of the labour of the a nivicts employed in cuitivation hass beed very thort of what might have been expected, and which ! take the liberty of poiating out to your lordhip in this place; to thow as fully as polfible the thate of this celony, and the needfity of the eunits being enpleyed by thofe who lave an interit in that ir labolir." The country for 20 miles to the wedt. wad is very copuble of cultuation; though the laboar - fouting down the irees is wery great. At Sydney Cove the flores had been intelled by a fwarm of rats which deAtroyed no lefs than $12,-001 \mathrm{l}$. weight of hour and rice. The gardens alfo had fulfered very confiterably; fo that, having met with fuxh a contiderable lofs of provifina, and a lificicint fupply not being procured from the Cape, governor Pliillip thought proper to fond a further ditachment to Norfolk Thand, where the fertility of the foil atfurdet great bepes of their being able in a hort time to fublilt inemfelves independent of any afiltance from the thores.

With regard to the civilettablifhnent i.s this colong, governor Phillip's jaridiction extends from $43^{3} 49^{\prime}$ t.) $30^{\circ} 3 \%$ fouth, being the nouthern and fuethern extremi- ties of the continest. It commences again in $135^{\circ} \mathrm{E}$. Lung. from Greenwich ; and pructedins in an eaflerly dircution, includes all the illands witain the above mentioned latitules in the Pactic octan; by which fartition it is fuppofed that every fource of litigation will be cet off, a all thefe are indifputably the difcovery of the S.:tifh navigators.

The powers of the governor are abfolutely unlimited, no mention being made of a council to affill him in any thing; and as no thated time is appointed for affernbling the courts fimilar to the affizes and gaol deliveries in England, the duration of imprifonment is altogether in his hands. He is likewife invetted with a power of fummoning general couts martial ; bet the infertion in the marine mutiny ar, of a foal. ler number of officers than 13 being at le to compofe fuch a tribunal, has been negleited; fo that a military court, fhonld detachments be made from head quarters, or fieknefs prevail, may not always be found practicable to be cbeained, unle fos the number of officous in the lettlenent at prefent be increatid. The Fevernor is allowed to grant pardons in all cafes, treafin and wilful murder excepted; and even in thefe he has authority to thay the executinn of the law until the king's Ifeafure thall be fignified. In cafe of the governor's death, the lieutenant governor takes his place 3 and on his deceafe, the authority is lodged in the ands of the femior offeer.

It was not long after the conviets were landed that there appeared a necothity for alfembling a criminal court; and it was accordingly convened by warrant from the governor. The members were the judge advocate, who prelided, three raval, and three marine afficers. The number of members is limited by act of parliament to feven; who are exprefily crdered to be
offecers either of his majefty's fea or land forces. The New H court being net, completely arrayed and armed as at a military tribunal, the judge advocate proceds to ac:minifer the ufual vatis taken by jurynea ia Eaglant to cach niember ; one of whom aterwards diveats him in a like inanner. 'This ceremony bemp over, the cinie is laid to the prifoner's change, and the quedion "guiley or not guily" put to him. No lave officer being appointed on the part of the crown, the party at whofe fuit he is tried is lefo to profecute the prifoner entirdy by limelf, All the witurfes are examinea on oath; and the decifion cau!! be given aecording to the laws of England, or "as nearly as may be, allowing for the cirsimilances and fitumion of the fettlemeat," by a majority of votes, beginning with the youngef member, and endiag with the prefident of the comrt. No verdict, however, can be given in cafes of a capital nature, undefs at learl tive of the feven members concur thertil. The evidence on both fides being tinilbed, and the prifoner's defence heard, the count is cleared, and, on the judgment being festhed, is thrown open again, and fentence proneunced. During the time of fitting, the place in which it is affenbled is directed to be furounded by a ginard under arms, and admiffion granted to every one who chafes to enter it. Of late, however, fays captain Tench, our colonitts are fuppufed to be in fuch a train of fubordination, as to make the prefence of fo large a military force unneceffary; and two ceatinels in aus. dition to the provoll martial are conflated as fuptio cient.

The firt trials which came hefore this court were Trials ${ }^{23}$ thofe of three convicts, one of whom was convieted convia of having ftrmek a marine with a couper's adze, and ${ }^{\text {sc. }}$. behaving otherwife in a mott fandalous and riviens manner. For this he was condemned to receive 150 lathes, being a fnaller punifhment than a fordier would have fuffered in a finilar cafe. A fecond, for having commited a petty theft, was fent to a finall bairen iffand, and kept there on bread and water only for a weck. The third was fenteaced to receive 50 lafhes; but being recommended by the court to the governor, had lis fentence remitted. 'The fame lenity, however, coull not be obferved in all cafes. One fellow, who hat been condenned to be hanged, was pardoned while the rope was about his neck, on condition thar he would become the common executioner ever after, He accepted the horrid ofice, but not without a payfes Some examples of feverity were undoubtedly neceflary: and among thefe it is impolfible to avoid feeling fons regret for the fate of one who fuficied death for ftealing a piece of loap of eisht pence value: but by the laft letter of governor Pliilip, we are informed that the convicts ia general are now behaving much better: more fo indeed than ever he expected. The latt flatement was of one woman who had fuffered for a robbery; five children laad died, and 28 been born. The whole amount of the deaths 77 , of the bith $8 \%$

The number of convits already fent to New Sout't Wales amounts to 2000 and upwards-above 1800 are finee embarked for that fettlement. The annual expence of the civil and military eftablifhents at that place is nearly L. 10,000.

Betides the criminal court, there is an inferior one compored of the judige adrocate, and one or mose

## H O L

Hon- juftices of the peace, for the trial of imall mifdemeanors. This court is likewife empowered to decide all law-fuits; and its verdict is final, except where the fun execeds L. 300, in which cale an ajpeal can be made to England from its decrec. In cafe of necoffity, an admialey court, of which the licutemant Governor is judge, may alfo be fummoned for the trial of offences conmitted on the high feas.

The quadrupeds on the continent of New Holland hitherto difonvered ase principally of the Opufum kind, of which the mott remarkable is the Kingaroo. There is allo a fpecies of dogs very different from thofe known in Europe. They are extremely fieree, and inever can be brought to the fame ciegree of familiarity with thofe we are acpuainted with. Some of them have been brought "A England, but thill retain their ufual feroeity. There are a great masy beautiful birds of various kinds; among which the principal are the black fwans already mentioned, and the ollrich or callowary; which lat arrives frequently at the height of feven feet or more. Several kinds of ferpents, large fpiders, and fcolopondras, have alio betn met with. 'There are likewife many curious fithes; though the finny tribe feem not to be fo plentiful on the coalt as to give any costiderable affitance in the way of provifions for the colony. Sonce very large tharks have been feen in Port Jackfon, and two fmaller (pecies, one named the Port Jack fon lhark, the other Watts's fhark. The latter, notwithllanding its diminutive fize, the mouth farce exceeding an ineh in breadth, is exceffively voracions. One of them having been taken and flung domn upon the deck, lay thete quiet for two hours; atter which Mr Watts's dog happening to pais by, the filh fpung upon it with all the ferocity imaginatle, and feized it by the leg in fuch a manner that the animal could not difengage himfelf without afliftance.

The climate of this continent appears not to be dif. agreetable, notwithllanding the violent complaints which fome have made about it. The heat has never been exceffive in fummer, nor is the cold ineolerable in win. ter. Sturms of thunder and lightining are fiequent; but thefe are common to dll warm countries ; and it has been fuppoied (though upon what foundation does not well appear) that were the country cleared of wood, and inhabited, thefe would in a great meafure cea?c. A thock of an earthquake has likewife been felt; but thefe natural calamities are incilent to fome of the finelt countries in the world. It is not known whether there are any volcanoes or not.
The inhabitants of New Holland are by all accounts reprefented as the moll miferable and favage race of mortals, perhaps, exitting on the face of the earth. They go entirely naked; and though pleafed at frit with fome ornaments which were given them, they foon threw them away as ufelefs. It does not appear, however, that they are infenfible of the bencfits of clothing, or of fome of the eonveniencies which their new neighbours are in poffefion of. Some of them, whom the colonifts partly eloched, feemed to be pleafed with the comfortable warmth they derived from it; and they all exprefs a great delire for the iron tools which they fee their neighbours make ufe of. Their colour, in the opinion of caprain Cook, is rather a deep chocolate than a full black; but the flch with which their \&ins
are covertd, prevents the true colour of them from ap. New Hospearing. At fonje of their interviews with the colonills, feveral droll inllances happened of their mitaking the negroes among the colonilts for their own coun. trymen. Notwithtanding their difregard for European furery, they are fond of adorning, or sather deturning, their hodies with fcars; fo that fome of them cus the moft hideons figure that can be imagined. The feats theinfelves have an uncommon appearance. Sometimes the fleth is rificd feveral inches from the flin, and appears as if filled with wind; and all thefe feem to be reckuned narks of honour amoug them. Sume of the: in perforate the cartilage of the nofe and thrum a large bune through it, an hideons kind of ornament lumoroully called ly the failors their Sprit-fuil yard. Their liair is generally fo much cloted with the red gum already inentioned, that they refemble a mop. They alfo paint themfelves with various colours like molt other favages: they will alfo fometimes ornanene themfelves with beado and thells, but make no ufe of the beanifilil feathers procurable from the birds of the country. Molt of the men want one of the fore teeth in the uiper jaw: a circumflance mentioned by Dampier and ctler navigtiors; and this allo appears to be a badge of honour among them. It is very common among the women to cut of the two lower joints of the litule finger ; whieh, confidering the clumbinef3 of the amputating infruments they poflefs, mult eertainly be a very painful operation. This was at firtt fuppofed to be peculiar to the married women, or thofe who had horne children, but fome of the oldeft wo. men were found without this ditinction, while it was obferved in others who were very young.

The New Hollanders appear extremely deficient in the ufefularts. Of the cultivation of the ground they have no notion; nor ean they even be prevailed upon to eat bread or dreffed meat. Hence they depend entirely for fubliftence on the fruits and roots they can gather, with the bifh thry eatch. Governor Phillip alfo mentions their frequent fetting fire to the grafs, in order to drive out the opoffums and other animals from their retreats; and we have already taken notice of their uling decoys for quails. As all thefe refourees, howerer, inult be at befl preearious, it is no wonder that they are frequently diftreffed for provifions. Thus, in the fummer-time they would eat neinher the hark nor iling. ray ; but in winter any thing was aceeptall-. A young whale being driven ahore, was quickly cut in pieces and carried off. They broiled it only long enough to forch the outfide; and in this raw llate they eat all their fiff. They brail alfo the fern root and another whofe fpecies is unknowa. Among the fraits ufed by them is a kind of wild fig; and they eat alfo the kernels of a fruit refembling the pine apple. The prineipal part of their fubfiltence, lowever, is fils: and when thefe happened to be farce, they were wont to watch the opportunity when the colonilts hauled the feine, and ofter feized the whole, though a part had formerly been offered or given them. I'hey fometimes Atrike the fifh from the canoes with their fpears, fonetimes catch them with hooks, and alio make ufe of nets, contrary to the affertion of Dr Hawkefworth, who fays that none of thefe are to be met with among them. Their net are generally made of the fibres of the fax plant, with wery little preparation, and are

Now fill- Arong and heavy; the lines of which they are com13n 1 pofed twilled like whereord. Some of them, how.
ever, appear to be made of the fur of an animal, and others of cotton. The mefhes of their nets are mede of very latge loops artificially inforted into each other, but without any knots. Their hooks are made of the infide of a hell very much refembling mother of-pearl. I"he canoes in which they fifh are nothing more than large pieces of bark tied up at both ends with vines; and confidering the night texture of thefe velfels, we cannot bise adoive the dexterity with which theyoare namaged, and the loldnefs with which they venture in then out iofa. They generally carry fire alone with them in thefe canoes, to drefo their fith when caught. When fifion with tic hook, if the filh appears too thoont to be draw amore by the line, the canoe is paddited to the dlore; and while one man gently draws the fin along, another llands ready to Hrike it with a forar, in which te generaly fucceeds. Thene is no good reaion for fuppoling them to be canibals, and they never eat animal fublances but raw or next to it. Some of their vegetables are poifnous when raw, but depined of this property wen bailed. A convict unhappily experienced this by cating them in an unprepared Sate: in confequence of which he died in $2+$ hours. The difike of the New Hollanders to the Eno ropean provifons has already been mentioned : if bread be given them, they chew and fit it out arain, feldom choofing to frallow it. They like falt beef and pork rather betier; but they could neror be brourgh io talle opirits a fecond time.

The lats of thete farages are formed in the moft rude and barbarous manner that can be imagined. They confift only of pieces of bark laid together in the form of an oven, open at one end, and very low, though long enough for a man to lie at full length. 'There is reafon, however, to believe, that they depend lefs on them for fhelter than on the caverns with which the rocks abound. They go invariably naked, as has already been obferved: though we mult not imagine that the cultom of going naked imures them lo to the climate as to make them infenfible to the injuries of the weather. The colonits had repeated opportunitics of obferving luis, by feeing them thiseting with cod in the winter time, or hudding together in heaps in their huts or in caverns, till a firc coald be kindled to warm them. It is probable, however, notwithflanding their exscme barbarity, that fome knowledge of the arts will foon be introdued among them, as tome have been feen attentiveh confidering the uaculits and conveniencies of the Europeans, with a riew, feenningly, of making limilar improvements of their onm. It has alfo been obferved, that in fome things they poffels a vety great power of imitation. They can insitate the fongs and language of the Entropeans almott infansaneoufly, much better than the Hater can invate thems by long pradice. Their talent for imitation is alfo difecrbible in their feu'ptures reprefenting men and other animals every where met with on the rocks; which, though rude, are very furprifing for people who have not the knowledge even of confluctine, habitations in the leaft comfortable for themfelves, or even clathes to preferve them from the cold.

In their perfonc, the New Hollanders are active, vi-
gorous, and fout, thounh generaliy lean. Dampier New afferts that they have a dinunefs of light ; thourh later navigators have determined this to be a miltake, aforibing to them, on the contrary, a quick and piercing light. Their fenfe of fomelling is alfo very acute. One of them having touched a piece of pork, held out his fanger for his comparion to fmell with llong mark of difeut. The only kind of food they eagerly accept of is difh. Their behaviont with regard to the women las been hitherto unacconntable to the colo. nills. Few of them, comparatively fueaking, have been feen: and thele have fometimes kept back with the mot jualous fenlibility ; fometimes offered with the greatell familiarity. Such of the females as have been feen, have foft and pleafing voices; and notwithftanding their barbarifm and exceffive rudenefs, feem not to be entirely deltitute of modelly.

The New Hollanders generally difplay great perfonal bravery on the appearance of any danger. An old man, whom governor Phillip lnad treated with fome familiarity, took occafion to fteal a fpade; but being taken in the fart, the governor gave him a few Alight haps on the fhoulder; on which the old man canght hold of a fpear, and, coming up to him, feemed for fome time determined to Arike, though had he done fo it would have been impolfible for him to ticape, being then furrounded by the officers and foldices. No enconnters between parties of the natives themfelves have been obferved, though from fome circamflances it appears that wars are carried on among them. They have more than once been feen affembled as if beat on fome expedition. An officer one day met if of them marching along in a regular Indian fie through the woods, each man hoving a fpear in one hand and a flume in the other. A chief appearcd at their head, who was dilligguifhed from the rell by teing paiated. They paffed on peaceably, though greasty fuperior in number to our people. On anuther oceafion they offered no hoftilities when affembled to the number of 200 or $3 c 0$, and mecting the governor attend. ed oaly by a fmall party. With ail their courage, however, they are much afraid of a muknet, and almoft equally fo of a red coat, which they know to be the martial drefs of the Europeans. The mifehief winch they have bithento donc has been exercifed only on fonse itraggling convicts, mott of whom probably have been the tint aggrefors.

Though thefe favares allow their heards to grow to a contiderable length, it does not appear that they look upon them to be any ornament, but rather the contrary, as appears from the following infance. Sume young gentemen belonging to the Sirius, one day met an old man in the woods with a beard of contiderdble length. This his new acquaintance let hima know that they would rid him of, ftroaking their cbins, and fhowing laim the fmoothnefs of them at the fame time. At length the old fellow confented; and one of the youngiters taking a penknife from his pocket, and making the beft fublitute for lather he could, performed the operation with fuch fuccefs that the Indian feemed highly delighted. In a few days he paddled alongfide of the Sirius arain, pointiag to his beard; but could not by any means be prevailed upon to enter the hhip. On this a burber was fent down to him, who again freed him from his beard, at
which

## H O L

tol- which he expreffed the utmoft fatisfaction. It has, however, been found impoffible to form any kind of permanent intercourfe with the natives, though many attempts have been made for that purpufe; but in his letter above quoted, governor I'hillip declares that he has not the leaft apprehenfion of their doing any damage to the colony. At firll the colonitts imagined the deears of the New Hollanders to be very trivial weapoos: but it now appears that they are capable of infieting very grievous and mortal wounds. They are foretimes pointed with a flarp picee of the fame reed of which the fhafts are made, but more frequently with the fharp bone of the fling-ray. They certainly burn their dead; which perhaps has given rife to the report of their being canibals. Governor Plillip, obferving the ground to be railed in feveral places, caufed one of thefe tumuli to be opened, in which were found a jaw bone half eonfuned and fome afhes. From the manner in which the athes are depolited, it appears that the body has been laid at length, raifed from the ground a little fpace, and confured in that polture; being afterwards lighily covered with mould.

The only domettic animals they have are the doges already meationed, which refemble the fox-dog of England. In theirlanguage thefe animals are called dingo; but all other quadrupeds withont exception they name Lionsaroo. - They feem very little given to thieving in com. parifon with the inhabitants of moft of the South Sea iflands; and are very honell among themfelves, leaving their fpears and other implements open on the beach, in full and perfeet fecurity of their remaining untovehed. They are very expert at throwing their javelins, and will hit a mark with great certainty at a confiderable diftance; and it feems that fometimes they kill the kangaroo with this weapon, as a long fplinter of one of the fpears was taken out of the thigh of one of thefe animals, the flef having elofed over it completely. The people are more numerous than uas at firt imarined, though atill the number of inhabitants mult be ac. counted few in comparifon to the extent of country; and there is great reafon to belitwe that the interior parts are uninhabitec.

The New Hollanders bake lletir provifions by the he!p of hot fones, like the inlabitants of the South. fea iflands. They produce fire with great facility according to Captain Cook, but with diffieulty accord. ing to later accounts, and fpread it in a wonderful manger. To produce it, they take two pieces of dry foft wood; one is a Nick about cight or nine inches long, the other nicce is flat. The flick they frape into an obtufe poins at one end; and prefing it upon the other, turn it niably, by holding it between both their hands, as we do a choculate-mill ; often mifting their liands up, and then moving them down upon it, to increafe the preffure as much as pufible. By this method they get fre in lefs than two minutes, and from the finalleft fark they increafe it with great fpeed and dexterity." We have often feen (fays captain Cook) one of them run along the fhore, to all appearance with nothing in his hand, who fluoping down for a moment, at the diftance of every fifty or an hundred yards left fire behind him, as we could fee, firtt by the fmoke, and then by the flame along the drift of wood and other litter which was feattered along the place. We had the curiolity to examine
one of there planters of fire when he fot off, ard we faw him wrap up a fmall fpark in dry grafe, which when he had run a little way, haviug been fanned by the air that bis motion produced. Berran to blaze; he then laid it dowp in a place coavenient for his purpofe, inclofing a fpark of it i: another quantity of grafs, and fo continued his courfe."

Holland in commence, 2 ine and clefe kind of linen, fo called from its being tirf manufactired id Holland.

HOLIAR (Wenceflaus); a celebrated engraver; born at Prague in 1607 . His parents were in a gentcel line of life; and he was at firll defigned fur the thudy of the law. But the civil commotions, which happened in his youth, ruining his family affairs, he was obliged to fiift for himelf; and by difcovering: fome genius for the arts, he was placed with Marian, a very able defyoner and engraver of views. Beitys. hinfelf a man of great ingenuity, he profited hattly from the inlluction of his tutor. He principally ex. celled in drawing geometrical and perfpectise view: and plans of buildings, ancient and moden cities and towns; alfo landfeapes, and every kind of natural and artifecial curionties; which he executed with a pen in a very peculiar ityle, excellently well adapted to the purpofe. He travelled through feveral of the great eities of Germany; and, notwithtanding all his merit, met with folitle encouragement, that he found it very difficult to fuppoit himfelf. 'l'he carl of A rundel being in Germary took lisn under his protection, broughe him to England, and recommended him to the favour of Charlesi. He engraved a variety of plates from the Arundel collection, and the portrait of the cart himfelf on horfelack. The civil wars, which lappened foon after in England, ruined lis fortune. He was talien prifoner; with fome of the royal party, and with diffenlty efeaped; when he returned to Antwerp, and joired his old pation the earl of Arundel. He fettled in thas city for a time, and publithed a confiderable nuriber of plates; but his patron going to Italy foon after fir the henefit of his health, Hoilar fell again into ditirefs, and was ubliged to work for the print and bookfellers of Antwerp at very low prices. At the reiloretion he returned into England; where, though he had fufficient employment, the prices lie received for his engravings were fo greatly inadequate to the labour necef. farily required, that he could but barely fubfill; and the plagite, with the fucceeding fire of London, putting for fome time an cficctual flop to bufinefs, his affairs were fo much embarraffed, that he was never afterwards able to introve his fortune. It is faid that he uled to work for the booktellers at the rate of four-pence an hour ; and alwa;"s lad an hour glass before him. He was fo vety fertpuloufy exact, that when obliged to attend the calls of nature, or whill talking, though with the perfoss for whom he was working and about their uwn bufinefs, he conflantly laid down the glafs, to prevent the fand from running. Neverthelefs, all his great induftry, of which his numerous works bear fufficient teftimony, could not procure him a fufficient maintenance. It is melancholy to add, that on the verge of his 7oth year, be was attached with an execution at his lodgings in Gardener's lane, Weftminifter; when he defired only the liberty of dying in his bed, and that he might not be aemorect to any other prifon than.

Hollant, 1tMar.
-rood
 obrained or mot. He dicd, however, in 1677.- His works amount nearly to 24,000 prints, accobding to

Veitue's Catalogue; and the lovers of art are always zealons to colleet them. Generally 「poking. they are etchings performed almof entirely with the point; and their metits are thas characterifed by Mrstmit: "They poflels great fpirit, with atkonihng freedom and lightnefs, efpecially when we condider how highly he has duifhed lume of them. Ihis views of abbeys, churches, mins, Ecc. with his R.ells, muff, and every fpecies of flill life, are admirable; his landfeapes frequenty have seat morit : and his diflant viess of towns and cities :er not only eaccuted in a very accurate, but a very fleahne mancr." A fomewhat culder character is fiven of them by Mr Gilpin in his Eflay on Prints: "Hollar gives us views of particular places, which he copies with griat truth. unorramented as he found them. If we are fatistied with cyact reprefentations, -re have them no where better than in Hollar's works: tut if we expeet pietures, we mult feek them chewhete. Hollar was an antiquarian and a dramghtfman: but feems to lave been little arguainted with the principles of painting. Stiffnte is his charaderillic, and a painfal exactnefs soid of tafte. His Targer views are mere plans. In fome of his fmaller, it the experce of infinite pains, fomething of an ef,f ef is fometimes produced. But ingeneral, we con. $f$ der him as a repofitory of curiofities, a record of antinuated crefice, abolified ceremonits, and ediaices now in ruins:

HOLA, Ol, in the fearlanguage, an exclamation .of anfxer, to any perfon who calls to another to . At fome queftion, or to give a particular order. Thus, if the maller intends to rrive any order to the people in the main-top, he previouly calls, Main ip, boat! to which they anfwer, Holloa! to foow that they hear him, and are ready. It is alfin the hef anfwer in hailnga thip at a ditance. See Habling.

1OLILY, in butany. See Ilex.
Sca-Mollo. sce Eryngum.
MOLM (Sax. butmus, infurt amnica), denotes an ine or fonoy ground, according to Bede; or a riverihnod. And where any place is called by that name, and this fyllable is joined with any other in the names of places. it Gguifes a place farrunded with water; as the Flatholmes and Stepholmes in the Severn near Briftol: but if the fituation of the place is not near the water, it may then fignify a hilly dace; lolm in saxun, fegnifying alio "a hill or cliff.

HOLOCAUST" (formed from ores "whrole" and >ow "I confume with lire)," a kind of facrifice, wherein the whole effering is burnt or confumed by lise, as an acknowledgement that God, the creator, proferver, and lord of all, was wortly of a't horemer and womhip, and as a token of mens giving themfdes entircly $u p$ to lim. It is calied allo in Seripture a lurneffrint- Sacrifices of this fort are often methtion$\because d$ by the heathers as well as Jews; particularly 1) X Xenophon, Cyyond. lib. viii. P. 4bat. ed Ituichinf. s738, who fpeaks of facrificing holocaults of oxen to Jupiter, and of horfes to the fun: and they appear to have been in ufe long before the inflitution or the other Jewith facrifices by the law of Nlofes; (fee Job i. 5 . slii. 8. and Cen. sxii. 13. viii. 20). On thisaccount, N 156.
the Jews, who would not allow the Gentiles to offer Holet on their altar any other facrifices peculiarly enjoined by the haw of Mofes, admitted them by the Jewith prictls to offer liolocaufts; becaufe thele were a fort of facrifices prior to the law, and common to all nations. 1)uring their fuljection to the Romans, it was no uncom. mon thing for thofe Gentics to efer facrifices in the God of Jrael at Jernfalem. Holocauds were dermed by the Jews the mot excellent of all their facrinces. It is faid, that this kind of facrifice was in common xfe among the leathens, till Prometheus introduced the cullom of burning only a part, and referving the remainder for his own uli. See Sacrifice.

HOLOFERNES, lieutenant general of the armies of Nebuchadonofer king of A解ra, who having in a remarkable encounter overcome Arphaxad king of the Medes, fent to all the neighbouring nations with an intention of obliging them this way to fubmit to his empire, pretending that there could be no power capable of refitting linn. At the fame time Holofer. nes, at the head of a powerful army, paffed the Euphrates, entered Cilicia and Syria, and fubdued alnoof all the people of thefe provinces.

Being refolved to make a conquet of Egypt, he ad. vanced towads Judxa, litie expecting to meet with any refiftance from the Jews. In the mean time, he was informed that they were preparing to oppofe him; and Achior the commander of the Ammonites, who had already fubmitted to Holofernes, and was with fome auxiliary troops in his army, reprefented to him that the Hebrews were a people protected in a particular manner by Gud Ahmighty fo long as they were obedient to him; and therefore he fhould not flater himfelt with expectations of overcoming them, valef3 they had committed fome offence againlt God, wherehy they might becume unworthy of his protection. Holofernes, difregarding this difcourfe, commanded Achior to be conveyed within light of the walls of Bethulia, and tied to a tree, and left there, whither the Jews came and loofed him.

In the mean time Holofernes formed the fiege of Bethulia; and having cut of the water which fupplisd the city, and fet guards at the ouly fountain which the belieged had near the walls, the inhabitants were foon reduced to exticmity, and refotved to furrender, if God did not fend them fuccours in five days. Judith, being informed of their refolution, conceived the defign of killing Holofernes in his camp. She sook her fineft clothes, and went ont of Bethulia with her maid-fervant; and being brought to the general, the pretended that fhe could no longer endure the fins ;and exceltes of the Jews, and that God had infpired her with the defign of furrendering herfalf to him. - As fron as Holofones faw her, he was taken with her beanty; and fome days after invited her to a great fcall, which be prepared for the principal officers of his army. But he diank fo mueh wine, that deep and dmakennels hindered him from fatisfying his paffonn. Judith, who in the night was left atone in his tent, cut of his head with his own fword; and departing with her fervant from the camp, fhe returned to Bethulia with the head of Holofernes. As foon as it was day, the befeged made a fally upon the ene. nies, who going into their general's tent, found his headlefs carcafe wallowing in is own blood. They the's
then difcerned that Jucith had dcceived them, and fad with precipitation, leaving the camp abounding with rich fpoils: the Jews purfued them, killed a great number of them, and returned loaded with boot $y$.

There is a great diverfity of opinions concerning the time when this war between Holoferties and the Jews happened. Sume date it from the captivity of Babylon, in the reign of Maneffich, and pontificate of Eliakim the high-priett ; others place it at fome time af. ter the captivity; and fome doubt the truth of the whole tranfaction. See the article Judith.

HOLOGRAPHUM (compofed of oxos "all," and $2 f^{a}: s$ "I write"), in the civil law, fomething written wholly in the hand-writing of the perfon who fignsit. Thic word is chiefly ufed in rpeaking of a teftament writen wholly in the teftator's own hand.

The Romans did not approve of holographic tef. taments; and, though Valentinian authorifed them by a novel, they are not ufed where the civil law is in full force.

HOLOSTEUM, in botany ; A genus of the trigynia order, belonging the triandia clafs of plants; and in the natural method ranking under the 22d order, Caryophyitic. Tlie calyx is pentaphyllous; the petals five, the caprule unilecular, and wearly cylindrical, opening at top.

HOI.OTHURIA, in zonhgy, a genus belonging to the erder of vermes mollufca. The budy detached, naked, gibhous, terminated by the anus. Many tentactula at the other textremity, furrounding the mouth. There are rine fereics, ail inhabitants of the ocean. The following deferiptions of three foceies are given by Mr Barbut.

1. The tremula, or quivering holothuria, "commonly meafures ciglat inches in length when dead; but alive it extends itfelf to more than a foot, or contracts its body into a ball. Its tigure is colindric, the diameter of which is every way equal to an inch and a few lines. The back of a dark brown proudiy bears a variety of flehy pyramid-like nipples, of a dark colour like wife at their bafis, but white at their apcx. They are obferved to be of two different fizes; the larger occupy the length of the back, in number 14 on each fide, at the didance of fix lines one from the other, when the holothuria is contracted, but the intervening fpace is full cight lines when the animal is extended. Others like thefe are placed here and there aromif. cuoully. The lefs are fcatered in like manner, with. out order, in every part of the back. Out of them all exfudes a whitifl macilage ferving to lubricate the hody. Hence all the forefaid nipples feem to be fo many glands furnimer with an excretory duct, the aperture of which is fo minute as not to be difcoverable by the help of a common glais. That they are morcover provided with various $n$ ufcles follows hence, that the holothuria can raife and chliterate them at pheafire. While the larger papiilx are quite erect, Their axis ard the diameter of their bafe meafurcs three - lines. The belly or part oppofte to the back in the holuthuria is of a pale brown and fot all over with cy. lindric tentacula, in fuch numbers siat the bead of a pin could farce fird room beween. Their diameter is net much atove a line, and their length is shat of four lince. They are of a Minirg whitenefs, escept the extremity which is of a dak colour, Vor. VILI. Part II.
and Maped like a fucket. By the thelp of there ten. Holoter. tacula the holothuria fixes its body at hie Lotiom of the fea, fo as not to be eafily furced away by tempents, which would otherwife happen the more frequently, as this zooplite divells near the fhores where the wa. ter fearce rifes to a fathom's lieight. Now if it adheres to other bodies by means of its ventral tentacula, their point muft neceflarily have the furm of a focket, as the cuttle-fif, fea-urchins, and far-fith lave theirs Shaped, by which they lay hold of any other body. From this fituation of the holothuria at the botton of the fea, which it allo retains when keft in a veflel filled with fea-water, it mult be evident to any one, that I have not groundefly deternined which was its back, and which its belly, which otherwife in a cylindric body would have been a diffectit talk. But as all animals uniformly waik or relt upon their bellies, and the holothuria las likewife that part uf its body turned to the earth on whicla the cylindric tentacuia are to be feen, it is clear that part is the abdomen or belly of this zoophite. However, both the abdomiral and dorfal tentacula are raifed and obliterated at the animal's pleafure; from which it is no light conjecture to cunclude, that they are furnintud with elevating and depreting mufeles, and particularly becaufe all the forefaid tentacula difappear after the aminal's desth: and hence it farther appears, that all naturalills bave given the reprefentation of a dead holothuria, feemg they have afiignod it no tentacula. I entertain fome doubt whether the illutrious Linnous himfelf did not draw his generical character of the holuthuria from a dead fulject, as he makes no mention of thele tentacula."
2. The plyfalis, or bladder-fhaped holothuria. The body of this fpecies is oval, approaching to triangular, of a gluffy tranfparency; the back tharp edged, of a dark green colour, whence run out a number of finews: anteriorly the body is of a reddifh lue. The trunk fpiral, redtith towards the thicker end. Many tentacula of unequal length under that thicker end ; the Aterter ones are taper and thicker, the middle ones ca. pillary, the point clay colour and in flape like a ball; the retl which are longer are filiform, of which the middlemoth is thicker and twice as long. Drown, in his Jamaica, calls it a diaphanous bladder with numerus tentacula reprefenting a man's belly; above it is furnifhed with a comb full of cills; under the other extremity lang a number of branchy tertacnia. It inhabits the feas.
3. The I'entactes, or five-rowed holuthuria, has the mouth encompaffed with tentacula, the bodybearing tentaculative difierent ways. The animal is of a red colour, nearly oval, or fomewhat cylindrical, affuming various hapes. The mouth is fet round with tea rays brilly at the puints. The body longitudimally doted in tive places with clay-coloured hollow warts, huate two together. It inhalyits the fea of Norway, iaking in and calting out again the water, as it eitlicr fwims or dives to the boitom.

HOLSTE1N, a cucly of Germany, founded by the German occan on the welt; the Daltic, or the gulph of 1,ubeck, on the catt; the duchy of Mech leniurg on the foutheaft; that of Brenen, with the river Libe, on the fouth-wett; and Lauenburg, with N.e territory of Hamburg, on the foth. Its greatelk 4 I

Itomein lergein is about So miles, and its breadth 60. The divecte of Eutin, and the county of Ranzau, though the : make a part of the duchy of Holltein, yet being lands belonging to the empire and circk, thall be deforibed feparately.

A great part of this country conlilts of rich marth. land, which being much expoled to inundations both from the fea and rivers, dykes have been raifed at a sreat expence to guard and defend them. The paflures in the marthes are fo rich, that cattle are bred in valt numbers and fattened in them, and great quantities of excellent butter and cheefemade of their milk. 'lhey are alfo very fruitful in wheat, barley, peale, beans, and rapefeed. In the more barren, fandy, and heathy parts of the country, large flocks of heep are bred and fed : nor are orchards wanting, or woods, efpecially of oak and beech; nor turf, poultry, game, and wild-fowl. Here is a variety both of fea and river fifh; and the beef, veal, mutton, and lamb, are very fat and palatable. Holtein is alfo noted for beautifil horfes. The geatry ufually farm the cows upon their clates to a Hollander, as he is called, who for every cow proys from fix to ten rix-dollars; the owner providing palkure for them in fummer, and flaw and hay in winter. It is no uncommon thing here to drain the ponds and lakes once in three or four years, and fell the carp, lampreys, pikes, and perch, fond in them: then fow them for feveral years after with oats, or ufe them for patkere; and after that lay them under water acain, and breed fifh ia them. There at hardly any hillo in the country ; but feveral rivers, of which the principal are the Eyder, the Stor, and the Trave. The duchy contains about 30 towns great and fmall: moft part of the peafants are under villenage, being obliged to work daily for their lords, and not even at liberty to quit their efaccs. The nobility and the provrietors of manors are poffefled of the civil and criminal jurifdiction, with other privileges and exemptions. Formerly there were diets, but now they feem to be entirely laid afode: meetings, however, of the notility are thill held at Kiel. The predominant seligion here is Lutheranifm, with fuperintendencies as in other Lutheran countries. In ioveral places the Jews are allowed the exercife of their teligion. At Glack. Stadt and Altena are both Calvinith and Popilh church. es: and at Kiel a Greck Ruffian clapel. Befides the Latin fehools in the towns, at Altena is agymnafinm, and at kiel an univerfity. Notwithfanding this country's advantageous hituation for commerce, there are few mannfactures and little trade init. Hamburg and Lubec fupply the inhabitants with what they want from abroad; from whence and Altena they export fome grain, malt, grots, tharch, buck-wheat, pafe, beans, raptfeed, butter, cheefe, heep, fwine, horned cattle, liorfes, and fifh. The manufactures of the duchy are chichy carried on at Altema, Kiel, and Gluckifadt. 'The duchy of Hollein eonfits of the ancient provinces of Hollein, Stormar, Ditmarfh, and Wagria. It belongs partly to the king of Deumark and partly to the dukes of Holte in Gottorf and Pluen. Anciently the counts of Holtcin were valtals of the dukes of Saxony; but afterwards they received the invelliture of their territories from the emperor, of the billops of Lubec in the emperor's nane, though now
the inveliture is given by the emperor in perfon. The Hoftefin king of Denmaris appoints a regency over his part of Holltein and the duchy of Sliefivick, which has its ofice at Gluckfadt. The feat of the igreat du'ce's privy conacil and resency eoart, together with the chief conflory, which is, united to it, is at Ki : : there are many inferior courti and conlitories, from which an appeal fics to the hirther. In the duehy of fioltein, the government of the convents and nobility is alternately in the king and duke for a year, fron Michaelmas to Michaclmas. The perfn in whon the government is lodged alminiters it by his regeney. In fome cafes an appeal lies from this court to the dislic conncil or chamber at Wetzlar: the convents, the nobility, and the proprietors of manors in the comatry, have a civil and ciiminal jurifdiction over their elates. The revenues of the fovereigns arife prinenpally from thir demefnes and regalia; befides which, there is a land and feveral other taxes and impolls. The duke's income, fetting alde his ducal patrimony, has been ellimated at $, 0,000$ or 80,000 pounds. The king ufually keeps here fome regiments of foot and one of horfe. With refpect to the duke's military force, it amounts to about soomen 'The king, on account of his hhure in this country, thyes himbelf duhe of Hol. ficin, Stormar, and Dimuorjo. The dukes both of the royal and princely houle tyye themfelves heirs of Noracay, dukes of S!jrvick, IIflait, Sowmar, ant Ditmarlb, and comuts of Oulenburg and Dilncnlorgl. On account of Holitein, both the king of Demanark and the grand duke have a leat and voice in the college of the princes of the empire, and in that of the circle. 'logether with Meckleuburg they allo nominate an afteffor for this circle in the Autic chamber. The matricular affefment of the whole duchy is 40 horfe and 80 foot, or 8oo llurins; to the chumber of Weizlar both pratices pay 189 vix dollars, 31 kruit. zers. In 1735, duke Chathe Erederic of Holteia Gontonf fommed an order of knighthood here, viz. that of St Anae, the enfign of which is a red crofs, enamblled, and worn pendant at a red ribbon edged with yellow. - The principal plieces of that part of the dueliy helonging to the king of Denmark and the doke of Iloen ate (Sluckfadt, Itzhoe, Rendfourg, and Pben; and that part belonging to the great duke are Kid, Oldenburg, Preese, and Aleena.

HOLSI'ENILS (Lueas), an ingencod and learned German, born at Hamburg in Ijof, was bied a Lutheran; but being converted io popery by father Simond the Jefuit, he went to Rome, and attached himfelf to cardinal Francis Barberini, who iook hisn under his protection. He was honoured by thee popes; Urban VIIl. gave him a cinomy of S: Peter's; Innocent X. made him librarian of the Vatican; and Alesander VII. fent hia in 1655 to queen Claitina of Sweden, whofe formal profeflion of the Cotholic faith he received at Inipruck. He fpent his life in ltudy, and was very learned both in facted and profaue antiquity. Fle died in 166 ; and though he was not the author of any great works, his notes and differtations on the works of others have been highly ettecmed for the judgment and preeifion with which they are drawir up.

HOL'l' (Sir John), knight, eldelt fon of Sir Thomas Holt, ferjeant at law, was born in $16 f^{2}$. He en- the common law with fo much indultry, that be foon became a very eminent barrifer. In the reign of James II. he was made recorder of London, which of fice he difcharged with much applanfe for abo:t a year and a half; hut lof his place for refufure to expound the law fuitably to the king's debigns. On the arrival of the prince of Orange, he was cheren a menber of the convention parliament, which afforded him a good opporturity of difplaying his abilities; fo that, as foon as the government was $\{e \cdot t$ led, he was made lord chicf jultice of the crunt of king's bench. and a privy counfellor. He contimued chief jullice fir 22 yeas, with great repute for Mcadinefs, integrity, and thorough knowle Ige in his profeffion. Upon great necafonste afferted the law with intrepidity, thongh he therely ventured to incur by turns the indignation of both the houfes of parliament. He publithed fome teporte, and dien! in 1509.

Holt (Sax.) "a wood;" wherefore the names of towns beginning or ending with bolt, as fluch bolt, \&e. denote that forme:ly there was gercat plenty of wood in thofe places.
holy. See Holiness.
HOLY-GHOST, one of the perfons of the holy Trinity. See Trinity.

Order of the Horr Grost, the principal military order in France, inllituted by Henry III is 1560. It confant of 100 kisights, who are to make proof of their robility for three defcents. The king is the grand-malter or fovereign; and as fuch takes an oath on his coronation- cay to maintain the dignity of the order.

The kniglats wear a goliten crofs, hung about their necks by a blue filk ribbon or collar. Eut before they receive the ordur of the Holy-Ghot, that of St Michael is conferred as a neceffaty degree; and for this reafon their arms are furrounded with a double collar.

HOLYIEAD, a town and cape of the ille of Anglefea in Wales, and in the Irifh channel, where people ufually cmbark for Dublin, there being three packet. boats that fail for that city every Monday, Wecheiday, and Friday, wind and weather pernitting. It is 276 miles from London, and las a $v$ ery convenient harbour for the northern trade, when taken fhort by contrary winds. It is fitnated near the extremity of the Mle, and is joined to the north-well part of it by a llone brilge of one arch. It has a fmall market on Saturdays. The parith is about five or fix miles long, and two or three broad, bounded nearly by the fea. The church llands above the harbour, within an old quadrangular fortilication, with a bation at each corner built about 450. On a mountain near it is another old fortification called Turris Munimentem, which is an old done wall withont mortar, and in its centre is a frall turret, and contains a well of water. Holyhead was frequently formenly vilited by Irifh rorers, and was defended as a place of confequence. There are feverell remains of old forthications and Druidical antiquities in its neighbourhoob, as well as chapels of religious worlhip. The parah charel of Helyhead was built in the reign of F.dward III. and is in the form of-a crofs, with a porch and Aceple very antique. 'There was an old chapel near the charch, now converted into a fchoul-hunfo. A fall-.ioufe was
erected an an illand in the harhour in queen Anne's reign, but it is now in ruins. The town is lithe more than a lifhing town, rendered contiderable by being the

Hhbeais,
thand. place of paffage to Ireland. It las three gond inns. The paflage hence to treland is in gencral about twelve hours. There is no freft water hare escept from rain, nor any bread fold but what comes from Ireland. A bath and affembly-room were evecied hure in 17:0. Under the mountains that overlaner the town is a lage cavern in the rock, fupported by matural piltars, cal!ed the Parliament-houle, accefrible only by boats, and the tide runs into it. If this harbour was propenly repaired, and ware-houles built, it would be very conveEnient for the Irihh to import fuch of their goods as pay Enclifh duty, it being hat a few luaus fail from Dublin. Ecfides. the Jublin merchants miglit comeover with the packets to fee their goods landed. The commolities are, butter, cheef, bacon, wild foul, loblers, crabs, oylters, razor-lifh, hhimps, hervings, cod-filh, whitings, whitingpollacks, cole lifh, fea tenches, turbots, foles, Aloun. ders, ratys, and plenty of other fifh. On the rocks the herb grows of which they make kelp," a fixed fait ufed in making glafs, culd in alum works. In the neighbourhood there is a lagge vein of white fullers earih and another of yeliow, which might be uleful to fullers. On the ine of Skerries, nine miles to the north, is a lifht houfe, which may be feen $2+$ miles nfi. Large lucks of puffinsare of ten leen here ; they all come in one night, and depart in due fame manner.

HOLY'IsLawd, a frall inand lying on the coalt of England, 10 milus foutl-ealt of Derwick, in Northam. berland. Bede calls it a femi-g/hund, being, as he obferves, twice an ifland and twiec continent in one day: for at the flowing of the tide, it is encompalted by water; and at the ebh, there is an almont dry paftage, both for horfes and carriages, to and from the main land; from which, if meafured on a fraight line, it is diftant about two miles eallward; but on acconnt of fome quickfands paflengers are obliged to make fo many detours, that the length of way is nearly doubled. "The water over thefellats at fpring-tides is only feven feet deep. - This ifland was by the britons called Inis MA:dicante; alfo Limdisfur, from the fmall rivulct of Lindi or Landi, which here runs into the fea, and the (eltic word fobiren or "recefs;" and on accomst of its being the habitation of fome of the firt monks in this conntry, it afterwards ohtained its prefent ame of Holy if and. It meafures from ealt to wed about two milss and a quarter, and its breadth from morth to fouth is farcely a mile and a lialf. At the northwhel part there runs out a fpit of land of about a mile in length. 'The monattery is fituated at the futhhermoft extremity; and at a finall diftance north of it fands the village. On this ifland there is plenty of fith and fowl; but the air and foil are bad. 'Ilhere is not a tree on the ifland. 'The village, which flands on a rifing graund, comilts but of a few feattered houles, chiefly inhabited by limermen; and it has two inns. Thec north and eall coalts are formed of perperdicular rociss, the other fides link by gradual flopes to the fands. 'Lhere is a commotious larbom', defended by a block-houfe; which latt was Gurprifed and taken in 1715 , hut was foon invelled and retaken.

Holy-inand, though really part of Northubstand, belongs :u Jorliam; and all civil difputes mult be de$\therefore$ I $=$

## 

termined by the juftices of that county. - It was a very ancient epifeopal feat. Ardan the firt bihop, atcer pretiling in it 14 years, died and was buried here A. 1). 0,1 . Finan, his fuccefor, built a wooden chuach, thatched with reeds, but before the end of the century coverd with lead by bilhop Eadbert. St Cuthbert, who from a poor thepherd became monk of Melrofs 15 yeurs, was prior here 12 more, when he recired to one of the barron Farn rocks, from whence he was called to this fee, which he held only two scars, and returned to his retirement, where he died, and was buried at the eatt end of his oratory, where his Rone coffin is tatil thown. His body was found freh 11 years after his death. Lindisfarn was ruined by the Dance, A. D. 793, when the monks carnied his body abous for feven yeare, and at laft fetted at Clefter-fe-itrect, whither the fee was tranfiated, and where it continned many years. On a fecond deftruction of the munaltery by the Danes they were removing to Rippon, bet llopped by a miracle at Durham, where the laint continued till the reformation, when his body was found entire, and privately buried in a wooden coffin, as fone pretend, near the clock, but more probably in the ground under where his farine flood. The entrochi found among the rocks at Landisfarn are calleci St Cuthbert's beads, and pretended to be made by him in the night. Eighteen bilhops fat here
till the removal of the fee to Cheiter, which had cightergon more till the removal to Durham, A. D. 995 . Lin. Hulswe disfarn became a cell to that Benedictiae monattery, valued at +81 fer ann. 'The north and fouth walls of the church are ilanding, much inclined; part of the wett end remains, but the eall is down. The columns of the nave are of four different forts, $: 2$ feet high and 5 feet diameter, mafly and richer than thofe ot Durham; the bafes and capitals plain, fupporting circular arches. Over each arch are large windows in pairs, feparated by a fhort column, and over thefe are imaller fingle windows. In the north and fouth walls are fome pointed arches. The length of the body is 138 feet, breadth is feet, and with the two ailes $3^{6}$ feet; but it may be doubted whether there ever was a tranfept. One arch of the centre tower remaius adorned as is its entrance from the nave with Saxon zigzag. Somewhat to the eafl is the baie of a crofs, and to the welt the prefent parih.church (A).

Hosr-Rood Day, a fellival obferved by the Roman catholics, in menory of the exaltation of our Saviour's croís. See Cross and Exaltation.

Holywele, a town of North Wales, in the county of Flint. It is a place of great note, for the well of St Windifred, who is reputed a virgin martyr; and it is much frequented by people that come to bathe in it, as well as by popifh pilgrins out of devotion. The
fpring
(A) A reference was inaduertently made to this article for a defeription of BAMBOROUGH, as if it had been fituated upon, or belonged to, Holy- Ifland. - Bamborough lies feveral miles to the fouth, and is fituated on the main land. The town is now an meonliderable village; but it once was a royal burough, and fent two members: it even gave name to a large thact extending fonthward, which was calied B.mborouthbire. It had alfo three religious foundations; a hoofe of friars preachers founded by Henry III. a cell of canoas regula of St Aultin, and an hofpital. Its very ancient catle thands on an almolt perpendicular rock clofe to the fea, and accefible only on the fouth-ealt fide, on a fpot whene, according to the monkith bittorians, there ftood the cafte or palace of the kings of Northumbertand; built, as it is faid, by king Ida, who began his reiga about the year $55 \%$. Part of the prefent ruins are by fome fuppofed to be the remains of king Ida's work. 'The ancient nane of this place was, it is faid, Bebunborouth; whole name Cambden, from the authority of Bede, imafines borrowed from Bebba, Ida's queen : but the author of the additions to that writer is of a cuntrary opimion, as in the Saxon copy it is called Cynclicanlerg, or the "royal manfion." According to Florikgus, king Ida at finf fenced it only with a wooden inclofure, but afterwards furrounded it with a wall. It is thus defcribed by Roger Hoveden, who wrote in the year 1192: "Bebba is a very lirong city, but not exceeding large; containing not more than ton or three acres of ground. It ha; but one hollow entrance into it, which is admirably raifed by lteps. On the iop of the hill fands a fair church; and in the weftern point is a well curioully adorned, and of tweet clean water." This calthe was belieged anoo 642 by Penda, the Pagan King of the Mercians, who, as the thory goes, attempted to burn it : for which purpofe he haid valt quantities of wood under the walls, and fet fire to it as foon as the wind was favourable; but no fooner was it kindled, than by the prayers of Se Adian, the wind changed and carried the llames intrs his camp, fo that he was obliged to raife the fiege. In 710 , king Ofred, on the dath of Alfred his father, took thelter in this calle with Bhithric his tutor or guardian; oue Edalph having feized the crown, by whom, with his partizans, they were unfucceffenlly befieged. Brithric made fo gallant a defence, that the diege wasturned into a blockade, which gave the loyal subjects time to arm in defence of their young hing. On their marching hither to his relief, Edulph fled, but was fulluwed, taken, and put to death by Brithric, who thereby fecurely feated Ofrcd on the throne, when this caftle became his palace. In the reign of Egbert, Kenulph bihop of Lindisfarn was cunlined here 30 years from 750 to 780 . In 933 , it was plundered and totally ruined by the Danes; but being of great imporsance in defending the northern paris agaiult the continual incurions of the Scots, it was foon after repaired, and made a place of contiderable ttrength. It is faid to have been in good repair at the time of the conquelt, when it was probably put into the coltody of fome trulty Norman, and had in all likehhood fonc additions made to its works; and this is the more probable, as the prefent area, contained within its walls, meafures upwards of 80 acres, inflead of three, as when defcribed by Howeden. About the year 1095 it was in the poffthon of Rubert de Mowbray earl of Northumberland, who engaging in fome treafonable pracrices againn William Rufus, that king laid liege to :t, and ubliged it to furrender. In the next reign it was ontuated by Henry I. to Eultace Fitz John, who was difpolfolid of it and his other employments by king Stephen

fpring gufhes forth withfuchimpetuofity, thatat a fmall diftance it turns feveral mills. Over the fpring is a chapel built upon pillars, and on the windows are painted the hiRory of St Winnifred's life. 'There is a mofs about the well, which fome foolifmly imagine to be St Winnifred's hair. W. Long. 3. 15. N. Lat. 54. 23.

HOLYOAK (Francis), anthor of the Latin dictionary, became rector of Sourth-ham in Warwickhire in 1604 ; and being greatly efteemed, was chofen member of the convocation in the firll year of Charles I.'s reign. He fuffered much for the king; and died in 1653, aged 87. His fon Thomas made enlargements to the faid Dictionary.

HOLYWOOD (John), or Halifax, or Sacre. bofo, was, according to Leland, Bale, and Pitts, born at Halifax in Yorkhire; according to Stainhurf, at Holywood near Dublin; and, according to Dempter and Mackenzie, in Nithflale in Scotland. The lattmentioned author informs us, that, having finithed his fludies, he cutcered into orders, and was made a canon regular of the order of Si Auguatin in the famous monaltcry of Holywood in Nithuale. The Englifh hiographers, on the conerary, tell us, that he was educated at Oxford. They all agree, however, in aftert-

ing that lie fpent moft of his life at Paris; where, fays Mackenzie, he was admitted a member of the univerfity on the fifth of June in the year 1221, under the

Stephen, that king being jealous of his attachment to Waud, daughter of Henry I. Irritated at this, Fitz John delivered the caltle of Alnwick to David king of Sootland, and brughtat to his aid all the forces he could raife; he was, however, afterwards reconciled to king Stephen, and held the manors of Burg and Knareßs. rough in Yorkhire, but never recovered the government of this calle.

In the 1 Gth of Henry 11. Come greas repairs feem to have been done here, as in Madox's hitory of the exchequer, under the article of Amercements, it app:ars one William, fon of Waldef, was fined five marks for refuting his afintanice in the king's works at Bacnbarg caftle. Its kee? is Juppoid to have been the work of this reign.
